ERRATA FOR VOLUME XLVI OF THE OFFICIAL GAZETTE.

ANNOUNCEMENTS—VOLUME XLVI.

DISCLAIMERS—VOLUME XLVI.

TEXT OF THE OFFICIAL GAZETTE, JANUARY 1 TO MARCH 26, 1889, INCLUSIVE.

INDEX TO THE DECISIONS OF THE COMMISSIONER OF PATENTS AND OF THE UNITED STATES COURTS IN PATENT CASES.

DIGEST OF DECISIONS OF THE COMMISSIONER OF PATENTS AND OF THE UNITED STATES COURTS IN PATENT CASES.

INDEX OF PATENTS AND PATENTEES FOR THE QUARTER YEAR, JANUARY TO MARCH, 1889.

ERRATA.

395,653, page 109, strike out all after number— title, drawing, and claims—and insert CANCELED.
396,033, page 230, in title, name of assignee, for "Christian J. Weniman" read *Christian J. Weinman.*
396,041, page 232, in title, name of assignee, for "Walter I. Kidd" read *Walter J. Kidd.*
396,204, page 287, in title, name of inventor, for "Anders Haggvist" read *Anders Haqqvist.*
396,206, page 289, first claim, line 2, for a "lever-fulcrum" read *lever fulcrumed.*
396,396, page 347, in title, name of inventor, for "Parker Fant" read *Parker Faut.*
396,605, page 409, in title, insert after residence of inventor, *assignor of one-half to Charles N. Harder.*
396,863, page 496, in title, residence of inventor, for "Albany, N. Y." read *Albany, Oregon.*
396,907, page 510, in title, residence of assignee, for "same place" read *San Francisco, Cal.*
396,957, page 524, strike out all after number—title, drawings, and claims—and insert CANCELED.
397,118, page 582, in title, for "Means for Operating Motive Power from Water and Air Currents" read *Means for Obtaining Motive Power from Water and Air Currents.*
397,174, page 598, in title, name of assignee, for "John Schuholy" read *John Schuholz.*
397,175, page 599, second claim, line 3, for "frames" read *planes.*
397,281, page 626, in title, names of inventors, for "Olaris Senstad" read *Olaus Senstad.*
397,523, page 707, in title, name of inventor, for "Almason J. Scofield" read *Almaron J. Scofield.*
397,811, page 791, claim, line 2, insert *friction or* before "toothed."
397,849, page 802, in title, for "administrator" read *executor.*
398,274, page 940, in title, residence of assignees, for "same place" read *Manchester, England.*
398,590, page 1039, in title, name of inventor, for "Carl E. Ehnborn" read *Carl E. Ehnbom.*
398,763, page 1092, in title, name of inventor, for "Owen T. Boker" read *Owen T. Baker.*
398,770, page 1094, in title, for "assignor" read *assignor of one-half.*
399,057, page 1185, in title, number of Belgian Patent, for "No. 76,612" read *No.* 76,712.
399,156, page 1222, claim 2, line 3, strike out "open-ended" and insert the same before "tube" in line 2.
399,164, page 1224, in title, for "Automatic Grain Weigher and Measurer" read *Automatic Grain Weigher and Register.*
399,552, page 1363, in title, date of English Patent, for "1870" read 1888.
399,623, page 1383, in title, names of assignees, for "Jacob Habermann" read *Joseph Habermann.*
400,404, page 1629, third claim, line 2, strike out "and" and insert a comma instead; line 3, strike out the dashes after "metal" and "mercury" and insert a comma after "bismuth;" fourth claim, line 2, strike out "and" after "lead" and insert a comma instead, and also insert a comma after "bismuth."

Page 449—Disbarment of Attorneys—for "John Lee Taylor" read *John Lu Taylor.*

The Official Gazette.

THE OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of its publication,) to June 30, 1883, it was published and bound in semi-annual volumes; since July 1, 1883, in quarterly volumes. All subscriptions must commence with the beginning of a volume; none taken for less than three months. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound semi-annual volumes, (prior to June 30, 1883,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1883,) full sheep, $2.75 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Fraudulent Practices by Attorneys.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., April 18, 1883.

The attention of this Office having frequently been called to circulars and communications of persons pretending to have access to the records of this Bureau, and claiming to possess information of the pendency of applications for patents, notice is hereby given the public that all such persons in so advertising themselves are acting under false representations and are guilty of unprofessional conduct, and should not be entitled to credit.

The Office has also received information that certain attorneys disbarred from practice under section 487 of the Revised Statutes are continuing to prosecute applications for patents under the names of other persons.

Hereafter a list will be published in the OFFICIAL GAZETTE containing the names and addresses of all such persons, and the public warned against employing them or intrusting applications or interests to their charge.

BENTON J. HALL, *Commissioner.*

The Office has information that *Isaac S. McGehan, No.* 155 *Broadway, New York,* a disbarred attorney, has been practicing under the name of *Alexander Melhado.*

Publishers' Catalogues.

This Office would be pleased to receive from manufacturers and publishers such catalogues, circulars, price-lists, or other advertisements relating to the sciences and mechanical arts as are published by them for gratuitous distribution; but notice is hereby given such manufacturers or dealers who feel disposed to send their publications that not less than three copies should be forwarded in order that the subjects may be properly indexed, classified, and subclassified in the Scientific Library for convenient and ready reference.

Issue of January 1, 1889.

DESIGNS.

18,830.—WAGON-BODY.—*Henry C. Armstrong*, Providence, R. I. Application filed September 1, 1888. Serial No. 284,371. Term of patent 14 years.

18,831.—HEATING-STOVE.—*Otto Germer* and *Gustave H. Guenther*, Erie, Pa., assignors to *Block & Germer*, same place. Application filed September 10, 1888. Serial No. 285,081. Term of patent 7 years.

18,832.—RADIATOR.—*John Hopson, Jr.*, New London, Conn. Application filed August 31, 1888. Serial No. 284,269. Term of patent 7 years.

18,833.—CHAIR-BACK.—*Herman Matsen*, Bedford, Ohio. Application filed November 5, 1888. Serial No. 290,020. Term of patent 3½ years.

18,834.—HEATING-STOVE.—*Frank Merion* and *Michael Hertenstein*, Columbus, Ohio. Application filed July 11, 1888. Serial No. 279,666. Term of patent 3½ years.

18,835.—JAPANESE TEA-STAND.—*William T. Merserecau*, South Orange, N. J. Application filed October 11, 1888. Serial No. 287,855. Term of patent 3½ years.

18,836.—GLASS OINTMENT-POT.—*John Whitall Nicholson* and *Joshua W. Gaskill*, Philadelphia, Pa., assignors to *James Whitall*, *John M. Whitall*, and *John Whitall Nicholson*, same place, *John Micker*, Millville, N. J., *C. Albert Tatum*, New York, and *Francis M. Underhill*, Brooklyn, N. Y. Application filed November 15, 1888. Serial No. 290,941. Term of patent 14 years.

18,837.—HEATING-STOVE.—*John A. Price*, Scranton, Pa. Application filed June 9, 1888. Serial No. 276,656. Term of patent 14 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

16,131.—POTATO-PLANTERS AND POTATO-DIGGERS.—*Aspinwall Manufacturing Company*, Three Rivers, Mich. Application filed October 25, 1888. Used since March, 1884.

"The word 'ASPINWALL.'"

16,132.—TOILET AND LAUNDRY SOAP.—*Beaver & Co.*, Dayton, Ohio. Application filed November 27, 1888. Used since September 25, 1885.

"The words 'GRAND MA'B.'"

16,133.—BLUE DRILLINGS.—*Boott Cotton Mills*, Lowell, Mass. Application filed November 27, 1888. Used since 1873.

"The letter 'A' and an ornamental floral border surrounding it."

16,134.—HALTER, DOG, PICTURE, AND SIMILAR CHAINS FORMED FROM WIRE.—*The Bridgeport Chain Company*, West Stratford, Conn. Application filed October 15, 1888. Used since July 1, 1887.

"The word 'TRIUMPH.'"

16,135.—SASH, SAFETY, AND SIMILAR CHAINS FORMED FROM SHEET METAL.—*The Bridgeport Chain Company*, West Stratford, Conn. Application filed October 15, 1888. Used since June 1, 1888.

"The word 'MONARCH.'"

16,136.—DETERGENTS CONTAINING AMMONIA.—*Columbia Chemical Works*, Brooklyn, N. Y. Application filed September 25, 1888. Used since October 4, 1886.

"The word 'ZOMONIA.'"

16,137.—OARS, HANDSPIKES, AND CAPSTAN-BARS.—*De Grauw, Aymar & Co.*, New York, N. Y. Application filed September 22, 1888. Used since June 15, 1888.

"The representation or figure of a lion."

16,138.—ARTIFICIAL FERTILIZERS.—*Joshua Horner, Jr.*, Baltimore, Md. Application filed November 23, 1888. Used since November 20, 1888.

"The words 'BUTCHER HOUSE.'"

16,139.—ARTIFICIAL DIAMONDS.—*Edward Ernest Kipling*, New York, N. Y. Application filed October 30, 1888. Used since September 15, 1888.

"The words 'AUSTRALIAN PEBBLES.'"

16,140.—WHISKY.—*Kirker, Greer & Co.*, (*Limited*,) Belfast, county of Antrim, Ireland. Application filed May 16, 1888. Used since 1880.

"An artistic label printed in colors, at the top of which appears a series of representations of medals, and at the center the representation of a shamrock-leaf, with the words 'THE SHAMROCK WHISKY' arranged in a circle around it."

16,141.—CIGARS AND CIGARETTES.—*Earnest Kohlberg*, El Paso, Tex. Application filed November 14, 1888. Used since January 1, 1887.

"The words 'LA INTERNACIONAL' printed on a central shield-like piece with the representation of the Mexican flag at one and of the American flag at the other side."

16,142.—FRICTION PARLOR-MATCHES.—*The Miller Match Company*, Akron, Ohio. Application filed November 20, 1888. Used since November 10, 1888.

"The words 'THE BEE MATCH' and the representation of a bee."

16,143.—FRICTION PARLOR-MATCHES.—*The Miller Match Company*, Akron, Ohio. Application filed November 20, 1888. Used since November 10, 1888.

"The words 'THE MILLER MATCH' and the representation of a moth miller."

16,144.—SOAP.—*Minnesota Soap Company*, St. Paul, Minn. Application filed October 22, 1888. Used since October 1, 1888.

"The representation of a leach and a kettle of boiling soap."

16,145.—TABLE-SAUCE.—*William C. Nicholson*, Boston, Mass., administrator of *William Halford*, deceased. Application filed November 28, 1888. Used since January 1, 1872.

"The representation of a crown bearing the letters 'H. S. Co.' and a star placed above the same."

16,146.—LINIMENT FOR MAN OR BEAST.—*A. B. Richards Medicine Co.*, Sherman, Tex. Application filed July 20, 1888. Used since July 1, 1887.

"The word 'HUNT'S.'"

16,147.—HORSE-COVERS, LAP-DUSTERS, HORSE-BLANKETS, AND HOODS.—*W. B. Riley & Co.*, Philadelphia, Pa. Application filed September 8, 1888. Used since June 1, 1884.

"'RED STAR' expressed pictorially or in words."

16,148.—WHEAT-FLOUR.—*Sidle, Fletcher, Holmes Company*, Minneapolis, Minn. Application filed May 8, 1888. Used since January 6, 1880.

"The word 'PERSIAN.'"

16,149.—WORSTED, WOOLEN, AND PART-WOOLEN GOODS.—*M. T. Stevens & Sons*, North Andover, Mass. Application filed October 6, 1888. Used since 1866.

"The representation of a bobbin and shuttle produced upon a shield."

16,150.—DRYING HOUSES OR KILNS FOR DRYING LUMBER, BRICKS, &c.—*I. & M. Wolff & Coleman*, Chicago, Ill. Application filed November 8, 1888. Used since June 15, 1888.

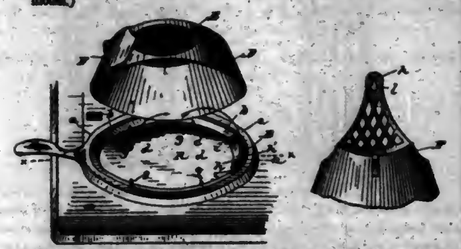
"The words 'CHICAGO IRON CLAD DRY KILN.'"

LABELS.

5,780.—Title: "EUSTACHIAN SNUFF FOR CATARRH."—*Emma Angeline Derby*, Boston, Mass. Application filed December 7, 1888.

5,781.—Title: "CRYSTALIZED VEGETABLE COMBINATION (FOR A COMPOUND FOR PAINTING PURPOSES.)—*Charles D. Fenstemaker*, Philadelphia, Pa. Application filed October 19, 1888.

5,782.—Title: "WHITE'S GLOVE-FITTING READY-CUT WAIST LINING."—*Phillipp Grosefeld*, Washington, D. C. Application filed December 1, 1888.



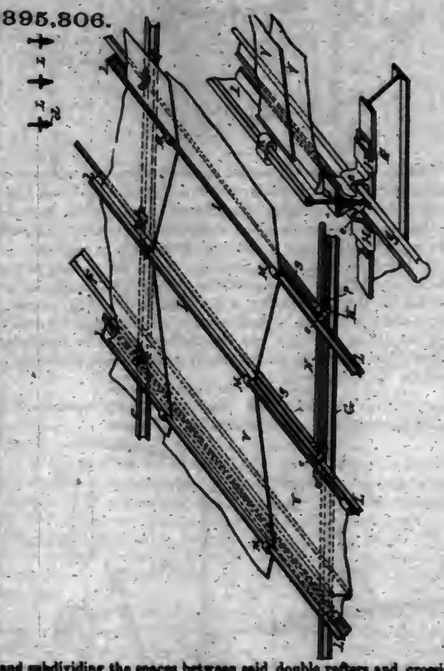
5,783.—Title: "MANAHAN'S DOUBLE STRENGTH PINE TAR OAKUM PAPER FOR PREVENTING MOTHS."—*Margaret E. Manahan*, New York, N. Y. Application filed December 7, 1888.

5,784.—Title: "OLIPHANT'S INVALUABLE RHEUMATIC REMEDY."—*Louis Oliphant*, Philadelphia, Pa. Application filed October 26, 1888.

PATENTS

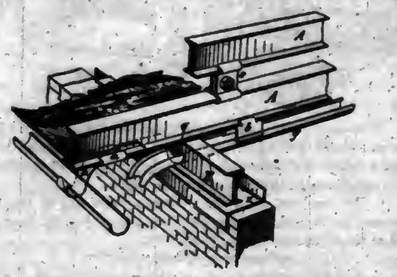
GRANTED JAN. 1, 1889.

395,805. ODORLESS AND SMOKELESS GRIDDLE. ALEXANDER M. ARCH, Buffalo, N. Y. Filed Sept. 22, 1887. Serial No. 250,458. (No model.)



Claim.—1. A griddle, A, surrounded by an inwardly-projecting flange, *a*, an inwardly-sloping rim, *b*, within said flange, the griddle having a smoke and odor opening, B, partly in said rim and partly in the bottom of the griddle, and a flange, *h k*, surrounding said opening, in combination with the hood or cover D, substantially as described.

2. A griddle, A, surrounded by an inwardly-projecting flange, *a*, an inwardly-sloping rim, *b*, within said flange, the griddle having a smoke and odor opening, B, partly in the rim *b* and partly in the bottom of the griddle, a flange, *h k*, surrounding said opening, and a gutter, *i*, formed in rim *b* between the flange *k* and the flange *a*, in combination with the hood or cover D, substantially as described.

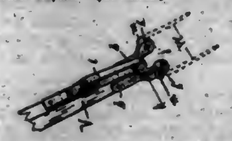


3. A griddle, A, having the inwardly-projecting flange *a*, the outward and downwardly projecting flange *c*, the sloping rim *b*, with the lugs *g* on its edge, the sloping sides *e*, the smoke and odor opening B, and the gutter *i*, in combination with the removable hood or cover D, substantially as described.

395,806. SKYLIGHT. OSCAR ANDRÉ, Paris, assignor of one-half to Georges Victor Alfred Berteaux, Neuilly, France. Filed Nov. 3, 1887. Serial No. 254,236. (No model.) Patented in France Feb. 26, 1887, No. 181,841.

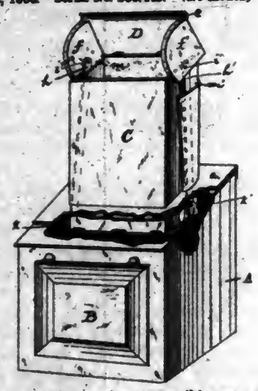
Claim.—1. A roof-framing consisting of rafters and purlins crossing each other and fastened together, in combination with the sheets of glass secured to said framing and arranged in a plane beneath and separated from the purlins.

2. The combination, to form a glazed-roof structure, of double rafters at intervals consisting each of two parallel beams, one above the other, purlins crossing said rafters and embraced between the upper and lower beams thereof, single rafters arranged parallel with



and subdividing the spaces between said double rafters and crossing said purlins, and the glass panes supported by said single rafters and the corresponding beams of said double rafters, all fastened together.

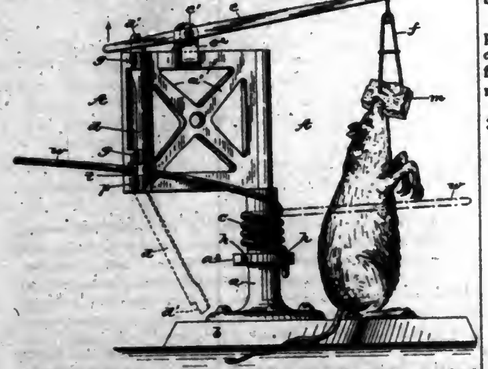
3. In a glazed-roof structure, the combination of a double rafter consisting of the flanged iron beams, one above the other, a flanged purlin crossing said rafter between the upper and lower beams thereof, with clamps for fastening together the upper and lower beams of the double rafter and embracing the purlin between them, and clamps engaging the flanges of the respective beams at their intersection.



4. In a glazed-roof structure, the combination, with a flanged rafter of I-beam and a gutter extending longitudinally beneath it, of a hanger for said gutter of inverted-U shape having a flat plate against the bottom flange of the I-beam and lips turned upwardly and inwardly from said plate over the flange on the rafter, and said hanger extending down at both sides and fastened to the gutter.

395,807. TEDDER. ADDISE ARNDT, Albion, Mich. Filed Oct. 18, 1887. Serial No. 252,690. (No model.)

Claim.—The combination of a fork-holder, V, a spring, *l*, thereon, bearing-plates *k*, having bearing-eyes *i i* and provided on their outer sides above the eyes with bosses, forming shoulders *m*, a fork having a crank, *h*, offsets *j j*, forming journals, and tines W, the latter adapted to contact against the shoulders *m* to avoid torsional strain on the offsets *j j* when meeting obstructions, substantially as described.

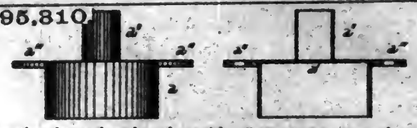


395,308. LETTER-BOX. WILLIAM R. AUGUSTINE, Aspen, Colo. Filed July 19, 1888. Serial No. 280,445. (No model.)

Claim.—1. A receiving-section for mail-boxes, said section provided at its top with a single flap and at its bottom with double flaps, the lower flaps independently connected with the upper flap by separate rods, and the section provided with a flange whereby it is adapted to be secured to the top of a mail-box, substantially as specified.

2. In combination with a mail-box having an opening in the cover or top thereof, a receiving-section having one end adapted to fit within the aforesaid opening, and a flange and bolts for securing same in said position, the receiving-section provided at its top with a single flap and at its bottom with double flaps, the lower flaps independently connected with the top flap by means of rods, substantially as and for the purpose set forth.

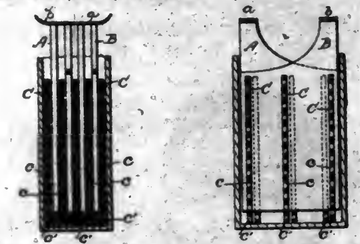
395,309. ANIMAL-TRAP. MARCUS J. BARTLETT, Providence, R. I. Filed July 27, 1888. Serial No. 281,204. (No model.)



Claim.—1. In an animal-trap, the combination, with a standard having an extension provided with a bait-carrying tripping device, substantially as described, of a spring-arm, *w*, having an end thereof coiled around said standard and fixed therein, the opposite end thereof engaging with the tripping device, substantially as described, and for the purpose hereinbefore set forth.

2. The combination, in an animal-trap, with a standard and the spring-arm *w*, coiled around and attached to said standard, of a check-lever, *d*, pivoted to an extension of the standard adapted to retain the free end of said spring-arm in a normal position, and a pivoted tripping-lever, *e*, having one end adapted to engage the free end of the check-lever and the other provided with a bait-carrying hook, all constructed and arranged substantially as shown and hereinbefore described.

3. The animal-trap A, hereinbefore described, consisting of the standard *a*, provided with an extension, *a'*, the spring-arm *w*, coiled around the standard and secured thereto, the check-lever *d*, pivoted to said extension, and the pivoted bait-carrying tripping-lever *e*, adapted to engage the upper end of the check-lever, all combined and adapted for operation substantially as shown and described.

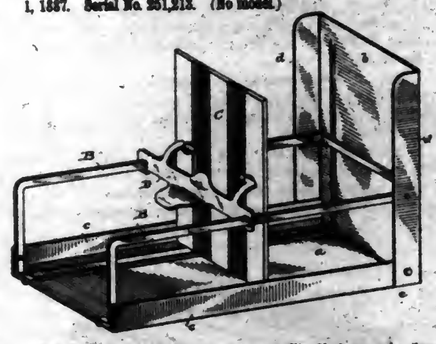


395,310. DEVICE FOR CUSHIONING LOOSE JOINTS. JOSHUA R. BOYNTON and WILLIAM CRISP, Elyria, Ohio. Filed Apr. 21, 1888. Serial No. 271,425. (No model.)

Claim.—In combination with a whiffletree and evener or crossbar, the short barrel *a*, provided with the tube *a'* and elastic cushion *b*,

operating in conjunction therewith, all for the purposes above set forth, and substantially as described.

395,311. INSULATING-SUPPORT FOR SECONDARY-BATTERY ELECTRODES. HENRY F. DE B. CAMERON, Detroit, Mich., assignor to the Woodward Electrical Company, same place. Filed Oct. 1, 1888. Serial No. 286,231. (No model.)



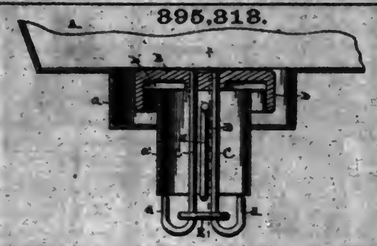
Claim.—1. In a storage-battery, the combination, with its elements, of insulators C, said insulators consisting of a number of separate loops having their heads *c'* at the bottom of the battery adapted to receive and hold the elements free from said bottom, and also so arranged that any one of the elements may be removed from the battery with its inclosing loop or loops without disturbing the other elements, substantially as described.

2. In a storage-battery, the combination, with its elements, of insulators, each of said insulators made in the form of a loop, the portions *c'* of which sustain and hold the battery-plate free from the bottom of the cell and provided with fluted arms *c*, standing up upon both sides of the element, substantially as described.

3. The insulator C for storage-battery elements, the same composed of hard rubber or equivalent insulating material, having a head, *c'*, for supporting a battery-plate free from the bottom of the cell with fluted arms *c*, adapted to stand up along the sides of a battery element, substantially as and for the purpose described.

395,312. FILE-BOX. MERLE R. CLINTON, Washington, D. C., assignor to the Schlicht & Field Company, New York, N. Y. Filed Oct. 1, 1887. Serial No. 251,213. (No model.)

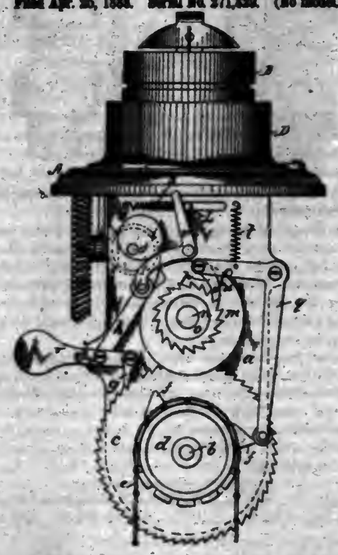
Claim.—1. As an improvement in metallic file-boxes, the flanged base and the flanged end rising therefrom, in combination with the angular side bars attached at one end to the flanges of the front and at the opposite end to the flanges of the base.



2. The improved body for a file-box, consisting of the flanged front and the flanged base formed in one piece, with the flanges fastened at the corner, substantially as shown.

395,313. COMBINED TRAP AND DIRT-COLLECTOR. HARRISON CLOUTTE, Manchester, N. H., assignor of one-half to Hiram C. Wiley, same place. Filed Apr. 30, 1888. Serial No. 272,250. (No model.)

Claim.—1. The herein shown and described trap, composed of the sink having a depression, the short tube projecting up from the bottom of the depression, the cap having ribs on its inner side and provided with arms having hooked ends, the anchoring-ball fitted between the arms, and the ring encircling the said arms, substantially as and for the purpose specified.



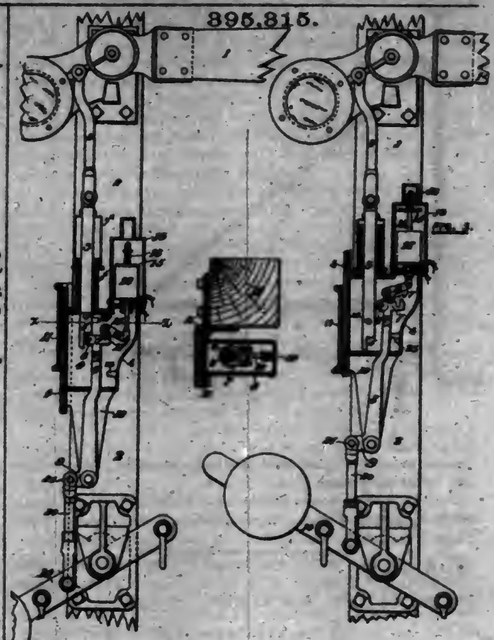
2. The combination, with the sink having the depression, and the

395,313.

tube *d'*, extending up from the bottom of the depression, of the cap having radial ribs on its inner side, the spring-arms C, having their lower ends bent to form hooks, the spring-ball D, fitted in the short tube, and the ring encircling the lower ends of the arms C below the top of the ball, substantially as and for the purpose described.

395,314. KNITTING-MACHINE. GEORGE H. GIDDEN, Laconia, N. H. Filed Apr. 25, 1888. Serial No. 271,830. (No model.)

Claim.—1. The combination, with a needle-cylinder provided on its lower end with inclines, the needles, and a rotary cam-cylinder to operate them, of a ring or annulus provided with inclines on which the needle-cylinder rests, a laterally-extending arm connected with the ring or annulus, a lever having one arm resting against said laterally-extending arm and the other against a rotary cam, and said cam, substantially as set forth.



2. The combination, with a rotary sprocket-wheel, a pattern-chain, a pivoted lever provided with a pawl adapted to be operated by said pattern-chain and a ratchet-wheel with which said pawl engages, a cam connected with said ratchet-wheel, and an elbow-lever having one arm engaged with said cam, of the ring or annulus G, provided with arm L, with which the other arm of the said elbow-lever is engaged, the needle-cylinder, needles, and cam-cylinder, substantially as set forth.

395,315. ELECTRIC SIGNALING APPARATUS. JOHN P. COLEMAN, Swinevale, Pa. Filed Mar. 10, 1888. Serial No. 266,806. (No model.)

Claim.—1. In an apparatus for connecting a signal with its primary actuating mechanism, the combination, with the signal and its connecting-rod, of a pivoted lever which forms one of the mechanical connections between the signal and the actuating mechanism, said lever being movable on its pivot into and out of connection with the signal connecting-rod, and an electro-magnet which acts on the lever to hold it in connection with the said signal connecting-rod, substantially as and for the purposes described.

2. In an apparatus for connecting a signal with its primary actuating mechanism, the combination, with the signal and its connecting-rod, of a pivoted lever which forms one of the mechanical connections between the signal and the actuating mechanism, said lever being movable on its pivot into and out of connection with the signal connecting-rod, a trigger which engages the rod and holds the rod

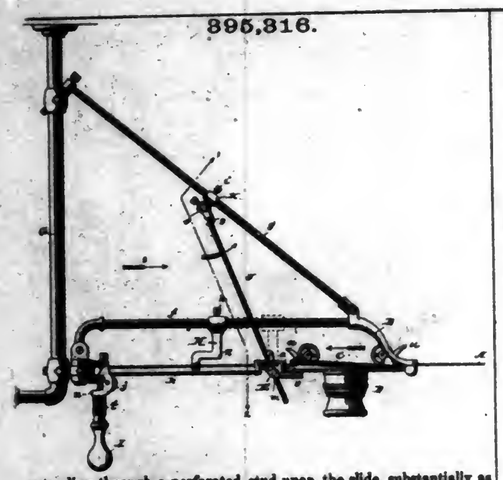
395,315.

and lever in connection, and an electro-magnet which controls the trigger, substantially as and for the purposes described.

3. The combination of an electric circuit, a signal, a movable box or frame, a lever pivoted thereto and arranged to engage the signal-operating mechanism, a trigger controlled by an electro-magnet for holding the lever in operative relation with the signal, said lever being connected with the moving mechanism of the box or frame which acts thereon against the force of the magnet and tends to disengage the lever from the signal, substantially as and for the purposes described.

4. In an apparatus for connecting a signal with its primary actuating mechanism, the combination, with the signal and its connecting-rod, of a pivoted lever which forms one of the mechanical connections between the signal and the actuating mechanism, said lever being movable into and out of connection with the signal connecting-rod, an electro-magnet and its armature which acts on the lever to hold it in connection with the said signal connecting-rod, and a spring which bears on the armature, substantially as and for the purposes described.

5. In an apparatus for connecting a signal with its primary actuating mechanism, the combination, with the signal and its connecting-rod, of a rod or lever which is movable vertically to operate the signal, a box or case into which said rod or lever projects, said box or case being connected with the rod or lever and moving with it in its motions to operate the signal, and a magnet and its armature which are inclosed by the box or case and which act on said rod or lever to hold it in operative connection with the signal connecting-rod, substantially as and for the purposes described.

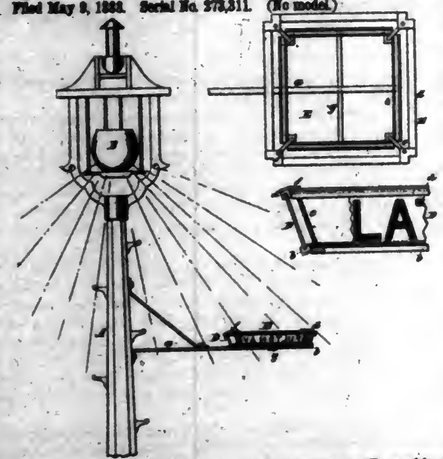


395,316. STORE-SERVICE APPARATUS. JAMES T. COWLEY, Lowell, assignor to the Lamson Store Service Company, Boston, Mass. Filed Dec. 3, 1887. Serial No. 256,916. (No model.)

Claim.—1. The combination, in a store-service apparatus having a way, carrier traveling thereon, and propelling-spring supported to engage with said carrier as it approaches the limit of its movement, of a slide independent of said spring provided with a catch for engaging with the carrier, a retracting device connected to the said slide, an adjustable contact-piece arranged to engage with the catch, and a spring-actuated arm for moving the slide outward, substantially as set forth.

2. The combination of the wireway A, a guide-rod, *f*, parallel thereto, a bracket supporting a propelling-spring, C, a carrier, a slide moving upon the way and provided with a catch for engaging with the carrier, a spring-actuated arm for moving the slide outward, and a contact-piece secured adjustably to the guide *f*, substantially as set forth.

3. The combination, with the slide carrying the catch for engaging with the carrier of a store-service apparatus, of a pivoted arm



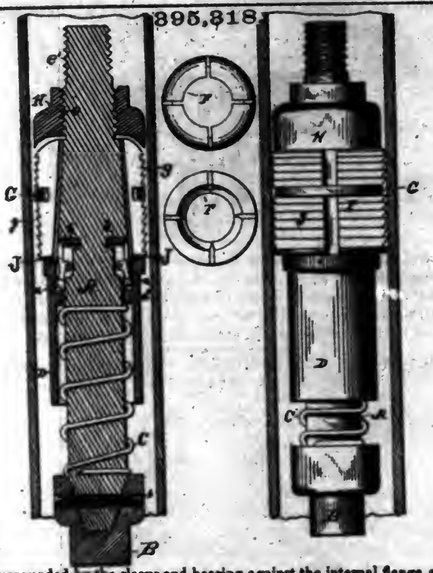
395,816.

extending through a perforated stud upon the slide, substantially as and for the purpose set forth.

4. The combination, with the slide E and pivoted arm J, of a block, K, adjustable upon a support, the arm J being pivoted to said block, substantially as set forth.

395,817. SIGN FOR ELECTRIC LIGHTS. EDWARD A. DUBEY, Brooklyn, N. Y., assignor of one-half to Thomas B. Eutan, same place. Filed May 9, 1888. Serial No. 273,311. (No model.)

Claim.—1. The electric-light post A, having a lamp, B, combined with a sign, D, which is carried by a bracket on said post, and entirely below and to one side of the lamp, so as to leave said lamp unobstructed, said sign being within the path of the pencils of light projected from the lamp to that side on which the sign is located, substantially as set forth.



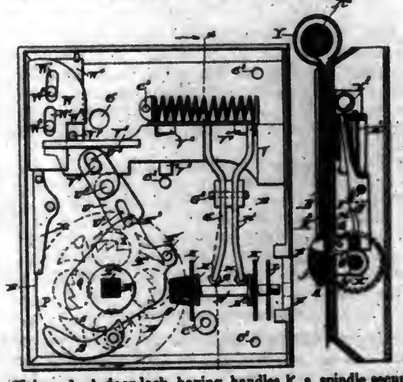
2. The open sign-frame E, constructed of upper and lower rails, *d b*, having longitudinal grooves facing each other, angle-pieces *f*, connecting the rails *d* and *d* and the rails *b* and *b*, and the connecting-rods *e e*, connecting the upper angle-pieces *f* with the lower angle-pieces *f*, in combination with the slanting sign D, that is held between said rails and rests in their grooves, substantially as described.

395,818. CASING-SPEAR FOR WELLS. WILLIAM H. EDWARDS, Foxburg, Pa. Filed Apr. 16, 1888. Serial No. 270,772. (No model.)

Claim.—1. A casing-spear comprising a central stem or mandrel provided with a tapered portion, expansible slips or wickers movably confined on the tapered portion, a spring-actuated sleeve longitudinally movable on the stem and normally tending to force the slips from the larger portion of the taper, and one or more dogs or catches adapted to detachably hold the sleeve in a depressed position, for the purpose described.

2. In a casing-spear, the combination, with a central stem provided with a tapered portion, of slips loosely confined on said taper, a sleeve embracing the stem below the taper and provided with an internal flange, and a spring embracing the lower part of the stem and partly

395,818.



surrounded by the sleeve and bearing against the internal flange, substantially as described.

3. A casing-spear comprising a main stem provided with an upwardly-tapered portion, slips longitudinally movable on the taper and loosely and expansibly confined on the same, a collar or sleeve longitudinally movable on the stem and independent of and normally tending to force the slips from the larger portion of the taper, and a spring embracing the stem and exerting a constant upward pressure upon the sleeve, for the purpose set forth.

4. In a casing-spear, the combination, with a main stem having an upwardly-extending taper, of expansible slips separate from other parts and confined on the taper and having a longitudinal movement thereon, and comprising a circumferential series of separate and independent rectangular pieces, and a ring loosely surrounding the same, by which they are expansibly and movably confined on the taper, substantially as described.

395,819. RECORDING DOOR-LOCK. GEORGE J. FERGUSON, Greenville, Tex. Filed Mar. 16, 1887. Serial No. 231,101. (No model.)

Claim.—1. A door-lock having handles F, a spindle secured in said handles, and a rigidly-attached plate, T, provided with a pawl pivoted thereto, in combination with a ratchet-wheel, a set of gears, and a record-strip actuated by said gears to impart a step-by-step rotary motion in one direction to intermittingly move said record-strip, as described.

2. A lock having an adjustable record-strip and a shaft, N, rotated as described and suitably journaled in the case, a wheel or disk, L, fastened to said shaft, and an outer guard, A, having a slot to receive said wheel to cut off a margin of the record-strip, all combined as and for the purpose described.

3. In a lock, the combination of an adjustable record strip or roll, a lock-case containing the operating-gears, a guard in which are journaled the counter-gears, and an open space between the lock-case and

the guard through which to interpose and retain the record strip or roll for the double purpose of adjustment and to impress the tooth-marks of the gears on record strip or roll, as set forth.

4. In a lock, the combination of an adjustable record strip or roll, the lock being provided with handles, a spindle secured in a plate, a pawl pivoted to said plate, a detent pivoted to lock-case, a ratchet, and a bevel-wheel journaled on the spindle, said bevel-wheel meshing in a pinion secured on a shaft, said shaft being journaled to the lock-case and provided with spur-gears, said spur-gears meshing in counter-gears journaled in guard, an open space between lock-case and the guard through which to pass the record strip or roll, said spur-gear and counter-gear meshing in each other through record strip or roll, together with pawl and detent to prevent a retrograde movement of record strip or roll, substantially as set forth.

5. A lock, as described, having an adjustable record-strip, handles F, spindle D, plate T, pawl R, ratchet Q, bevel-wheels P and O, angular-ended shaft N, toothed wheels K K, and wheels J, all combined to automatically adjust the record-strip, and an independent means for adjusting said record-strip, consisting of key M, having an angular hole to fit the angular end of the shaft N, as and for the purpose described.

6. A lock having an adjustable record-strip and means for moving it, as described, combined with plates T and U, and the attached bolt V, for the purpose of projecting said bolt to lock and withdrawing the bolt to unlock the door, as and for the purpose described.

7. In a recording-lock, a record strip or roll adjusted by the operation of the lock and capable of an independent adjustment by the key, and a lock-bolt operated as described, said lock-bolt being provided with inclined surfaces V^2 and V^4 and reverse cam-surface V^3, in combination with the punch-levers G' and H' and the punches G and H, substantially as set forth.

8. A recording door-lock having a record-strip and marking mechanism, a lock-bolt, V, handles F, spindle D, plates T and U, and tumblers W, W^2, and W^3, with means for raising said tumblers to permit bolt V to move to its unlocked position, as described.

9. The combination, with a recording-lock mechanism and its record-strip, of movable tumblers W, W^2, and W^3, and stationary plate W^4, a hooked key, M, and bolt V, as and for the purpose described.

10. The combination, with a recording mechanism and its record-strip, of automatically-gravitating tumblers W, W^2, and W^3, and stationary plate W^4, to lock the bolt in projected position, and a lifting-catch, X, for unlocking from the inside, as described.

11. In a lock, a record strip or roll, a set of gears to adjust and mark said record strip or roll, a key having an angular socket fitting angular end of shaft to rotate said gears and thereby independently adjust said record strip or roll, a lock-bolt, and one or more recording-punches, said punches being operated by lock-bolt to record each locking and unlocking of lock on record strip or roll, as set forth.

12. The combination, with a record-strip and means for marking it, a lock-bolt, and means for moving the lock-bolt, of automatically-locking tumblers constructed as described to rise above the unlocking position and thereby prevent the withdrawal of lock-bolt, as and for the purpose described.

13. In a lock, the combination of a record strip or roll having consecutive numbers on one or both margins, a set of gears, a shaft journaled in lock-case, the spur-gears, a guard and its journaled counter-gears, and a key having an angular hole in its stem fitting angular end of shaft to rotate said gears to place a certain number above or below said guard, as set forth.

14. In a lock, the combination of an adjustable record strip or roll, a lock-case containing operating-gears, and a narrow guard supporting journaled counter-gears, said guard and gears constructed to retain and support said record strip or roll when interposed between them, and said record strip or roll being exposed above and below said guard, so it can be signed or otherwise marked, and said record strip or roll being capable of adjustment by operation of lock and independent adjustment by key, as set forth.

15. The combination, with a recording-lock secured to the door and provided with a record-strip, marking devices for the same, and a lock-bolt operating in the lock, of a locking-bar, 2, having an opening, 10, to permit said lock-bolt to move to locked position, the said bar being provided with guide-slots and screws, and adapted to lock at the top and bottom of the door, as and for the purpose described.

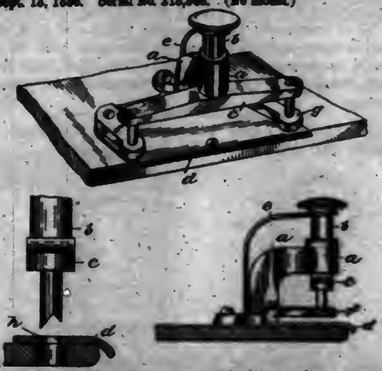
16. In a lock, the combination of a record strip or roll, a lock-case containing operating-gear, a guard supporting counter-gear, and an open space between lock-case and guard for record strip or roll to pass through, said guard supporting and retaining said record strip or roll to receive impressions and to be adjusted, for the purpose described.

17. In a continuous recording-lock, the combination of a record-roll, a case to contain and protect it, and the lock-case having guides to removably support the record-roll case, as set forth.

18. The combination, with the recording-lock provided with record-strip and marking devices, as described, of movable tumblers W, W^2, and W^3, having slots W^7, and a projecting portion, W^5, and a hooked key, M, the said tumblers having a range of movement above opening-point, and a stationary plate, W^4, to obstruct the movement of keys not made to fit, as set forth.

19. The combination, with a recording-lock provided with a record-strip and marking devices, of a key, M, having a hook-shaped bit and an angular hole in its stem to unlock the bolt and adjust the record-strip, as and for the purpose described.

20. In a lock, the combination of a record strip or roll, the operating-gears, the recording-punches, and a lock-bolt positively connected to operating-gears and the recording-punches, the movement of said lock-bolt effecting the double purpose of adjusting the record-strip and operating said recording-punches, for the purpose described.



21. In a recording-lock having handles, a spindle secured in said handles, a lock-bolt, a record strip or roll, and means to simultaneously operate the lock-bolt and adjust the record strip or roll, substantially as set forth.

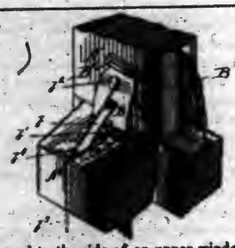
22. In a recording-lock, a record strip or roll and means to simultaneously move and mark said strip or roll, a lock-bolt simultaneously operated with said record strip or roll, and punches operated by the movement of the lock-bolt, substantially as set forth.

23. In a continuous recording-lock, the combination of knobs or handles, a spindle secured in said handles and suitably connected to lock both the movement of the handles, simultaneously operating a ratchet, a set of gears, a lock-bolt, recording-punches, a record strip or roll, an outer guard having an open space between it and the lock-case, through which to pass the record-roll to be operated on by said punches and teeth of gears, and thereby making continuous impressions on said record-roll by the locking and unlocking, and a case or receptacle to sustain, protect, and guide said record-roll, as set forth.

24. In a recording-lock, a record strip or roll and means to move and mark it, a lock-bolt operating horizontally, and a lock-bar operating vertically, said lock-bar having an opening to register with the lock-bolt in the locked position thereof, substantially as set forth.

395,820. PAPER-PUNCH. SAMUEL H. PERE, Hinsdale, Ill. Filed Sept. 12, 1888. Serial No. 283,986. (No model.)

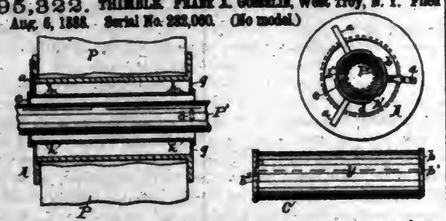
Claim.—1. The combination, with the punches mounted upon the cross-bar carried by the plunger, of a spring for holding the plunger in its elevated position and three guides, one in the standard of the frame and one in each of the arms or legs, the cutting-edges of said punches being of the form shown, one lip or point of each being longer than the other lip or point, whereby the punches are directed through the dies, as described.



2. The combination, with the cross-bar and the plunger supported by its bearing in the standard of the frame, of the punches or cutters, respectively, at the different ends of the cross-bar, the cutting-edges of said punches being of the form shown, one lip or point of each being longer than the other lip or point, the legs with openings or guides surrounding the said cutting-edges, and the dies *h* in the plate below substantially as described.

3. The punches provided with cutting-edges of the form shown, one lip or point of each being longer than the other lip or point of the same punch, in combination with openings or guides surrounding the said cutting-edges, and dies, one for each cutter, whereby on forcing the punches through the guides several thicknesses of paper placed in their path may be perforated, substantially as and for the purpose specified.

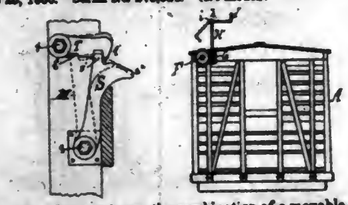
395,821. FASTENER FOR MEETING-RAILS OF SASHES. JAMES S. FISHER, Chicago, Ill. Filed Oct. 10, 1888. Serial No. 287,705. (No model.)



Claim.—The combination of a metallic plate with raised ledge

395,321.

B³ B³, being secured to the side of an upper window-sash with a metallic hinge, B a B', the arm B having its upper end free and being provided with a projecting knob, b^3, the arm B' being secured to the upper frame of the lower window-sash beneath the ledge B^3, and being provided with a flat metal spring, b, which presses the free end of B against the ledge B^3, substantially as set forth.



395,322. THIMBLE. FRANK X. GOEBELIN, West Troy, N. Y. Filed Aug. 6, 1888. Serial No. 282,060. (No model.)

Claim.—1. In a thimble, the combination, with an outer sleeve provided at each end with an annular wall-flange and inwardly-projecting radial arms, one of the wall-flanges being detachable, of an inner sleeve inserted in the outer sleeve and projecting therefrom at each end, and provided on each of its projecting ends with arm-engaging cams, substantially as described.

2. The combination, in a thimble, of two sleeves, one inclosed and supported by the other, the inner sleeve being contracted in diameter by an introverted pipe-supporting flange, and open at the other end and provided with air-passages through its shell, the outer sleeve being contracted in diameter by an introverted inner sleeve-supporting flange at one end and open at the other end, substantially as described.

395,323. STOCK-CAR. GEORGE HACKNEY, Topeka, Kans. Filed June 23, 1888. Serial No. 278,081. (No model.)

Claim.—1. In a stock-car, the combination of a movable platform with the stop M, composed of the pivoted boot-shaped pawl S, provided with the heel s', and the detent T, containing the recesses t' and t^2, fitted to receive the heel s', as and for the purpose stated.

2. A stock-car provided with a movable platform, C, chains c, shaft D, spur-wheel F, worm G, shaft H, and stop M, composed of the boot-shaped pawl S, bearing the heel s', and detent T, containing the recesses t' and t^2, as and for the purposes stated.

3. In a stock-car, the combination of the movable platform C, chains c, shaft D, spur-wheel F, worm G, shaft H, handle I, and stop M, composed of the boot-shaped pawl S with its heel s', and the detent T with its recesses t^2 and t', as and for the purposes stated.

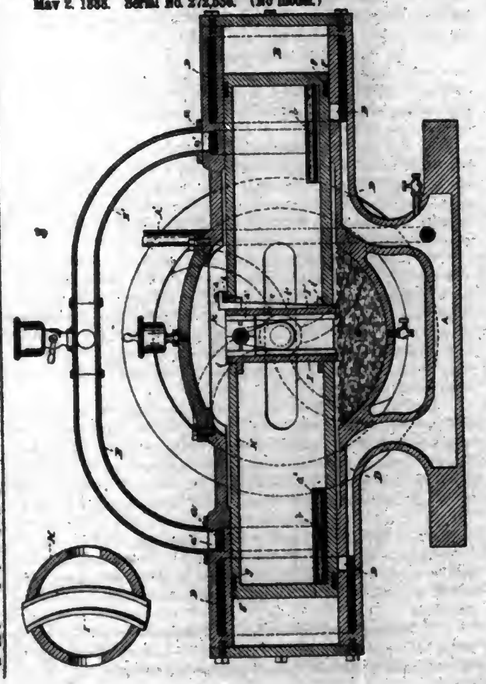
395,324. PLATFORM-DOOR FOR CARS. JACOB HAHN, De Kalb, Ill. Filed Feb. 23, 1888. Serial No. 265,089. (No model.)

Claim.—1. The combination of the coach A, provided on its side with the vertical and external stanchion, C, and the slotted bracket K, attached thereto, the way or groove L on the lower edge of the roof, the door D, sliding on said way or groove and provided with the slotted bracket E and the rack P, the shaft G and pinion O engaging said rack and operating the door, and the lid M, attached to the shaft G, all substantially as and for the purposes set forth.

2. The combination of the coach A, having a way or trough, L, along its roof and an external vertical stanchion, C, having the slotted bracket K attached thereto, the door sliding in said way or trough

395,324.

and upon the rack P, and the braces H and J, pivoted at one end, and at the other sliding in the slots of said bracket.



3. In combination with the car, the door D, sliding in the way or trough L at its upper end, and at its lower end on the rack P, with the lid M, and the pinion O and shaft G, to which shaft said lid and pinion are fixed.

4. In a car, the lid M, combined with and fixed to the shaft G, which carries the pinion by which the door is moved, and with the door, substantially as described.

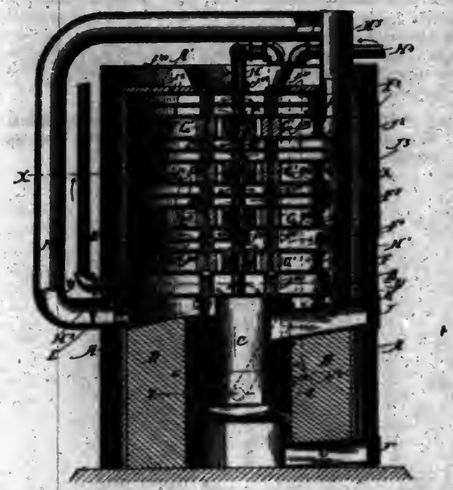
5. In a car, the combination of the sliding side door with a lid to cover the steps, substantially in the manner set forth, whereby the forward or backward movement of the door serves, respectively, to lower or raise said lid, substantially as set forth.

6. In a railroad-car having movable side doors, a lid for covering the steps when the side doors are moved forward operated simultaneously with the movements of said side doors.

395,325. STEAM-ENGINE. EDGAR S. HARPER, Tyler, Tex. Filed May 2, 1888. Serial No. 272,536. (No model.)

Claim.—1. In a steam-engine, the curved guides transversely in the piston and the crank-pin brasses having projections adapted to engage said guides, substantially as specified.

2. In a steam-engine, the crank-pin brasses having the pivoted ribs thereon, the laterally-curved guideways of the piston, and the adjusting-key, substantially as specified.



3. In a steam-engine, the combination, with the piston having the longitudinal slots, the cylinder, and the crank-shaft having bearings therein, of the laterally-curved transverse ways having their ends seated in the rectangular bearings, the inclined adjusting-key having the downwardly-turned end, the set-screw, and the crank-pin brasses, substantially as specified.

4. In a steam-engine, the combination of the cylinder, the hollow slotted piston, the crank-shaft having the crank within the piston, and oscillating mechanism engaging the crank-pin, substantially as specified.

5. A steam-engine consisting of a cylinder, a slotted piston having transverse curved guides, and a transverse crank-shaft passing through said piston and engaging said guides, substantially as specified.

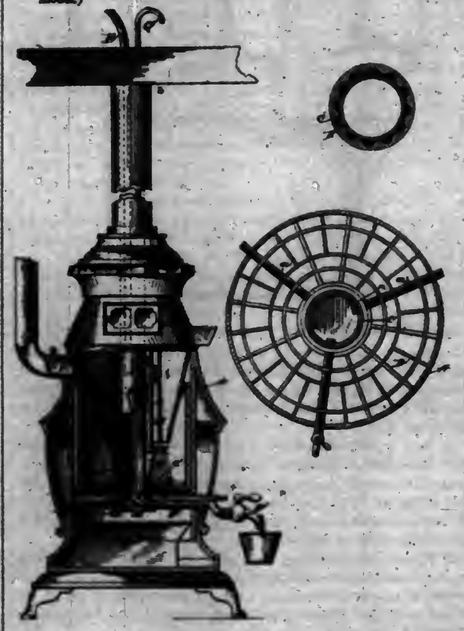
6. The combination, with a steam-cylinder and a crank-shaft extending transversely through the same, of an oscillating reciprocating piston having a curved yoke engaging the crank by a slide movement and provided with ports, substantially as specified.

395,326. WATER-HEATER. MICHAEL HAVEY, Chicago, Ill. Filed July 23, 1888. Serial No. 280,712. (No model.)

Claim.—1. In a water-heater, in combination, substantially as set forth, a vertical series of horizontally-extended water-chambers communicating with each other successively through their horizontal walls, each of said chambers having a horizontal diaphragm intermediate its upper and lower walls and obstructing the line of communication between its induction and eduction openings, the water-supply pipe entering the uppermost of said chambers through its upper wall, and an eduction-pipe from the lowermost of said chambers, whereby the water descends by gravity from one chamber to the next, and is compelled to spread out over the horizontal diaphragm and return underneath it to pass to the next chamber.

2. In a water-heater, in combination with a case to which the products of combustion have access at the lower part and from which they escape at the upper part, a series of communicating water-chambers located within such case between the access and escape of the products of combustion, such chambers contacting the interior wall of said case throughout their entire periphery except a portion at one side, consecutive chambers having that portion at opposite sides of the case, each water-chambers communicating with each other successively, each of said chambers having a diaphragm intermediate its upper and lower walls wholly or in part discovered from the lateral walls of the chamber and obstructing the line of communication between its induction and eduction openings, the water-supply pipe entering the uppermost of said chambers above the diaphragm, and an eduction-pipe from the lowermost of said chambers, whereby the water descends by gravity from one chamber to the next, and is caused to flow back and forth in contact successively with the upper and lower interior surfaces of such water-chambers, while the products of combustion pass back and forth in contact successively with the lower and upper exterior surfaces of the same walls, substantially as set forth.

3. In a water-heater, in combination with the fire-chamber having double walls inclosing an annular chamber around the fire-chamber, a series of horizontal communicating chambers F F², located above the fire-chamber, the lowermost of said chambers communicating with the lower part of the annular chamber, and the chamber (as F) communicating with the upper part of the annular chamber, a water-supply pipe entering the topmost of the horizontal chambers, and the service-pipe leading from the chamber F, substantially as set forth.



4. In combination, substantially as set forth, the fire-box and the water-chamber located above the same and supported thereby, said chambers having their upper and lower walls connected by posts (as f^{23}) and the blocks G' interposed between said chambers in vertical line with said posts, whereby the weight of the chambers is transmitted to and sustained by the walls of the fire-box.

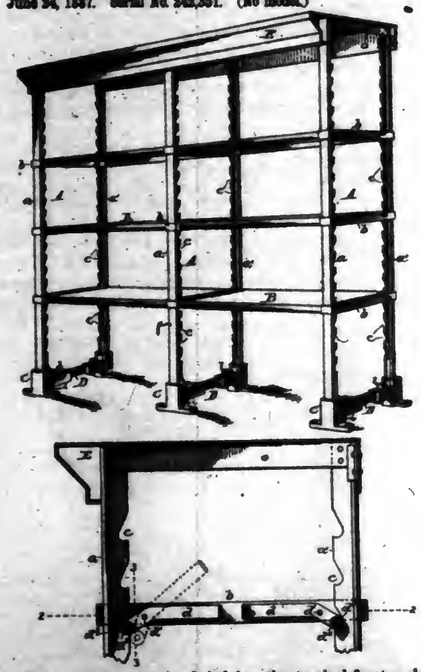
5. In combination, substantially as set forth, the chambers F^3 and F', located one above another in vertical series and communicating through their bosses f^{32}, seating one upon another successively, each of said chambers having its upper and lower walls connected by the interior posts, f^{23}, the blocks G', interposed between said chambers in vertical line with said posts, said posts and blocks being vertically bored to admit the bolts G, inserted through them, whereby said chambers are bound together and the junctions at their bosses f^{32} kept tight.

6. In combination, substantially as set forth, the fire-chamber C, having the annular water-chamber C' surrounding it, and the horizontally-extended water-chamber F, located above it, communicating with the chamber C and with the service-pipe, the communicating chambers F' and F^2, located one above another and above the chamber F, the lowest of said chambers communicating with the annular chamber C' and the uppermost communicating with the induction-pipe H, whereby the water circulates downward by mere gravity until it reaches the annular chamber C' about the fire, and thence circulates upward to enter the service-pipe.

7. In combination with the case A, the fire-chamber, and the water-chambers located above it, the damper K, pivoted to the lowest of the water-chambers and adapted to close the communication past said chamber within the case, and the supplemental smoke-pipe H^3, communicating with the case below the lowest water-chamber and with the main smoke-pipe above the highest water-chamber, substantially as and for the purpose set forth.

395,327. HEATING-STOVE. HERBERT HOPKINS and JOSEPH R. PERRY, Wilkes-Barré, Pa. Filed Apr. 3, 1888. Serial No. 269,486. (No model.)

Claim.—1. As an improvement in stoves of the class herein described, the centrally-disposed pipe or cylinder, the ring or base into which the lower end of said cylinder is secured, and the boiler located in said pipe or cylinder and supported thereby at its lower end, a flue or passage-way being formed therebetween, substantially as shown and described.



2. As an improvement in stoves of the class herein described, the stove having the ring or base, the conical tube secured at its lower end in said ring or base, the pipe or cylinder attached to the upper end of said conical tube, and the boiler inserted in said pipe or cylinder, whereby a hot-air flue or passage-way is formed, substantially as shown and described.

3. As an improvement in stoves of the class herein described, the stove having the central pipe or cylinder, the boiler secured therein and supported thereby at its lower end, the water-supply pipe, and the hot-water or steam-exhaust pipes connected to said boiler, substantially as shown and described.

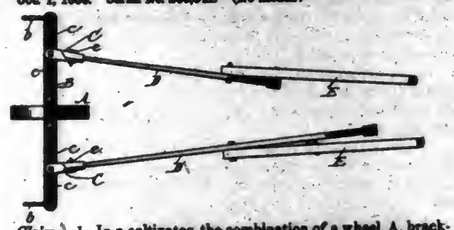
4. The combination, with a stove having the ring or base, of the pipes or tubes supporting said ring or base and opening thereinto, the pipe or cylinder supported by said ring or base, and the boiler disposed in said pipe or cylinder and resting against the lower conical tube thereof, substantially as shown and described.

5. The herein-described improvement in stoves, comprising the ring or base, the pipes opening into said ring or base and supporting the same, the central pipe or cylinder, the boiler inserted into said pipe or cylinder, the hot-water pipe extending into said boiler, and the hot-water pipe connected to said boiler at its lower end and having a cock or faucet, substantially as shown and described.

395,328. METAL SHELVING. M. ROBEYN JEWELL, Rochester, N. Y., assignor to the Schlicht & Field Company, same place. Filed June 24, 1887. Serial No. 242,351. (No model.)

Claim.—1. In a system of shelving, the toothed front and rear posts, *a a'*, and the vertically-movable cross-bars *b*, in combination with dogs mounted in the opposite end of each bar *b* to engage in the toothed posts, and adapted to be simultaneously disengaged therefrom by one hand, as set forth.

2. In a system of shelving, a series of toothed posts, *a a'*, and two or more shelves adjustable thereon in the same horizontal plane, in combination with the vertically-movable slotted cross-bar *b*, provided with studs d^3 on each side to support the shelves, and the pivoted dogs concealed in the slotted bar to engage with the toothed posts, substantially as described.

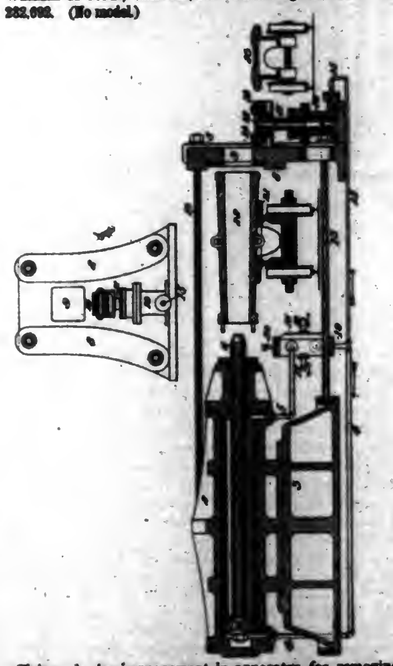


3. In a system of shelving, the posts *a a'* and shelves B, adjustable thereon, in combination with the slotted cross-bars *b*, having studs d^3 for the shelves, and the U-shaped dogs *d*, pivoted on each end of the bars and having a roller mounted in their engaging end, substantially as described.

4. In a system of shelving, the posts *a a'* and the cross-bars *b*, adjustable thereon and provided with the studs d^3, in combination with the sheet-metal shelf B, having its sides bent downward, as shown, to form strengthening-flanges, and provided with notches *f*, adapted to engage the studs on the cross-bars, substantially as and for the purpose specified.

5. In combination with the shelf-sustaining bars, their sustaining-dogs, the posts *a a'*, with which the dogs engage, the foot-blocks secured to the posts, and the cross-bars D, connecting said blocks.

6. In combination with the posts *a a'* and cross-bar D, the foot-blocks *i*, each having slot M, groove *j*, and block *k*, bolted in place.

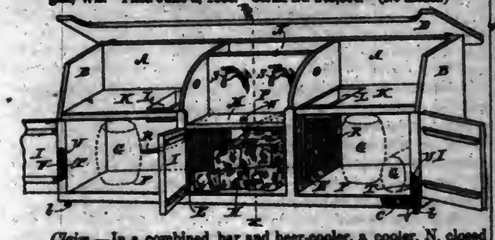


395,329. CULTIVATOR. FRED B. JONES, Dallas, Tex., assignor to himself, and the Rock Island Plow Company, Rock Island, Ill. Filed Oct. 1, 1888. Serial No. 286,841. (No model.)

Claim.—1. In a cultivator, the combination of a wheel, A, brackets *a*, cross-bar B, supported by the brackets *a*, two couplings, C, and two shovel-beams, D, each carrying a shovel, *d*, and each provided with a handle, E, whereby the shovels and beams can be moved independently both vertically and laterally, substantially as and for the purposes specified.

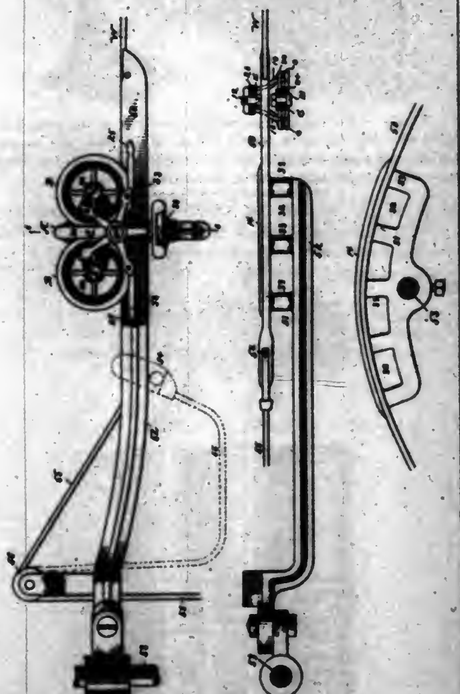
2. In a cultivator, the combination of a wheel, A, brackets *a*, cross-bar B, supported near its center by the brackets *a*, and provided with adjusting-holes *c* on each side of the brackets *a*, two couplings, C, and two shovel-beams, D, independent of each other, and each provided with a handle, E, and carrying a shovel, *d*, substantially as and for the purposes specified.

395,330. APPARATUS FOR REMOVING INGOTS FROM MOLDS. WILLIAM R. JONES, Braddock, Pa. Filed Aug. 13, 1888. Serial No. 282,698. (No model.)



Claim.—1. An improvement in apparatus for removing ingots from the molds, which consists in the combination, with the ingot-pusher and a car upon which the ingot is pushed from the mold, of an interposed supporting-table which is movable into and out of the path of the ingot, substantially as and for the purposes described.

2. An improvement in apparatus for removing ingots from the molds, which consists in the combination, with the ingot-pusher and a car upon which the ingot is pushed from the mold, of an interposed supporting-table which is movable into and out of the path of the ingot, said table being provided with friction-rollers, substantially as and for the purposes described.



3. An improvement in apparatus for removing ingots from the molds, which consists in the combination, with the pusher and its motive cylinder, of a supporting-table and its motive cylinder by which it is movable into and out of the path of the ingot, the fluid-pressure supply-pipes of said cylinders being connected with a common supply, whereby the motions of the pusher and table are effected simultaneously, substantially as and for the purposes described.

395,331. BAR AND BEER-COOLER. JOHN F. KAUBLER, Sheboygan, Wis. Filed June 2, 1888. Serial No. 275,266. (No model.)

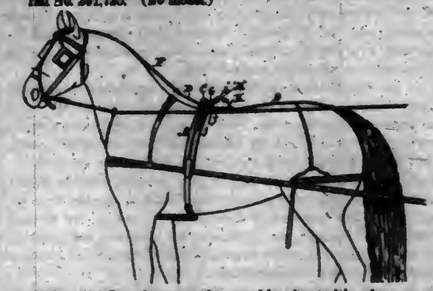
Claim.—In a combined bar and beer-cooler, a cooler, N, closed at the top by the swinging bar top D and adapted to be entirely filled with ice, in combination with a beer-chamber, F, an ice-receptacle, H, separated from the beer-chamber by a perforated partition only, the bottom of the beer-chamber being at least as low as the bottom of the ice-receptacle, and a pipe, R, leading from the beer-chamber into the cooler N and therefrom through the side of the cooler at a distance from the top and terminating there in a faucet, S, substantially as described.

395,332. STORE-SERVICE APPARATUS. GEORGE KETCHUM, Philadelphia, Pa., assignor to the Lamson Store Service Company, Boston, Mass. Filed Apr. 11, 1888. Serial No. 270,312. (No model.)

Claim.—1. The combination, with the frame of a carrier having a side opening, of a rotatable guard, C, closing said side opening in the frame, substantially as described.

2. The combination, with the frame of a carrier having a side opening, of a rotatable guard composed of a plurality of arms, *c*, closing said side opening, substantially as described.

3. The combination, with a track or way connected with a track-support by one or more bars, 33, of a carrier provided with a guard comprised of a plurality of arms adapted to be rotated by contacting with said bars to pass said track-support, substantially as described.



4. The combination, with a track or way connected with a track-support by one or more bars, 33, of a carrier provided with a rotatable guard having a plurality of arms, a lock for securing the guard against rotation, and a contacting-piece for moving the lock to free the guard, substantially as described.

5. The combination, with a track-wire, 50, its supporting-bracket, and connecting-web having a plurality of bars, 33, of a carrier provided with a rotatable guard, C, having a plurality of arms, *c*, adapted to contact with said bars in passing said supporting-bracket, substantially as described.

6. The combination, with a track-rail, 50, its supporting-bracket, and connecting-web having a plurality of bars, 33, and a contacting-piece, 14, at the side of said rail, of a carrier provided with a rotatable guard having a plurality of arms, *c*, and a lock for securing the guard in a fixed position, having a tongue adapted to contact with said contacting-piece to move the lock to free the guard, substantially as described.

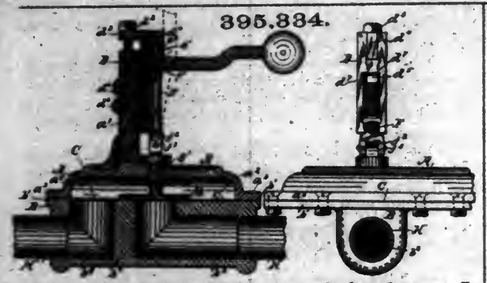
7. The combination, with a carrier, a rotatable guard mounted thereon, and a lock for holding the guard against rotation, of a contacting-piece to operate the lock, substantially as described.

395,333. AUTOMATIC HORSE-CHECK. WASHINGTON H. KELSOEN, Olean, N. Y. Filed Jan. 12, 1888. Renewed Nov. 26, 1888. Serial No. 291,735. (No model.)

Claim.—1. In a harness, the combination, with a box, a spring-actuated tape therein, and a spring-actuated dog within the box for locking the tape, of a lever fulcrumed on the box, said lever provided with a hook in position to release the dog when operated, substantially as set forth.

2. In a harness, the combination, with a box, a spring-actuated tape having perforations therein, and a spring-actuated dog pivoted in the box for locking the tape, of a lever fulcrumed on the box, said lever having a hook in position to release the dog, an arm on one end of the lever, and a V-shaped crotch loosely connected with one end of the said lever, substantially as set forth.

3. In a harness, the combination, with a checkrein, of a box secured to the harness, a spring-actuated tape provided with a perforation mounted on a drum journaled in the box, a lever fulcrumed on the box, a V-shaped bar at one end of said lever adapted to enter the perforation in the tape, and a strap attached to the free end of the lever, by which to operate said lever to release the tape and checkrein, substantially as set forth.



4. In a harness, the combination, with a checkrein, of a box secured to the harness, a spring-actuated tape mounted on a drum journaled in the box, said tape being provided with a perforation near one end and having its free end attached to a checkrein, a lever fulcrumed on the box, a bar of said lever adapted to enter the perforation of the tape, a strap attached to the free end of the lever, a loop on the harness, through which the strap is adapted to pass, and a V-shaped crotch at the free end of said strap, substantially as set forth.

5. In a harness, the combination, with a checkrein, of a box secured to the harness, a spring-actuated tape mounted in the box, a V-shaped bar made integral with the lever to enter a perforation in the tape, a rearwardly-projecting arm, also integral with the lever, a spring for maintaining the bar in engagement with the tape, and an arm secured to the lever to release the actuating mechanism, substantially as set forth.

395,334. AUTOMATIC CUT-OFF FOR GAS. CHRISTIAN M. KIRKPATRICK, Indianapolis, Ind., assignor of one-half to Joseph M. Taylor, same place. Filed Oct. 5, 1883. Serial No. 367,547. (No model.)

Claim.—1. In a gas cut-off, the two-part casing having the vertical standard and having the inlet and outlet ports b^2 b^3 normally covered by a flexible diaphragm, and a disk-valve to press the diaphragm closely over the inlet-opening, a valve-operating mechanism therefor, consisting of a weighted lever, a pitman pivoted thereto and to the valve-stem in such manner that when the valve is closed and the lever on a horizontal plane the pivotal points will be exactly aligned vertically, and the carriage D, connected to the weighted lever by pivot d^2 and adjustably connected to the standard *a'* by the bolt d^3, all substantially as shown and described.

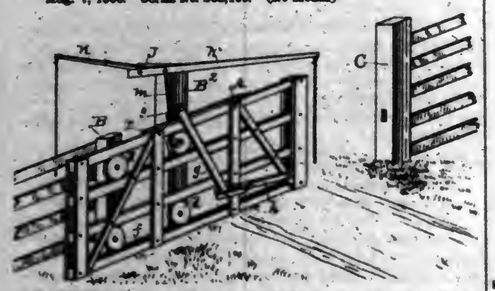
395,334.

2. An adjusting device for the valve mechanism of gas cut-offs, consisting of the carriage D, to which one element of the valve mechanism is pivoted, adjustably secured to a portion of the casing by a tap-bolt, d^3, substantially as shown and described.

3. In a gas cut-off, the standard d', having a bolt-hole in its upper end, in combination with the carriage D, having the rearward projection d^3, and having ears d' to engage the standard, a bolt extending through the projection d^3 into the standard d', by means of which the carriage may be adjusted vertically, and a valve mechanism connected to said carriage, substantially as described.

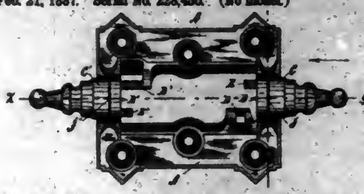
4. A gas cut-off having a valve and valve-operating mechanism, consisting of a valve-stem, a weighted lever, and a connecting rod or pitman so pivoted together that when the valve is depressed the pivotal points are in a line directly central with relation to the movement of the valve, substantially as and for the purpose set forth.

5. In a gas cut-off, the standard d', cast integral with the casing, the carriage D, having the transverse longitudinal opening d^5 therethrough, the bolts d^6, extending through said opening and through the standard and securing the carriage to the standard, the adjusting-bolt d^3, and the valve-operating mechanism, all combined and arranged substantially as shown and described.



6. In a gas cut-off, the carriage D, adjustably secured to a standard of the casing, in combination with the weighted lever E, having the right-angle projection at its inner end, where it is pivoted to the carriage, and a valve-operating pitman pivoted to the inner end of the lever E in a line with but remote from the point at which the lever is pivoted to the carriage, all substantially as shown, and for the purpose described.

395,335. HAT. PHILIP N. KNAPP and JOHN R. BRITTO, South Norwalk, Conn. Filed Oct. 15, 1888. Serial No. 288,093. (No model.)

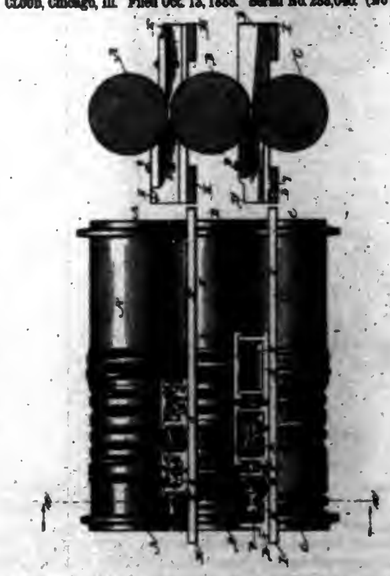


Claim.—The combination, with the hat-body and lining, of a series of flexible stays having their lower ends formed into hooks to which the lining is directly attached, the upper ends of said stays being secured to the hat-body, substantially as shown and described.

395,336. GATE. WILLIAM LA MAR, Pleasantville, Iowa. Filed Aug. 7, 1888. Serial No. 282,169. (No model.)

Claim.—The combination, with a sliding gate having a fixed block, *r*, on its top, of the bar A, pivoted to the gate, the elbow-lever *g*, pivoted to bar A, and also to the gate-post, so as to engage the block *r* with its short arm when the gate is closed, and an operating-lever, *k*, connected to its short arm, substantially as shown and described.

395,337. SPRING-HINGE. NEWTON LIBBEY, Freeport, Ill. Filed Feb. 21, 1887. Serial No. 228,430. (No model.)



Claim.—The combination of the leaf A', provided with integrally-formed ears C C', bearing inwardly-projecting gudgeons F F', respectively, and the leaf A, provided with the ear B, perforated to receive one of said gudgeons, and with the leaf B', similarly perforated to receive the remaining gudgeon, and provided with a gradually-deepening groove, H, in its outer face, extending from the gudgeon-receiving perforation to the margin of the ear, substantially as and for the purpose set forth.

395,338. OVERSHOE. PHILIP LOSH, Perrysville, Ohio. Filed July 11, 1887. Renewed Aug. 25, 1888. Serial No. 283,794. (No model.)

Claim.—The combination, with an overshoe, of the plate provided with a spring and a tongue pivoted to the plate, said tongue having a pin adapted to enter a hole in the heel of the boot or shoe upon which the overshoe is worn, substantially as described.

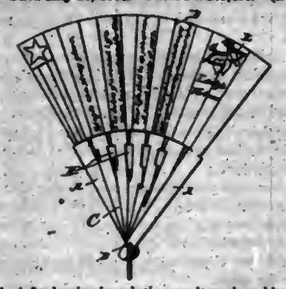
395,339. MACHINE FOR REDUCING OLD RAILS. SIDNEY MCCLOUD, Chicago, Ill. Filed Oct. 13, 1888. Serial No. 288,040. (No model.)

Claim.—1. The combination, with a set of rolls for reducing railroad-rails, of a delivery-guide having a rib adapted to bear upon the under side of the head portion of the rail, substantially as described.

2. The combination, with a set of rolls for reducing railroad-rails, of a delivery-guide having a rib adapted to bear upon the under side of the head portion of the rail, said rib being of tapering shape from back to front, substantially as described.

3. The combination, with a set of rolls for reducing railroad-rails, of a delivery-guide having side walls converging from front to back and having a central rib adapted to bear upon the under side of the head portion of the rail and tapering from back to front, substantially as described.

4. The combination, with a set of rolls for reducing railroad-rails, of a delivery-guide the top and bottom plates of which are provided with ribs or elevations adapted to bear upon the under side of the head portion of the rail, substantially as described.



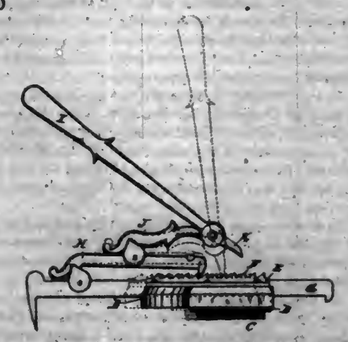
5. The combination, with a set of rolls for reducing railroad-rails, of a delivery-guide having a rib for bearing upon the under side of the head portion of the rail, and a receiving-guide having a rib for bearing against the head portion of the rail upon the opposite side of the rail, substantially as described.

6. The combination, with a set of rolls for reducing railroad-rails, of a receiving-guide having a rib arranged to extend into the space between the head and flange portions of the rails as it passes through the rolls, substantially as described.

7. The combination, with a set of rolls for reducing railroad-rails, of a receiving-guide having a stop plate extending in proximity to the periphery of the rolls, substantially as described.

8. The combination, with a set of rolls for reducing railroad-rails, of a guide having a removable cover, substantially as described.

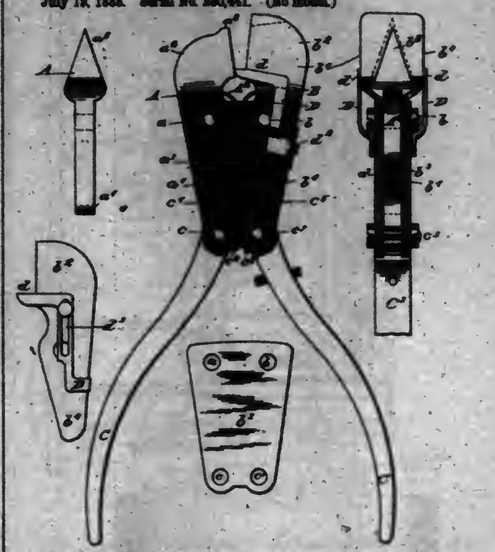
395,340. FORTUNE-TELLING FAN. WILLIAM MCWILLIE, Canton, Miss. Filed May 26, 1888. Serial No. 275,136. (No model.)



Claim.—1. A fan having inscriptions on its web and having notches in the edges of its ribs provided with an index, as set forth.

2. A fan having inscriptions on its web and notches in the edges of its ribs, said notches increasing in length successively from one side of the fan to the other and provided with an index, as set forth.

3. A fan having inscriptions on both faces of its web and having indexes in both sides of its ribs, the indexes on the opposite sides of the fan extending in reverse directions, as set forth.



395,341. CARPET-STRETCHER. THOMAS R. NIXON, Gananoque, Ontario, Canada, assignor to the St. Lawrence Steel and Wire Company, (Limited,) same place. Filed May 15, 1888. Serial No. 273,903. (No model.)

Claim.—1. A carpet-stretcher consisting of a movable platform or base, a pad connected to the under side thereof and provided with pins or wires, a struck-up or cast flanged plate attached to the platform, a hooked bar beneath the plate, a lever which engages with ratchet-teeth upon the flanged plate, and an arm which connects said lever to a pawl attached to the hooked bar, substantially as shown and described.

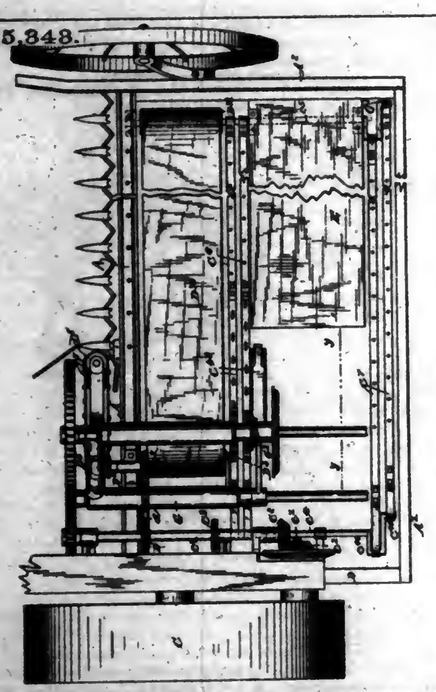
2. A carpet-stretcher consisting of a grooved platform or base, A, pad B, attached to the under side thereof and provided with pins or wires C, hooked bar G, which extends through groove D in the platform or base A beneath a struck-up or cast flanged plate, E, a pawl, H, attached to hook-bar G and engaging with ratchet-teeth F, and a lever or handle, I, connected to pawl H by arm J, the short arm K of lever I so constructed as to engage with the ratchet-teeth of the plate E, substantially as shown and described.

395,342. PUNCH. STEPHEN T. HAKANSSON, Boston, Mass. Filed July 19, 1888. Serial No. 280,441. (No model.)

Claim.—1. The punching implement herein described, the same comprising the punch-lever A, having the head a^2 and punch a^3 integral therewith, the die-lever B, having the die-block b^2 integral therewith, provided with a flat surface, and a die-recess, b^3, extending from said surface through the block, the side plates, *a' b'*, the lever-pivots *a b*, the operating-arms C C', having the extensions c^2 c^3, to operate the punch and die levers, respectively, the pivots *c c'*, and the spring A^3, substantially as described.

2. The punching implement herein described, the same comprising the punch-lever A, having the head a^2 and the punch a^3 integral therewith, the die-lever B, having the die-block b^2 integral therewith, provided with a flat surface, and a die-recess, b^3, extending from said surface through the block, the side plates, *a' b'*, the lever-pivots *a b*, the operating-arms C C', having the extensions c^2 c^3, to operate the punch and die levers, respectively, the pivots *c c'*, the spring A^3, and the adjustable gage or gages D, substantially as described.

3. In a hand punching implement, the punch-lever A, having the head a^2 and punch a^3 integral therewith, and arm a^4, in combination with the die-lever B, having the die-block b^2 integral therewith, provided with a flat surface, a die-recess, b^3, extending from said surface through the block, and the arm b^4, substantially as described.

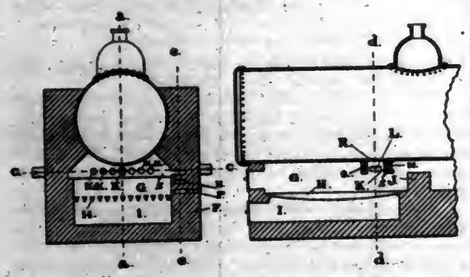


395,343. HARVESTER. LA VERNE W. NOYES, Chicago, Ill. Filed Feb. 24, 1888. Serial No. 265,140. (No model.)

Claim.—1. In combination with the continuously-operating endless-belt conveyer, a pair of alternately-reciprocating feed-bars operating parallel thereto and in the rear thereof, and a fixed platform-deck located in the rear of said feed-bars and substantially in the horizontal plane of the endless belt, substantially as and for the purpose set forth.

2. In combination with the binder-deck sloping upward from the receiving to the discharging side, the endless-belt platform conveyer extending underneath the receiving edge of the binder-deck and located at the forward part of the platform, and the alternately-reciprocating feed-bars parallel thereto and extending also beyond the receiving edge of the binder-deck nearly to the vertical plane of the needle rock-shaft and bent upward at their stubbleward ends, substantially as set forth.

3. In combination with the endless-belt conveyer located at the forward part of the platform, a pair of alternately-reciprocating feed-bars located in the rear of said endless conveyer and operating parallel thereto, and having an upwardly-sloping portion at their stubbleward ends, the binder-deck overhanging at its receiving end the stubbleward portion of the endless conveyer and divided to admit the upwardly-inclined portion of said feed-bars, said bars at their most stubbleward position extending stubbleward a considerable distance beyond the vertical plane of the receiving edge of the binder-deck and reaching nearly to the vertical plane of the needle rock-shaft, substantially as set forth.

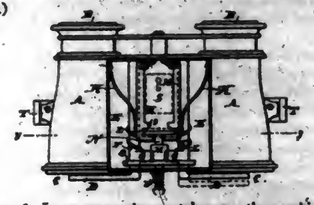


395,343.

4. In combination with the endless belt-conveyer located at the forward part of the platform, and the fixed decking located at the rear part, the binder-deck in two parts, the forward part having its receiving edge overhanging the stubbleward portion of the endless belt and sloping upward therefrom, and the rear part having its receiving edge secured to the fixed decking and sloping upward therefrom, and alternately-reciprocating feed-bars located and operating between the endless belt and the fixed decking and between the forward and rear parts of the binder-deck, substantially as set forth.

5. In a harvester, in combination with the two shafts c^4 and c^5, having each cranks ninety degrees apart, and the bars connecting corresponding cranks, the endless-belt conveyer D^{20}, having its driving-rollers at the grain side on the shaft c^5, substantially as set forth.

395,344. FURNACE. JOSEPH P. OLIVER, Oakland, Cal. Filed Aug. 27, 1888. Serial No. 283,236. (No model.)



Claim.—1. In combination with a boiler-furnace, the deflector Q, the depending wall to the rear of the said deflector, having the openings K, slides or valves M, and the air-passages N, O, and L, for the purpose of supplying fresh air and increasing combustion, constructed, arranged, and operated substantially as and for the purposes set forth.

2. The combination, with a boiler-furnace, of the depending wall Z, having the air-openings K and slides M, for the purpose of regulating the passage of fresh air through said wall, substantially as set forth.

3. The combination, with a boiler-furnace having the return flues or passages N, of connecting-passages L and O, whereby fresh air may be supplied and partially heated, the deflector arranged beneath the boiler, the depending wall in rear of the said deflector provided with openings, and the slides M for closing the same, substantially as specified.

395,345. COIN-CONTROLLED OPERA-GLASS. CLARA B. PATTERSON, New York, N. Y. Filed Feb. 10, 1888. Serial No. 263,606. (No model.)

Claim.—1. In an opera-glass or telescope, the combination of the object-glass with a movable shutter, a lock to hold the shutter closed over said glass, a coin-receiving box or receptacle, and lock-controlling devices actuated by the deposited coin to unlock said shutter.

2. In an opera-glass or telescope, the combination of the object-glass with a movable shutter, a lock to hold the shutter closed over said glass, a coin-receiving box or receptacle, lock-controlling devices actuated by the deposited coin to unlock said shutter, and a spring to cause said shutter to move from in front of the glass when unlocked.

3. In an opera-glass or telescope, the combination of the object-glass with a movable shutter, a lock to hold shutter closed over said glass, a coin-receiving box or receptacle, lock-controlling devices actuated by the deposited coin to unlock said shutter, and a spring to reset the lock and secure said shutter over the glass when turned to such position.

4. In an opera-glass or telescope, the combination of the object-glass with a movable shutter, a lock to hold the shutter closed over said glass, a coin-receiving box or receptacle, lock-controlling devices actuated by the deposited coin to unlock said shutter, a spring to cause said shutter to move from in front of the glass when unlocked, and a spring to reset the lock and secure said shutter over the glass when turned to such position.

5. In an opera-glass or telescope, the combination of the object-glass with a movable shutter, a lock to hold the shutter closed over said glass, a coin-receiving box or receptacle, lock-controlling devices actuated by the deposited coin to unlock said shutter, and a latch controlled by the shutter to prevent resetting of the lock until the shutter is closed over the glass.

6. In an opera-glass or telescope, the combination of a movable shutter adapted to obstruct the view through the lenses or glasses, a coin-receiving receptacle, a lock to control the movement of the shutter, a stop device to control the movement of the lock and adapted to receive the coin, and an extension on the lock to force the coin against the stop device to move it for the purpose of allowing movement to the lock.

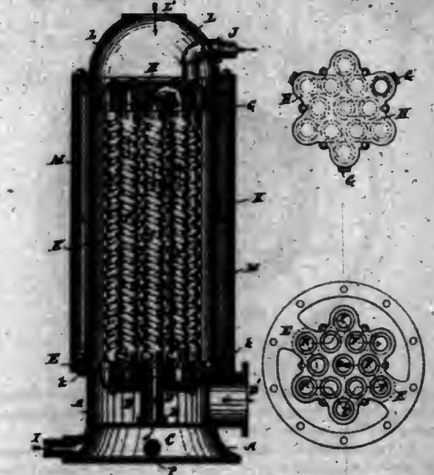
7. In an opera-glass or telescope, the combination of a movable shutter adapted to obstruct the view through the lenses or glasses, a coin-receiving receptacle, a lock to control the movement of the shutter, a stop device to control the movement of the lock and adapted to receive the coin, an extension on the lock to force the coin against the stop device to move it for the purpose of allowing movement to the lock, and a latching device to hold the lock in its unlocking position and controlled by the shutter, whereby the lock cannot be reset until the shutter is turned over the glass again.

8. In an opera-glass or telescope, the combination of a movable shutter adapted to obstruct the view through the lenses or glasses, a coin-receiving receptacle, a lock to control the movement of the shutter, and an obstruction in the path of the lock adapted to be pushed out of the way by the coin when it is inserted and the lock pressed in, whereby the lock may be moved out of the way and allow the shutter to move from in front of the glass.

9. In an opera-glass or telescope, the combination of a movable shutter adapted to obstruct the view through the lenses or glasses, a coin-receiving receptacle, a lock to control the movement of the shutter, an obstruction in the passage of the lock adapted to be pushed out of the way by the coin when it is inserted and the lock pressed in, whereby the lock may be moved out of the way and allow the shutter to move from in front of the glass, and a spring to automatically throw the shutter from off the glass.

10. An opera-glass having a coin-receiving receptacle formed thereon and consisting a part thereof, and arranged between and secured to the two fixed cylinders of the glasses.

11. An opera-glass of the usual kind in which the lenses are held permanently and rigidly in line by the inclosing frame or case, in combination with two shutters secured to the frame or case and adapted to be moved in front of the center of the lenses to obstruct the vision through the lenses, springs to hold them in position off the lenses, and a coin-actuated lock to unlock said shutters upon the passage of a coin through the lock.



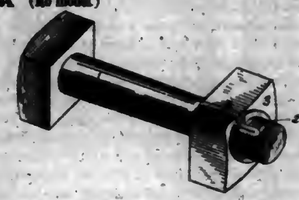
12. An opera-glass having two shutters pivoted or hinged to the frame of the glass between the cylinders and adapted to move in a plane parallel to the plane of the lenses to or from each other.

13. An opera-glass having a coin-receiving receptacle formed thereon and constituting a part thereof, arranged between the cylinders and provided with a slot for the coin and a coin-extracting door.

395,346. COUGH MIXTURE. ALONZO M. POE, Lakeport, Cal. Filed Jan. 17, 1888. Serial No. 261,007. (No specimens.)

Claim.—The herein-described cough mixture, consisting of eucalyptus, spikenard, yerba-santa, mullein, hoarhound, licorice, and oil of tar, substantially in the proportions named.

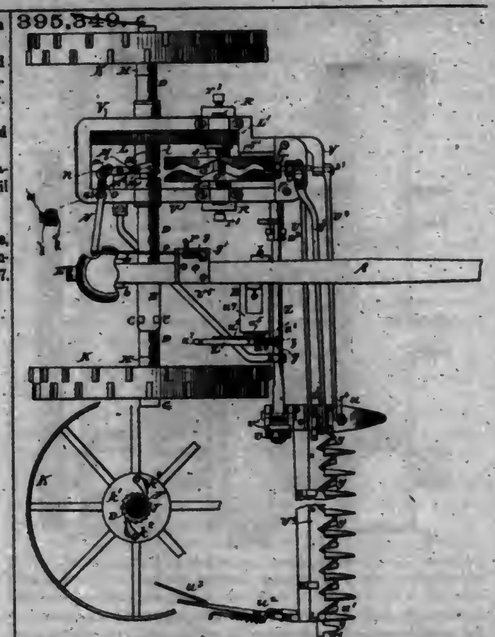
395,347. FEED-WATER HEATER. REUBEN F. PRATT, Revere, and CHARLES D. WAINWRIGHT, Medford, Mass., assignors to the Wainwright Manufacturing Company, Portland, Me. Filed Jan. 12, 1887. Serial No. 224,171. (No model.)



Claim.—1. In the feed-water heater, the base A, the tube-plate E, resting thereon, the core-plate H, bolted to said tube-plate, tubes F, tube-plate G, core-plate H, located thereon, and casing K L, in combination with suitable inlets and outlets for water and steam, located substantially as described, and all adapted for the purposes set forth.

2. In combination, a base, A, the tube-plate E, located thereon, the core-plate H, bolted under said tube-plate, tubes F, tube-plate G, core-plate H, located upon said tube-plate, casing K L, and the pipe J, connected with said tubes F, passing through and connected with said casing K L and serving to steady the tube-nest F H H, the whole provided with suitable inlets and outlets, all substantially as and for the purposes set forth.

3. In a feed-water heater, the base A, provided with a chamber, C, and an exhaust-chamber, D, in combination with the casing K, dome L, and a series of pipes, F, connected by core-plates H H, having return-bends cast therein, substantially as shown and described.



395,348. NUT-LOCK. SAMUEL H. RAY, St. Louis, Mo., assignor of one-half to George S. Tyler, same place. Filed Sept. 26, 1887. Serial No. 250,734. (No model.)

Claim.—1. The combination, in a nut-lock, of a full-threaded bolt, a nut having an eccentric key-groove and a beveled edge, as at 10, and a locking key or pin having a spring-arm adapted to clasp the nut, substantially as and for the purposes specified.

2. A tempered-steel locking-key for nut-locks, having the round locking-section, the folded driving and drawing section, and the spring-arm formed from a single piece of wire and shaped to clasp the nut, substantially as and for the purposes specified.

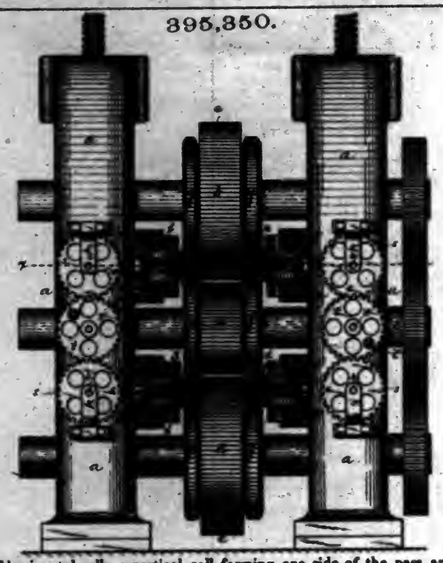
395,349. MOWER. JOHN H. REDFIELD, SAMUEL H. REDFIELD, and ABRAHAM B. HAMMOND, Glendale, Oreg. Filed Jan. 20, 1887. Serial No. 225,296. (No model.)

Claim.—1. In a mower, the combination, with the axle having a threaded end, of the ground-wheel K, provided with a hub having the annular flanges *k* standing out from both sides thereof, the ratchet-wheel l, recessed and seated on the flange *k* on the inner side of the hub, the spring-controlled pawl l^2, arranged to engage said ratchet-wheel, and the recessed nut G, screwed upon the extended and threaded end of the axle and provided with a circumferential flange that embraces the flange *k* on the outer side of the hub and bears on the periphery of the latter, substantially as specified.

2. In a mower, the combination of the main axle or shaft having the ground-wheels attached, the gear-wheel L, seated loosely on said axle and having its hub *l* forming one section of a clutch, the opposite section, *m*, of said clutch splined or feathered on said axle and provided with a circumferential groove, the pivoted and forked lever M, having the pin m^4 on its outer or rear end and the pin *m'* on the arms of its fork, which pins project into the circumferential groove of the clutch part or section *m*, the pivoted lever N, provided with the inclined or diagonal slot *n* and the pin *n'*, the coiled spring *o*, connecting the pins m^4 and *n'*, and the pivoted lever-handle P, having its front end within easy reach of the driver's seat, substantially as specified.

3. The combination, with the cam S, composed of two sections having waved facing edges that would fit upon each other if the sections were brought into contact, which sections are seated on the shaft R, the tapered openings through said shaft and through the outstanding bosses of said sections, and the tapered-adjusting-keys r^2, of the centrally-pivoted shaft T, having anti-friction rollers on its ends entering between said sections, the pitmen U U', connected to the respective ends of said lever T, and the cutter-bars attached to the outer ends of said pitmen.

395,350. APPARATUS FOR REROLLING OLD RAILS. ABRAM REESE, Pittsburg, Pa. Filed Apr. 20, 1888. Serial No. 271,267. (No model.)



Claim.—1. In rolls for rolling rails or beams, the combination of three horizontal rolls forming three sides of two separate passes, with two vertical friction-rolls adjustable horizontally and forming the fourth side of said passes, substantially as and for the purposes set forth.

2. In rolls for rolling rails or beams, the combination of a pair of horizontal rolls, a vertical roll forming one side of the pass and mounted in journal-box in the housing, and a wedge-bar in the housing for adjusting said vertical roll, substantially as and for the purposes set forth.

3. In rolls for rolling rails or beams, the combination of a pair of horizontal rolls, a frame supported in the housing and having guide-ways therein, a vertical roll mounted in a journal-box sliding in said guideways, and a wedge for adjusting said vertical roll horizontally in the frame, substantially as and for the purposes set forth.

4. In rolls for rolling rails or beams, the combination of a pair

395,350.

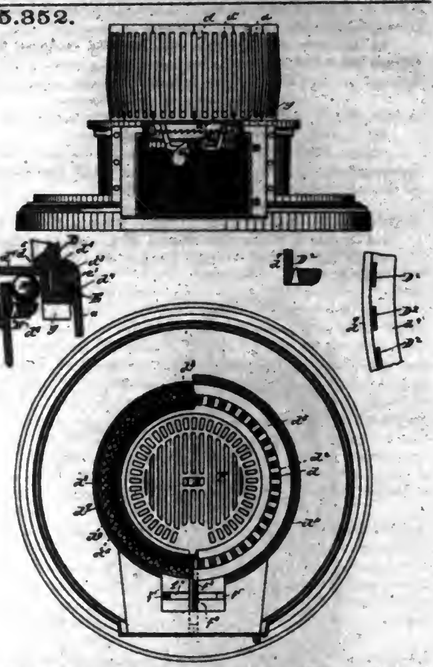
of horizontal rolls, a vertical roll forming one side of the pass and mounted in a journal-box, a wedge-bar for adjusting said vertical roll horizontally, provided with a threaded bar, and a revolving nut screwing on said threaded bar for adjusting said wedge-bar longitudinally, substantially as and for the purposes set forth.

5. In rolls for rolling rails or beams, the combination, with three horizontal rolls mounted in suitable housings, of two vertical rolls mounted in suitable journal-boxes, wedge-bars beyond said journal-boxes for adjusting the rolls, threaded bars secured to said wedge bars, pinions screwing onto the threaded bars, and a pinion gearing with both said pinions, substantially as and for the purposes set forth

395,351. WATCH-REGULATOR. ROSE B. RICHMOND, Decatur, Ill. Filed May 7, 1888. Serial No. 273,003. (No model.)

Claim.—1. A micrometer watch-regulator comprising a graduated arc, an arm pivoted at or near the center of the circle that the arc would form if continued, a swivel on the arm between the pivot and the arc, adapted to carry the regulating-pointer, and means for adjusting the arm with relation to the arc, as and for the purpose set forth.

2. A micrometer watch-regulator comprising a graduated arc, an arm yieldingly pivoted near the center of the circle that the arc would form if continued, a roller in the arm bearing with a yielding pressure against the arc, and means for connecting the arm with a regulator-pointer, as and for the purpose set forth.



3. In micrometer watch-regulators, in combination, arc *b*, springs *b' b'*, carrying pivot *f*, arm *c*, pivoted at *f*, roller *d'* in arm *c*, bearing against the periphery of the arc, and swivel *e*, adapted to carry pointer *a*, as and for the purpose set forth.

395,352. HEATING STOVE AND FURNACE. CHARLES I. RIDGWAY, Boston, Mass., assignor to the Ridgway Furnace and Stove Company, Nashua, N. H. Filed July 27, 1885. Serial No. 172,748. (No model.)

Claim.—1. In a heating stove or furnace, the combination, with the wall of the ash-pit, of a transversely-angular supporting-ring resting upon such wall, a series of anti-friction rollers loosely supported upon such supporting-ring, an annular support resting upon the anti-friction rollers, and an annular or cylindrical fire-pot resting upon the annular roller-supported support, substantially as described.

2. The combination, with the wall of an ash-pit, of an annular support consisting of vertical and horizontal portions, a series of anti-friction rollers resting upon such annular support, a supporting-ring

395,352.

or double-angle plate resting upon the series of anti-friction rollers and covering the inner surface of the same, and a fire-pot resting upon such angle-plate, substantially as specified.

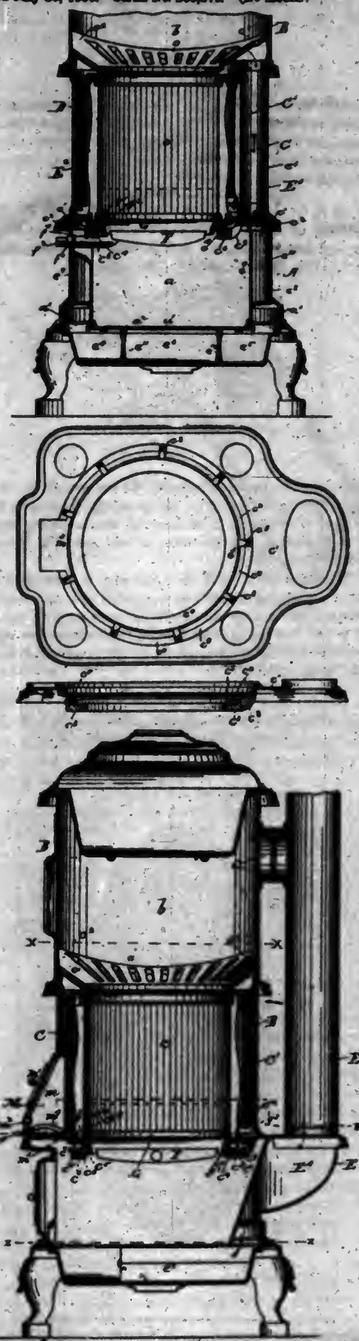
3. The combination, with the wall of an ash-pit, of a recessed and perforated annular support which rests thereon, a series of movable anti-friction rollers which are supported at bottom and covered exteriorly by such perforated annular support, a supporting-ring or double-angle plate which rests upon the anti-friction rollers and covers the same interiorly, and a fire-pot which rests upon the supporting-ring or double-angle plate, substantially as set forth.

4. The combination, with the wall of an ash-pit, of an annular support having an exterior vertical portion and an interior horizontal perforated portion, a series of anti-friction rollers upon such annular support, an annular rotary plate which has a main vertical portion, an upper exterior, and a lower interior horizontal portion, and a fire-pot which has double bearing-faces, one of which rests upon the exterior and the other upon the interior horizontal portion of the double-angle plate.

5. The ash-pit wall having a supporting-shoulder, the perforated single-angle plate, the series of anti-friction rollers, the double-angle plate, the fire-pot provided with inner annular flange or ledge at its lower extremity, and the cylindrical or annular covering-piece resting upon the flange or ledge and extending downwardly over the inner portion of the fire-pot and of the double-angle plate, all in combination, substantially as described.

6. The combination, with the wall of the ash-pit, of an annular support resting upon such wall, a series of anti-friction rollers upon such annular support, an upper annular angle-plate having a series of bottom engaging-teeth supported upon the anti-friction rollers, a fire-pot resting upon such upper annular angle-plate, and a horizontally-oscillating grate provided with a pawl for engagement with the bottom teeth upon the upper annular angle-plate, substantially as described.

7. The combination of the ash-pit wall d^{11}, having the shoulder d^{10}, the angle-plate d^9, the series of balls d^8, the rotary plate d^6, and the superposed fire-pot wall D, substantially as set forth.



8. The combination, in a furnace or heating-stove, of a rotary fire-pot wall, a grate adapted to have an oscillating movement imparted to it, and a device connecting the grate or grate-operating mechanism with the fire-pot wall, whereby upon the movement of the same in one direction the fire-pot wall is caused to be revolved, all substantially as described.

9. The combination, in a heating stove or furnace, of a rotary fire-pot wall having teeth *g*, a grate adapted to have an oscillating movement imparted to it, and a pawl carried by the grate-operating arm or rod and arranged to engage the teeth of the fire-pot wall when it is moved in one direction, all substantially as described.

10. A heating stove or furnace which is provided with a rotary

fire-pot wall and with an oscillating grate which carries a pawl, which may or may not engage the fire-pot wall to rotate the same when the grate is oscillated.

395,353. HEATING-STOVE. CHARLES I. RIDGWAY, Everett, Mass., assignor to the Ridgway Furnace and Stove Company, Nashua, N. H. Filed July 28, 1886. Serial No. 208,576. (No model.)

Claim.—1. A heating-stove having the base-section A, the upper section, B, containing a combustion-chamber, a heat-radiating section or shell, C, the fire-pot *c*, inclosed thereby, and a chamber, D, interposed between the radiating outer section and the fire-pot, separated from the ash-pit and connected with the combustion-chamber, substantially as described.

2. The combination, in a heating-stove, of a base-section containing an ash-pit and base-flues, an upper section containing a combustion-chamber, an interposed section, the fire-pot contained therein provided with openings or recesses, a chamber, D, surrounding the same and opening into the combustion-chamber, a partition-plate separating the said chamber from the ash-pit, the pipes E K F F', forming the downflues, and the uptake E', substantially as described.

3. The combination of the base having the side flues, c^7 c^8, arranged on each side of the ash-pit, the side flues, c^4 c^5, and the horizontal flue c^6, below the ash-pit plate, the front flues, *c c'*, opening into the front ends of the side flues, c^4 c^5, the combustion-chamber *b*, and the uptake E', substantially as described.

4. The base-plate c', having the section c^3, forming an exposed surface of the section c^2, constituting a support for the fire-pot wall, and the intermediate arms, c^3, forming the recesses c^2, in combination, substantially as described.

5. The combination, with the stove, of the annular plate G, for supporting a fire-pot, having the recess g^2, for receiving the extension c^{12} of the fire-pot, substantially as described.

6. The combination, with a stove, of the annular plate G, having the downwardly-extending ring *g*, the surfaces g^6 g^7, the flange g^5, the teeth g^3, and the recess g^2, for receiving and holding the base of the fire-pot wall, substantially as described.

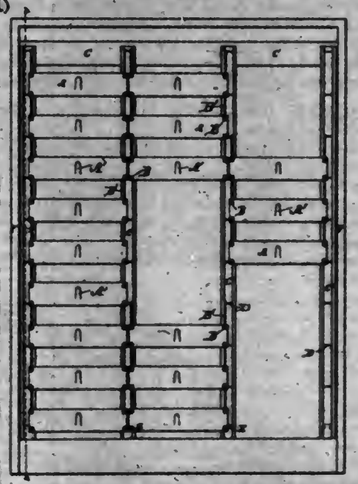
7. The plate c', having a ball-holding recess provided with the lip c^9, in combination with the balls c^8, the plate G, and the fire-pot wall *c*, substantially as described.

8. The combination, in a heating-stove, of the fire-pot *c*, the chamber D, opening into the combustion-chamber *b*, the casing C, forming the exterior of the stove, and the enlargement M to the chamber D, all substantially as described.

9. The combination of the scraper having two deflecting or scraping surfaces, *n*, with the plate G, having the extension or flange g^5, substantially as described.

10. The combination of the fire-pot *c*, the chamber D, the flues *c c' c⁶ c⁵*, and the guard *e*, substantially as described.

11. In a heating-stove, the combination, with the fuel-chamber, of the coal-guard *o*, raised or extending upward at its corners o^2, substantially as and for the purposes described.



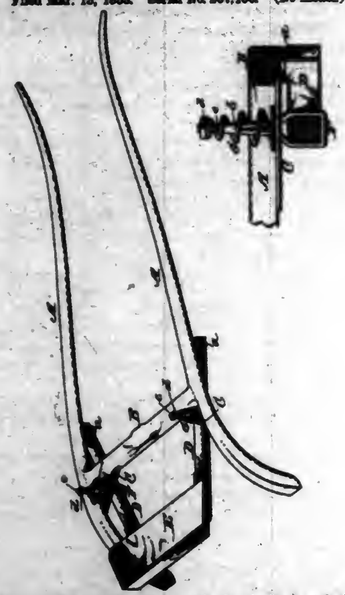
12. The combination of the outer casing, c^{10}, with the plate c', shaped to provide the base-flues c^7 c^8, substantially as described.

13. In a heating-stove, the ash-pit *a*, having the pocket *h'*, for holding the gear H, substantially as described.

14. The combination, in a heating-stove, of the chamber D, having the enlargement M, and the door *m'*, hinged at m^2 to open outward and downward, substantially as described.

15. The combination of the plate G, having the extension or flange g^5, with the scraper N, having one or more deflecting-surfaces, *n*, and supports to permit a vertical movement to be imparted to it by the plate or by any obstruction thereon, substantially as and for the purposes described.

395,354. RAILWAY-COUPON-TICKET RACK. GEORGE ROSS, South Butte, Mont. Filed June 20, 1888. Serial No. 277,090. (No model.)



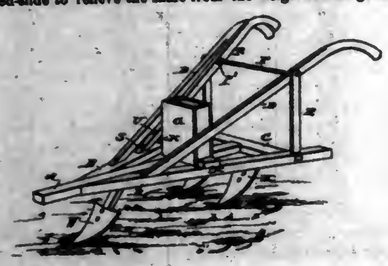
Claim.—1. The combination of the longitudinally-grooved standards, the transverse pegs secured in the standards, the links engaging

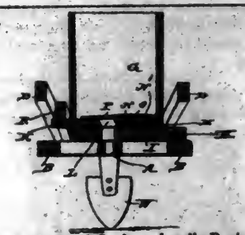
said pegs, and the ticket-holding plates secured to said links, as set forth.

2. The combination of the grooved standards, the transverse pegs D, the forwardly-projecting pegs E, the links B', adapted to engage the pegs D, and the ticket-holding plates having openings in their corners engaged by the links and engaging the pegs E, as set forth.

3. The combination of the casing, the links supported within the casing, and the ticket-holding plates detachably secured at their corners to the ends of the links, as set forth.

395,855. TWO-WHEELED VEHICLE. FREDERICK RUFF, Milford Ind. Filed Mar. 12, 1888. Serial No. 267,100. (No model.)

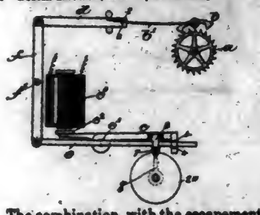




Claim.—1. The combination, with the shafts A and the bars D, pivoted at one end to the under side of said shafts and at the other end carrying the seat, of the diagonal supports C, the yokes F, embracing said bars, and having shanks *b* extended through holes in the supports C, the conical spiral springs encircling the said shanks, and the adjusting-nuts on the ends of said shanks and bearing on said springs, substantially as shown and described.

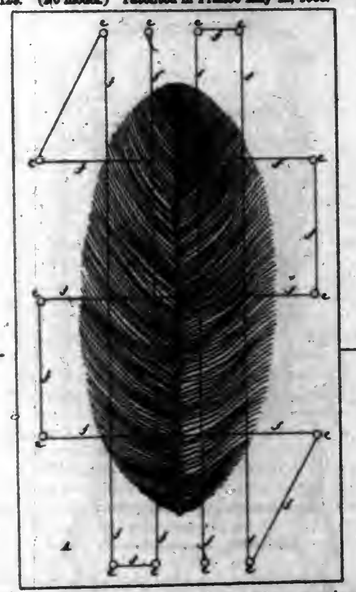
2. The combination, with the shafts, the clips *a* on the under side thereof, the cross-brace B, the diagonal bars D, pivoted at one end to said clips and at the other carrying the seat, and the metal supports C, extended in a diagonal direction from the shafts to said brace and secured thereto, of the yokes embracing the bars D near the center of their length, and formed with tapered shanks *b*, passed loosely through holes in the supports C in the crotch of the shafts and brace to the rear of the brace, the conical coiled springs encircling said shanks, and the adjusting-nuts on said shanks above the springs, substantially as shown and described, and for the purpose specified.

395,856. CORN-PLANTER. CHARLES M. RUFF, Rocky Fork, W. Va. Filed Mar. 22, 1888. Serial No. 268,154. (No model.)



Claim.—In a planter, the combination, with the main frame, the handles D, secured thereto, the cross-bar F of the handles, and the hopper having in its bottom the groove I and a suitable discharge-opening, of the seed-slide having a discharge-opening, L, and shallow longitudinal groove M, the slotted plate N, adjusted by the screw O, the spring-guide plate and protector P, arching up centrally above the seed-slide to relieve the same from the weight of the grain that

might impede its motion, and the lever-handle R, pivoted at S on the main frame, connected at U to the seed-slide, provided with the slot P', by means of which it is supported and guided between the handles and prevented from being displaced or removed by the adjacent handle D, substantially as specified.

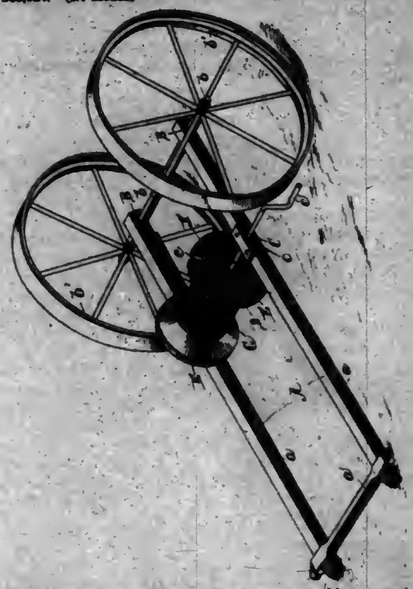


395,857. CONTROLLING DEVICE FOR THE REGULATING MEMBERS OF CLOCKS. WILLIAM S. SCALES, Somerville, assignor, by direct and mesne assignments, to Royal E. Robbins, Boston, Mass. Filed Mar. 17, 1888. Serial No. 267,457. (No model.)

Claim.—1. The combination, with the escapement *a* and verge *b*, of a resisting-spring for the verge, the operating bar or lever for varying the force or resistance of said spring, and an electro-magnet for moving or controlling the movement of said operating bar or lever, substantially as described.

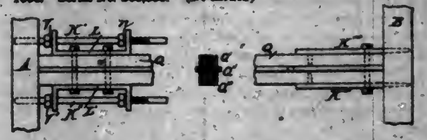
2. The combination, with the regulating or controlling member of a clock, of a spring operatively connected with said member and the operating bar or lever for increasing or decreasing the force or amount of the resistance of said spring, and an electro-magnet for moving or controlling the movement of said operating bar or lever, substantially as described.

395,858. ART OF ORNAMENTING FEATHERS. OSCAR SOHEURER and ALPHONSE FORNEY, Paris, France. Filed June 25, 1888. Serial No. 278,129. (No model.) Patented in France May 12, 1888.



Claim.—1. The improvement in the art of ornamenting feathers for dress purposes, which consists in printing them in colors or patterns, substantially as described.

2. The improvement in the art of ornamenting feathers for dress purposes, which consists in placing the feather on a soft yielding cushion and printing it by means of a printing-plate, whereby during the impression the rib embeds itself in the cushion.

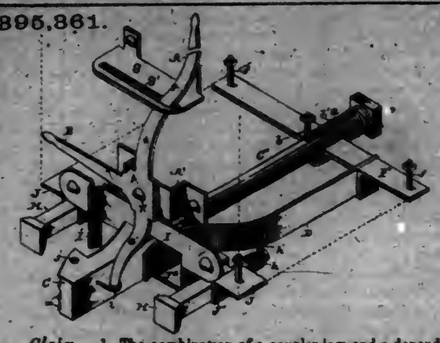


3. As a new article of manufacture, a feather for dress purposes printed in any color or pattern, as hereinbefore specified.

395,859. FENCE-WIRE-LAYING MACHINE. ORVIS R. SHARP and IRA J. REED, Marengo, Iowa. Filed Sept. 20, 1888. Serial No. 285,857. (No model.)

Claim.—The improved fence-wire-stringing machine, comprising the side bars, *a*, having notches in their under sides at one end adapted to engage an axle, the other ends of said bars being tapered and connected by a cross-bar, *a'*, the crank-shaft journaled in the side bars, the spool loosely mounted on the crank-shaft, and having annular flanges at its ends, one of said flanges having a radial notch in its edge, and the detent having one end pivoted in a staple on the crank-shaft, and having its end hooked and adapted to engage the notch in the flange of the spool, as specified.

395,860. GATE. JAMES SHOUP, Newport, Mich. Filed Feb. 25, 1888. Serial No. 265,233. (No model.)



Claim.—1. In a wire gate, the combination, with two uprights, (hinge-board and latch-board,) of a center bar, Q, consisting of an iron plate laid between two boards, which are bolted edgewise to the plate, two iron straps, K''' K''', bolted one below and one above to the front or latch end of the center bar, the projecting rounded ends of said straps entering into the latch-board in lieu of tenons, two clips, L L', bolted—one above, the other below—to the hind or hinge end of the center bar, two straining-bolts, K' K'', passed through the upturned ends of said clips, each bolt having a shoulder near one end, with a thread and nut at the other, and their ends beyond the shoulders V V' entering the hinge-board in lieu of tenons, wires stretched across the gate, stiffening-cables, the strands of which pass round said wires, and a tie-rod stretched from the front part of the gate to the upper end of the hinge-board, where it is fastened by a thumb-screw or threaded nut, (the end of the tie-rod being threaded,) the whole substantially as and for the purposes set forth.

2. A wire gate having a center bar, Q, consisting of a plate of iron laid between two boards bolted edgewise to the plate, substantially as described.

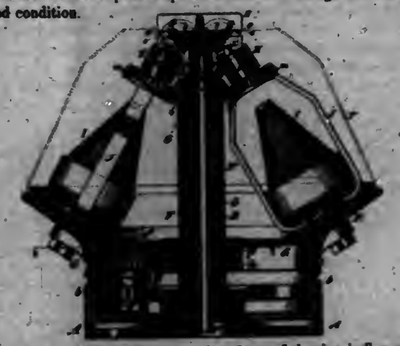
3. A wire gate having its center bar provided with the combined straining-bolts K K' and clips L L'.

395,861. CAR-COUPLING. HENDRON SOMERFIELD, Canton, Kans. Filed Sept. 19, 1888. Serial No. 285,797. (No model.)

Claim.—1. The combination of a coupler-jaw and a depending stop arranged to one side thereof in a position to prevent lateral movements of opposing coupler-jaws, and formed by folding a metal plate, I, substantially as set forth.

2. In combination with a car-coupler jaw and the bumpers, a plate, J, secured to the under forward end of the car, having sockets J' for the bumpers, and a depressed portion, J², for the coupler-jaw, substantially as described.

3. In combination, a spring-actuated coupler-jaw, a plate, such as J, secured to the front end of the car and provided with sockets J' and a depression, J², and bumpers H, mounted in said sockets, substantially as described.



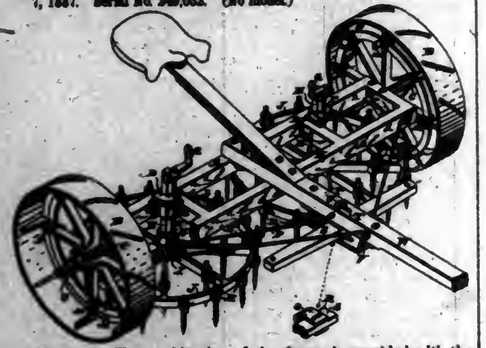
395,862. BRUSH FOR COTTON-GINS. ROBERT F. SPALDENBERGH, New Orleans, La. Filed Apr. 26, 1887. Serial No. 236,197. (No model.)

Claim.—A brush-cylinder provided with lags having diagonally-arranged inclined perforations in parallel series, as shown, and the tufts of bristles secured in the said inclined perforations, substantially as specified.

395,863. MACHINE FOR COVERING WIRE. HENRY SPLITDORF, New York, N. Y., assignor to the Splitdorf Wire Company, same place. Filed Dec. 5, 1887. Serial No. 256,972. (No model.)

Brief.—The invention consists in certain improvements upon the machine covered by Letters Patent No. 300,403, dated June 17, 1884, which is of that class of machines whereby the fibers are first untwisted and then placed upon the wire in a straightened and flattened condition.

Claim.—1. The bobbin-carrying frame J, having hollow spindle *l* and rotary support E for said frame J, spring-clamp L on the spindle *l* for holding the fibers as they are untwisted, and gear *m* on said frame J, combined with the hollow stationary spindle B for the passage of a wire, rotating tube G, and gear *i* on said tube, the gear *i* engaging the gear *m*, the fibers being led from the clamp to the wire above the end of the spindle, substantially as described.



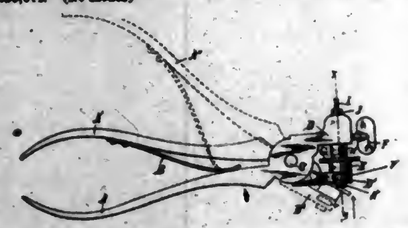
2. The support E, having hollow standard F, combined with the tube G within the standard F and projecting beyond said standard, and with gear-wheel *e* on the support E, gear A on tube G, and intermediate gear, *f g*, connecting the support E with the tube, whereby, when the support E rotates, said tube will be driven independently of said support, substantially as herein shown and described.

3. The rotating support E, having hollow standard F, tube G, gear *i* on said tube, and means for turning said tube independently of the support E, combined with the longitudinally-fluted rollers N O, for spreading and feeding the fibers, said rollers carrying gear *o*, and, with the gear *r*, meshing with the gear *i* on the tube G, and turning the gear *o* for driving the rollers N O, substantially as herein specified.

4. The combination, with the rotating support E, having hollow standard F, tube G, partially within said standard, and having gear *i*, and means for turning the tube G, of the frames J, having gear *m*, meshing with the gear *i*, spring-clamp L, and rollers N O, the roller N, having the gear-wheel *o*, pinion *p*, engaging gear *o* and gear-wheel *r* on the shaft with the pinion *p*, said gear *r* meshing with the gear *i*, whereby the rollers N O are driven by the tube G, substantially as described.

5. The combination of the base A, stationary hollow spindle B, support E above said base, said spindle passing through said support, tube G, embracing the stationary spindle B, and gearing *e f g h*, connecting the tube G with the support E, whereby as the support E rotates the tube G will be independently rotated by said support, substantially as herein shown and described.

395,864. ROTARY HARROW. IRA E. STUMP, Kirkville, assignor of one-half to A. C. and Gen. T. McConnell, Cleveland, Ohio. Filed Sept. 7, 1887. Serial No. 249,052. (No model.)

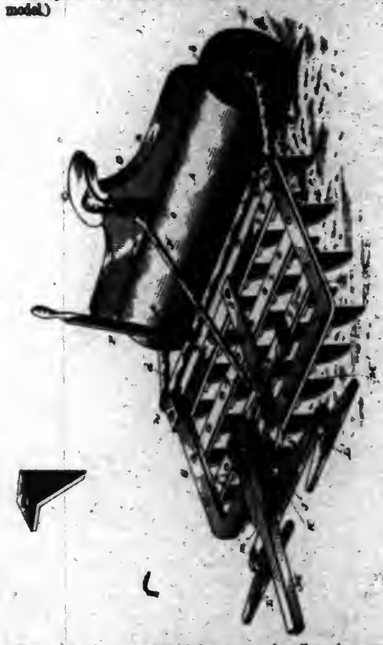


Claim.—1. The combination of the frame A, provided with the castings D, the spindles E, having located upon their lower ends the rotating harrows J, the screws F, provided with the handles G, the lifting lugs H, and the driving-lugs M, substantially as and for the purpose specified.

2. The combination of the frame A, the wheels B, the castings D, the screws F, the spindles E, having located upon their lower ends the rotating harrows J, and the draft-rod P, connecting the lifting-lugs H and the draft-strap O, substantially as and for the purpose specified.

3. The combination of the frame A, the wheels B, provided with secondary rims, and the driving-lugs M, adapted to be moved in radial slots and to engage with the teeth of the harrows J, substantially as and for the purpose specified.

4. The combination of the pole W, provided with the slot T, the doubletree S, provided with the slot R, the draft-strap O, and the draft-rods P, substantially as and for the purpose specified.



395,865. APPARATUS FOR FORMING ABRADING-WHEELS. WILLIAM H. TAGGART, Prospect, Ill. Filed Oct. 28, 1887. Serial No. 253,671. (No model.)

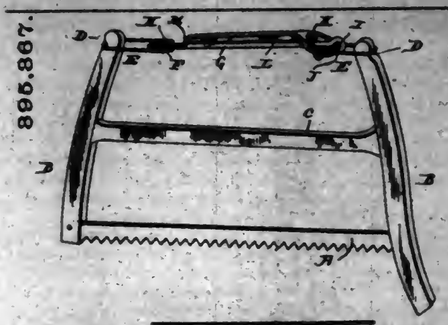
Claim.—1. In a device for forming abrading-wheels directly upon their shafts, the combination, with two coacting jaws, of a pressure-block attached to one of said jaws, a matrix attached to the other jaw and having a cutting-edge adapted to bear upon said pressure-block, and an axial bore adapted to receive a shaft, and means, substantially as shown and described, for securing a shaft in the bore of said matrix during the formation of an abrading-wheels, substantially as and for the purpose set forth.

2. In an apparatus for forming abrading-wheels directly upon their shafts, the combination, with two suitably-bored coacting jaws, of a pressure-block having a shank removably seated in the bore of one of said jaws, an axially-bored matrix having a shank removably seated in the other of said jaws and formed with a transverse opening, and a transverse set-screw seated in said last-named jaw and adapted to pass through the transverse opening in the shank of the matrix and to secure a shaft in said shank and at the same time to secure the shank in the jaw in which it is seated, substantially as and for the purpose set forth.

395,866. COMBINED HARROW AND ROLLER. JOHN T. VAN POOL, Tiptonville, Tenn. Filed Apr. 28, 1888. Serial No. 272,201. (No model.)

Claim.—1. In a combined harrow and roller, the combination, with the frame provided with an arm projecting therefrom, of a lever adjustably secured to said arm, substantially as set forth.

2. The combination, in a combined harrow and roller, with the roller, a beam connected therewith provided with an apertured plate, and a harrow connected with said roller and provided with a slotted lug, of a bar secured at its rear end to the apertured plate and having its front end engaging the apertured lug, substantially as set forth.



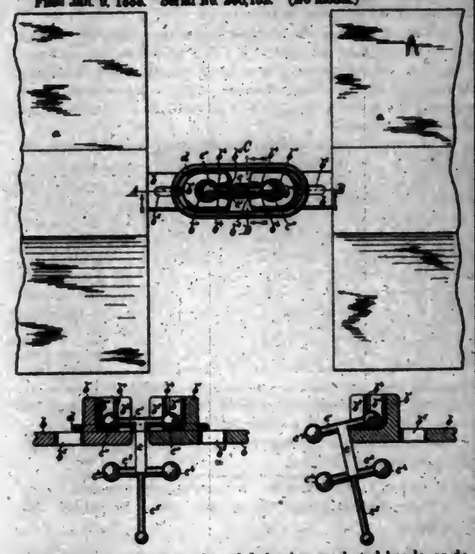
3. The combination, in a combined harrow and roller, with the roller, the connecting-frame, and the harrow, of bearing-plates removably secured to said harrow and engaging the frame, substantially as set forth.

4. The combination, in a combined harrow and roller, with the roller, a horizontal frame having bearings at its ends for the same, a lever for adjusting said frame, and a harrow connected with the latter, of a beam connected with the roller-axes and provided with a seat and an adjustable bar connecting said beam and harrow, substantially as set forth.

5. The herein-described harrow and roller, consisting of the roller, a beam connected with the axes thereof and provided with a seat and an apertured plate, a frame having bearings at its ends for said axes and provided with an adjusting-lever, a harrow connected with said frame and carrying an adjustable tongue, a slotted lug on said harrow, and a bar adapted to adjustably engage said lug and the said apertured plate, substantially as set forth.

395,867. SAW-TIGHTENER. SAMUEL WALTER, Dallas City, Ill. Filed Aug. 18, 1888. Serial No. 283,123. (No model.)

Claim.—The combination of the handles, the loops or bails engaging the upper ends of the handles, the stretching-bar having one end connected to the ends of one of the loops and its opposite end entering the end of the other loop, and the lever having a fork, K, at its end, provided with an integral cross-bar, J, the end of the stretching-bar being pivoted on the said cross-bar J and the ends of the adjacent bail being pivoted on the sides of the fork at a point between the cross-bar J and the end of the lever, as set forth.



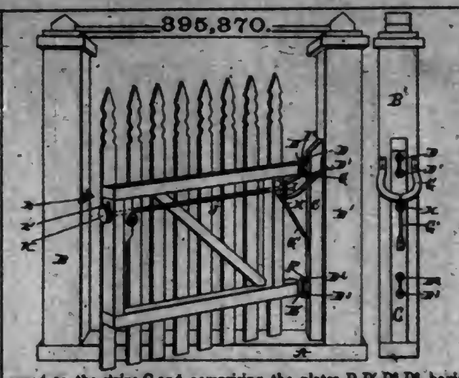
395,868. PROCESS OF COVERING HAMS, &c. ALEXANDER WARNER, New York, N. Y. Filed Feb. 9, 1888. Serial No. 263,308. (No specimens.)

Claim.—1. The within-described improvement in the art of applying preservative coverings to hams and other articles of food, consisting in first applying directly to the article a plastic composition containing amylaceous matter susceptible of coagulation, and afterward producing coagulation of said composition upon the article, substantially as set forth.

2. The process of producing preservative coverings upon hams and other articles of food, consisting in first applying closely to each article a binder or wrapper, in combination with a plastic composition containing amylaceous matter susceptible of coagulation, and afterward producing coagulation of said composition upon the articles, substantially as set forth.

3. The improvement in the art of applying preservative coverings to hams and other articles of food, consisting in applying thereto a coating of amylaceous matter with a wrapper, and subsequently immersing the so-coated article in a heated alkaline solution.

395,869. CAR-COUPLING. DARIUS WELLINGTON, Boston, Mass. Filed Jan. 9, 1888. Serial No. 260,132. (No model.)



Claim.—1. The draw-bars *b b*, having pocketed heads, as described, combined with the cross-piece *d* and end projections, *c' c'*, thereon, the arm or lever *c* on said cross-piece, and the lower cross-piece, *c*², adapted to serve as a stop against the under side of the draw-bars to prevent the accidental uncoupling of the device, as set forth.

2. The draw-bars *b b*, having pocketed heads, as described, and the coupler composed of an arm or lever having one or more cross-pieces and end projections adapted to rest in the pocketed draw-bar heads, combined with the safety-link *d*, adapted to encompass the draw-bar heads, substantially in the manner and for the purpose set forth.

395,870. GATE-HINGE. SOLOMON D. WELLS, Fairmont, Minn. Filed July 19, 1888. Serial No. 280,647. (No model.)

Claim.—The combination, with the posts B B', sill A, and gate, of the strip G, interposed between the gate and post B', hinges secured to the stripe G and comprising the plates D D' D² D³, having eyes E E, the inclined U-shaped track G, secured to the post B', inclined bar G', and rod J, having rollers I K secured at each end, whereby the gate is opened and closed by its own gravity, substantially as and for the purpose described.

395,871. PIANO-TRUCK. CALVIN L. WEBER, New York, N. Y. Filed Apr. 28, 1888. Serial No. 272,196. (No model.)

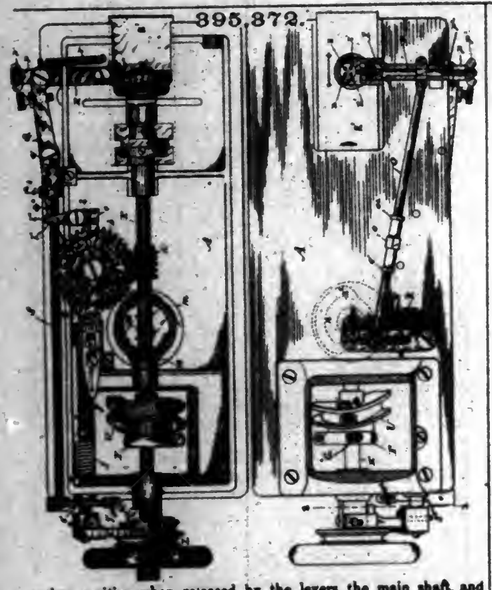
Claim.—1. In a piano-forte truck, the bed-frame *b b' d d'*, united to the standards *m m'* in such manner that the bed-frame may revolve in the standards at points approximately opposite the balancing plane of an upright piano-forte, substantially as and for the purpose described.

2. In combination with the swiveled bed-frame of a piano-forte truck, as described in claim 1, a regulating-rod, *g*, connected with the cross-bar *l l*, *l'* and revolving coincidently with the revolution of the swiveled bed-frame by means of its insertion through the opening *p* in the upper cross-bar *d d'*, substantially as and for the purpose described.

3. In combination with the swiveled bed-frame and the regulating-rod *g* of a piano-forte truck, a stop or button, *k*, attached to the regulating-rod *g*, for the purpose of limiting the revolution of the truck around its centers *f f'*.

4. In combination with the swiveled bed-frame and the regulating-rod *g*, a set-screw, *c*, inserted into the upper cross-bar *b b'*, opposite the opening *p*, to bind or clamp the regulating-rod *g* in the opening *p*, substantially as described.

5. In combination with the regulating-rod *g*, the side pieces of the bed-frame *b b'*, terminated at their lower extremities by the dogs *a a'*, substantially as described.



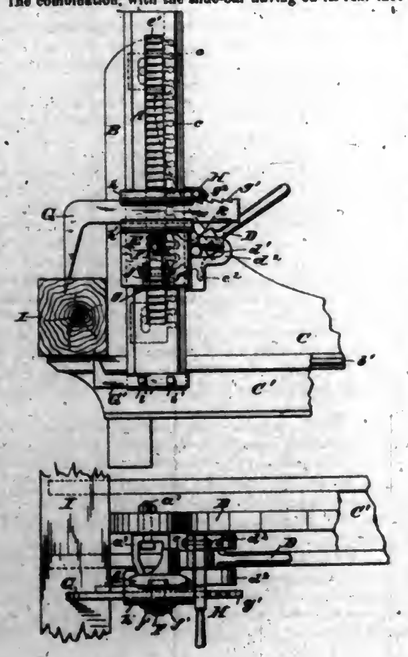
395,872. BUTTON-SEWING MACHINE. LEMAN C. WIRE, Boston, Mass., assignor, by direct and mesne assignments, to the Union Button Sewing Machine Company, of Massachusetts. Filed Sept. 4, 1886. Serial No. 212,673. (No model.)

Claim.—1. In a button-sewing machine, as a means for readily and with the utmost nicety adjusting the button-carrier with respect to the needle on a line substantially transverse to the reciprocating movements of the carrier, the combination, with a sewing mechanism, of a button-carrier provided with a rod, P, screw-threaded on its rear end, a presser-foot mechanism provided with a lug or block, *p*, having a hole through which the rod P passes, a thumb-screw, *p'*, on the outer end of the rod to adjust the button-carrier, and a locking-nut, *p*², to lock the button-carrier in adjusted position, substantially as set forth.

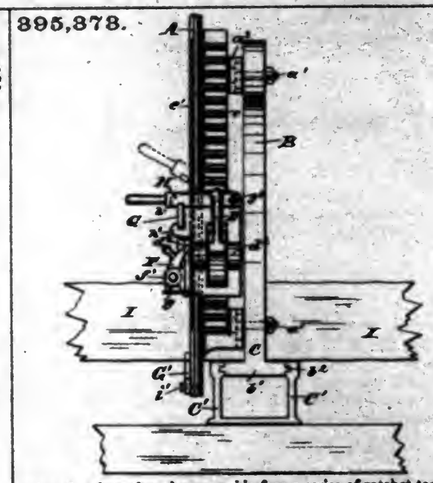
2. In a button-sewing machine, a sewing mechanism, a button-carrier and means for operating it, the main shaft, a dog, *f*, pivoted thereon, a driving-pulley running loose on the main shaft and adapted to engage the dog and drive the main shaft, a rock-shaft, J, and means for controlling the movement of the same, and an arm, *f'*, on the rock-shaft, provided with a spring-pressed pin, *g*, and having the inclined surface *f*³, substantially as set forth.

3. A sewing mechanism and a button-carrier, in combination with a lever, R, directly connected with the button-carrier, levers Q and *l*, for locking or holding the button-carrier in one position, lever Q being directly connected with lever R, and lever *l* being directly connected with lever Q, a spring for moving the button-carrier to

395,372.



another position when released by the levers, the main shaft, and camshaft wipers operated by the main shaft and arranged to operate on lever *l*, substantially as and for the purposes set forth.



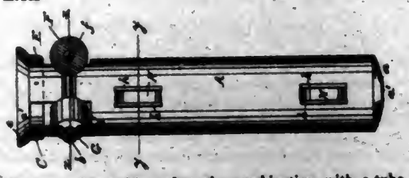
395,373. SAW-MILL DOG. HARVEY R. WOLFE, Louisville, Ky., assignor to John R. Bascom, and the Brennan & Co. South Western Agricultural Works, both of same place. Filed Dec. 27, 1887. Serial No. 259,007. (No model.)

Claim.—1. In a saw-mill dog, the combination, with an upright slide-bar having rack-teeth formed upon one face and provided with a timber-grasping dog at its lower end, of a sliding head engaging said slide-bar and provided with two grooved projections, a notched dog adjustable in said projections, a locking-lever pivoted to the sliding head and engaging with one of the notches in the adjustable dog, and a cog-lever pivoted to the sliding head, the cogs on said lever engaging the rack-teeth on the slide-bar to move the latter up and down, substantially as described.

2. The combination, with the slide-bar having on its rear face a

395,373.

series of rack-teeth and on one side face a series of ratchet-teeth and provided with a dog, of the sliding head carrying a dog, a cogged lever loosely journaled in said head to engage with the rack-teeth on the slide-bar, and a spring-pressed pawl pivoted on the sliding head to engage with the ratchet-teeth on the slide-bar, for the purposes set forth.



3. The combination, with the slide-bar having on its rear face a series of rack-teeth and on one side face a series of ratchet-teeth and provided with a dog, of the sliding head carrying a dog and having slotted ears, the upper sides of the slots in the ears being enlarged at their forward ends, a pawl pivoted on the sliding head to engage with the ratchet-teeth on the slide-bar, and a cogged lever loosely journaled in said ears to engage with the rack-teeth on the slide-bar, for the purposes set forth.

4. The combination, with the slide-bar having cylindrically-formed teeth on its rear face, provided with a dog, of the sliding head carrying a dog and the operating-lever loosely journaled in the head, the said lever having cylindrically-faced cog-teeth at its forward end to mesh with the teeth on the slide-bar, substantially as described, and for the purpose stated.

5. A saw-mill dog comprising the following essential elements, the upright or knee B, the slide-bar A, adjustably secured thereto and having the cylindrically-faced teeth at its rear and the ratchet-teeth upon its side, the sliding head E, having the mutilated cogged lever D to engage the teeth of the slide-bar A, and having the enlarged ended elongated bearing *d'* for the journal of the lever D, the locking mechanism consisting of the pawl F, pivoted to the sliding head, and the spring *g*, to hold said pawl into engagement with the ratchet-teeth of the slide-bar, said slide-bar carrying one of the timber-grasping dogs and the sliding head the other, substantially as shown and described.

6. The combination, in a saw-mill dog, of the slide-bar A, having the cylindrical rack-teeth *c* and ratchet-teeth *c'*, the slide-bar carrying one of the dogs G', the sliding head E, having the pivoted lever D to engage the teeth of the slide-bar, the spring-pawl-locking device to engage the ratchet-teeth, the notched dog G, adjustably seated in grooves in the sliding head, and the pivoted locking-lever H, to engage the notches of said dog and hold it against displacement, all substantially as shown and described.

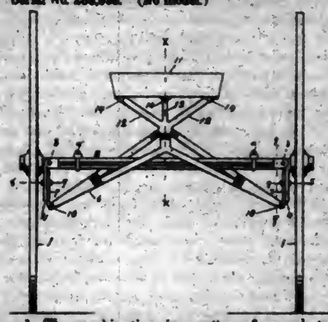
395,374. WHIP-SOCKET. WILLIAM WEBBER, Plymouth, County of Devon, England. Filed May 21, 1888. Serial No. 274,469. (No model.)

Claim.—1. In a whip-socket, the combination, with a tube for the whip-handle, provided with a bell-mouthed flange at its upper end and slots or apertures in its sides below the flange, of the revoluble rollers projecting through the said apertures in the upper end of the tube.

2. In a whip-socket, the combination, with a tube for the whip-handle, of an unyielding ring secured to the mouth of the tube, and

rollers of elastic material having holes of larger diameter than the portions of the said ring upon which they are journaled.

3. In a whip-socket, the combination, with a tube provided with slots at its upper end and a circumferential bulge formed in the metal between the said slots, of a ring supported by the said bulge, and rollers journaled on the ring and projecting through the slots.



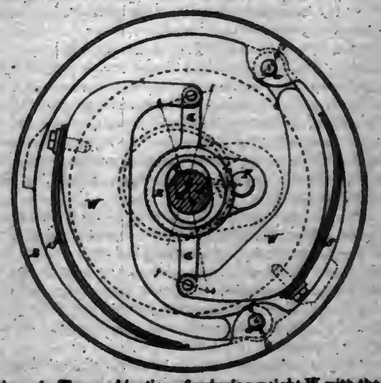
4. In a whip-socket, the combination, with a tube provided with slots at its upper end, of a ring secured to the tube between the slots, and rollers of elastic material having holes of larger diameter than the said ring upon which they are journaled.

5. In a whip-socket, the combination, with a tube having slots at its upper end and a circumferential bulge formed in the metal between the slots, of a ring having its ends butted together and held in position by the said bulge, and india-rubber rollers journaled upon the said ring and projecting through the slots.

6. In a whip-socket, the combination, with a tube provided with open-ended slots at its upper end, of a ring secured inside the tube between the slots, rollers projecting through the slots and journaled upon the said ring, and a collar secured to the top of the tube above the rollers.

7. In a whip-socket, the combination, with a tube provided with open-ended slots at its upper end, of a ring secured inside the tube between the slots, rollers journaled upon the ring and projecting through the slots, and a collar secured to the tube and provided with a bell-mouthed flange, and a circular shoulder resting upon the top edge of the tube.

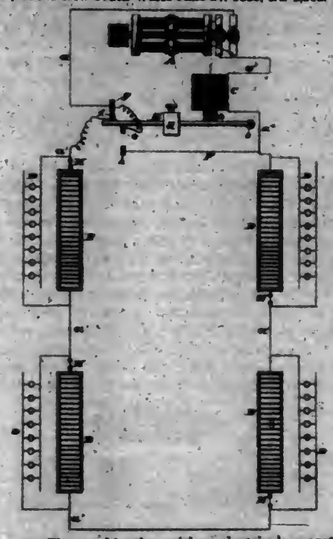
395,375. SULKY. CHARLES O. YALE, Rome, N. Y. Filed Oct. 17, 1888. Serial No. 288,308. (No model.)



Claim.—1. The combination, in a sulky, of an axle-tree jointed inside of the hubs, the outer jointed portions of the axle-tree having downwardly-projecting angles, and a brace flexibly connected to the downwardly-projecting angles, substantially as set forth.

2. The combination, in a sulky, of the jointed axle-tree, the outer jointed portions of the axle-tree provided with downwardly-projecting angles, and a vertically-adjustable brace pivoted to the downwardly-projecting angles, substantially as set forth.

3. The combination, in a sulky, of the jointed axle-tree, the outer jointed portion of the axle-tree provided with downwardly-projecting angles, a brace pivoted to the downwardly-projecting angles, and the horizontally-adjustable seat mounted on the brace, substantially as set forth.



395,376. CUT-OFF GOVERNOR. JOHN F. ALLEN, New York, N. Y. Filed Feb. 22, 1888. Serial No. 264,960. (No model.)

Claim.—1. The combination of swinging weight W with the connecting-rod G, one end of the latter turning upon arm E, the whole constituting a reverse toggle-joint for moving arm E, substantially as specified.

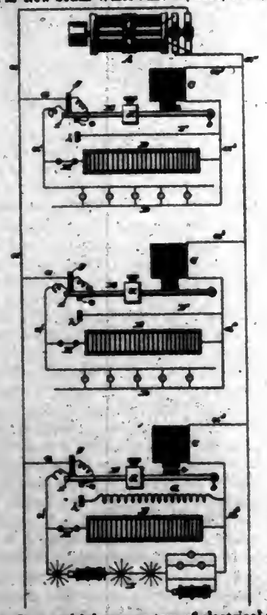
2. The combination of curved weight W, hinged to pulley B and connected through rod G with a rock-shaft, F, turning in the web of said pulley and supporting the eccentric C, with flat spring S, the spring being curved or rolled upon the outer surface of the weight, substantially as specified.

395,377. SECONDARY-BATTERY CHARGING. CHARLES F. BROWN, Cleveland, Ohio, assignor to the Brush Electric Company, same place. Original application filed June 13, 1888, Serial No. 64,082. Divided and this application filed Dec. 11, 1888. Serial No. 114,308. (No model.) Patented in England July 1, 1888, No. 3,106; in Belgium July 23, 1888, No. 84,839; in Germany July 26, 1888, No. 44,583; in France July 26, 1888, No 190,318; in Russia Aug. 5, 1888, No. 5,699; in Italy Sept. 30, 1888, No. 14,463; in Victoria Nov. 13, 1888, No. 3,344; in Cape of Good Hope Dec. 15, 1888, No. 11/121; in South Australia Dec. 20, 1888, No. 318; in Spain Feb. 1, 1889, No. 3,478; in Austria-Hungary Apr. 15, 1889, No. 3,804; in Portugal May 2, 1889, No. 841; in India May 8, 1889, No. 170/88, and in New South Wales June 27, 1888, No. 1,902.

Claim.—1. The combination, with an electrical generator, a main or charging circuit, and two or more secondary batteries included in the main or charging circuit in series, and a discharging or working circuit connected with each battery, of a switch constructed and arranged to switch all said batteries into the charging-circuit, and an electro-magnet included in the charging-circuit and adapted to actuate the switch and automatically and simultaneously switch all said batteries into the charging-circuit, substantially as set forth.

2. The combination, with an electrical generator, a main or charging circuit, and two or more secondary batteries included in the main or charging circuit in series, each of said batteries having a discharging or working circuit connected therewith, of a switch constructed and arranged to switch all said batteries out of the charging-circuit and an electro-magnet included in the charging-circuit and adapted to actuate the switch and automatically and simultaneously switch all said batteries out of the charging-circuit, substantially as set forth.

3. The combination, with an electrical generator, a main or charging circuit, and two or more secondary batteries included in the main or charging circuit in series, each secondary battery being provided with a discharging or working circuit, of a switch constructed and adapted to switch said batteries into and out of the charging-circuit, and a circuit around all of said batteries adapted to be opened and closed by said switch, and an electro-magnet constructed and arranged to actuate said switch and automatically and simultaneously switch said batteries and discharging-circuits out of the charging-circuit when the current stops or becomes sufficiently reduced and establish a circuit for the charging-current around all said batteries, substantially as set forth.



4. The combination, with an electrical generator, a main or charging circuit, and two or more secondary batteries included in the main or charging circuit in series, each secondary battery being provided with a discharging or working circuit, and a circuit around all said batteries adapted to be opened and closed by a switch, of a switch constructed and arranged to open and close a circuit around said batteries and an electro-magnet included in the charging-circuit and adapted

to actuate said switch and automatically establish a closed circuit around said batteries and their discharging-circuits when the charging-current stops or becomes sufficiently reduced, substantially as set forth.

5. The combination, with an electrical generator, a main or charging circuit, and two or more secondary batteries included in the main or charging circuit in series, each secondary battery being provided with a discharging or working circuit, of a circuit including a resistance around all said batteries, a switch for opening and closing the resistance-circuit, and an electro-magnet constructed and arranged to actuate the switch and automatically and simultaneously switch all said batteries out of the charging-circuits and establish a circuit, including the resistance, around said batteries, substantially as set forth.

6. In a system embracing a suitable electric generator, the combination, with a main or charging circuit, two or more secondary batteries included in the main or charging circuit in series, a discharging-circuit connected with each battery, and a circuit around said batteries adapted to be opened and closed by a switch, of a switch constructed and arranged to switch all said batteries into and out of the charging-circuit and to open and close a circuit around all said batteries, and an electro-magnet included in the charging-circuit and adapted to actuate the switch and automatically and simultaneously switch all said batteries out of the charging-circuit and establish a circuit around all said batteries when the charging-current ceases or becomes sufficiently reduced, and for opening said circuit and automatically and simultaneously switching the batteries into the charging-circuit when the charging-current is re-established, substantially as set forth.

395,878. SECONDARY-BATTERY CHARGING. CHARLES F. BRUSH, Cleveland, Ohio, assignor to the Brush Electric Company, same place. Original application filed June 13, 1883, Serial No. 64,083. Divided and this application filed Dec. 11, 1883. Serial No. 114,309. (No model.) Patented in England July 1, 1882, No. 3,108; in Belgium July 22, 1882, No. 58,889; in Germany July 25, 1882, No. 24,583; in France July 26, 1882, No. 150,318; in Russia Aug. 5, 1882, No. 5,690; in Italy Sept. 30, 1882, No. 14,453; in Victoria Nov. 13, 1882, No. 3,244; in Cape of Good Hope Dec. 15, 1882, No. 11/131; in South Australia Dec. 20, 1882, No. 318; in Spain Feb. 1, 1883, No. 3,478; in Austria-Hungary Apr. 15, 1883, No. 3,604; in Portugal May 2, 1883, No. 841; in India May 3, 1883, No. 170/82, and in New South Wales June 27, 1883, No. 1,362.

Claim.—1. In a multiple-arc system of electrical distribution, the combination, with an electric generator, a main or charging circuit, and a secondary battery included in a multiple-arc branch of the main or charging circuit, of a switch for electrically connecting and disconnecting the secondary battery and charging-circuit, and an electro-magnet for automatically actuating the switch and switching the multiple-arc branch and the secondary battery included therein into the charging-circuit, substantially as set forth.

2. In a multiple-arc system of electrical distribution, the combination, with an electrical generator, a main or charging circuit, and a secondary battery included in a multiple-arc branch of the main or charging circuit, of a switch for electrically connecting and disconnecting the secondary battery and charging-circuit, and an electro-magnet for automatically actuating the switch and switching the multiple-arc branch and secondary battery included therein out of the charging-circuit, substantially as set forth.

3. In a multiple-arc system of electrical distribution, the combination, with an electrical generator, a main or charging circuit, and a secondary battery included in a multiple-arc branch of the main or charging circuit, of a switch constructed and adapted to electrically connect and disconnect the secondary battery and charging-circuit, and an electro-magnet for actuating the switch and automatically switching the multiple-arc branch and secondary battery included therein into and out of the charging-circuit, substantially as set forth.

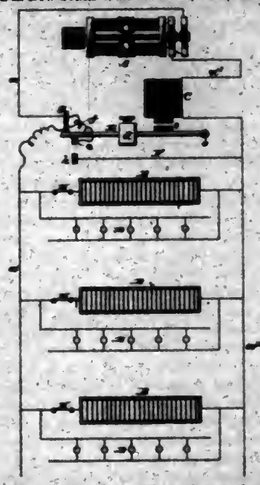
4. In a multiple-arc system of electrical distribution, the combination, with an electrical generator, a main or charging circuit, and a secondary battery included in a multiple-arc branch of the main or charging circuit, of a switch for electrically connecting and disconnecting the secondary battery and charging-circuit, and an electro-magnet included in the charging-circuit of the battery and adapted to actuate the switch and automatically switch the secondary battery into and out of the charging-circuit while the charging-current is established therein, substantially as set forth.

5. In a multiple-arc system of electrical distribution, the combination, with an electrical generator, a main or charging circuit, and a secondary battery included in a multiple-arc branch of the main or charging circuit, of a switch for electrically connecting and disconnecting the secondary battery and main or charging circuit, and an electro-magnet included in the charging-circuit of the battery and adapted to actuate the switch and automatically switch the secondary battery out of the charging-circuit when the charging-current stops or becomes sufficiently reduced, substantially as set forth.

6. In a multiple-arc system of electrical distribution, the combination, with an electrical generator, a main or charging circuit, and a secondary battery included in a multiple-arc branch of the main or charging circuit, of a switch constructed and adapted to electrically connect and disconnect the secondary battery and charging-circuit, and a circuit around the battery adapted to be opened and closed by said switch, and an electro-magnet constructed and adapted to actuate the switch and automatically switch the secondary battery out of the charging-circuit when the charging-current stops or becomes sufficiently reduced and establish a circuit for the charging-current around the secondary battery, substantially as set forth.

7. In a multiple-arc system of electrical distribution, the combination, with an electrical generator, a main or charging circuit, and a secondary battery included in a multiple-arc branch of the main or charging circuit, of a switch for electrically connecting and disconnecting the secondary battery and charging-circuit, and an electro-magnet included in the charging-circuit of the battery and adapted to actuate the switch and automatically switch the battery and its multiple-arc branch circuit out of the charging-circuit while the charging-current is acting therein, substantially as set forth.

8. In a multiple-arc system of electrical distribution, the combination, with an electrical generator, a main or charging circuit, a secondary battery included in a multiple-arc branch of the main or charging circuit, and translating devices included in the discharging or working circuit of the secondary battery, of a switch and an electro-magnet included in the charging-circuit of the battery and adapted to automatically establish a closed circuit around the battery and its discharging-circuit when the charging-current stops or becomes sufficiently reduced, substantially as set forth.



9. In a multiple-arc system of electrical distribution, the combination, with an electrical generator, a main or charging circuit, and a secondary battery included in a multiple-arc branch of the main or charging circuit, of a resistance in a circuit around the battery, a switch constructed and adapted to electrically connect and disconnect the battery and charging-circuit, and a circuit including a resistance around the battery controlled by said switch, and an electro-magnet constructed and adapted to actuate the switch and automatically switch the battery out of the charging-circuit and automatically establish a circuit including the resistance around the battery, substantially as set forth.

10. In a multiple-arc system of electrical distribution, the combination, with an electrical generator, a main or charging circuit, and two or more secondary batteries, each included in an independent multiple-arc branch of the main or charging circuit, of a switch and electro-magnet associated with each multiple-arc branch and constructed and adapted to automatically and independently switch the secondary batteries included therein into the charging-circuit, substantially as set forth.

11. In a multiple-arc system of electrical distribution, the combination, with an electrical generator, a main or charging circuit, and two or more secondary batteries, each included in an independent multiple-arc branch of the main or charging circuit, of a switch and electro-magnet associated with each multiple-arc branch and constructed and adapted to automatically and independently switch the secondary batteries included therein out of the charging-circuit, substantially as set forth.

12. In a multiple-arc system of electrical distribution, the combination, with an electrical generator, a main or charging circuit, and two or more secondary batteries, each included in an independent multiple-arc branch of the main or charging circuit, of a switch, an electro-magnet included in the charging-circuit of each battery, and a shunt-circuit associated with each battery, said parts being constructed and adapted to automatically and independently switch each of said batteries out of the charging-circuit and establish a circuit around each battery when the charging-current ceases or becomes sufficiently reduced, and to automatically open said circuits around the batteries and switch the latter into the charging-circuit when the charging-current is re-established, substantially as set forth.

395,879. SECONDARY-BATTERY CHARGING. CHARLES F. BRUSH, Cleveland, Ohio, assignor to the Brush Electric Company, same place. Original application filed June 13, 1883, Serial No. 64,083. Divided and this application filed Dec. 11, 1883. Serial No. 114,310. (No model.) Patented in England July 1, 1882, No. 3,108; in Belgium July 22, 1882, No. 58,889; in Germany July 25, 1882, No. 24,583; in France July 26, 1882, No. 150,318; in Russia Aug. 5, 1882, No. 5,690; in Italy Sept. 30, 1882, No. 14,453; in Victoria Nov. 13, 1882, No. 3,244; in Cape of Good Hope Dec. 15, 1882, No. 11/131; in South Australia Dec. 20, 1882, No. 318; in Spain Feb. 1, 1883, No. 3,478; in Austria-Hungary Apr. 15, 1883, No. 3,604; in Portugal May 2, 1883, No. 841; in India May 3, 1883, No. 170/82, and in New South Wales June 27, 1883, No. 1,362.

Claim.—1. The combination, with an electrical generator, a main or charging circuit, and two or more secondary batteries, each included in an independent multiple-arc branch circuit of the main or charging circuit, each secondary battery having a discharging or working circuit connected therewith, of a switch for electrically connecting and disconnecting all of said secondary batteries and the main or charging circuit, and an electro-magnet constructed and arranged to actuate the switch and automatically and simultaneously switch all said batteries into the charging-circuit, substantially as set forth.

2. The combination, with an electrical generator, a main or charging circuit, and two or more secondary batteries, each included in an independent multiple-arc branch circuit of the main or charging circuit, each secondary battery having a discharging or working circuit connected therewith, of a switch for electrically connecting and disconnecting all of said secondary batteries and the main or charging circuit, and an electro-magnet constructed and arranged to actuate the switch and automatically and simultaneously switch all said batteries out of the charging-circuit, substantially as set forth.

3. The combination, with an electrical generator, a main or charging circuit, and two or more secondary batteries, each included in an independent multiple-arc branch circuit of the main or charging circuit, each secondary battery having a discharging or working circuit, of a switch for electrically connecting and disconnecting all said batteries and the main or charging circuit, and a circuit around all said batteries adapted to be opened and closed by said switch, and an electro-magnet included in the charging-circuit and arranged to actuate said switch and automatically and simultaneously switch all said batteries out of the charging-circuit when the current stops or becomes sufficiently reduced and establish a circuit for the charging-current around all said batteries, substantially as set forth.

4. The combination, with an electrical generator, a main or charging circuit, and two or more secondary batteries, each included in an independent multiple-arc branch of the main or charging circuit, each secondary battery having a discharging or working circuit, of a circuit adapted to be closed around all said batteries, and an electro-magnet included in the charging-circuit and arranged to actuate said switch and automatically establish a closed circuit for the charging-current around all said batteries when the charging-current stops or becomes sufficiently reduced, substantially as set forth.

5. The combination, with an electrical generator, a main or charging circuit, and two or more secondary batteries, each included in an independent multiple-arc branch of the main or charging circuit, each secondary battery having a discharging or working circuit, of a switch constructed and arranged to electrically connect and disconnect the batteries and the charging-circuit, a short circuit including a resistance around all said batteries adapted to be opened and controlled by said switch, and an electro-magnet constructed and arranged to actuate said switch and automatically and simultaneously switch all said batteries out of the charging-circuit and establish a circuit including the resistance around all said batteries, substantially as set forth.

6. A system embracing a suitable electric generator, a main or charging circuit, and two or more secondary batteries, each included in an independent multiple-arc branch of the main or charging circuit, each battery being provided with a discharging or working circuit, of a short circuit adapted to be opened and closed, and a switch included in the charging-circuit and arranged to simultaneously switch all said batteries into and out of the charging-circuit, and an electro-magnet constructed and arranged to actuate the switch and automatically and simultaneously switch all of the batteries out of the charging-circuit and establish a circuit around said batteries when the charging-current ceases or becomes sufficiently reduced, and for opening said short circuit and switching all of said batteries into the charging-circuit when the charging-current is re-established, substantially as set forth.

395,880. PRESSER-BAR. HENRY F. CAMPBELL, Malden, Mass. Filed Mar. 27, 1888. Serial No. 268,623. (No model.)

Claim.—The presser-bar provided with the lip a^3 and grooved at its under side, combined with the roller a^2, and boxes a^4, fitted in the said groove, and means to adjust said boxes and roller vertically independently of the presser-bar, whereby the position of the roller with relation to the presser-bar may be changed, as and for the purpose specified.

395,881. SUPPLEMENTAL BEARER FOR COFFIN OR GASKET STOOLS. BENJAMIN G. CARLES, Cleveland, Ohio. Filed July 2, 1888. Serial No. 278,044. (No model.)

Claim.—1. The combination, with a casket-stool having a main bearer, of an elevated supplemental bearer and interposed standards for supporting the elevated bearer above the main bearer, substantially as and for the purposes specified.

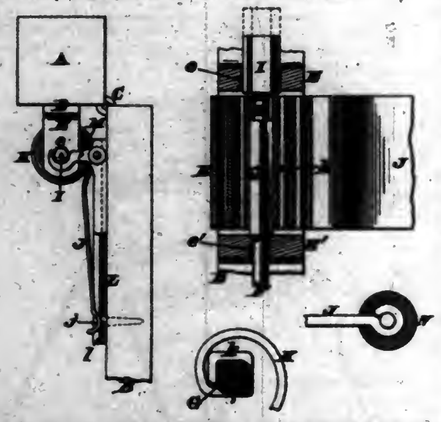
2. The combination, with a casket-stool having a main bearer provided with vertical pegs, of an elevated detachable supplemental bearer and interposed sleeve or tubular standards for supporting the elevated bearer above the main bearer, substantially as and for the purposes specified.

3. In a coffin or casket stool, the combination, with the main bearer, of vertical jointed pegs and a supplemental bearer having sleeve-standards which fit over the vertical jointed pegs of the main bearer, substantially as and for the purposes specified.

4. In a coffin or casket stool, the combination, with the main bearer having detachable pegs, of a supplemental bearer having sleeve or tubular standards which fit on the pegs of the main bearer, substantially as and for the purposes specified.

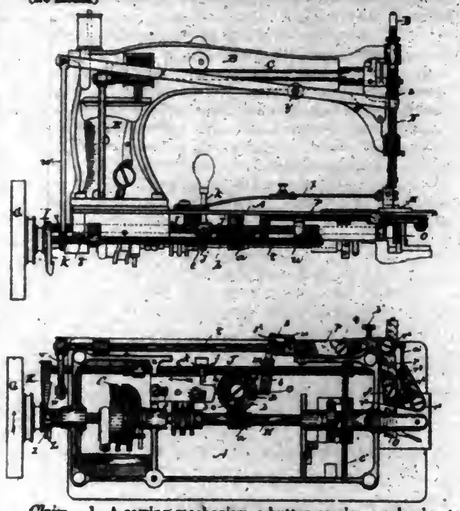
5. In a coffin or casket stool, the combination, with a bearer having vertical jointed pegs, of a supplemental bearer provided with detachable sleeve or tubular standards which fit over the jointed pegs of the main bearer, substantially as and for the purposes specified.

6. A folding supplemental bearer for coffin or casket stools, provided with detachable sleeve or tubular standards adapted to fit on pegs on the main bearer of a coffin or casket stool, substantially as and for the purposes specified.



395,882. AUTOMATIC DAMPER. GEORGE H. CROWELL, Berlin Falls, N. H. Filed Apr. 4, 1888. Serial No. 269,563. (No model.)

Claim.—The combination, with the casing A, having the studs A' and slots *a*, of the reciprocating gridiron B, having openings *b*, straight slots *b'* and *b²*, and eccentric slot *b³*, the shaft *d*, passing through the slot *b²*, and carrying disk D', provided with pin *d'*, engaging with slot *b³*, the reciprocating damper C, having the openings *c* and superposed upon the gridiron B, the thermostatic bar F, and the bell-crank lever I, engaging with the damper C and connected with the bar F, all combined and operating substantially as and for the purpose set forth.

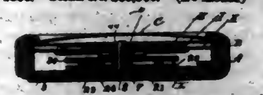


395,883. DOOR-SPRING. JOHN H. DAVIS, Covington, Ky. Filed May 14, 1888. Serial No. 273,854. (No model.)

Brief.—To the bearing-plate for the free end of the spring is secured a hook or fastener, which is adapted, when the door is thrown open, to engage with the head of the tension-adjusting pin of the spring, and thereby securely hold the door in an open position

Claim.—In combination with a spring having its free end in contact with a bearing-plate secured to a door or gate and its opposite end coiled around a tension-adjusting pin attached to a plate projecting from a post or frame, a swinging fastener coupled to said bearing-plate and engaged with the head of said pin when the door or gate is thrown wide open, as herein described.

395,884. BUTTON-SEWING MACHINE. LAWRENCE J. DEMOLL, Somerville, Mass., assignor, by mesne assignments, to the Union Button Sewing Machine Company. Filed Sept. 4, 1886. Serial No. 212,677. (No model.)



Claim.—1. A sewing mechanism, a button-carrier, mechanism to reciprocate it to present first one hole of a button and then another to the needle, locking devices consisting of a lever, *l*, a lever, *p*, and links or levers intermediate of the lever *p* and button-carrier to hold the latter in one reciprocating position, a spring to move the button-carrier to a second reciprocating position, a rotary shaft, a worm thereon, a wheel engaging and operating said worm, and a cam-piece or wiper on said wheel, said cam-piece being constructed and arranged to engage the lever *l*, whereby said lever may be moved to release the locking devices and permit the spring to move the button-carrier into the second-mentioned position, substantially as hereinbefore set forth.

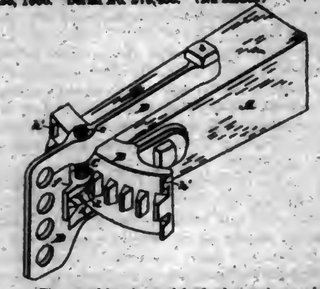
2. In a button-sewing machine, the main shaft, means to drive the same, a clutch mechanism adapted to be operated to connect the driving means with the main shaft and disconnect it therefrom, a worm on the main shaft, a gear provided with a cam-piece or wiper engaged with and operated by said worm, a shipper-rod provided with devices connected with the clutch mechanism to hold the same out of operative position and allow the driving means to become connected with the main shaft, a shipper lever or handle, *k*, on said rod, a spring to rock said shipper-rod to cause its connected devices to operate said clutch mechanism to disconnect the driving means from the main shaft, and a slide, *c*, constructed and arranged to engage said shipper lever or handle *k* to lock or hold said shipper-rod and its connected devices against the tension of said spring and out of operative position with respect to the driving means, said slide being also arranged with respect to the cam-piece or wiper on said worm-wheel to be engaged thereby and be moved to permit the shipper lever or handle to be released or unlocked, and its connected devices to be moved by said spring into operative position, all combined substantially as hereinbefore set forth.

3. The sewing mechanism, a button-carrier and mechanism to move it to present first one hole of a button and then another to the needle, locking devices to hold the button-carrier in one reciprocating position, a spring to move the button-carrier into a second reciprocating position, a lever pivoted to the machine constructed and arranged to engage said button-carrier to raise the same, a rod provided with a finger constructed to engage said locking means and connected devices to move the same into the first-mentioned position, and a link connecting said rod with said lever, whereby when the latter is operated to raise the button-carrier said rod will be rocked and said finger operated, as before stated, all combined substantially as described.

395,885. CALENDAR. WILLIAM J. REECE, Cortland, N. Y. Filed Sept. 15, 1888. Serial No. 285,500. (No model.)

Claim.—1. The combination, in a calendar, of a base-plate provided with a sectoral slot, a handle, constructed as described, to reciprocate in said slot, ratchet-wheels mounted concentric to said slot and connected to indicating-plates, and pawls on the handle to engage said ratchets, as set forth.

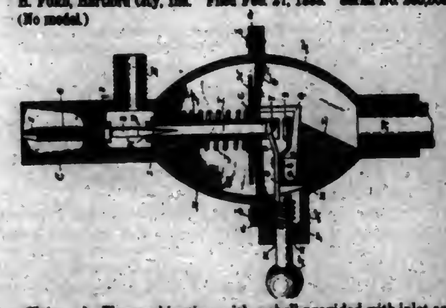
2. In a calendar, a rotating disk bearing numbers and a ratchet connected thereto, a disk bearing names of days connected to a ratchet having its teeth facing in opposite direction from the other ratchets, and a reciprocating handle having pawls to engage all the ratchets when moving in one or the other direction.



3. The combination, in a calendar, of a ratchet connected to an indicating-plate and having a notch in its periphery, a curved guide-pawl having a tooth to enter said notch, a reciprocating handle having a pivoted pawl resting against the guide-pawl, and a ratchet-wheel in position to be acted on by said last-mentioned pawl, substantially as described.

4. In a calendar, a ratchet and a month-indicating disk connected thereto, a second ratchet and a plate bearing the numbers of the days connected thereto, a dog in one of the ratchets, and a shifting-piece connected with the other ratchet controlled by a switch in the supporting-plate, whereby the two ratchets may turn together when the shifting-piece is in engagement with the dog, the elements in combination as set forth.

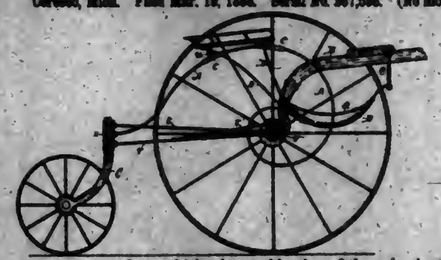
5. In a calendar, the combination of a month-indicating disk and a ratchet mechanism to rotate the same in one direction, a plate bearing numbers and a ratchet for moving in the opposite direction, a dog connected to one ratchet and a shifting-piece to the other, a switch controlling said shifting-piece, and a four-toothed wheel bearing on the shifting-piece, all substantially as described, whereby the ratchets are coupled together at certain times under the influence of the dog and shifting-piece, as set forth.



6. In a calendar, the combination of a ratchet and a wheel carrying the names of days connected thereto, a ratchet having a different number of teeth and a number-indicator connected thereto, a reciprocating handle and separate pawls carried thereby to engage both ratchets, and a bearer against which one of the pawls rests during a part of its movement, whereby the ratchets are moved independently and to different distances by the same movement of the handle, as set forth.

395,886. CLEVIS. OLIA A. REED, Canton, Ohio, assignor to the Universal Plow Company, same place. Filed Nov. 2, 1887. Renewed June 26, 1888. Serial No. 278,463. (No model.)

Claim.—The combination, with the beam A, provided with the crown-head B, of the draft link or bar D, pivotally attached to the beam A, the drop catch or lock provided with the pin C, projection *d*, shoulders *g*, side flanges, *h*, and recess *f*, the teeth *e*, and bar D, substantially as and for the purpose specified.

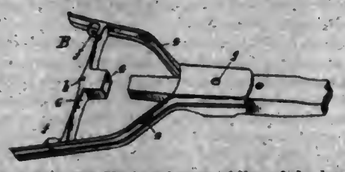


395,887. AUTOMATIC GAS REGULATOR AND CUT-OFF. EDWIN H. FORD, Hartford City, Ind. Filed Feb. 27, 1888. Serial No. 265,503. (No model.)

Claim.—1. The combination, with a shell provided with inlet and outlet pipes for the gas, and a tube-seat, as described, of a flexible diaphragm, a spring-pressed reciprocating tube secured to the diaphragm, an adjustable valve with which said tube coacts, a reciprocating spring-actuated arm, and a spring-pressed lever adapted to hold said arm out of contact with the tube while pressure is on the diaphragm, and also to release it and allow it to engage with the tube and seat it when pressure is off, substantially as set forth.

2. In an automatic regulator and cut-off, as described, the combination, with the adjustable valve, the flexible diaphragm, the spring-pressed reciprocating tube attached to the diaphragm, a collar and lugs on said tube, a supporting-plate between the collar and diaphragm, a washer below the diaphragm and secured to the tube, and a tube-seat, of a reciprocating spring-actuated arm having upwardly-inclined fingers for engaging with the lugs on the tube to press the tube to its seat, and a spring-pressed lever for holding the arm out of contact with the tube when pressure is on the diaphragm, and also for releasing the arm when pressure is off, substantially as described.

395,888. THREE-WHEELED VEHICLE. WILLIAM J. PRAEGER, Corunna, Mich. Filed Mar. 19, 1888. Serial No. 267,593. (No model.)



Claim.—1. In a vehicle, the combination of the axle, the thills shackled thereto, a body or seat-bars, the springs bowing from the axle upward and rearward and supporting the body or seat, thence extending rearward and downward, a thimble attached to the ends of said springs, rods attached to said thimble and to the axle, and a bar bearing a wheel swiveled in said thimble, substantially as set forth.

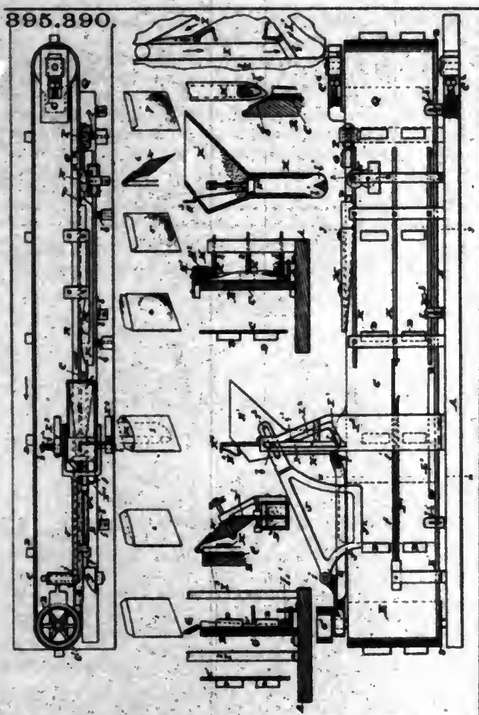
2. The combination of the axle, the springs, the third wheel, and the body flexibly hung at the forward end and adjustably supported at the rear end by the springs, substantially as set forth.

3. The combination of the body flexibly hung at the forward end, the upwardly-bowed springs having the re-enforced portions with series of holes, and the bolsters attached beneath the seat to the body and adjustably connected at their ends with said holes, substantially as set forth.

395,889. DRAW-IRON FOR WAGONS. JACOB GROH, Cochocton, Ohio. Filed Sept. 5, 1888. Serial No. 284,603. (No model.)

Claim.—1. A metallic draw-iron consisting of the bound-extension *a*, the cross-bar *c*, connecting the rear ends thereof, the sockets *b c*, adapted to receive the tongue, and provided with means for securing such tongue and the hammer-strap, and the bearings *f* to the rear of said cross-bar, adapted to receive the pivot-rod, the parts being arranged and combined substantially as described.

2. The combination, with the bounds, of the draw-irons secured to the forward ends thereof and formed with cross-bar *c*, sockets *c* and *b*, and with bearings *f* to the rear of said cross-bar, the tongue supported by said sockets with its rear end forward of the said bearings, and the pivot-rod C, connecting said bounds and passing through said bearings independent of the tongue, substantially as shown and described.



395,890. BAG-FILLING MACHINE. HARRY D. HAMMERSLEY, Bristol, assignor of one-third to Barnet Landreth, Mountain, Pa. Filed May 9, 1887. Serial No. 237,526. (No model.)

Claim.—1. In a bag-filling machine, a support for the bag, in combination with a reciprocating filling-nozzle made hollow and with discharge-openings at or near its bottom, and suitable means, substantially as described, to reciprocate said nozzle to cause it to enter the mouth of the bag.

2. In a bag-filling machine, a support for the bag, in combination with a reciprocating filling-nozzle made hollow and with discharge-openings at or near its bottom and with a hopper at the top, a valve to control the passage of material from the hopper to the nozzle, and suitable means, substantially as described, to reciprocate said nozzle to cause it to enter the mouth of the bag.

3. In a bag-filling machine, a traveling feed for the bags, in combination with a vertically and horizontally reciprocating filling-nozzle,

395,390.

and means, substantially as described, to operate said nozzle to cause it to enter the bag before discharging its contents.

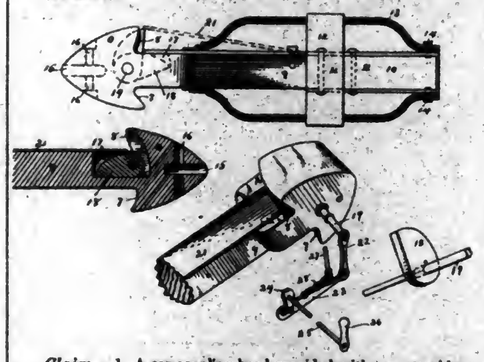
4. In a bag-filling machine, a traveling feed for the bags, in combination with a vertically and horizontally reciprocating filling-nozzle, means, substantially as described, to operate said nozzle to cause it to enter the bag before discharging its contents, folding and pasting devices, substantially as set forth, to fold the flap of the bag and paste it down tight after being filled.

5. In a bag-filling machine, the combination of a magazine-feed for the bags, a vertically and horizontally reciprocating filling-nozzle adapted to enter, fill, and feed the bags in succession, means, substantially as described, to operate the nozzle, an endless feed-band for the bags to which they are delivered by the nozzle, and suitable pasting and sealing devices, substantially as set forth, for pasting down the flaps of the bags while in the custody of the endless feed-band.

6. The feeding device for a bag-filling machine, consisting of a magazine-feed for the bags and a vertically and horizontally reciprocating feeding-nozzle which enters the mouth of the bag and draws it from in front of the other bags, and suitable mechanism, substantially as described, to reciprocate said feeding-nozzle.

7. The combination of the nozzle H, having hopper H' at the top, the valve H^3, cord H^3, connecting with said valve at one end and fixed at the other, means, substantially as set forth, for reciprocating said nozzle and hopper, and a suitable support and feed for the bags normally below the nozzle when the latter is raised.

8. The combination of a reciprocating filling-nozzle made hollow and having discharge-openings at or near its bottom, a feeding device, substantially as described, to pass the bags in succession into operative position under the nozzle, and an endless conveying device, substantially as described, provided with mechanism, substantially as set out, to automatically and simultaneously feed the bags and reciprocate the nozzle synchronously, whereby the nozzle shall enter each bag in succession.



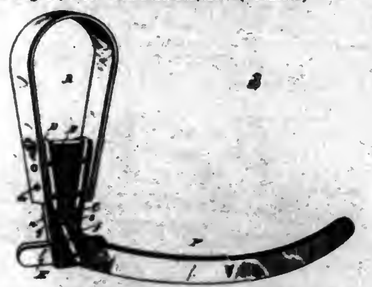
9. The combination of a reciprocating filling-nozzle made hollow and having discharge-openings at or near its bottom, a feeding device, substantially as described, to pass the bags in succession into operative position under the nozzle, and automatic mechanism, substantially as set out, to simultaneously feed the bags and reciprocate the nozzle synchronously, whereby the nozzle shall enter each bag in succession, and an adjustable guide for the bag to adjust it vertically with relation to the nozzle.

10. The combination of the feed-box S with its follower S' and guide G, the vertically-reciprocating nozzle H, horizontally-reciprocating frame J^4, carrying said nozzle, guides I, I', I^2, and I^4, and a pin or roller on the nozzle to run upon said guide, substantially as and for the purpose specified.

11. The combination of the feed-box S with its follower S' and guide G, the vertically-reciprocating nozzle H, horizontally-reciprocating frame J^4, carrying said nozzle, a dog, J', on said frame, guides I, I', I^2, and I^4, a pin or roller on the nozzle to run upon said guides, an endless band, C, having projections D, adapted to catch the dog J' to reciprocate the frame in one direction, and a weight or its equivalent to reciprocate the frame in the other direction, substantially as and for the purpose specified.

12. The combination of the feed-box S with its follower S' and guide G, the vertically-reciprocating nozzle H, horizontally-reciprocating frame J^4, carrying said nozzle, guides I, I', I^2, and I^4, a pin or roller on the nozzle to run upon said guides, and vertically-adjustable guide L', substantially as and for the purpose specified.

395,391. CAR-COUPLING. STARLING F. HEATH and HAYDEN A. THAYER, Fitchburg, Mass. Filed Dec. 15, 1887. Serial No. 257,967. (No model.)

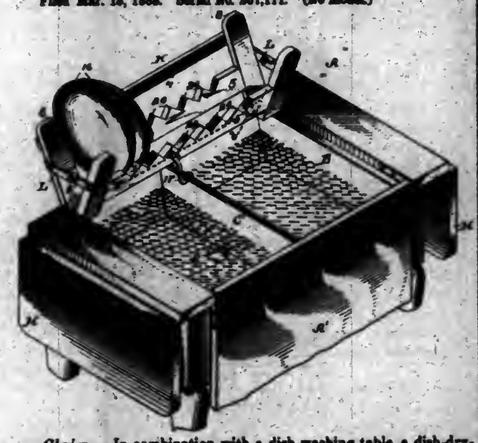


Claim.—1. A car-coupling head provided with two attaching-jaws and with a socket in the rear of one of said jaws, in combination with a cam located in said socket on a shaft extending transversely through the coupling-head, and a flat spring secured to the extension of the coupling-head and co-operating with the cam, substantially as set forth.

2. A pair of car-coupling heads, each provided with two attaching-jaws and with a socket in the rear of one of said jaws, in combination with cams located in said sockets on shafts extending transversely through the coupling-heads, a flat spring secured to the extension of each coupling-head, and appliances connected to said transverse shafts for actuating the same from the side or roof of the car, substantially as set forth.

3. The combination, with a pair of coupling-heads, each provided with two attaching-jaws and with a socket in the rear of one of said jaws, in combination with releasing-cams located in said sockets on shafts extending transversely through the coupling-heads, and appliances for operating said shafts, consisting of bar 22, rod 23, and rod and chain 27 and 28, substantially as set forth.

395,392. ANIMAL-POKE. JOHN D. HIGGINS, Mount Liberty, Ohio. Filed Aug. 13, 1888. Serial No. 282,629. (No model.)

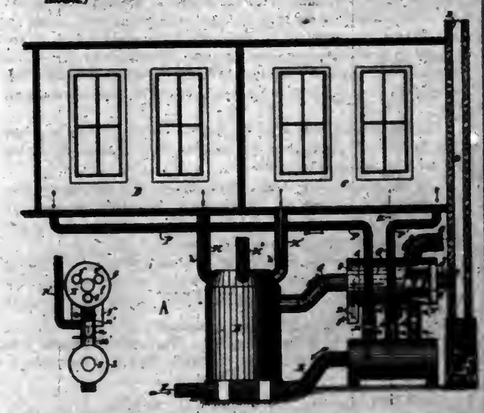


Claim.—1. The combination, with the yoke and a bolt passed therethrough, of a carrier fitting neatly within the yoke, hinged at its upper end on said bolt, and provided at its lower end with a breast-board, and a stale hinged at the upper edge of its inner or rear end to said carrier, the rear end of the stale resting normally against the carrier, substantially as described.

2. The combination, with the yoke and a bolt passed therethrough, of a carrier hinged at its upper end on said bolt and provided at its lower end with a breast-board, and a stale having a diagonally-cut inner end hinged at its upper edge to the said carrier, substantially as described.

3. The combination, with the yoke and a bolt passed through it, of a carrier fitting neatly within the yoke, hinged at its upper end on said bolt, and provided at its lower end with a breast-board, a stale having a diagonally-cut inner or rear end provided at said end on each side with a perforated metallic hinge-strip, the perforations in said strips being above the upper edge of the stale and a staple passed through the hinge-strips and secured in the carrier, the carrier being grooved to permit the free passage of the projecting ends of said strips in folding up the stale, substantially as described.

395,393. DISH-DRAINER. ISAAC HOLSHARK, Kansas City, Kans. Filed Mar. 12, 1888. Serial No. 267,111. (No model.)



Claim.—In combination with a dish-washing table, a dish-drying rack hinged thereto, said rack being composed of a pair of hinged frames having their free ends provided with toggle-links and held in an upright position by means of a supporting-hook, substantially as described.

395,394. ELASTIC COMPOSITION. JOHN HUNTER, South Melbourne, near Melbourne, Victoria. Filed June 26, 1888. Serial No. 278,263. (No specimens.) Patented in Victoria Mar. 22, 1887, No. 4,511.

Claim.—An improved elastic compound consisting in the combination of black-jack, being the refuse of stearine-stills, with slaked lime, in or about the proportions substantially as described.

395,395. MEANS FOR HEATING AND VENTILATING BUILDINGS. EDWIN T. JOHNSON, Minneapolis, Minn., assignor to Sexton & Phillips, same place. Filed Feb. 9, 1888. Serial No. 263,551. (No model.)

Claim.—1. The combination, with a hot-air furnace having hot-air flues to the various rooms of a building, of an air-heating receptacle or draft-chamber inclosing the exit-flue of said furnace and having a foul-air outlet, an air-receptacle outside said furnace and communicating with the same, independent pipes connecting said outside air-receptacle and draft-chamber and provided each with a pair of dampers, and air-outlet ducts from the various rooms to said connecting-pipes, uniting each with its respective pipe at a point between said dampers, substantially as described.

2. The combination, with a hot-air furnace having hot-air flues to the various rooms of a building, of an independent air-heating receptacle or draft-chamber having a foul-air outlet, independent air-outlet ducts from the various rooms, each having a connection to said draft-chamber and a connection to said furnace, and dampers in said connections for throwing any and all of said ducts into communication with said draft-receptacle or with said furnace at will, substantially as described.

3. The combination, with a hot-air furnace having hot-air flues to the various rooms of a building, of an independent air-heating receptacle or draft-chamber having a foul-air outlet, an air-receptacle in communication with said furnace and sets of independent pipes, corresponding to the number of rooms, connecting said receptacles and provided each with a pair of dampers, and independent air-outlet ducts from the various rooms to said connecting-pipes, uniting each with its respective pipes at a point between said dampers, substantially as described

395,396. THILL-COUPLING. WALTER KETCH, North Attleborough, Mass. Filed Aug. 2, 1888. Serial No. 281,885. (No model.)

Claim.—1. In a thill-coupling, a clip having projecting ear-plates provided with vertical slots and a clip-plate extending beneath said ear-plates, in combination with a shaft vertically movable in said slots, on which shaft the thill is journaled, a barrel embracing said shaft, having a stud extending downwardly through said clip-plate, and a nut fitting on said stud beneath said clip-plate.

2. In a thill-coupling, a clip having projecting ear-plates provided with vertical slots and a clip-plate extending beneath said ear-plates, in combination with a shaft vertically movable in said slots, on which shaft the thill is journaled, a barrel embracing said shaft, having a stud extending downwardly through said clip-plate, a nut fitting on said stud beneath said clip-plate, and an elastic block interposed between said barrel and said clip-plate.

3. In a thill-coupling, a clip having projecting ear-plates provided with vertical slots and a clip-plate extending beneath said ear-plates, in combination with a shaft vertically movable in said slots, a thill having projecting cheek-plates journaled on said shaft between said ear-plates, a barrel embracing said shaft between said cheek-plates, a stud formed on said barrel extending downwardly through said clip-plate, a tightening and securing nut fitting on said stud beneath said clip-plate, an elastic block interposed between said barrel and said clip-plate, and elastic pieces between said cheek and ear plates.

395,397. GRATE. JOHN W. KEYES, PEKIN, Ill. Filed Jan. 24, 1888. Serial No. 261,742. (No model.)

Claim.—1. In a transversely extensible and folding grate, the combination of a part, r, having a longitudinal bar, q, and a head provided with openings x, and a part, r', having a longitudinal bar, q', carrying transverse fingers p', extending through the openings x, and means, substantially as described, for clamping together the parts r and r' and supporting the grate, substantially as set forth.

2. A grate formed in two parts, r and r', adjusted together to adapt them to be extended and folded transversely with reference to each other, in combination with a journal device, B, for supporting the grate at each end and clamping the parts r and r' together, comprising a journal, n, and a bearing, m, connected with the journal and provided with a lug, l, and means, substantially as described, for securing the device B in place, substantially as set forth.

3. A grate formed in two parts, r and r', adjusted together to adapt them to be extended and folded transversely with reference to

each other, in combination with a journal device, B, for supporting the parts *r* and *r'* together, comprising a journal, *n*, a bearing, *m*, connected with the journal and provided with a lug, *l*, and an opening, *k*, and a bolt and nut, C C', substantially as described.

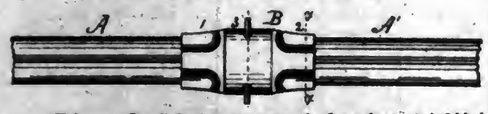
4. In a transversely extensible and folding grate, the combination of a part, *r*, having a longitudinal bar, *q*, carrying transverse fingers *p*, and provided with a head, *o*, having openings coincident with the said fingers *p*, a longitudinal bar, *q'*, carrying transverse fingers *p'*, and provided with a head, *o'*, having openings coincident with the said fingers *p'*, and means, substantially as described, for clamping the parts *r* and *r'* together and supporting the grate, substantially as set forth.

5. In a transversely extensible and folding grate, the combination of a part, *r*, having a longitudinal bar, *q*, carrying transverse fingers *p*, a part, *r'*, having a longitudinal bar, *q'*, carrying transverse fingers *p'*, a combined clamp and journal, B, at each end, comprising the parts *n* and *n'*, and the bearing *m*, having a lug, *l*, and opening *k'*, and a bolt, C, and nut C', substantially as and for the purpose set forth.

395,398. SLEIGH-RUNNER. THOMAS H. LEWIS, Dublin, Tex.
Filed July 5, 1888. Serial No. 279,070. (No model.)

Claim.—1. A sleigh-runner formed of two adjustable sections adapted to embrace the rim of a wheel; one of said sections being provided with a tenon adapted to enter the opposite section, substantially as specified.

2. A sleigh-runner comprising two sections adapted to embrace the rim of a wheel, in combination with an intermediate tenon for entering each of said sections, substantially as specified.



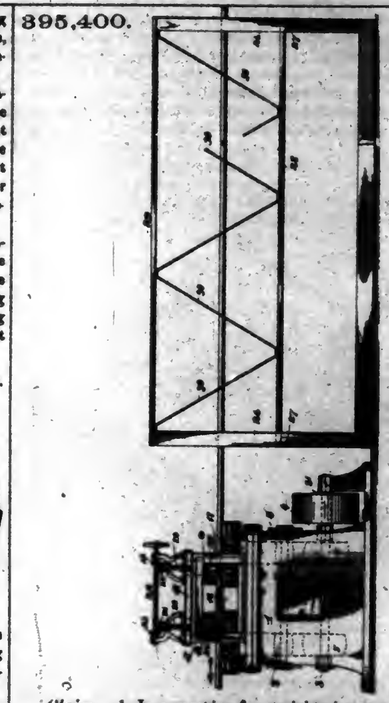
3. The combination, with the wheels of a vehicle, of two runner-sections provided with an intermediate tenon entering each of said sections and of an intermediate coupling device for locking the wheels against movement.

4. The combination, with the wheels of a vehicle, of a runner-section for each of U shape and adapted to embrace the rims of said wheels, an intermediate tenon entering each of the sections, and a coupling device connected to the sections and to the wheels and comprising two overlapping plates, substantially as specified.

5. The sections 1, curved, as at 2, and provided with the oppositely-located lugs 3, in combination with the tenon 6, wheels 16, plates 4, and nuts 5, substantially as specified.

6. The combination, with the wheels 16 and the runner-sections 1, constructed as described, of the overlapping plates 8, staples 10, plates 11, nuts 12, the adjusting-bolt 9, and the hook-arms 14, substantially as specified.

395,399. LIGHTNING-ROD. LOUIS L. MAST, West Milton, Ohio.
Filed Mar. 30, 1888. Serial No. 268,980. (No model.)



Claim.—1. In a lightning-conductor, the flanged core A, infolded with copper plate 4, and the edges thereof inwrapped by the upturned edge of one side being infolded by the other, substantially as shown and described.

2. In a lightning-conductor, connection-burr having a square orifice to embrace the end of a flanged rod, said orifice provided with projection 7 to enter orifice 6 of said flanged rod as said burr is compressed between the flanges of said rod to securely unite the same, substantially as set forth.

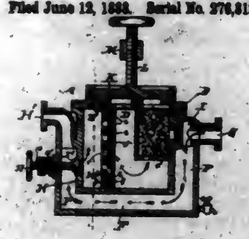
3. The connection-burr B of mated parts 1 and 2, having square orifices in the outer ends to embrace sections of rods, and each part having coincident semicircular circumferential grooves and coincident radial orifices, with wire adapted to said orifices to unite said parts, substantially as shown and described.

395,400. MACHINE FOR STRAIGHTENING METAL BARS, TUBES, &c. WILLIAM A. MCCOOL, Beaver Falls, Pa., assignor of one-half to H. W. Hartman, same place. Filed Oct. 1, 1888. Serial No. 286,836. (No model.)

Claim.—1. In a machine for straightening or polishing rods tubes, and like articles, the combination, with centrally-arranged rotary supports whose axes of rotation are parallel with the line of feed, of a series of rotary pressure-surfaces arranged before and behind the rotary supports, said pressure-surfaces having their axes of rotation parallel with each other and with the line of feed, substantially as and for the purposes specified.

2. In a machine for straightening or polishing rods, tubes, and like articles, the combination, with rotary rod-supports, of a series of pressure-rolls having parallel axes and lapping perimeters, substantially as and for the purposes specified.

3. In a machine for straightening or polishing rods, tubes, and like articles, the combination of rotary supports having parallel axes and convex perimeters and rotary pressure-rolls having parallel axes and lapping perimeters, substantially as and for the purposes specified.



4. In a machine for straightening or polishing rods, tubes, and like articles, the combination, with adjustable pressure-rolls, of two parallel centrally-arranged rod-supports provided with pulleys and loop-belts and tightening-pulleys for rotating both of the rotary supports in the same direction, substantially as and for the purposes specified.

5. The combination, with a straightening or polishing machine, of a flexible or yielding rod, bar, or tube guide, substantially as and for the purposes specified.

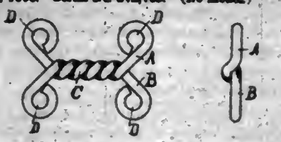
6. The combination, with a straightening or polishing machine, of a flexible or yielding rod or tube guide arranged to support the bar at several different points along its length, substantially as and for the purposes specified.

7. The combination, with the series of straightening or polishing rolls, of a flexible or yielding strap-guide having a series of rod-holes and arranged in the line of feed of said rolls, substantially as and for the purposes specified.

395,401. GREASE-EXTRACTOR. WILLIAM D. NEASH, San Francisco, Cal. Filed June 12, 1888. Serial No. 276,812. (No model.)

Claim.—In a feed-water oil and grease extractor, the combination of the two-way cock I with filtering-chamber C and auxiliary passage or conduit F, valve I', chambers D and E, separated by filtering-screens, and the outlet-pipe H', as herein set forth.

395,402. CAR-COUPLING. FRANCIS W. PARSONS, Philadelphia, Pa.
Filed Dec. 17, 1887. Serial No. 258,201. (No model.)



Claim.—1. In a car-coupling of the class described, the combination of a fixed jaw and a movable jaw with a locking-bolt arranged in rear of said movable jaw, and a pivoted arm mounted on said bolt and bearing on said movable jaw, substantially as specified.

2. In a car-coupling of the class described, a pivoted jaw having a shoulder at its rear end, in combination with a slotted spring-seated bolt and a rock-shaft provided with a blade seated in said slot and adapted to operate said bolt, substantially as specified.

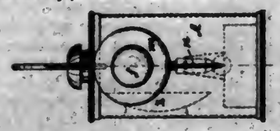
3. The combination of the draw-head A, having the jaws A^7, arms A^2, and recesses $A' A^3$, with the jaw C, pivoted, as at C', in said arms and having the shoulders C^2 C^3, the bolt B, mounted in the recess A^3 and having a spring, B', and slotted, as at B^2, and the shaft B^4, having the blade B^5, passing through said slot and adapted to actuate the bolt, substantially as specified.

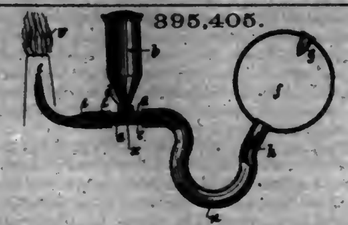
4. The combination of the head A, having the recesses $A' A^3$, fixed jaw A^7, the shoulders A^4 A^5, the arms A^2, carrying the pivoted jaw C, formed with the shoulders C^2 C^3 and knuckle C^4, and with the bolt B, mounted in said slot, having the spring B', opening B^3, and pivoted arm B^7, and the shaft B^4, having the blade B^5, entering said slot and adapted to actuate the bolt, substantially as specified.

395,403. WIRE HINGE. WILLIAM C. PERKINS, New Haven, Conn.
Filed May 4, 1888. Serial No. 272,786. (No model.)

Claim.—As a new article of manufacture, a hinge composed wholly of wire and consisting of two pieces of wire with their central portion twisted together and the remaining ends of each piece of wire turned outward from the center of the hinge in the same direction and plane and bent to form eyes for the reception of the screws which fasten it to the door, substantially as described.

395,404. HORSE-COLLAR PAD. SIMON R. RAW, Sheffield, Iowa.
Filed June 9, 1888. Serial No. 276,572. (No model.)





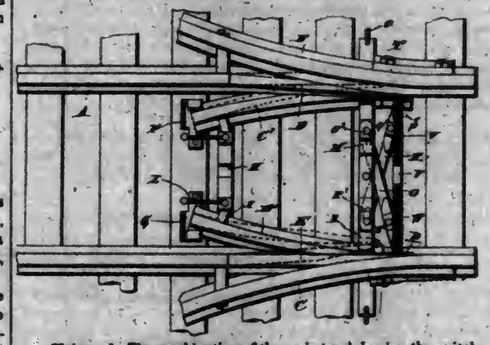
Claim.—1. A horse-collar pad having an arched saddle, a series of transverse laterally-yielding arched springs straddling the saddle, side bars secured to the saddle and to the ends of the springs, and a longitudinal bar or backbone secured to the middle of the springs, substantially as described.

2. A horse-collar pad consisting of the combination, with the perforated leather saddle A, of the side bars, B, secured thereto, the ox-bow-shaped springs C C, secured to the side bars, and the backbone D, secured to the springs, substantially as and for the purpose set forth.

395,405. SEMAPHORE. JOHN W. C. C. SCHIEN, Breslau, Prussia, Germany. Filed Oct. 10, 1888. Serial No. 287,771. (No model.)

Claim.—An optical signaling apparatus or semaphore consisting of the combination of pipe *a*, with truncated cone *x* within the bore

of the same, reservoir *b*, containing the powder, jet-pipe *c*, flame *v*, blast-pipe *n*, and blast or elastic ball *f*, having suction-valve *g* and exit-valve *h*, substantially as specified.



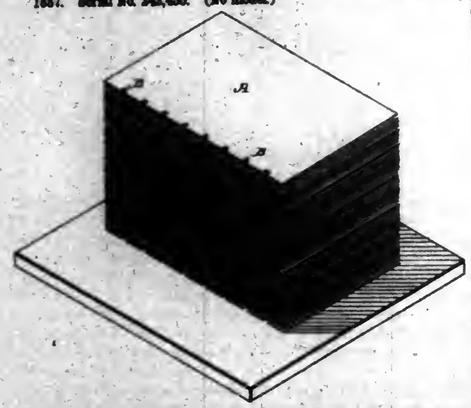
395,406. REVOLVING CHAIR AND STAND. LOUIS F. SMITH, Kewaunee, Wis. Filed May 24, 1888. Serial No. 274,207. (No model.)

Claim.—1. The combination, with a revolving seat or support, of a screw-threaded spindle secured thereto, a stand provided with a smooth-bored hole for said spindle to slide in vertically, and a retractible sectional block or nut provided with screw-threads engaging with said screw-threaded spindle and supported in the said stand, substantially as and for the purposes set forth.

2. The combination, with a revolving seat or support, of a screw-threaded spindle secured thereto, a stand provided with a smooth-bored hole for said spindle to slide in vertically, a sectional block or nut pivoted at its lower end to the stand and provided with screw-threads engaging with the said screw-threaded spindle, a spring pressing the nut into gear with the spindle, and a sliding foot-piece supported by the stand and connected to the said sectional nut, whereby it may be retracted out of gear with the spindle, substantially as and for the purposes set forth.

395,407. RAILROAD-SWITCH. DANIEL R. SHEA, Rochester, N. Y.
Filed July 14, 1888. Serial No. 279,973. (No model.)

Claim.—1. The combination of the main track having the switch-rails D E, the side tracks branching in opposite directions from the main track, having the switch-rails C B' on the inner sides of rails D E, respectively, the tie-bar connecting the free ends of the switch-rails C B', and the tie-bars R O, connecting the free ends of the switch-rails D E, respectively, to the switch-rails B' C', whereby the switch-rails B' C' will operate in unison together with one of the switch-rails D E, substantially as described.

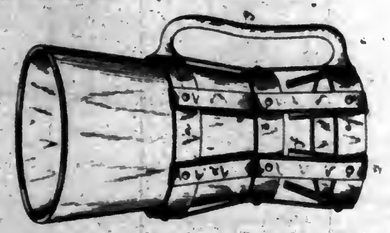


2. The combination of the main switch-rails, the side-track switch-rails on the inner sides thereof, the tie-bar connecting the free ends of the side-track switch-rails to cause the same to move in unison, the tie-bars connecting said tie-bar to the main-track switch-rails, and the springs normally to close the main-track switch-rails, substantially as described.

3. The combination of the side-track switch-rails having their free ends connected and thereby adapted to move in unison, the main-track switch-rails connected loosely with the side-track switch-rails and independently of each other, the guide-bar passing through the free ends of the main-track switch-rails, and the springs on said bar bearing against the inner sides of said switch-rails, for the purpose set forth, substantially as described.

4. The combination of the side-track switch-rails, the tie-bar M, connecting the free ends thereof, the main-track switch-rails, the tie-bars R O, loosely and independently connecting the free ends thereof to the tie-bar M, and the operating-rod attached to the tie-bars M R O, and the operating-lever connected to the said rod, substantially as described.

5. The combination of the main track having the switch-rails D E, the side tracks branching from opposite sides of the main track, having the switch-rails B C, the tie-bar M, the arms N, secured to the free ends of the side-track switch-rails and pivoted to the bar M, the tie-bars R O, loosely connected to the tie-bar M, the arm P, secured to switch-rail E and pivoted to the tie-bar O, and the arm S, secured to switch-rail D and pivoted to tie-bar R, substantially as described.



395,408. BOOK-BINDING. JOHN J. SULLIVAN, Cincinnati, Ohio, assignor of one-half to Thomas W. Graydon, same place. Filed June 25, 1887. Serial No. 242,435. (No model.)

Claim.—1. The above-described improvement in the art of book-binding, which consists in cutting a series of transverse grooves in the back edges of the leaves or signatures at about the same relative distances apart as the binding-cords usually employed and filling said grooves with liquid glue or other liquid cement, whereby when the adhesive substance solidifies the leaves or signatures will be united.

2. The above-described improvement in the art of book-binding, which consists in cutting a series of transverse grooves in the back edges of the leaves or signatures at about the same relative distances apart as the binding-cords usually employed, filling said grooves with liquid glue or other liquid cement, and applying the cover before the adhesive substance solidifies, for the purposes set forth.

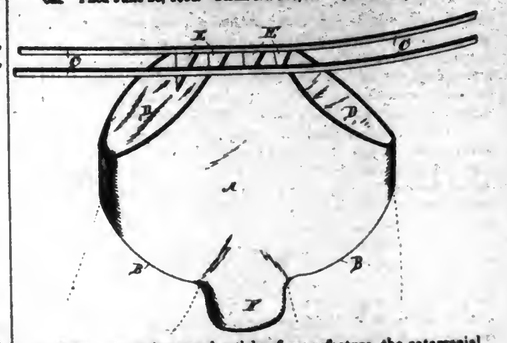
395,409. REVERSIBLE TUMBLER-HOLDER. GEORGE F. WATERS, Washington, D. C., assignor of one-half to Francis McC. Criswell, same place. Filed Apr. 14, 1888. Serial No. 270,707. (No model.)

Claim.—1. A tumbler-holder open at both ends, and thereby adapted to receive a glass in either end, substantially as described.

2. A tumbler-holder open at both ends and having such ends of different diameter, and thereby adapting the holder to receive glasses of different diameter, substantially as described.

3. A tumbler-holder having the general outline of an hour-glass and open at both ends, and provided in each end with spring-fingers, substantially as described.

4. A tumbler-holder open at both ends, composed of a series of bands and a series of strips secured at right angles to the said bands, and spring-fingers arranged in the open ends, substantially as described.



5. A tumbler-holder open at both ends and composed of annular bands *a b c*, strips *d*, secured to said bands and terminating within the bands at both ends in spring-fingers *f*, and thereby adapted to receive a tumbler in either end, and a handle, *g*, substantially as described.

6. A tumbler-holder open at both ends and provided internally with an obstructing medium for arresting the too great descent of a tumbler, substantially as described.

395,410. COMPOSITION FOR WATERPROOFING TEXTILE MATERIALS. JACOB WELTZ, New York, N. Y., assignor of one-half to Sigmund S. Hirschler, same place. Filed Nov. 19, 1887. Serial No. 255,630. (No specimens.)

Claim.—A waterproofing composition consisting of glue, sugar of lead, alum, chloride of zinc, tin-salt, and water, as described.

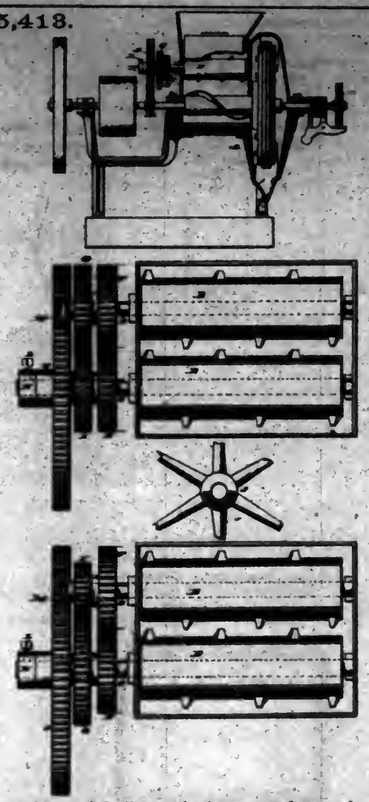
395,411. CATAMENIAL SACK. EMMA A. WILEY, Los Angeles, Cal. Filed June 28, 1882. Serial No. 278,473. (No model.)

Claim.—As an improved article of manufacture, the catamenial sack having the thin rubber body portion A, adapted to fit snugly around the lower portion of the trunk of the wearer and provided near its bottom on opposite sides of the center with thigh-openings B B, the loose depending sponge-containing pocket F, located between the thigh-openings and integral with the body portion, and the drawing strings or tapes C at the upper edge of the body portion, substantially as and for the purpose specified.

395,412. RAILROAD-CAR. DAVID Y. WILSON, Gum Tree, assignor of one-half to William B. Haslett, Parkesburg, Pa. Filed Oct. 9, 1883. Serial No. 267,640. (No model.)

Claim.—1. The combination, with a railroad-car having door-openings, of the doors arranged in said openings, and pivoted latches arranged between the edges of the doors and the sides of the openings, and having arms of unequal length extending in opposite directions from their pivots and adapted to hold the doors normally closed, as set forth.

2. The combination, with the car having the door-opening, of the door arranged in said opening and having the groove G and recess I, and the latch pivoted in the side of the opening, and having its arm resting in the groove G, and a keeper-plate pivoted to the door and normally extending across the latch, as set forth.



3. The combination, with the car having the door-opening B, of the door arranged in said opening, and the latch pivoted in one side of the door-opening and having a longer arm normally resting in a groove in one side of the door, and a shorter arm adapted to contact with the other side of the door when the longer arm is raised, as set forth.

4. The combination, with the car having the opening B, provided in one side with the sockets or recesses, of the door having pins to engage said sockets, and a latch at the opposite side of the opening, as set forth.

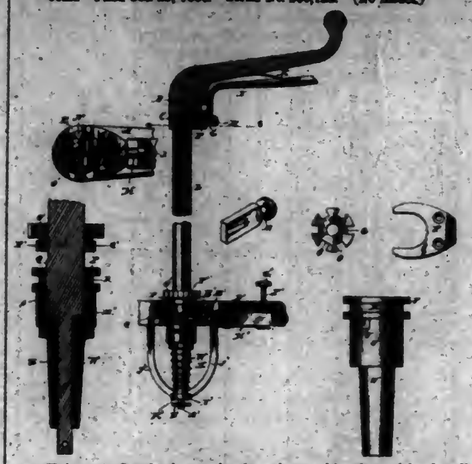
395,413. CRUSHING AND GRINDING MILL. JAMES F. WIRCHELL, Springfield, Ohio, assignor to the Foos Manufacturing Company, same place. Filed July 14, 1887. Serial No. 244,270. (No model.)

Claim.—1. In a crushing and grinding mill, the combination, with the main shaft, a crushing-conveyer thereon, and grinding mechanism,

395,413.

of the crushing and feeding mechanism mounted to crush and feed the material to the said conveyer, a driving gear-wheel geared to the main shaft and to the crushing mechanism, and an interchangeable pinion and idler connecting the said gear-wheel with the crushing mechanism, whereby the speed of the crushing mechanism may be varied with respect to that of the said conveyer and the grinding mechanism at will.

2. In a crushing and grinding mill, the combination, with the main shaft and grinding mechanism, of crushing mechanism mounted to crush and feed the material to the grinding mechanism, a driving gear-wheel geared to the main shaft and to the crushing mechanism, and an interchangeable pinion and idler connecting said gear-wheel with the crushing mechanism, whereby the speed of the crushing mechanism may be varied with respect to that of the grinding mechanism at will.



3. In a crushing and grinding mill, the combination, with the main shaft and the grinding mechanism, of feeding-crushers geared together, a driving-gear on the shaft of one of the said feeding-crushers and operated by the main shaft, and an interchangeable pinion and idler mounted on the shafts of said feeding-crushers and transmitting motion thereto.

4. In a crushing and grinding mill, the combination, with the main shaft, pinion, and a grinding-head carried thereby, and a stationary grinding-head, of two intergeared feeding-crushers, an idler on one and an intergeared pinion of different diameter on the other of the crushing-shafts, and a driving-gear on one of said shafts clutched with the pinion or idler on that shaft (as the case may be) and meshing with the pinion on the main shaft.

5. In a crushing and grinding mill, the combination, with the main shaft and a pinion thereon, of the feeding-crushers, the gear-wheels rigidly secured to the shafts of said crushers, one of said wheels being provided with a clutch or shoulder, the intermediate gear-wheel or idler, G, having a clutch or shoulder and loosely mounted on the shaft of one of the crushers, a smaller intermediate gear, I, loosely mounted on the shaft of the other crusher and provided with a clutch or shoulder, and a gear-wheel, J, also having a clutch, said wheel being loosely mounted on the same shaft with the last-named intermediate gear-wheel and meshing with the pinion on the main shaft.

6. In a crushing and grinding mill, the combination, with the main shaft and a pinion thereon, of feeding-crushers and gear-wheels rigidly secured to the shafts of said crushers, the intermediate gear-wheel or idler, G, mounted on the shaft of one of the crushers and a smaller intermediate gear-wheel, I, mounted on the shaft of the other crusher, the said gear-wheels G and I being interchangeable from one crusher-shaft to the other, and a gear-wheel, J, also mounted on one of the crusher-shafts and meshing with a pinion on the main shaft.

395,414. STREET-CAR BRAKE. JOHN H. WEBSTER, Bridgeport, Conn. Filed Oct. 25, 1888. Serial No. 288,122. (No model.)

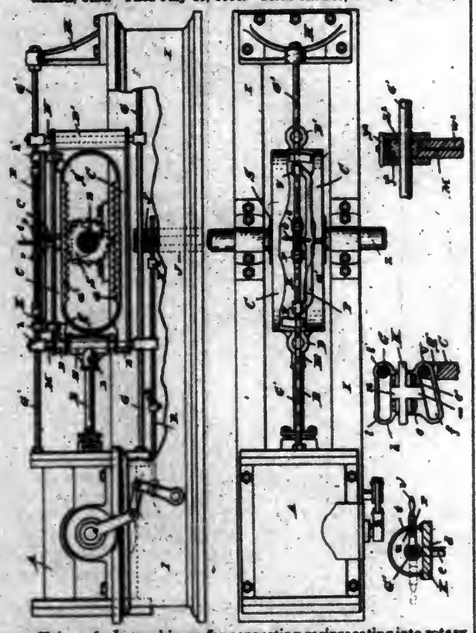
Claim.—1. In a brake mechanism, the combination, with a handle having a horizontal coupling-pin and an independent hand-lever for operating the same, of a post carrying the handle, which is swiveled upon its upper end, and having a fixed collar provided in its periphery with retaining-points to receive the pin, which is radially moved toward and away from its periphery by the said hand-lever, substantially as set forth.

2. In a brake mechanism, the combination, with a handle having a flat square-edged coupling-pin and a spring-actuated hand-lever for operating the same, of a post carrying the handle and having a fixed collar provided in its periphery with a series of transverse slots corresponding in shape to the end conformation of the said pin, substantially as set forth.

3. In a brake mechanism, the combination, with a handle having a coupling-pin and a hand-lever for operating the same, of a post carrying the handle and having a fixed collar provided with retaining-points to receive the pin, and a retaining-plate secured to the handle and holding the same upon the post, substantially as set forth.

4. In a brake mechanism, the combination, with a post, of a chain-barrel sleeved over the post, so as to rotate freely thereupon when released for unwinding the chain, a clutch-head feathered upon the post close to the said barrel, so as to be directly engaged therewith to lock the barrel for winding the chain and to be disengaged therefrom to release the barrel for unwinding the chain, substantially as set forth.

5. In a brake mechanism, the combination, with a post, of a chain-barrel sleeved over the same, a clutch-head feathered on the post and adapted to be normally coupled with the head, the face of the head and the upper end of the barrel being constructed to couple when brought into one specific relation and in no other, whereby the handle returns to its right position after using the relief-clutch, substantially as set forth.



6. In a brake mechanism, the combination, with a post, of a chain-barrel sleeved over the same, a clutch-head feathered on the post and adapted to be normally coupled with the barrel-head, and lever mechanism connected with such head and arranged to be operated by the driver with his foot, substantially as set forth.

7. In a brake mechanism, the combination, with a brake-post, of a handle located at the upper end thereof, a stirrup-shaped brace secured to the car and provided with an offsetting bracket through which the lower end of the post passes, a chain-barrel sleeved over the post, so as to rotate freely thereupon when released and resting upon the said bracket, and means for locking the barrel to the post and releasing it therefrom, substantially as set forth.

8. In a brake mechanism, the combination, with a brake-post, of a handle located at the upper end thereof, a chain-barrel sleeved over its lower end, a clutch-head feathered upon the post and adapted to be normally coupled with the barrel, lever-connections with the said head for operating it to relieve the barrel, and guards inclosing such mechanisms from the dirt, substantially as set forth.

9. In a brake mechanism, the combination, with a brake-handle, of a post provided at its upper end with an offsetting shoulder and a retaining-plate secured to the handle and cut away to fit around the post, with the shoulder of which it engages to couple the post and handle together, substantially as set forth.

395,415. MECHANICAL MOVEMENT. RICHARD L. AYER, Cincinnati, Ohio. Filed July 16, 1888. Serial No. 280,152. (No model.)

Claim.—1. In machinery for converting reciprocating into rotary motion or the opposite, in combination with the body moving with a reciprocating motion, a rack-frame supported upon incline planes and containing two parallel racks so arranged that the rack-frame automatically ascends and descends the incline planes at the termination of each portion of the reciprocating motion, and the teeth of one rack engage with the teeth of a wheel during one portion of the reciprocating movement, and the teeth of the other rack engage with the teeth of the same wheel during the opposite movement, substantially as described.

2. In mechanism for converting reciprocating into rotary motion or the reverse, the combination, with a rack-frame having parallel racks, of a shifting-bar supported upon one of the supporting-rods upon which move the rack-frame and the shifting-bar, and also resting upon a projecting pin from the rack-frame, and also at its two extremities attached to the rack-frame by loops forming inclined planes, so constructed that when the rack-frame is at the upper portion of the loops one of the racks engages with the wheel to which or from which motion is to be transmitted, and when the rack-frame rests at the lower portion of the loops the opposite rack engages with the same wheel, substantially as set forth.

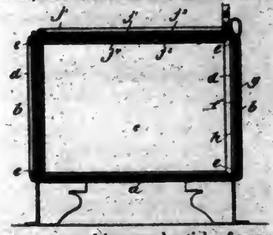
3. In machinery for converting reciprocating motion into rotary motion or the opposite, the combination of the piston-rod B, the rack-frame C, the racks *a a'*, the shifting-bar K, the loops *h h'*, the supporting-rod G', the loops *f f'*, and the wheel S, substantially as set forth.

4. In a device for converting reciprocating into rotary motion or the opposite, the combination of a shifting-bar supported at its center upon a pin extending from a rack-frame and at its extremities attached to the rack-frame by loops which form incline planes, with a connecting-bar whose extremities form a sliding connection with the supporting-rod, over which it moves freely until checked by nuts screwed at desired points upon the supporting-rod, and attached at its center by a guide to the shifting-bar, substantially as set forth.

5. In mechanism for converting reciprocating into rotary motion or the reverse, the combination of the reciprocating body B, the rack-frame C, the racks *a a'*, the wheel S, the shifting-bar K, the pin *c*, the loops *h h' f f'*, the connecting-bar P, with its guide *t*, the eyes *p q*, and the stops *r* and *s*, substantially as set forth.

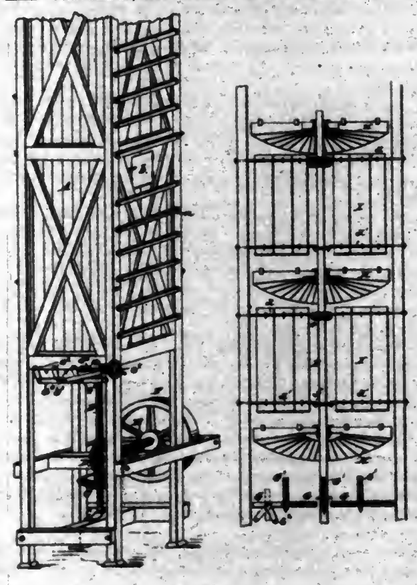
6. In mechanism for converting reciprocating into rotary motion or the opposite, in combination with a toothed wheel upon a driving-shaft, a rack-frame attached to the reciprocating body, consisting, essentially, of two parallel racks which, alternately with the change of the reciprocating movement, engage the teeth of the wheel, sleeves at its two extremities through which pass cross-heads by which it is attached to supporting-rods along which it moves, and a flange surrounding the racks, with means for automatically raising and lowering the rack-frame, substantially as set forth.

395,416. BOILER FOR CLEANING OR BOILING RAGS. GEORGE F. BARTON, Warehouse Point, Conn., assignor of one-half to Charles B. Barton, same place. Filed Feb. 6, 1888. Serial No. 263,134. (No model.)



Claim.—1. The combination of a boiler of the class described, with the ejector at the discharge-opening of the boiler, and the pipe *m*, extending around to the opposite side of the boiler, substantially as described, and for the purpose specified.

2. In a boiler of the class described, the combination of an ejector, the covering screen or strainer *f*, hinged as described, and the pipe *m*, leading laterally to one side of the strainer in a line parallel to its hinge and from thence to the opposite side of the boiler, substantially as described, and for the purpose specified.



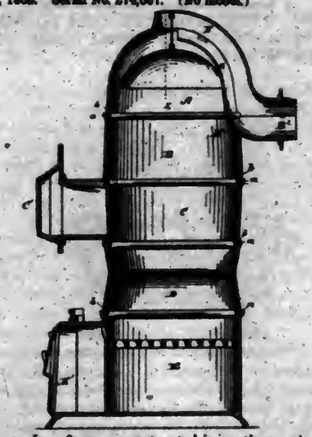
3. The combination of a boiler of the class described and the pipe *m*, extending from under the screen at the exit around to the opposite side of the boiler, substantially as described, and for the purpose specified.

395,417. ORNAMENTAL BOX. MENDEL BANKAN, New York, N. Y. Filed Nov. 20, 1888. Serial No. 291,202. (No model.)

Claim.—As a new and improved article of manufacture, an ornamental box composed of united panels forming the side and end walls of the box, each being made of slotted tubes holding an inner plate, *f*, an outer glass plate, *b*, and an interposed ornament, *h*, the panels being secured to a bottom, *a*, substantially as described.

395,418. AIR-DRAFT ENGINE. OTTO A. BERKENDORF, Wilmot, Kans. Filed Jan. 28, 1888. Serial No. 262,247. (No model.)

Claim.—The combination, with the upright air-flue and revolving shaft bearing horizontal wind-wheels, of the bearings for said shaft, tension-rods *d d'*, connecting said bearings to the sides of the flue, and wind-guides I, connected to and supported by said tension-rods, substantially as and for the purpose described.



395,419. FURNITURE-DRAWER. GEORGE BOWER, Fayette, Mo. Filed June 28, 1888. Serial No. 278,396. (No model.)

Claim.—1. The combination, with a casing and a sliding drawer, of a roller journaled on the rear of the drawer, below the upper edge thereof, and having its ends projecting beyond the ends of the drawer, and cords wound on the projecting ends of the said roller and having their ends secured to the front and rear of the casing, substantially as described.

2. The combination, with a casing and a drawer sliding therein of brackets secured to the back of the sliding drawer, a roller journaled in the said brackets below the upper edge of the back of the drawer and having its ends projecting beyond the ends of the drawer, cords wound on the projecting ends of the roller and having one end connected to the rear of the casing, and adjustable pins secured to the front of the casing, and to which the other ends of the said cords are secured, substantially as herein shown and described.

395,420. HOT-AIR FURNACE. NICHOLAS BRAYER, Rochester, N. Y., assignor to the Co-Operative Foundry Company, same place. Filed May 16, 1888. Serial No. 274,067. (No model.)

Claim.—1. In a furnace constructed in sections, substantially as described, the combination, with the upper section, of the plate co-operating with the inside wall thereof and forming a passage communicating with the upper portion, and the succeeding lower section arranged to support said plate when in position, as set forth.

2. In a furnace constructed of superposed sections, the combination, with the top section, of the plate located on the inside thereof and co-operating with the side wall to form a passage communicating with the interior at the top, the interlocking lugs forming a connecting means, and the next lower section forming the support for the lower end of the plate, substantially as described.

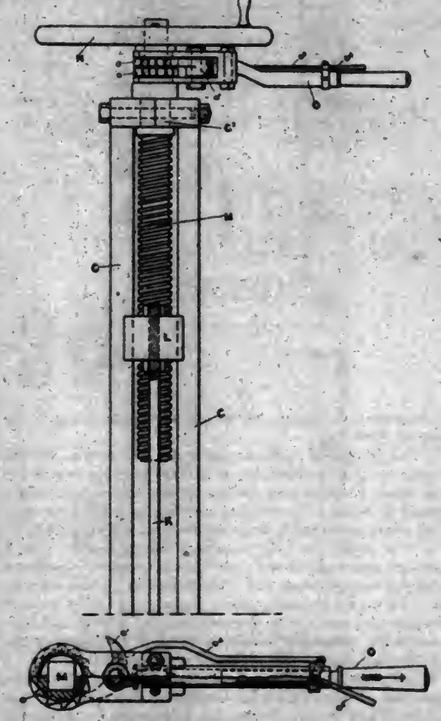
3. In a furnace constructed of superposed sections, the combination, with the top section, of the plate located on the inside thereof and co-operating with the side wall to form a passage communicating with the interior at the upper portion, and means—such as interlocking lugs—connecting the plate and section and the next lower section having a portion of the exit-passage formed therein with which the end of the plate co-operates to form a continuation of the passage, substantially as described.

4. The combination, with the upper section having a portion of the exit-flue formed at the lower side thereof, of the plate located on the inside and co operating with the side wall to form a passage communicating with the interior at the upper portion, means—such as interlocking lugs—for connecting the plate and section, and the lower section having a portion of the exit-flue formed thereon adapted to co-operate with that on the upper section, and with which the lower portion of the plate also co-operates, substantially as described.

5. In a furnace, the combination, with the upper section having the lower portion, of the exit-flue formed thereon, and the plate removably secured therein and co-operating with the side wall to form a passage opening into the chamber near the top of the next succeeding section, having the groove in its upper side, with which the lower side of the upper section and the end of the plate co-operates to form a joint, and having also a portion of the exit-passage formed thereon, also grooved to co-operate with the edge of the corresponding portion on the upper section, substantially as described.

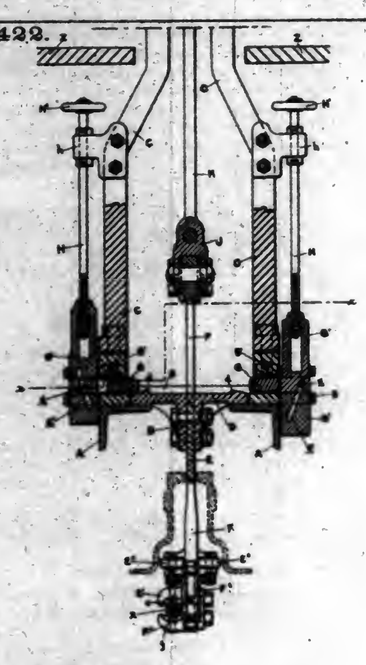
395,421. SAFETY DEVICE FOR USE IN ELECTRIC CIRCUITS. ARTHUR C. COCKBURN, London, England. Filed July 18, 1888. Serial No. 280,242. (No model.) Patented in England Mar. 18, 1887, No. 4,138; in France Aug. 30, 1887, No. 185,565, and in Germany Sept. 1, 1887, No. 42,912.

Claim.—1. A safety device for electric circuits, consisting of a rod fusible by an excess of current passing through it, secured at its ends, and having a weight arranged thereon between the ends for the purpose of breaking the rod the moment it reaches the molten state, substantially as described.

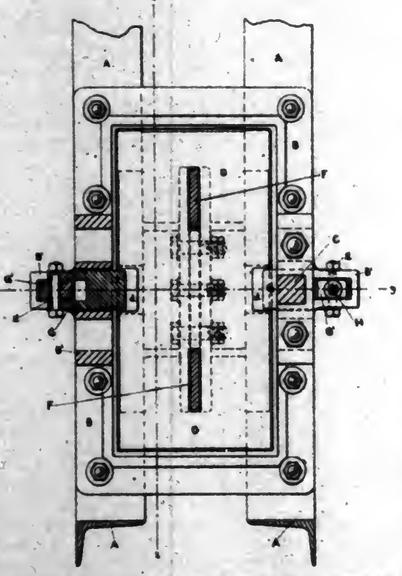


2. A safety device for electric circuits, consisting of a rod fusible by an excess of current passing through it, having a thickened weighted portion between its ends, substantially as and for the purpose described.

3. A safety device for electric circuits, consisting of a fusible wire or strip having a knotted thickened portion between its ends, substantially as described.



395,422. CABLE-TRAMWAY GRIPPER. WILLIAM N. COLAM, London, County of Middlesex, England. Filed Feb. 29, 1888. Serial No. 265,752. (No model.)



Claim.—1. In a gripper for cable tramways, the combination, with a foundation-plate permanently secured to the car, of a movable grip-jaw supported by the said foundation-plate, a fixed grip-jaw, and a plate detachably connected to the said foundation-plate and supporting the fixed grip-jaw, whereby the fixed grip-jaw and the cable may be raised by the continued upward motion of the moving jaw when required.

2. In a gripper for cable tramways, the combination, with the loose plate carrying the fixed jaw of the gripper, of the holding-down tongues mounted in blocks on the foundation-plate and adapted to

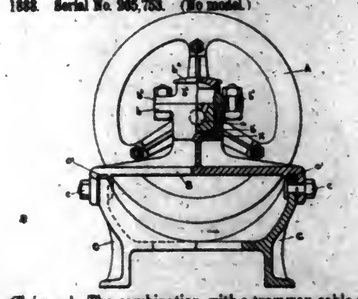
395,422.

slide transversely to engage with the said loose plate, as and for the purpose set forth.

3. In a gripper for cable tramways, the combination, with the loose plate carrying the fixed jaw, of the links and cross-head carrying the shank of the moving jaw and adapted to receive a vertical movement by means of the traveling nut working on the screw operated by a hand-wheel and lever, as and for the purpose set forth.

4. In a gripper for cable tramways, the combination, with a movable grip-jaw provided with a shank, a revoluble screw operatively connected to the said shank, and a foundation-plate permanently secured to the car for supporting the said moving jaw and its screw, of a fixed grip-jaw, a loose plate supporting the said grip-jaw, and locking mechanism detachably connecting the said loose plate to the foundation-plate, substantially as and for the purpose set forth.

5. In a gripper for cable tramways, the combination, with a movable grip-jaw provided with a shank, a revoluble screw operatively connected to the said shank, and a foundation-plate permanently secured to the car for supporting the said moving jaw and its screw, of a fixed grip-jaw, a loose plate supporting the said fixed grip-jaw, and retractible locking-tongues provided with guides and detachably connecting the said loose plate to the foundation-plate, substantially as and for the purpose set forth.

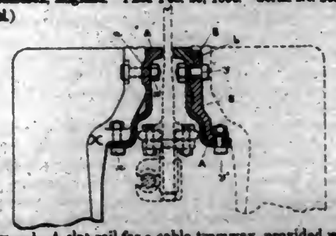


6. In a gripper for cable tramways the moving jaw of which is operated by a rotating screwed spindle, the combination, with a hand-wheel for operating the said screwed spindle, of a hand-lever pivoted on the said spindle and connected thereto by a reversible ratchet-and-pawl gear, as and for the purpose set forth.

7. In a gripper for cable tramways the moving jaw of which is operated by a rotating spindle, the combination, with a hand-wheel for operating the said spindle, of a telescopic hand-lever mounted loosely on the said spindle and connected thereto by a reversible ratchet-and-pawl gear, as and for the purpose set forth.

8. In a cable tramway the gripper of which is operated by the rotary motion of a screwed spindle, the combination, with a hand-wheel for operating the said spindle, of the auxiliary hand-lever for operating the said spindle with increased leverage, the loose plate carrying the shank of the fixed jaw of the gripper, the tongues for locking the loose plate of the foundation-plate carrying the gripper mechanism, and the screwed spindles for operating the locking-tongues through suitable sliding cams, as and for the purpose set forth.

9. In a gripper for cable tramways, the combination, with the moving jaw operated by a hand-wheel through a suitable endless screw and traveling nut, of the auxiliary telescopic hand-lever adapted to operate the said endless screw through a reversible ratchet-and-pawl gear, the loose plate carrying the fixed jaw adapted to be locked down to the foundation-plate carrying the gripper mechanism, the sliding tongues for locking down the said loose plate, the screwed spindles and sliding cam-pieces for operating the said tongues, and the detachable dies in the jaws, all arranged and operating as and for the purpose set forth.

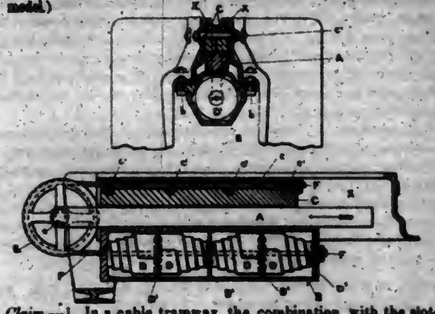


395,423. PULLEY-CARRIER FOR CABLE TRAMWAYS. WILLIAM H. COLAM, London, County of Middlesex, England. Filed Feb. 29, 1888. Serial No. 265,753. (No model.)

Claim.—1. The combination, with a tramway-cable guide-pulley, of a block adapted to slide laterally in a horizontal straight line for supporting the said pulley, a pedestal provided with a base-flange for attachment to the foundation and a flat upper surface for supporting the said sliding block, and bolts for regulating and securing the desired lateral adjustment of the said block, substantially as and for the purpose set forth.

2. The combination, with tramway-cable guide-pulley provided with an axle, of the bearing-blocks *b* for the ends of the axle to run in, the laterally-adjustable block B, having bearings for the bearing-blocks and caps for securing the bearing-blocks in said bearings, the pedestal C, provided with cross-slots at each end, and the bolts passing through lugs on block B and through the said slots for regulating and securing the lateral adjustment of the said block, substantially as and for the purpose set forth.

395,424. CABLE TRAMWAY. WILLIAM H. COLAM, London, County of Middlesex, England. Filed Feb. 29, 1888. Serial No. 265,754. (No model.)



Claim.—1. A slot-rail for a cable tramway, provided with a horizontal flange upon one side at the top of it, a double bead in its vertical web, thereby throwing the lower part of said web to one side and a second horizontal flange at the bottom of the rail upon the opposite side of it from the top flange, substantially as and for the purpose set forth.

2. In a cable tramway, the combination, with the slot-rail hereinbefore described and shown, of the fish-plate adapted to be fixed to the slot-rail by two rows of bolts whose lines of tension are at right angles to one another, as and for the purpose set forth.

3. In a slot-rail for a cable tramway, the combination of the outward bend of the vertical web to give increased width to the slot, increased head-room in the cable-way, and to provide a bearing-surface for thrust-rollers mounted on the gripper-shank, the lower horizontal flange for fixing the slot-rail, and the longitudinal projection for supporting the same, as set forth.

395,425. CABLE TRAMWAY. WILLIAM H. COLAM, London, County of Middlesex, England. Filed Feb. 29, 1888. Serial No. 265,755. (No model.)

Claim.—1. In a cable tramway, the combination, with the slot-rails and cable-way, of the longitudinal box fixed to the said slot-rails and containing volute springs adapted to cushion longitudinally, as set forth.

2. In a cable tramway, the combination, with the slot-rails and the cable-way, of the longitudinal box containing four or more volute springs arranged in pairs with plates between them and adapted to cushion longitudinally, as set forth.

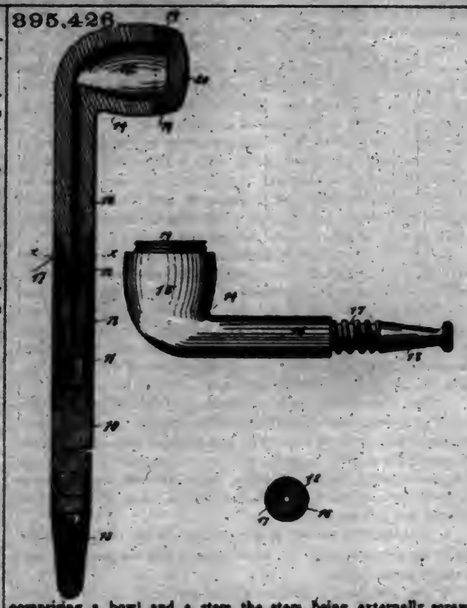
3. In a cable tramway, the combination, with the slot-rails and the cable-way, of the bar or piston sliding freely in a channel formed by and between the inner sides of the slot-rails, the top of the longitudinal box, and the inner side of packing-pieces fixed between the said rails, as set forth.

4. In a cable tramway, the combination, with the slot-rails, of the longitudinal box containing volute or analogous springs adapted to cushion longitudinally, and the bar or piston forked at its forward end to carry a small pulley and adapted to slide longitudinally in a channel formed between the slot-rails, as set forth.

5. In a cable tramway, the combination, with the slot-rails, of the bar or piston sliding freely in a horizontal plane between the slot-rails and carrying a pulley, partially round which passes a length of wire rope or chain fixed at one end to the slot-rails and passing through the volute springs in the longitudinal box and fixed to a plate bearing against the rear spring, as and for the purpose set forth.

6. In a cable tramway, the combination, with the sliding bar or piston and the longitudinal box containing the volute springs, of the packing-pieces in the top of the slot forming a top to the channel in which the rod or piston slides, and providing a means of attaching the fixed end of the rope or chain to the slot-rails or frame of the cable-way, as and for the purpose set forth.

7. In a cable tramway, the combination, with the slot-rails X X, of the rod or piston A, the longitudinal box B, the packing-pieces C C, the springs D D, &c., the plates D' D', &c., the pulley E, mounted on the axle-pin *e*, carried by the forked end of the rod or piston A, and the wire rope or cord F, all combined, arranged, and operating as and for the purpose set forth.

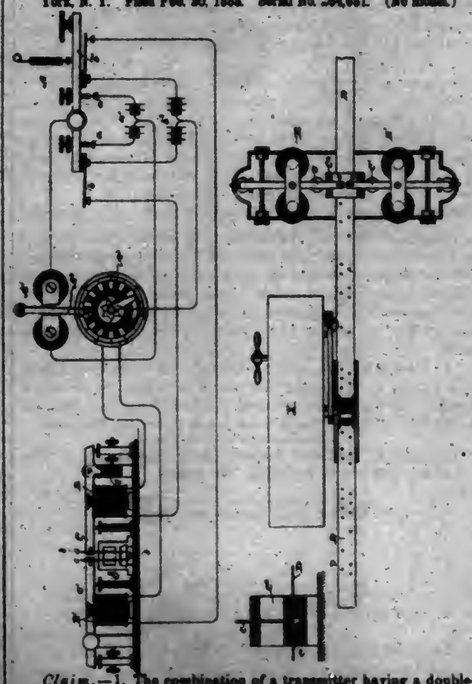


395,426. COMBINED TOBACCO-PIPE AND CANE. GEORGE H. COUDREY, Baltimore, Md. Filed July 2, 1888. Serial No. 278,768. (No model.)

Claim.—1. A walking-cane having a tobacco-pipe detachably secured to the upper end thereof, so that the bowl of the pipe will form the handle and the stem a portion of the cane, substantially as described.

2. The combination, with the staff of a walking-cane having a hollow upper end, of a tobacco-pipe having its stem detachably secured in the said hollow end of the cane, substantially as described, whereby the bowl of the pipe is made to form the handle and the stem of the pipe a portion of the cane, as set forth.

3. The combination, with the staff of a cane provided with a hollow upper end having an internal screw-thread, of a tobacco-pipe



395,426

comprising a bowl and a stem, the stem being externally screw-threaded near its outer end to adapt it to be screwed into the hollow upper end of the cane, substantially as and for the purpose set forth.

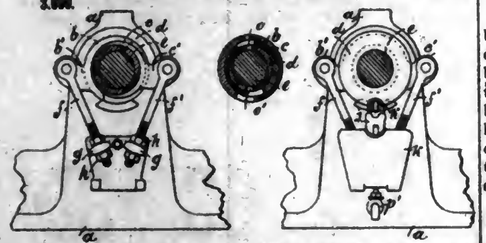
4. The combination, with the staff of a cane and an internally-screw-threaded collar secured to the upper end of the staff, of a tobacco-pipe comprising a bowl, a stem integral with the bowl, and a mouth-piece, the stem being externally screw-threaded adjacent to the mouth-piece to adapt it to be screwed into the said collar, substantially as herein shown and described, whereby the parts can be readily attached and detached, and when connected the bowl of the pipe is made to serve as a head for the cane and the stem a portion of the staff of the same, as set forth.

395,427. AUTOMATIC TELEGRAPHY. PATRICK B. DELANY, New York, N. Y. Filed Feb. 20, 1888. Serial No. 264,661. (No model.)

Claim.—1. The combination of a transmitter having a double-grooved surface over which the ribbon having lines of apertures coin-

ciding with said grooves passes, pivoted transmitting-fingers having pointed ends under which the ribbon runs connected with the main line and each arranged opposite or in line with one of the said grooves, insulated battery-connected stops against which said fingers fall when their pointed ends enter apertures in the ribbon, and a source of electric energy having poles of unlike sign connected to said stops, substantially as and for the purpose set forth.

2. The combination, with ribbon drawing or feeding devices, of a block or holder through which the ribbon is drawn, duplicate puncturers arranged side by side and having sharp or needle points for piercing the ribbon, their actuating-magnets, and the circuits of said magnets, the Morse key, and actuating-magnet circuit-completing devices interposed between said magnets and the key.



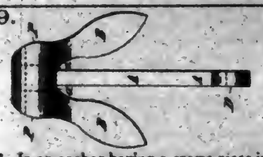
3. The combination of the duplicate recording devices, their magnets B B', and the circuits of said magnets, the alternate segments in the table A^2 included in the circuits of said magnets, the trailer traversing said segments, the Morse key, and trailer-actuating devices interposed between the trailer and key, whereby the trailer is moved when the key is depressed and when it is raised, and said magnets alternately energized for brief periods irrespective of the time during which the key is held in either position.

4. The combination, substantially as set forth, of the duplicate recording devices, their magnets B B', a key capable of being manipulated according to the Morse or like codes, circuit-controlling devices interposed between the magnets and key, and consisting of contacts or segments and a trailer traversing them, trailer-actuating devices interposed between the key and trailer, and the circuit of the magnets B B', for the purpose described.

5. The block C^3, formed with a passage for the reception of the ribbon, the recess opposite the recording-rod, and the groove c', substantially as set forth.

6. The combination, substantially as set forth, of two or more independent ribbon recorders, each having duplicate recording devices and actuating-magnets B B', the table of segments having alternate segments connected in circuit with the magnets B of the respective recorders, and the remaining segments connected in circuit with the magnets B' of the recorders, the trailer traversing said segments and connected in both said circuits, the Morse key, and trailer-actuating devices interposed between the trailer and key, whereby upon the manipulation of the key the same matter may be recorded upon several ribbons at the same time.

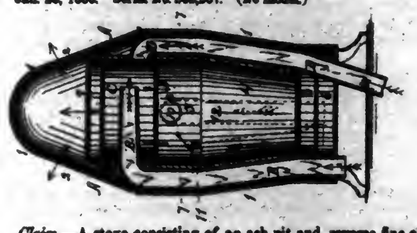
395,428. ADJUSTABLE SHAFT-BEARING. BENJAMIN A. DOBSON, Bolton, County of Lancaster, England. Filed July 26, 1888. Serial No. 281,054. (No model.) Patented in England Mar. 10, 1888, No. 3,690.



Claim.—1. The improved shaft-bearing consisting, essentially, of the following parts, combined substantially as shown and described; a non-rotating metal bushing forming a journal for the shaft and fitted within an eccentric sleeve, which is fitted within a second eccentric sleeve supported by the pedestal, and means for operating the eccentrics to adjust the position of the shaft with the said bushing as required.

2. The combination, with the pedestal *a*, of the bushing *d*, forming a journal for the shaft *c'*, the pair of eccentrics *b c*, the screw-threaded rods *f f'*, nuts *h*, and eyes *g*, attached to the pedestal, all substantially as and for the purposes herein shown and described.

395,429. ANCHOR. HERBERT O. DUER, Washington, D. C. Filed June 1, 1888. Serial No. 275,794. (No model.)



Claim.—1. In an anchor having a crown-piece integral with two spread flukes containing a longitudinal opening contracted on the fluke side, a shank with an enlarged tapered head containing a transverse cylindrical opening, said shank passing through the opening in the crown-piece, in combination with an axial bolt passing transversely through the shank-head and crown-piece, connecting the two, and allowing flukes to actuate each side of the shank, substantially as specified.

2. In an anchor having a crown-piece integral with two spread flukes containing a longitudinal opening shaped to fit a tapered shank-head and contracted on the fluke side, a bolt or pin, in combination with a shank having an enlarged tapered head containing a transverse cylindrical opening, said shank passing through the crown-piece and connected thereto by said bolt passing transversely through the crown-piece and shank-head, allowing angular motion, substantially as set forth.

3. In an anchor having an enlarged headed shank containing a transverse cylindrical opening for axial bolt, a crown-piece integral with two spreading flukes containing a longitudinal slot or opening allowing shank-head to actuate, in combination with an axial bolt, so that the shank has angular motion each sides of flukes, said slot or opening being contracted between the shoulders of the flukes and preventing detachment of shank in case of removal of axial bolt, substantially as specified and set forth.

395,430. STOVE. CHARLES W. EMERSON, Somerville, Mass. Filed Jan. 28, 1888. Serial No. 262,507. (No model.)

Claim.—A stove consisting of an ash-pit and reverse flue-chamber in the base, a grate, a fire-pot, a combustion-chamber, a heating-chamber above the combustion-chamber, provided with a perforated bottom, and a flue leading from the heating-chamber down through the base, a flue leading from the combustion-chamber down into the base and connected therefrom to the smoke-pipe, an air-inlet flue leading upward through the base and exterior to the fire-pot and combustion-chamber, but heated therefrom, into the upper part of the stove, and a casing inclosing all of these parts and perforated, substantially as described.

395,431. WRENCH. GEORGE R. FRANKLIN, Natick, Mass. Filed Apr. 28, 1888. Serial No. 271,582. (No model.)

Claim.—1. In a wrench provided with a fixed jaw, the movable jaw C, to which is pivoted a gripping-plate, D, furnished with the arm *f*, in combination with a spring-lever, E, disposed upon the back of said wrench and pivoted to the movable jaw, and the connecting-links G G, which unite said plate and lever, all operating substantially as and for purposes described.

2. In a wrench, the combination, with the fixed jaw and a movable jaw screw-actuated, of a gripping-plate pivoted to and carried by said movable jaw, and the compound lever system which actuates said gripping-plate, composed of the pivots *c d* in the movable jaw, the operating-lever E, lever-arm *f*, and a link or links, G, uniting said arm and lever, substantially as herein specified.

395,432. WEAR-IRON FOR VEHICLES. JACOB M. R. GERMEY, Little Falls, N. J. Filed Aug. 20, 1888. Serial No. 283,221. (No model.)

395,432.

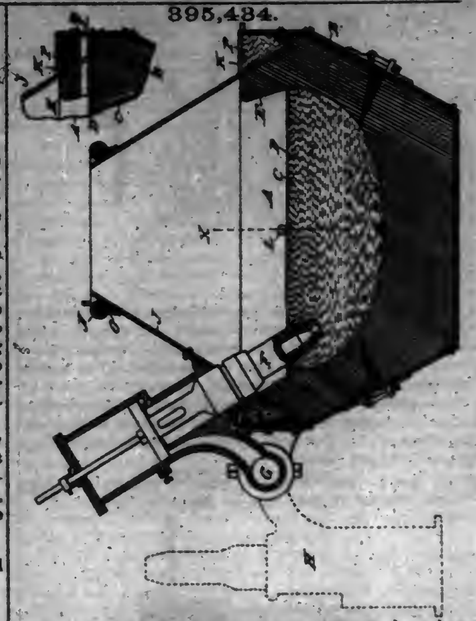
Claim.—1. The combination, with the angle-plate formed with end bearings at its angle, of a roller mounted in said bearings, yielding blocks in said bearings abutting the ends of the roller, and a screw-plug in one of the bearings acting to press the yielding blocks and the roller together, substantially as described.

2. The herein-described wear-iron for vehicles, consisting of an angle-plate formed with a longitudinal socket at one end of its angle, a longitudinal sleeve at the other end thereof threaded internally at its other end, and a concave bearing between and in line with the said sleeve and socket, a plain cylindrical friction-roller mounted to turn in the socket, bearing, and sleeve, a threaded plug screwing longthwise in the outer threaded end of the sleeve, and compressible rubber or kindred blocks interposed between the ends of the roller and the socket-head and screw-plug, respectively, substantially as described.

3. In a wear-iron for vehicles, an angle-plate adapted to set over the angle of the vehicle-body and formed with a longitudinal socket at one end, a longitudinal sleeve at the other end, and a concave roller-bearing connecting and in line with said sleeve and socket, said sleeve, socket, and bearing being all diagonally in front of the angle of the plate, as and for the purpose specified.

395,433. BEVEL-GAGE. MILOS O. GORDON, Monrovia, Cal. Filed July 6, 1888. Serial No. 279,290. (No model.)

Claim.—1. The bevel-gage comprising the hinged-together plates, one being provided with a pointer or index and adapted for application to a planing-tool, while the other is provided with a graduated segmental plate and segmental rods passed through apertured posts applied to the aforesaid plate and provided with thumb-screws engaging said rods, substantially as set forth.



2. The bevel-gage consisting of the hinged-together plates, one plate having plate-like bars provided with clamp-plates, thumb-screws, and slots which receive screw-like studs or pins connecting with said clamp-plates, said latter-referred-to plate also having at its inner edge inwardly-projecting flanges and a pointer or index, while the other plate is provided with segmental rods and a graduated segmental plate, said rods being adjustably held in posts which are secured to the said plate-like bars, substantially as specified.

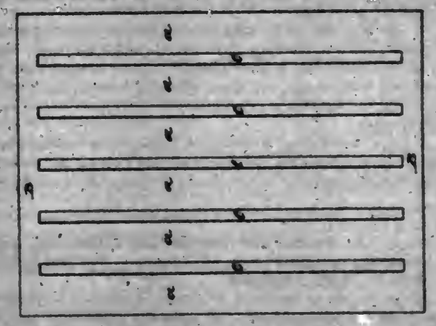
395,434. CONVERTER. FRED. W. GORDON, Philadelphia, Pa., assignor to Gordon, Strobel & Laureau, same place. Filed July 13, 1888. Serial No. 171,868. (No model.)

Claim.—1. In a dephosphorizing-converter, the combination of an acid lining-zone below the metal line and a neutral lining-zone at the metal line, substantially as and for the purpose set forth.

2. In a dephosphorizing-converter, the combination of an acid lining-zone below the metal line and a neutral lining-zone extending

395,434.

from the top of the acid zone upward to or above the slag, substantially as and for the purpose set forth.

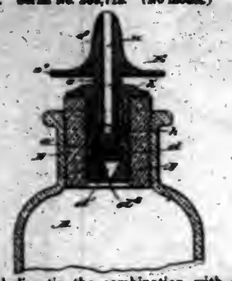


3. In a dephosphorizing-converter, the combination of an acid lining-zone below the metal line, a neutralized acid lining-zone at the metal line, and a cooling-channel in the neutral zone of the lining, substantially as and for the purpose set forth.

4. In a dephosphorizing-converter, the combination of an acid lining-zone below the metal line, a neutralized acid lining-zone at the metal line, a cooling-channel in the neutral zone of the lining, a hood of neutral material reaching upward from the neutralized lining-zone, and means for distributing a cooling agent contiguous but exterior to the splash-receiving surface of the hood, substantially as and for the purpose set forth.

5. In a converter, the combination of a converting-vessel, an acid lining therefor, and a tuyere formed of basic material and disposed free of contact therewith, substantially as and for the purpose set forth.

6. In a converter, the combination of a converting-vessel having a metal shell, an acid lining therefor, a hood joining said shell at about the metal line of the converter and converging upward to a top opening, an annular shower-pipe at the top of the hood, and a trough at the foot of the hood around the lining at the metal line, substantially as and for the purpose set forth.



395,435. STEREOTYPE-PLATE. LEWIS GEE, Upper Montclair, N. J. Filed Mar. 19, 1888. Serial No. 267,883. (No model.)

Claim.—1. The stereotype-plate A, formed with columns *a*, slots C between said columns, and the end pieces, B B, by which the columns are united, substantially as described.

2. The plate A, formed with the grooves *h*, and diagonal slots *j*, forming the angles *P P* with the sides of the groove *h*, substantially as described.

395,436. INHALING-TIP. MYRON S. GREEN, New York, N. Y. Filed Nov. 1, 1888. Serial No. 289,712. (No model.)

Claim.—In an inhaling-tip, the combination, with a socket provided with a longitudinal internally-threaded bore, *d*, having conical walls *d'* at its lower end and a bottom channel, *d²*, leading into said bore, of a stem, E, adapted to screw into the socket, having a nipple-flanged top, *e'*, and a conical lower end, *e*, and provided with a longitudinal aperture, H, extending downward from its top, a diametrical aperture, *h*, crossing the longitudinal aperture at its bottom, and a longitudinal exterior air-channel, *h'*, below the nipple-flange, substantially as shown and described.

395,437. CAR-COUPLING. SAMUEL T. GRIMSLEY, West Plains, Mo. Filed Feb. 13, 1888. Serial No. 263,896. (No model.)

Claim.—1. In a car-coupling, the combination of the draw-head, the spring-arms secured therein and having their free ends arranged to bear close together, and one of said arms having a socket fitted to receive the end of a link, the pin-supporting slide, and a support therefor, substantially as set forth.

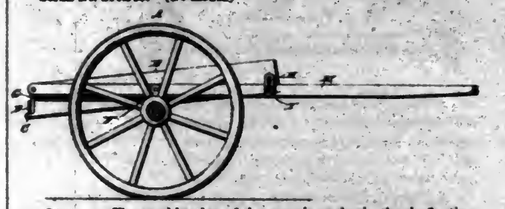
2. The combination, in a car-coupling, of the spring-arms adapted at their free ends to hold the link, a bar secured at one end to and projected upwardly from one of said arms, and the pin-supporting slide mounted on said bar, substantially as set forth.

3. The combination of the draw-head, the spring-arms adapted at their free ends to secure the link, the bar mounted on one of said arms and carrying the pin-supporting slide, and the screw operating between the spring-arms, substantially as set forth.

4. In a car-coupling, the combination of the draw-head, the spring having arms and secured in said draw-head and adapted at its forward end to engage and hold the link, and the auxiliary spring connected with and supplementing said armed spring, substantially as set forth.

5. The combination of the draw-head, the spring secured therein and having arms adapted at their forward ends to engage and hold the link, and the screw operating between the arms of said spring, substantially as set forth.

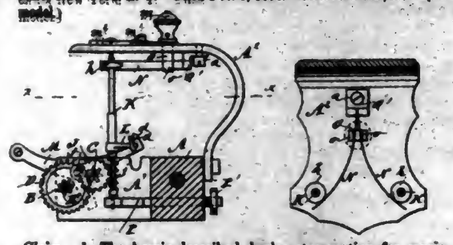
6. The improved car-coupling herein described, consisting of the draw-head, the pin-supporting slide movable under the upper wall thereof, the spring having arms adapted at their forward ends to engage and hold the link, the screw operating between the arms of said spring, and the auxiliary spring, substantially as and for the purposes specified.



7. In a car-coupling, a spring, D, having arms bearing close together at their free ends, and one of the arms having its free end provided with a socket to receive the link, substantially as set forth.

395,438. WATER-PROOF COMPOUND CONTAINING CORK. CARL GRÜNWEG, Ludwigshafen-on-the-Rhine, Germany. Filed June 13, 1888. Serial No. 276,960. (Specimens.)

Claim.—1. As an improved article of manufacture, a granular water-proof and non-heat-conducting compound consisting of ground cork the granules of which are provided with a thin external coating of resin and asphalt, substantially as set forth.



2. As an improved article of manufacture, a compressed water-proof and non-heat-conducting block or body formed of granules of cork coated thinly externally with resin and asphalt, substantially as set forth.

395,439. DUMPING-CART. JOHN C. GUSS, Knoxville, Tenn., assignor of one-half to Claude B. Prescott, same place. Filed June 9, 1888. Serial No. 276,565. (No model.)

Claim.—The combination of the carrying-wheels, the shafts, the brackets securing the shafts to the axle, the end-gate secured rigidly to the rear ends of the shafts, the body supported on the axle and provided at its rear end with the rearwardly-projecting shoulders C, adapted to receive and support the end-gate, and the pins D, projecting upward from the shoulders C in rear of the end-gate, as set forth.

395,440. STOP-MOTION FOR MUSIC-BOXES. GUSTAVE J. JACOBS, New York, N. Y. Filed Feb. 9, 1888. Serial No. 263,432. (No model.)

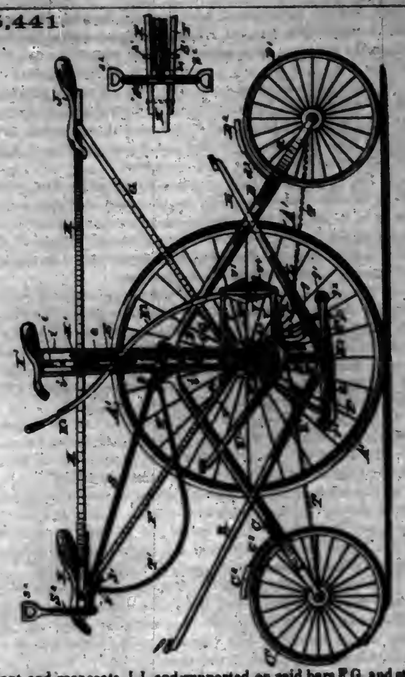
Claim.—1. The herein-described duplex stop-motion for music boxes, which consists of two vertical shafts having stop-arms, a stop-lever for each arm, and a counter-shaft provided with gears for revolving the vertical shafts, substantially as described.

2. The shafts K, provided with the brake-buttons *h*, in combination with the springs N, arranged to press upon the buttons, and the button *m* and fork O, for regulating the springs, substantially as described.

3. The combination, with the shaft C, of the shafts K, the connecting-gear, and the adjusting-plates P, in which the lower ends of the shafts K are journaled, substantially as described.

4. The stop-lever M, having arm M', and studs or projections *d*, in combination with the two shafts K K, stop-arms L L, shaft C, gear-wheels J J, pinion H, shaft B, gear-wheel D, and pinion E, substantially as described.

5. The springs N N, shafts K K, and buttons *h h*, in combination with the fork O, knob *m*, spring-arm *m'*, and notched plate *m²*, all arranged to operate substantially as described.



395,441. VELOCIPEDE. CALVIN JACKSON, Jacksonwald, Pa. Filed Jan. 10, 1888. Serial No. 260,318. (No model.)

Claim.—1. In a velocipede, the main frame constructed with a transversely-ranging frame, E, supported by the driving-wheel axle or axles, and bars F G, connected to said frame E and extending upward and forward and backward, respectively, to support an upper seat-frame, and said bars F G extended below to give support to the fulcrums of treadle-levers operated by riders on the upper seat-frame, substantially as herein set forth.

2. In a velocipede, the combination, with a transversely-ranging frame, E, supported by the driving-wheel axle or axles, of a seat-supporting frame bar or bars pivotally connected to the frame E for lateral movement thereon, and a lower carriage forming part of or connected to the seat-supporting frame bar or bars and swinging therewith, treadle-levers fulcrumed on said carriage, and mechanism connecting said levers with the axle or axles of the machine, substantially as described, for the purposes set forth.

3. In a velocipede, the combination, with the main frame consisting of a frame, E, supported by the driving-wheel axle or axles, a frame bar or bars pivotally connected to the frame E for lateral swinging movement thereon, and a lower treadle-lever carriage forming part of or connected to the seat-supporting frame bar or bars and swinging therewith, of anti-friction rollers H' H³ on the seat-frame and lever-carriage, respectively, which move on the frame E and brace it in vertical position transversely of the machine, substantially as herein set forth.

4. In a velocipede, the combination, with a transversely-ranging frame, E, supported by the driving-wheel axle or axles, of two bars, F G, pivoted to the frame E for lateral movement, a frame, H, carrying front and rear seats, I J, and supported on said bars F G, and stay-bars F F, connected to the lower ends of the bars F G, substantially as shown and described, whereby the laterally-movable frame F G F, while supporting the seats, will also furnish support for treadle-levers operated by the riders on said seats and connected to the driving-wheels for propelling the machine, as herein set forth.

5. The combination, in a velocipede, of a frame, two transversely-ranging axles pivoted at or near their outer ends to said frame and guided for vertical movement at their inner ends, shafts journaled to the frames or supports of said axles and carrying driving-wheels at their outer ends, and connections from the inner ends of said axles and in control of the rider for leveling the axles on transversely-sloping or uneven roads, substantially as herein set forth.

6. The combination, in a velocipede, of a transversely-ranging frame, E, a seat-frame supported thereat, two axles, A B, pivoted at or near the ends of the frame E and guided for vertical movement at their inner ends, rotating shafts A^4 B^4 in the axles A B and carrying driving-wheels A' B', a rack, *n*, on the frame E, a pulley and gear-wheel, M N, journaled on the seat-frame, said gear-wheel engaging the rack *n*, and a chain or belt, O, on said pulley and connected at opposite ends to the inner ends of the axles A B, substantially as described, for the purposes set forth.

7. The combination, in a velocipede, of a transversely-ranging frame, E, frame-bars F G, pivoted thereon for lateral movement and adapted to support a seat-frame and extended below their pivot e^3, stay-bars F F, connected to the lower ends of the bars F G and forming with them a lower carriage, treadle-levers fulcrumed on said carriage, driving-wheels A' B', supported on axles A B, pivotally connected to the ends of the frame E, mechanism, substantially as described, connected with the inner ends of both axles and adapted for leveling the axles, treadle-levers fulcrumed on the lower frame-carriage, and mechanism connecting the driving-wheel shafts with these levers, substantially as shown and described, whereby the seat-frame and treadle-lever carriage will swing laterally as the axles are leveled by depressing the treadle-levers, as and for the purposes set forth.

8. The combination, in a velocipede, of a transversely-ranging frame, E, having a rack, *n*, front and rear diagonally-ranging bars, F G, pivoted on the frame E for lateral movement, a seat-frame, H, supported on the bars F G, a pulley and gear-wheel, M N, journaled on the frame, said wheel N engaging the rack *n*, axles A B, pivoted at or near the ends of the frame E and guided for vertical movement at their inner ends, rotating shafts A^4 B^4 in said axles and carrying driving-wheels A' B', a chain or belt, O, on said pulley M and connected at opposite ends to the inner ends of the axles A B, and said frame-bars F G extended below their pivot e^3, bars F' F', connected to the bars F G and forming with them a lower carriage, treadle-levers fulcrumed on said carriage, pulleys on the driving-wheel shafts or axles, and belts connecting said pulleys with the treadle-levers, substantially as described, for the purposes set forth.

9. The combination, in a velocipede, and with a transversely-ranging frame, E, a seat-frame, H, supported thereat for lateral movement, and driving-wheels supporting said frame and mounted in axles pivoted to the frame E and connected at their inner ends to a device for leveling the axles, substantially as specified, of a latch device on the seat-frame engaging the frame E for locking the seat-frame at any desired lateral adjustment, substantially as herein set forth.

10. In a velocipede, the combination, with the main frame supported by side driving-wheels, of front and rear wheels, C D', bars C D, connected to said wheels C, a steering-bar jointed to the bars C D, and chains T, connecting the axles of the wheels C D' or their bars C D with the axle or axles of the main side driving-wheels, substantially as described, for the purposes set forth.

11. In a velocipede, the combination, with the main frame supported by side driving-wheels, of front and rear wheels, C D', bars C D, connected to said wheels C D', respectively, a universal joint connected to said bars, and an axially-movable steering-bar connected to the universal joint and in control of the rider for flexing said joint and operating both wheels C D' simultaneously in steering the vehicle, substantially as herein set forth.

12. In a velocipede, the combination, with the main frame comprising a transverse frame, E, supported by side driving-wheels, of front and rear frame-bars, F G, having a forked construction at their upper parts, front and rear wheels, C D', bars C D, connected to said wheels C D', respectively, and passed through the forked parts of the bars F G as guides, a universal joint connected to the bars C D, and an axially-movable steering-bar, S, connected to the universal joint and in reach of the rider for flexing said joint and operating both wheels C D' simultaneously, as herein set forth.

13. In a velocipede, the combination, with the main frame supported by driving-wheels, of front and rear wheels, C D', bars C D, connected to said wheels C D', coupling-sections R' R^2, connected pivotally at *r* and pivoted to the bars C D by pins c^2 d^2, ranging at right angles to the pivot *r*, and an axially-movable steering-bar, S, connected to the pivot *r* and controllable by the rider, substantially as herein set forth.

14. In a velocipede, the combination, with the main frame supported by side driving-wheels and a seat-frame thereon, of front and rear wheels, C D', bars C D, connected to said wheels C D', respectively, a universal joint connected to said bars, an axially-movable steering-bar connected to the universal joint and in control of the rider, and a spring, T, held at one end to the seat-frame and at its other end to the steering-bar, substantially as described, for the purposes set forth.

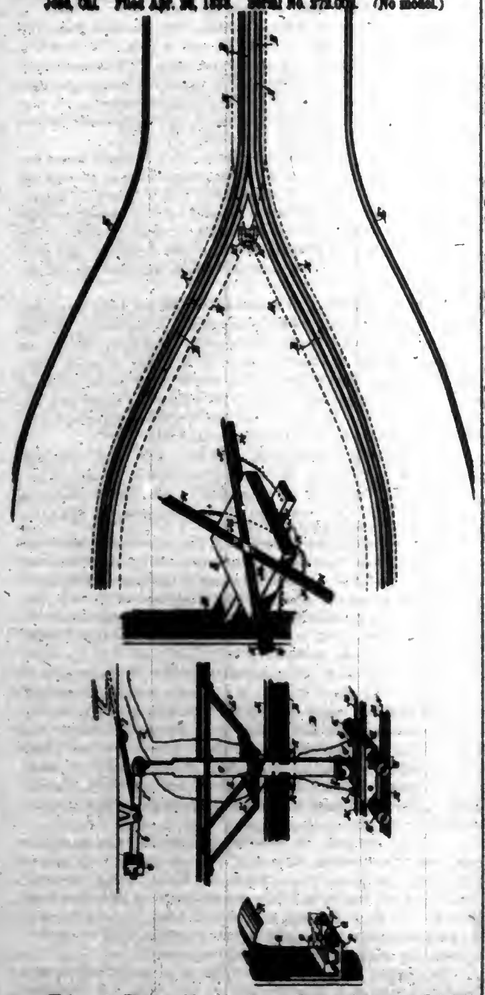
15. In a velocipede, the combination, with the main frame supported by side driving-wheels and supporting a seat-frame, of front and rear wheels, C D', bars C D, connected to said wheels C D', respectively, a universal joint connected to said bars, an axially-movable steering-bar, S, connected at one end to the universal joint and supported at its other end in a collar, S', held to the seat-frame, and in which collar the bar S has axial and lengthwise movement, substantially as described, for the purposes set forth.

16. A velocipede constructed with two short axles, each supported pivotally at or near its outer end on a suitable frame and carrying a driving-wheel, and the inner ends of said axles connected to a device for leveling the axles, and side seats supported on said axles, substantially as herein set forth.

17. A velocipede constructed with two short axles, each supported pivotally at or near its outer end on a suitable frame and carrying a driving-wheel, and the inner ends of said axles connected to a device for leveling the axles, side seats supported on the axles, pulleys on the driving-wheel shafts of the axles, and treadle-levers fulcrumed on supports held to said axles and connected to the pulleys, substantially as herein set forth.

18. In a velocipede, the combination, with a frame, an axle or axles, and driving-wheels thereon, of side seats mounted on the axle or axles, clutch-pulleys on the shafts of the driving-wheels, treadle-levers fulcrumed on the axle or axles or on frames held thereto, and hand-levers, also fulcrumed on the axle or axles or on the frames thereon, and said treadle and hand levers geared together for simultaneous operation, substantially as shown and described, whereby both hand and foot power may be used to propel the vehicle, as herein set forth.

19. In a velocipede, the combination, with a frame, an axle or axles, and driving-wheels thereon, of seats mounted on the axle or axles, clutch-pulleys on the shafts of the driving-wheels, frames V, fixed to the axle-frames, treadle-levers fulcrumed to said frames and provided with segmental gear v^4, and hand-levers, also fulcrumed on the frames V, and having segmental gear v^5, meshing with the gear v^4, substantially as described, for the purposes set forth.



20. The combination, in a velocipede, of a transversely-ranging frame, E, a seat-frame supported thereat, two axles, A B, pivoted at or near the ends of the frame E and guided for vertical movement at their inner ends, rotating shafts A^4 B^4, journaled to the frames of

the axles A B and carrying driving-wheels A' B', and a pulley and belt device connected with the inner ends of both axles and adapted for leveling the axles on transversely-sloping or uneven roads, substantially as described, for the purposes set forth.

21. The combination, in a velocipede, of a transversely-ranging frame, E, a seat-frame supported thereat, two axles, A B, pivoted at the ends of the frame E and guided for vertical movement at their inner ends, rotating shafts A^4 B^4 in the axles A B and carrying driving-wheels A' B', and mechanism, substantially as described, connecting the inner ends of the axles to the seat-frame, whereby as the axles are leveled the seat-frame will be shifted laterally on the main frame, as and for the purposes set forth.

22. In a velocipede, the combination, with a frame, two transversely-ranging axles pivoted at or near their outer ends to said frame and guided for vertical movement at their inner ends, shafts journaled to the frames or supports of said axles and carrying driving-wheels at their outer ends, and connections from the inner ends of said axles and in control of the rider for leveling the axles, substantially as specified, of clutch-pulleys on the wheel-shafts, levers fulcrumed on the frame or axles, and straps connecting the levers and clutch-pulleys, a pulley journaled on the frame, and a cord or belt running on this pulley and connected at opposite ends to the driving-wheel clutch-pulleys, substantially as shown and described, whereby the pair of clutch-pulleys and levers will be reversed by downstroke of one of the levers and the clutch-pulley and lever connections will steady the inner ends of the driving-wheel shafts and axles, as and for purposes herein set forth.

395,442. CONDUIT ELECTRIC RAILWAY. BYRON JENNINGS, San José, Cal. Filed Apr. 26, 1888. Serial No. 272,002. (No model.)

Claim.—1. The combination, in a railway, of two parallel lines of track, a single underground tube or tunnel between the two with a slot through which connection is made with its interior from above, and parallel slot-irons upon which the inner rails of the two lines of track are formed or secured, substantially as herein described.

2. The underground tube or tunnel with a slot and parallel slot-irons at the top, said irons having rails formed with or secured to their outer edges and forming the inner rails of two lines of railway, the outer rails of which are parallel with the slot-irons upon opposite sides thereof, substantially as herein described.

3. The underground tube or tunnel having the yokes or frames forming its outline and supporting the combined slot-irons and inner track-rails, in combination with the transverse frames secured to the yokes, and the outer line of track secured to and supported on the frames to form a double line of parallel tracks and a single tube in one structure, substantially as herein described.

4. The trolley or truck through which connection is made between the electric conducting-rails within the tube and the motor on a car traveling upon the rails above, the shank C, by which the trolley or tube is suspended, and a movable slide through which the shank passes, in combination with the levers, by which it is raised and lowered to make and break the connection, and the adjustable counter-balance-weight, substantially as herein described.

5. The combination of the truck or trolley with its suspending shank, the movable slide through which said shank passes, the operating-levers, and the double or universal joint whereby the trolley automatically adjusts itself, substantially as herein described.

6. The truck or trolley through which communication is made between the electric conducting-rails and the motor, and the shank C, by which it is suspended and raised and lowered, in combination with the brace-rods fixed to the car, the guide, and the slide through which the shank C passes, substantially as herein described.

7. The conductor-supports bolted to the yokes within the tube and having the horizontal slotted tables, in combination with the glass insulating-chairs upon which the conducting-rails rest, said chairs having shanks extending into the slots in the tables and movable therein, substantially as herein described.

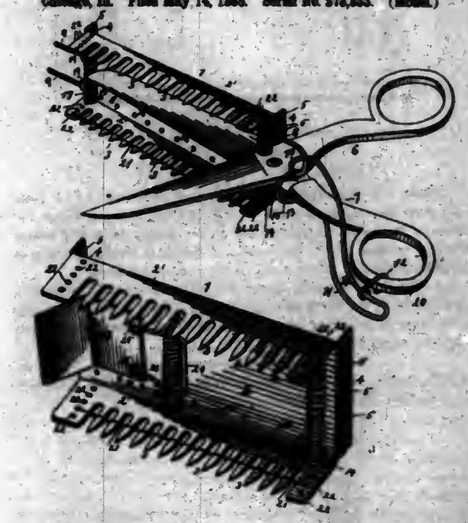
8. The horizontal slotted supports for the conductors bolted to the sides of the tube and having upturned sides or edges, in combination with insulating-chairs resting upon the supports, and the rails supported in the chairs, so as to automatically adjust themselves to the expansion and contraction, substantially as herein described.

9. The conducting-rails supported in insulating-chairs and having the depressions or channels formed in the upper surface, in combination with the re-enforcing wire-conductor fitted into said channel, so as to make a contact with the truck or trolley, which travels upon the rails, substantially as herein described.

10. The electric conductors supported within an underground tubular tunnel, in combination with the shields curved upward and outward and extending from the sides of the tunnel toward the center, so as to overhang the conductors and protect them, substantially as herein described.

11. The slotted underground tube or tunnel with the electric conductors, the truck or trolley through which connection with the conductors is made and broken, and the wires leading from the truck through the slot to the motor on the car, in combination with the shank C, having inclosing and protecting sleeves or collars surrounding the wires where they pass between the sides of the slot, substantially as herein described.

395,443. WALL-PAPER HANGER. LOUIS E. KENWORTHY, Ackworth, Iowa. Filed May 10, 1887. Serial No. 237,760. (No model.)



Claim.—1. In a machine for hanging wall-paper, the combination of the track or guide A, having the flanges B projecting from opposite sides of its face, the frame having the rollers I I bearing against the inner sides of the flanges, the shaft P, projecting laterally from one side of the frame and to which the roll of paper is adapted to be secured, the shaft K, journaled in said frame, projecting laterally from one side thereof, and having the rotating brush W, to bear against the roll of paper, and the wheels L L, engaging the outer side of the track, the fountain to supply paste to the brush, and the smoothing-brush Z, substantially as described.

2. In a paper-hanging machine, the combination, with the guide-track, of the traveling frame thereon and projecting from one side of the track, the main shaft K, journaled in the frame and having the wheels L engaging the track, the shaft P for the roll of paper, journaled in the frame, the rod R, secured to the frame, (said shaft P and rod R being on opposite sides of the main shaft,) the rotating brush W, secured to the main shaft, the fountain, and the smoothing-brush Z, attached to shaft R, substantially as specified.

3. In a paper-hanger, the combination of the guide-track, the main frame adapted to slide thereon, and having the main shaft K, provided with the wheels L, engaging the track, the said shaft having the projecting ends on opposite sides of the main frame, the shaft P, journaled in the main frame and adapted to slide longitudinally therein, the rod R, secured to the main frame and also movable longitudinally, the brush W, adapted to be attached to either end of the shaft K, and the brush Z, adapted to be secured to either end of the rod R, substantially as described.

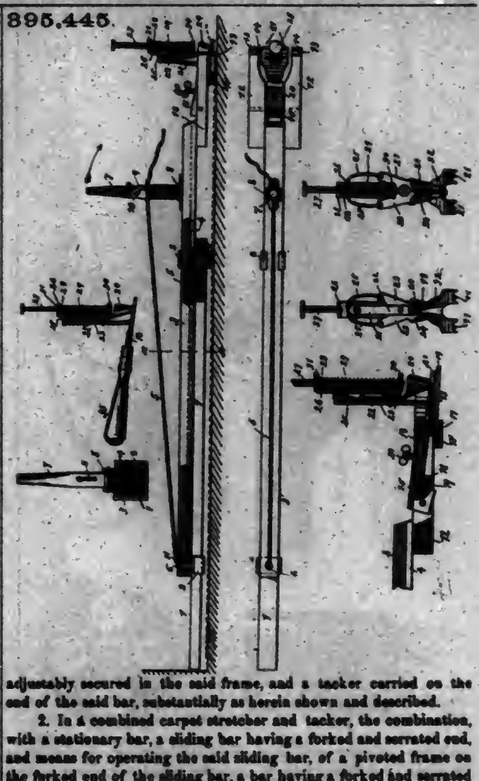
395,444. APPARATUS FOR CUTTING HAIR. MARCUS KLEIN, Chicago, Ill. Filed May 14, 1888. Serial No. 273,833. (Model.)

Claim.—1. An apparatus for cutting hair, consisting of a double comb-frame provided with a scissors-securing frame and steadying-rests for one of the blades of the scissors, in combination with a pair of scissors having its blades located between the combs, substantially as described.

2. An apparatus for cutting hair, consisting of a double comb-frame provided with a scissors-securing frame laterally adjustable thereon and steadying-rests for one of the blades of the scissors, in combination with a pair of scissors having its blades located between the combs, substantially as described.

3. In an apparatus for cutting hair, the double comb-frame 1, formed with a bottom, 2, having a series of holes, 16, and lips 4, with perforations 5, sides 2', with teeth 3, and adjustable scissor-blade rests consisting of coiled springs 14 and 17, secured by wires 15 and 18 to the bottom of said frame, substantially as described.

4. In an apparatus for cutting hair, the double comb-frame 1, formed with a bottom, 2, having a series of holes, 16, and lips 4, with perforations 5, sides 2', with teeth 3, adjustable scissor-blade rests consisting of coiled springs 14 and 17, secured by wires 15 and 18 to the bottom of the frame 1, and the scissor-blade stop consisting of a bent plate, 23, with a U-shaped wire, 24, engaging the coiled spring 17, substantially as described.



5. The combination, with a double comb-frame, 1, having sides 2', with teeth 3, and the series of holes 22 at the ends of sides 2', of a wire, 21, extending over and engaging the teeth 3, substantially as described.

6. The combination, with a double comb-frame, 1, having the series of holes 16 in its bottom, and having adjustable coiled-spring rests 14 and 17, also secured to said bottom, and depending lips 4 with holes 5, of the wire frame 7, with straight portions 8, extending through the lips 4 and secured by nuts 19, and the loops 10, with a wire guard, 13, the curved portions 11, with a hook, 12, and the scissors 6, having one of its blades resting in the coiled springs 14 and 17 and its pivotal portion located within the loops 10, and the guard 13 and the hook 12, engaging the thumb-hole 20 of said scissors, substantially as described.

395,445. CARPET STRETCHER AND TACKER. ANSEL F. LAMB, Stockbridge, Vt. Filed Apr. 28, 1888. Serial No. 271,907. (No model.)

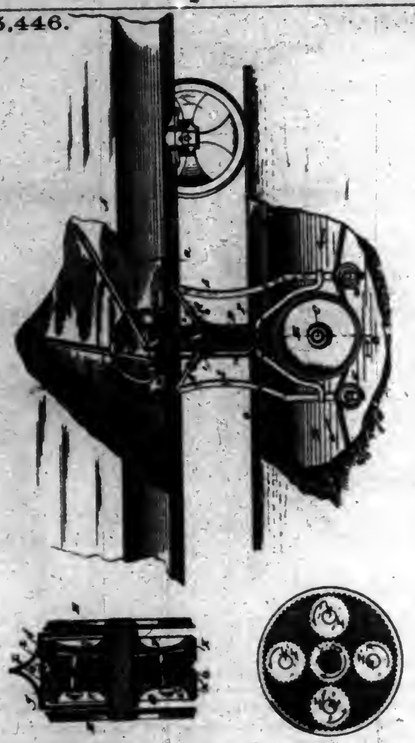
Claim.—1. In a combined carpet stretcher and tacker, the combination, with a stationary bar and a sliding bar having a forked and serrated end, of a pivoted frame on the end of the sliding bar, a bar

395,445.

adjustably secured in the said frame, and a tacker carried on the end of the said bar, substantially as herein shown and described.

2. In a combined carpet stretcher and tacker, the combination, with a stationary bar, a sliding bar having a forked and serrated end, and means for operating the said sliding bar, of a pivoted frame on the forked end of the sliding bar, a bar having a forked and serrated end and adjustably secured in the pivoted frame, and a tacker on the forked end of the said adjustable bar, substantially as herein shown and described.

3. In a combined carpet stretcher and tacker, the combination of a stationary bar, a sliding bar having a forked and serrated end, a lever pivoted to the sliding bar and provided with a catch, a rope secured to the stationary bar, passed under and through an aperture in the sliding bar and engaged by the catch on the said lever, a pivoted frame on the forked end of the sliding bar, a bar having a forked and serrated end and adjustably secured in the pivoted frame, and a tacker on the forked end of the said bar, substantially as herein shown and described.



4. The combination, with the bar 16, having a forked and serrated end, and the standard 22, carried by said bar and provided with the bracket 26, of the arms 23, pivoted to the standard and having partly closed and tapering lower ends, the spring-arms 25, for holding the arms 23 closed, the plunger 27, working in the bracket 26, and the spring 29, surrounding the plunger, substantially as herein shown and described.

5. A combined carpet stretcher and tacking mechanism, consisting of the main bar 1 and the extensible bar 3 sliding thereon, held together by means of the sleeves 2, the outer end of the sliding bar 3 being formed with a forked head, 12, having the arms 13 and cross-piece 13' and serrated ends 14, and the frame 15, pivoted in the forked head 12 and having mounted therein a bar, 18, secured by the set-screw 20, and formed with a forked end having serrated points 21, and a tack-driving mechanism consisting of a standard, 22, mounted on the forked end of the bar 18, and provided with pivoted arms 23, having the lower tapering folded ends, 24, and the spring-arms 25, connected with their upper ends, and a spring-actuated plunger, 27, mounted on the frame 22, together with means for extending the sliding bar 3 consisting of the cord 5, fastened in the inner end of the bar 1, passing through a groove, 4, in the bottom of the bar 3, and an opening, 6, in the end of the bar 3, and secured to a lever, 7, mounted on the bar 3, by means of a pivoted catch, 9, substantially as described.

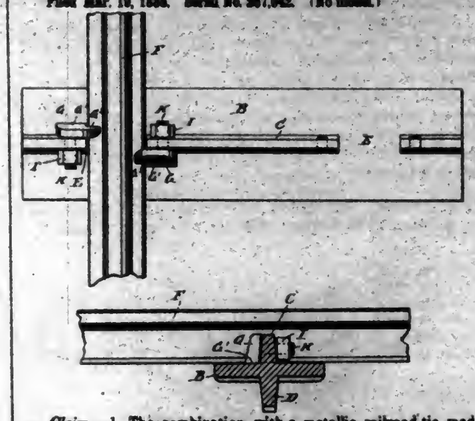
395,446. APPARATUS FOR TRANSMITTING POWER. THERON W. LEMBURG, Duluth, Minn. Filed Mar. 26, 1888. Serial No. 268,894. (No model.)

Claim.—1. In a device for transmitting a motion to a wheeled vehicle, the combination, with the standard B, a transverse shaft, C, journaled therein, the wheels B E, secured to the outer ends of said

395,446.

shaft, and means for reversing the motion of said shaft, substantially as described, of the inverted rails supported above the wheels, as and for the purpose described.

2. In a device for transmitting a reversible motion from a continuous-running cable to a car, the combination, with the standard B, the shaft C at its lower end, and means, substantially as described, for reversing the motion of said shaft, of the bars S, carrying cable-supporting sheaves T at their lower ends and connected at their upper ends to the standard B, and means, substantially as described and shown, for raising and lowering said bars, as and for the purpose specified.

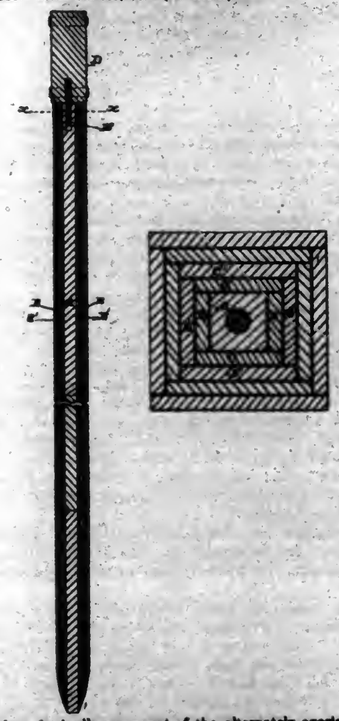


3. In a device for transmitting a reversible motion to a car, the combination, with the standard B, secured to said car, of the shaft C, the wheels secured on the outer ends thereof, the band-wheels F G, mounted on said shaft, the wheel F arranged for frictional contact with the cable, and the intermediate gearing for reversing the motion of said shaft, all arranged substantially as and for the purposes described.

4. In a device for transmitting a reversible motion to a car, the combination, with the standard B, carrying at its lower end the reversing mechanism, substantially as described, and provided with the yoke P, of the bars S, carrying the cable-sheaves T, said bars S guided in the yoke P, as shown, and means, substantially as described, for raising and lowering the bars S, as and for the purpose set forth.

5. In a device for transmitting a reversible motion to a car, the combination, with the standard B, the shaft C, the wheels E E, secured on said shaft, the inverted track-rails *d d*, and the gear J, fixed on said shaft C, of the band-wheels F G, loosely mounted on the shaft C, the intermediate gearing arranged on said band-wheels, said gearing imparting reversible motion to the gear J and shaft, the band-wheel F being arranged for frictional contact with the cable, substantially as and for the purpose specified.

6. In a device for transmitting a reversible motion to a car, the combination, with the standard B, the shaft C, journaled therein, the wheels E E, secured on said shaft, the inverted rails *d*, and the gear J, of the pulley F, loosely mounted on the shaft C and adapted to be revolved by contact with the cable, said wheel F provided with annular beveled flange *f*, provided with internal cogs, the pulley G, loosely mounted on said shaft C, the gears I, mounted on one face of the pulley G and adapted to gear with the cog-flange of the wheel F and the gear J, and suitable brake mechanism, substantially as shown, for holding either of the wheels F and G from turning, all arranged substantially as and for the purpose described.

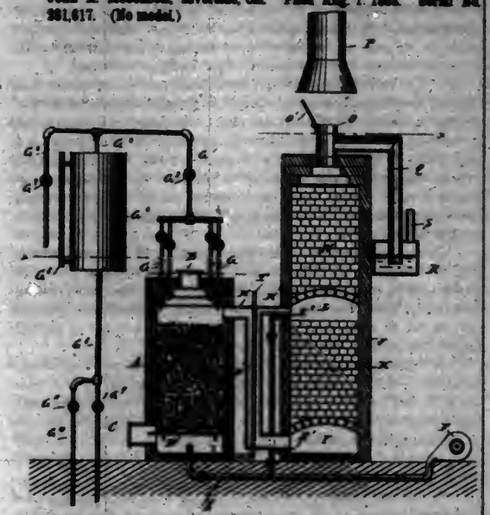


395,447. RAILROAD-TIE. MICHAEL MALONEY, Ironton, Ohio. Filed Mar. 19, 1888. Serial No. 267,842. (No model.)

Claim.—1. The combination, with a metallic railroad-tie made cross shape in cross-section and having openings in its top flange and offsets on its horizontal flanges, and a downwardly-extending flange, of a bolt secured to the top flange and having a head projecting on the base of the rail, substantially as shown and described.

2. A railroad-tie made cruciform in cross-section and formed with offsets B' D' on the lower face of its flanges B and on the lower edge of its flange D, the upper flange, C, having rail-receiving recesses, substantially as set forth.

395,448. PILE. ROBERT B. MARKLE, Westport, Cal. Filed Aug. 21, 1888. Serial No. 283,373. (No model.)



Claim.—1. A pile composed of the alternately overlapping sections secured together at right angles with each other, substantially as and for the purpose herein described.

2. A pile composed of alternately overlapping sections secured together at right angles, in combination with an intermediate filling of a preservative compound between each series, substantially as herein described.

3. A pile composed of strips or sections and overlapping each other successively at right angles, said sections being made in lengths, having

the adjacent abutting end joints at a distance from each other, substantially as herein described.

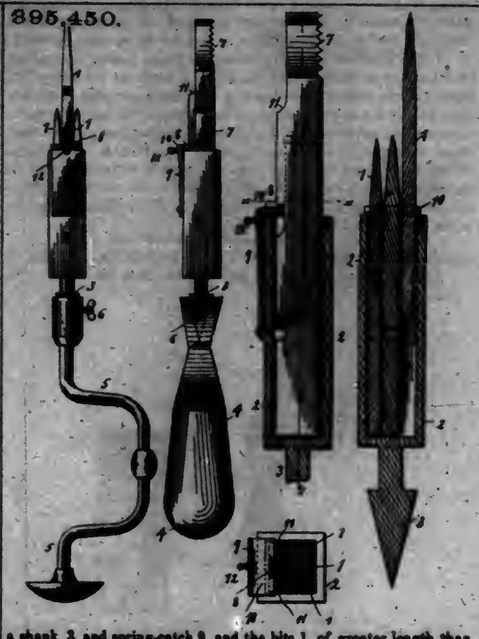
395,449. APPARATUS FOR THE MANUFACTURE OF GAS. JOHN A. MCCOLLUM, Riverside, Cal. Filed Aug. 1, 1888. Serial No. 281,617. (No model.)

Claim.—1. In a gas-making apparatus, the combination, with a furnace, of oil-supply pipes discharging into the top of the said furnace, a double fixing-chamber filled with checker-bricks and having two fire-places, being connected by pipes with the said furnace, and a blast-pipe discharging into the said fire-places, and also into the bottom of the said furnace, substantially as shown and described.

2. In a gas-making apparatus, the combination, with a furnace, of oil-supply pipes discharging into the top of the said furnace, branch pipes leading from the said furnace, a superheater filled with checker-bricks and having two fire-places into which discharge the said branch pipes, and a blast-pipe discharging into the said furnace at its bottom, and also provided with branch pipes leading into the said fire-places of the fixing-chamber, substantially as shown and described.

3. In a gas-making apparatus, the combination, with a furnace, of oil-supply pipes discharging into the top of the said furnace, branch pipes leading from the said furnace, a fixing-chamber filled with checker-bricks and having two fire-places into which discharge said branch pipes, a blast-pipe discharging into the said furnace at its bottom, and also provided with branch pipes leading into the said fire-places of the superheater, and a steam-pipe passing through one of the said branch pipes into the bottom of the said furnace, substantially as shown and described.

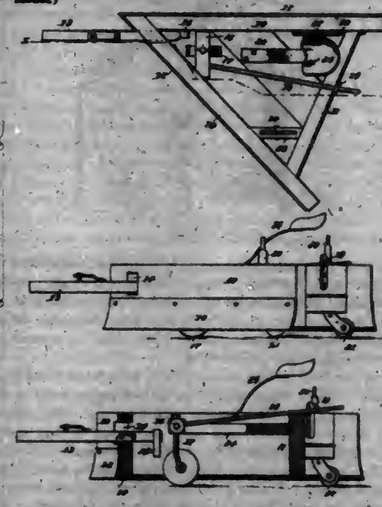
4. In a gas-making apparatus, the combination, with a furnace, of oil-supply pipes discharging into the top of the said furnace, branch pipes leading from the said furnace, a fixing-chamber filled with checker-bricks and having two fire-places into which discharge said branch pipes, a blast-pipe discharging into the said furnace at its bottom, and also provided with branch pipes leading into the said fire-places of the fixing-chamber, a steam-pipe passing through one of the said branch pipes into the bottom of the said furnace, and a pipe leading from the upper end of the said superheater and connected with a washer, substantially as shown and described.



5. In a gas-making apparatus, the combination, with a furnace, of oil-supply pipes discharging into the top of the said furnace, branch pipes leading from the said furnace, a fixing-chamber filled with checker-bricks and having two fire-places into which discharge said branch pipes, a blast-pipe discharging into the said furnace at its bottom, and also provided with branch pipes leading into the said fire-places of the fixing-chamber, a steam-pipe passing through one of the said branch pipes into the bottom of the said furnace, and a valve held on the upper end of the said fixing-chamber to discharge into a smoke-stack, substantially as shown and described.

395,450. SCREW-DRIVER. CHARLES B. HOSMAN, Telluride, Colo. Filed Mar. 22, 1888. Serial No. 268,117. (No model.)

Claim.—1. In a compound screw-driver, the combination, with the detachable casing and its spring-catch 9, of the projecting bits 1 1, having the beveled shoulder 11 and notch 8 on one edge and the serrations 7 on the other, said bits being of greater length than the casing, so that their serrated ends project therefrom, as shown and described.

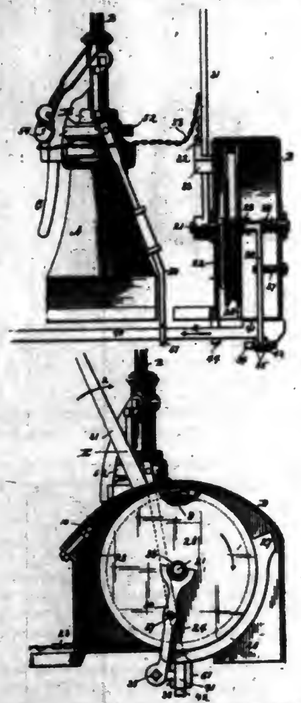


2. In a screw-driver, the combination of a casing, provided with

395,450.

a shank, 3, and spring-catch 9, and the bits 1, of greater length than the casing, and each provided with a notch, 8, and shoulder 11, substantially as herein shown and described.

395,451. ROAD GRADER AND DITCHER. MARLOW F. PERRY, West Osceola, N. Y. Filed July 16, 1888. Serial No. 280,141. (No model.)



Claim.—1. The combination, with the triangular scraper, of the transverse rock-shaft 16, pivoted between the converging ends of the side bars, a caster-wheel, 17, having its shank depending from the said shaft, a vertically-movable lever connected at its forward extremity to the said rock-shaft for rocking it, and means for locking the said lever, the parallel vertical forwardly-swinging levers 20, pivoted at or near their lower rearwardly-curved ends within the rear end of the frame, and provided with wheels at their lower ends, substantially as set forth.

2. The combination, with a triangular frame, cutting or scraping blades secured to the base of the same, and a draft-beam pivoted in the forward end of the frame parallel with one side beam, of a rock-shaft journaled in the forward portion of the frame, a caster-wheel pivoted in said rock-shaft, a horizontal lever attached to the rock-shaft, vertical levers secured to the inner side of the frame at the rear, wheels pivoted in the lower end of said vertical levers, and

means, substantially as shown and described, for retaining the said levers in a predetermined position, as and for the purpose specified.

3. The combination, with a triangular frame, cutting or scraping blades attached to the face of the frame, a draft-bar pivoted to the frame parallel with one side beam, a rock-shaft journaled in the forward end of the said frame, and a caster pivoted in said rock-shaft, of vertical levers pivoted to the inner sides of the frame at the rear, wheels secured to the lower extremity of said vertical levers, racks inclosing the upper portion of the said levers, a horizontal lever attached to the rock-shaft, and a cleat secured to the rear of the frame adapted to engage the said horizontal lever, all combined to operate in the manner set forth.

395,452. INTERLOCKING SWITCH AND SIGNAL. ROBERT B. PORTER, Hilburn, N. Y. Filed Jan. 20, 1888. Serial No. 261,301. (No model.)

Claim.—1. The combination, with an automatic switch-stand and signal devices which tend automatically to go to the danger position, of a reciprocating rod connected to move with the switch-rails, and a clutch or locking device which operates to hold the signal devices in their safety position, and arranged to be operated by the said rod when moved, substantially as described.

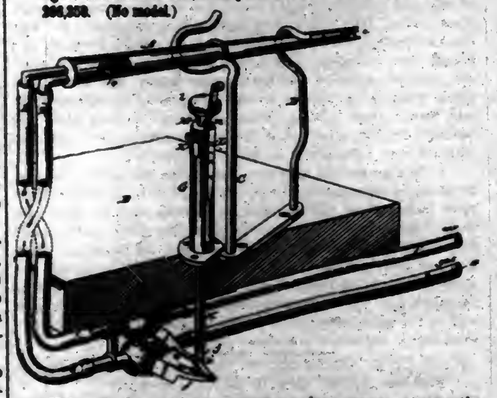
2. The combination, with an automatic switch-stand and signal devices which tend to automatically go to the danger position, of a reciprocating rod connected to move with the switch-rails, a clutch or locking device which normally holds the signal devices against automatic movement, arranged to be operated by the said rod to release the signal devices, and an obstructing device operated by the signal devices and normally arranged in the path of the said rod when the signal is set to the safety position, substantially as described.

3. The combination, with the switch-stand having a vertically-moving block, E, and the signal devices, of a reciprocating rod, 40, connected to move with the switch-rails, a connecting-rod, 50, between the reciprocating rod and the block E, and an obstructing device actuated by the signal devices and arranged above and in the path of the rod 40 when the signal is set in the safety position, substantially as described.

4. The combination, with the switch-actuating devices and the signal devices, of a reciprocating rod connected to move longitudinally with the switch-rails, a connecting-rod between the reciprocating rod and a moving part of the switch-actuating devices, arranged to move the reciprocating rod transversely while the switch-actuating devices are moved, and an obstructing device connected with the signal devices and arranged by the side of the reciprocating rod when the signal is set to safety position to obstruct its transverse movement, substantially as described.

5. The combination, with the switch-rails and the switch-stand A, of the reciprocating rod 40, connected to move with the switch rails, a connecting-rod between the rod 40 and a moving part of the switch-stand, arranged to move the rod 40 transversely when the switch stand is operated, the wheel 20, by which the signal is operated, and an obstructing projection carried by said wheel and arranged to lie in the path of the rod 40 when the signal is set to "safety," to obstruct its transverse movement, substantially as described.

6. The combination, with the switch-rails and the switch-stand A, having the vertically-moving block E, of a reciprocating rod, 40, connected to move with the switch-rails, a connecting-rod between the rod 40 and the block E, the wheel 20, by which the signal is operated, and a flange, 26, provided with an expanded end, 27, carried by said wheel, said flange being arranged to lie above the rod 40 when the signal is set to "safety," and the expanded end 27 being arranged to one side of the rod 40 when the signal is set to "danger," substantially as and for the purpose set forth.



7. The combination, with the switch-rails, of the reciprocating rod 40, connected to move therewith, a signal-operating wheel, 20, loose upon its shaft, but normally held clutched thereto, an operating-handle by which the wheel is turned, and a shipping-lever operated by the rod 40 when reciprocated to throw the wheel out of engagement with its shaft, substantially as set forth.

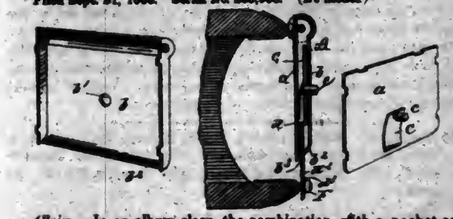
8. The combination, with the switch-rails, of the rod 40, connected to move with the switch-rails, a signal-operating wheel, 20, loose upon its shaft, but normally held clutched thereto by a spring, a shipping-lever adapted to slide the wheel on its shaft out of engagement with its clutching device, and an adjustable contact-arm carried by the shipping-lever in the path of the rod 40 as it moves with the rails to the danger position, substantially as described.

9. The combination, with the switch-rails, a switch-stand, A, and the signal devices, of the rod 40, connected to move with the switch-rails, a connecting-rod between the rod 40 and a moving part of the switch-stand, a signal-actuating wheel, 20, loose upon its shaft, but normally held clutched thereto by a spring, an interlocking or obstructing device operated by the signal-actuating wheel to be moved into the path of the rod 40 to obstruct the same when the signal is set to "safety," and a shipping-lever for releasing the wheel from its shaft and provided with a projection in the path of the rod 40, substantially as set forth.

10. The combination, with the switch-rails, a switch-stand having a vertically-moving block, E, and the signal devices, of the reciprocating rod 40, connected to move with the switch-rails, the connecting-rod 50 between the block E and the rod 40, which latter is seated in a loop, 51, through which it slides freely, a signal-operating wheel 20, loose on its shaft, but normally held clutched thereto, the operating-handle 31, by which the wheel is turned, the flange 26, carried by said wheel and arranged above the rod 40 when the signal is set to "safety," whereby it obstructs the upward movement of the rod by the connecting-rod 50, and a shipping-lever for releasing the wheel from its shaft, provided with a projection in the path of the rod 40, substantially as set forth.

395,453. BLOW-PIPE. EDWARD B. POWERS, Taunton, Mass., assignor to Reed & Barton, same place. Filed Mar. 6, 1888. Serial No. 266,268. (No model.)

Claim.—1. In a soldering apparatus, the arrangement upon the work-bench B of the vertical standard C, having its upper end bent laterally to form a support for the blow-pipe, the vertically-sliding valve-rod H, and the guide G therefor, arranged close alongside and slightly in advance of said stand, as shown and described, whereby the head of the valve-rod is in front of the vertical bend of the stand, as shown, and for the purpose specified.

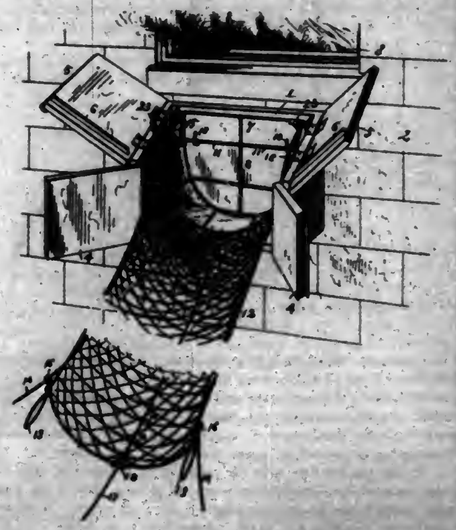


2. In a soldering apparatus, the combination, with a work-bench, a hollow standard secured vertically thereto, the blow-pipe, the air and gas tubes, and cut-off valves applied to said tubes, of a spring-supported rod arranged and adapted to slide within the said standard and connected with and operating the valves, and a catch which automatically engages the rod when the latter is depressed, and thereby holds the valves closed, as shown and described.

3. In a soldering apparatus of the class hereinbefore specified, the combination, with the blow-pipe, the air and gas tubes, valves for the latter, and a vertical guide, G, of the valve-rod working in said guide, a collar affixed to the valve-rod, and a spring-catch attached to the guide and having an inward bend or projection forming a shoulder, as specified, whereby the catch is adapted to engage with said collar when the rod is forced down, thus locking the valves in the open position.

4. In a soldering apparatus of the class hereinbefore specified, the combination of the spring-catch having the inward bend or projection forming a shoulder, the valve-rod having a collar which is located between its head and the guide in which the rod works, and is adjustable on said rod, the valves, and air and gas tubes, and a blow-pipe proper with which the latter connect, as shown and described.

5. In a blow-pipe apparatus, the combination, with the bench, the air-tube 1 and gas-tube 2, of the valves E and F, having the respective arms *e f*, of which the latter is longer than the former, the connecting-link *i*, the vertically-sliding rod H, the standard or tubular guide G, supported upon the bench, all as shown and described, whereby when said rod is depressed the air-valve is closed and the gas-valve but partly closed, as specified.



395,454. ALBUM-CLASP. LOUIS B. FRANAU, Brooklyn, N. Y. Filed Sept. 21, 1888. Serial No. 285,966. (No model.)

Claim.—In an album-clasp, the combination, with a pocket and a spring-pawl held within the pocket and provided with a button extending outward through one wall of the pocket, of a plate adapted to slide within the pocket and provided with ratchet-teeth engaging said pawl, and the stop for said plate, substantially as shown and described.

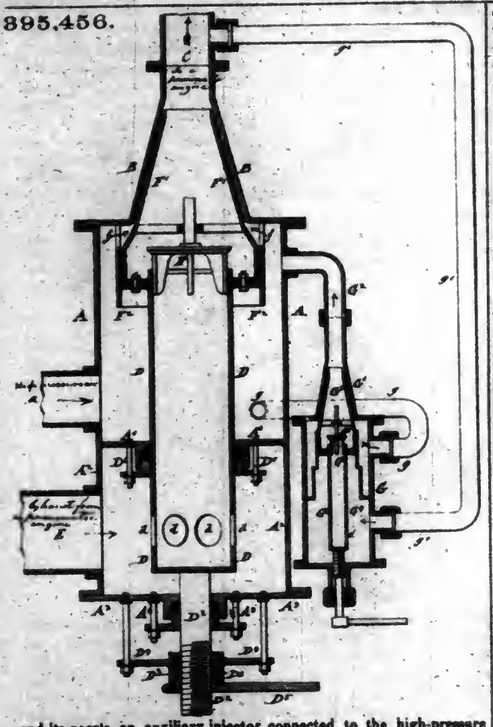
395,455. FIRE-ESCAPE. RUDOLPH A. REED, Hoboken, N. J., and EDWARD PFEIFFENOVER, New York, N. Y. Filed Nov. 2, 1888. Serial No. 289,790. (No model.)

Claim.—1. A fire-escape consisting of a casing with automatically-opening doors attached to a building, a frame with a U-shaped front projection detachably secured in the casing, with a trough-shaped chute attached at one end to the U-shaped projection, which gives the chute a U-shaped or trough form, and ropes extending lengthwise of and beyond the chute for detaching the frame from the casing, and drawing it down therefrom, substantially as shown and described.

2. A fire-escape chute constructed of netting and having secured at one end a frame formed with a U-shaped portion, to which the end of the chute is secured, giving it a U or trough shape, and a vertical rear portion adapted to engage retaining devices in a receptacle, substantially as described.

3. A fire-escape consisting of a casing attached to a building and formed with self-opening doors in front and spring-actuated opening-doors on top, a frame held in the casing by hooks and having a U-shaped front projection, a chute of netting secured at one end to the U-shaped projection and having hand-holds at its lower end, and ropes for detaching the frame from the retaining-hooks, which ropes pass over pulleys in the casing and through guides in the sides of the chute to and beyond its lower end, and a rope for drawing down the frame, and netting connected to the frame extending beneath the chute and through guides therein and beyond the lower end of the chute, substantially as shown and described.

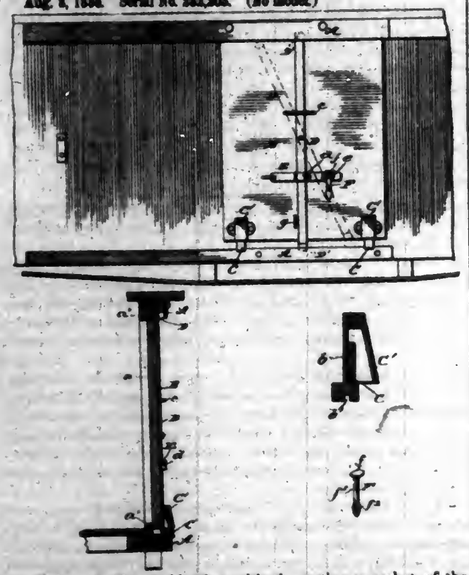
395,456. ATTACHMENT FOR COMPRESSED-AIR ENGINES. ALBERT BAUER, Pittsburg, Pa. Filed Mar. 19, 1888. Serial No. 267,681. (No model.)



Claim.—1. The combination of a high-pressure air-cylinder, an injector communicating with said cylinder and the induction end of a pneumatic engine, an interior cylinder communicating with the eduction-pipe of said engine, and a check-valve at that end of the interior cylinder communicating with the injector, substantially as set forth.

2. The combination, with a high-pressure cylinder provided with the injector-nozzle connected with the induction end of a pneumatic engine, of an interior cylinder connected to the eduction end of said engine, a nozzle at the inner end of the interior cylinder, a check-valve in said cylinder, and means for adjusting the interior cylinder and its nozzle to the exterior nozzle of the high-pressure cylinder, substantially as set forth.

3. The combination of a high-pressure air-cylinder, an injector communicating with said cylinder and the induction end of a pneumatic engine, an interior cylinder communicating with the eduction end of said engine and at the opposite or inner end with said injector, and an auxiliary injector communicating with the high-pressure cylinder and the outlet-pipe of the same, so as to establish an equilibrium of pressure in the high-pressure cylinder and the outlet-pipe, substantially as set forth.



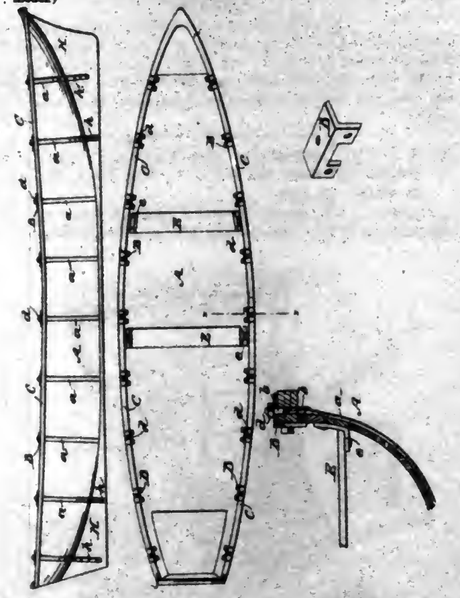
4. The combination of a high-pressure cylinder provided with an injector-nozzle connected to the induction end of a pneumatic engine, an interior cylinder connected to the eduction end of said engine, the inner end of the interior cylinder being provided with a nozzle and a check-valve, means for adjusting the interior cylinder

395,456.

and its nozzle, an auxiliary injector connected to the high-pressure cylinder and to the outlet-pipe of the same, and means for adjusting the auxiliary injector, substantially as set forth.

395,457. CAR-DOOR. EDWARD B. SEARLES, Baltimore, Md. Filed Aug. 2, 1888. Serial No. 282,203. (No model.)

Claim.—1. The combination, with the casting or socket, of the shoe or bearing, its horizontal portion having in the lower surface a groove or passage, its upper portion formed into a vertical arm entering the socket and having a loose connection therewith, whereby it is adapted to transverse play within said socket, substantially as shown and described.



2. The combination, with the casting or socket having one of the faces of its chamber flared or inclined outward and downward toward its lower edge, of the shoe or bearing of step-like shape having in the lower surface of its horizontal portion a groove or passage, its upper or vertical portion entering the chamber, said portion adapted to transverse movement in said chamber, whereby it will rest against the vertical portion of said chamber when the door is open and against the inclined wall when the door is closed, substantially as and for the purpose described.

3. The combination, with the door fitting into the door-opening and flush with the outer side of the car-body and the rails applied to said car-body, of the shoes or bearings each of a step-like shape and having in the lower surface of its horizontal portion a groove or passage, their upper ends formed with upwardly-projecting arms, and the sockets or castings applied to said door and having interior chambers which receive the projecting arms of the bearings, forming a loose connection therewith, whereby said arms have a transverse movement in said chambers or sockets, substantially as and for the purpose specified.

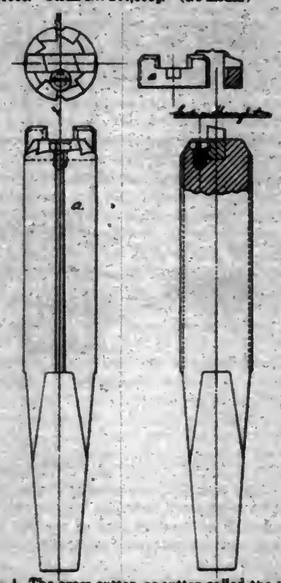
4. The combination, with the door fitting into the door-opening and flush with the outer side of the car-body and the rails applied to said car-body, of the lever centrally pivoted to the door and having its ends fitting between the car-body and rails, the hasp connected to the door and having its central portion spanning said lever, while its slotted free end receives a staple projecting from the door, the pin or bolt for insertion into said staple, sockets connected to the door, and the shoes, their lower faces riding upon the rails, their upper ends projected and loosely fitted into the sockets, whereby said sockets are adapted to transverse movement on said shoes, substantially as herein before described.

5. The combination, with the door fitting into the door-opening and flush with the outer side of the car-body and the rails applied to the car-body, of the lever centrally pivoted to the door and having its ends fitting between the car-body and rails, the hasp connected to the door and spanning the lever, the lever stop and keeper applied to the door, the staple projecting from the door through the slot in the hasp, the pin or bolt for insertion into said staple, sockets connected to the door, and the shoes, the lower faces thereof riding upon the rails, their upper ends projected and loosely fitted into the sockets, whereby said sockets are adapted to transverse movement on said shoes, substantially as and for the purposes described.

395,458. BOAT. ALBERT L. SEARS, St. Louis, Mich., assignor to himself and William S. Turk, same place. Filed Oct. 11, 1886. Renewed Oct. 27, 1887. Again renewed May 17, 1888. Serial No. 274,198. (No model.)

Claim.—1. The method of constructing a vessel, which consists in first bending the planking over a form, then securing the ends of the planking at the stem and stern, and finally passing transverse bands around the structure from the gunwale and adjusting the bands to draw the longitudinal edges of the planking together, the said bands then serving as permanent braces, substantially as set forth.

2. The combination, with the planking or frame of a vessel, of outer transverse adjustable braces secured at their ends to the gunwale, whereby the longitudinal edges of the planking may be drawn together by adjusting said bands, substantially as set forth.



3. The combination, with a vessel, of outer transverse braces passed around the hull and having threaded ends extending up through the gunwale, and nuts thereon for drawing the edges of the planking together, substantially as set forth.

4. The combination, with a vessel and the angle-irons B, secured to the gunwale thereof, and having vertical apertures, of the outer braces passed around the hull and having their ends formed or provided with bolts extending through the vertical apertures in the angle-plates, and tightening-nuts on the threaded ends of the bolts, by tightening which the longitudinal edges of the planking may be drawn together, substantially as set forth.

5. The combination, with a vessel having outer transverse grooves therein, of the adjustable braces extending through or within said grooves and secured at their ends to the gunwale, substantially as set forth.

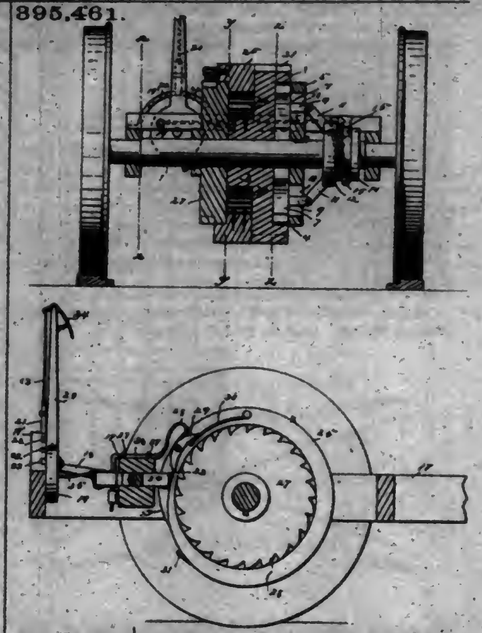
6. The combination, with a vessel having removable outer clamping-bands, of a keel having straps or securing devices connected with said clamping-bands, whereby the bands and keel may be removed together for repair, substantially as set forth.

395,459. BORING-TOOL. JOHN BEHRLE, Jersey City, N. J. Filed June 19, 1888. Serial No. 277,000. (No model.)

Claim.—1. The cross-cutter, or cutter called the "advance cutter," in combination with the rose-bit, for the purpose herein described in this specification.

2. The cross-cutter B in connection with the screw C, in combination with the rose-bit A.

395,460. OIL-FEED FOR LAMPS. CHRISTIAN GERBOLD, Salinas, Cal. Filed Mar. 30, 1888. Serial No. 268,974. (No model.)



Claim.—1. The combination, with the lamp body or vessel A, having an inlet in its bottom, of the float D within the body, a depending tube, *d*, extending down through the said inlet, and having an opening, *g*, through one side and a cup on its lower closed end, substantially as set forth.

2. The combination, with a lamp-body, A, having a depending tube, *b*, of a float, D, within the body, a pipe, *d*, closed at its lower end, suspended from the float, passing down through the tube *b*, and provided in its side with an opening, *g*, said opening being below the lower end of the tube *b* when the float is lowered, substantially as set forth.

395,461. CAR BRAKE AND STARTER. JOHN R. SWAIM, Hoosburg, Ind. Filed Sept. 5, 1888. Serial No. 284,612. (No model.)

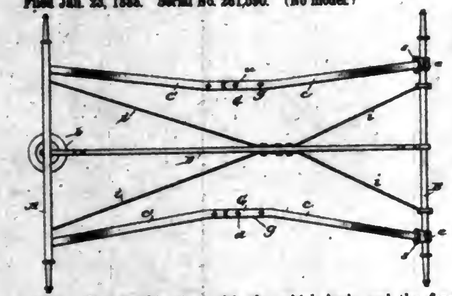
Claim.—1. A car starter and brake consisting of a toothed disk mounted on a car-axle, a pawl on the car-frame engaging the toothed

disk, a second toothed disk mounted on the car-axle, a ring loosely mounted on the second toothed disk, located between the toothed disks and having a spring-actuated pawl adapted to engage the second toothed disk, a coiled spring located within the ring and having one end secured thereto and the other to the first toothed disk, a spring-actuated pin and arm on the car-frame adapted to hold the ring from turning in the same direction with first toothed disk, and holding the pawl of the ring out of engagement with second toothed disk, a sleeve movable lengthwise on the car-axle and having sliding friction-blocks adapted to engage the first toothed disk, and a lever mechanism for operating the ring-engaging pin, the pawls of toothed disks and the friction-blocks and their disk on the axle, substantially as shown and described.

2. In a car starter and brake, toothed disks mounted on a car-axle, a loose ring located between the toothed disks and inclosing a coiled spring having one end secured to the ring and the other to one of the toothed disks, a spring-actuated pawl for holding one of the disks from turning in one direction, a spring-actuated pin and sliding arm on the said pin, and a spring-pawl on the ring for holding the latter from turning in the opposite direction to toothed disk connected with the coiled spring, and a lever mechanism for disengaging the ring from the car-frame and engaging it with the second toothed disk, substantially as shown and described.

3. The combination, with disk 1, having teeth 31, and spring-pawl 32, disk 27, with teeth 28, ring 25, loosely mounted on disk 27, and having tooth 33 and spring-pawl 29, and spring 26, connected at one end to ring 25 and at the other to disk 1, of lever 20, with spring-pawl 21, disk 19, cord 35, and sliding spring-pin 34, with bent arm 36, adapted to engage ring 25, and pawl 29, substantially as shown and described.

4. The combination, with disk 1, of disk 5, projecting into disk 1 and having sliding friction-blocks 7, adapted to bear against disk 1, with arms 9, pivoted bars 11, sleeve 12, connected by spline 13 to axle 2 and movable laterally thereon, and having circular groove 14, and forked lever 16, engaging groove 14, connecting-rod 18, and lever 20, with spring-pawl 21, and the disk 19, to which rod 18 is eccentrically pivoted, substantially as shown and described.



5. The disk 1, with teeth 31 and spring-pawl 32, disk 27, with teeth 28, ring 25, loosely mounted on disk 27 and having tooth 33 and spring-pawl 29, spring 26, connected at one end to ring 25 and at the other to disk 1, disk 5 projecting into disk 1 and having sliding friction-blocks 7, adapted to bear against disk 1 with arms 9, pivoted bars 11, and sleeve 12, movable laterally on axle 2 and having circular groove 14, in combination with lever 20, having spring-lever 24, rod 23, and pawl 21, engaging notches 22 in bar 19', disk 19, cord 35, sliding spring-pin 34, with bent arm 36, rod 18, eccentrically pivoted to disk 19, and forked lever 16, connected at one end to rod 18, and at the other having pins 15, engaging slot 14 in sleeve 12, substantially as shown and described.

395,462. FIGURED FABRIC. THOMAS TAYLOR and JACOB WARBURTON, Bolton, County of Lancaster, England. Filed Dec. 9, 1887. Serial No. 257,414. (Specimens.) Patented in England Dec. 13, 1886, No. 16,284.

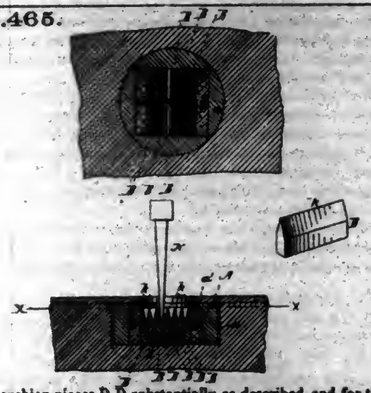
Claim.—A figured fabric, of relatively fine and coarse weft and relatively fine and coarse warp threads, having raised figures in fine weaving upon a level ground or surface composed of the coarser-warp threads and finer-weft threads interwoven as calico or plain cloth, in combination with a backing composed of the coarser-weft threads interwoven with the finer or face warp, said coarser-weft threads lying between the face-cloth and the back warp where the figure comes, substantially as herein described and illustrated.

395,468. VEHICLE-SPRING. JAMES F. THOMAS, Alexandria, Nebr. Filed Jan. 23, 1888. Serial No. 261,590. (No model.)

Claim.—The combination, with the vehicle-body and the front and rear axles, of the continuous bowed side springs, G G, bent laterally inward at the middle parts, *g*, and there secured to the vehicle-body or cross-piece thereof, thence diverging in straight lines outward and clipped to the front and rear axles, substantially as set forth.

395,464. MILK-REFRIGERATOR. C. BRADLEY TRAVER, Brooklyn, N. Y. Filed Oct. 1, 1887. Serial No. 251,258. (No model.)

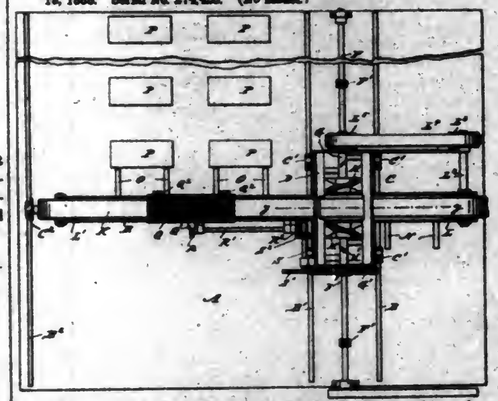
Claim.—1. A refrigerator box or case provided with a lining having ledges, as 5 6, and a lid for closing said case, combined with a false bottom resting upon ledge 5, a removable receptacle passing centrally through said false bottom, and a cover surrounding the mouth of said receptacle and resting upon ledge 6, substantially as set forth.



2. A refrigerator box or case provided with a lining having ledges, as 5 6, and a lid for closing said case, combined with a false bottom resting upon ledge 5, a removable receptacle passing centrally through said false bottom and provided with perforations at its top, and a cover surrounding the mouth of said receptacle above the perforations and resting upon ledge 6, substantially as set forth.

3. A refrigerator box or case provided with a lining having ledges, as 5 6, and a lid for closing the box or case provided upon its under surface with felt, and with a handle, as 16, combined with a false bottom resting upon ledge 5, a receptacle passing centrally through said false bottom and perforated at its top, and a cover surrounding the mouth of said receptacle and resting upon ledge 6, substantially as set forth.

395,465. LAST. FRED M. WADE, Campello, Mass. Filed Aug. 31, 1888. Serial No. 284,301. (No model.)



Claim.—In a last or other article in which nails are frequently driven, the combination of the metal case A, having a circular exterior and an interior square chamber, with the knife-edge pieces B and

395,465.

elastic cushion-pieces D D, substantially as described, and for the purpose set forth.

395,466. MOLDING AND MOLD-DISTRIBUTING MACHINE. MARTIN W. WALKER and WILLIAM JOWITT, Sing Sing, N. Y. Filed May 19, 1888. Serial No. 274,425. (No model.)

Claim.—1. In a molding and mold-distributing machine, the combination, with a carriage, of an endless belt mounted on the said carriage, and a flask-filling machine held on the said carriage and through which said endless belt passes, substantially as shown and described.

2. In a molding and mold-distributing machine, the combination, with a carriage, of an endless belt mounted on the said carriage and carrying the flasks, a casing held on the said carriage through which said belt passes, and means, substantially as shown and described, for filling the molds while passing through the said casing, as set forth.

3. In a molding and mold-distributing machine, the combination, with a carriage, of an endless belt mounted on the said carriage and carrying flasks, a casing held on the said carriage and containing sand to be filled into the molds, said belt passing through the said casing, a shaft journaled in the said casing, and spiral plates secured to the said shaft to press the sand into the molds on the said belt, substantially as shown and described.

4. In a molding and mold-distributing machine, the combination, with a carriage, of an endless belt mounted on the said carriage, a casing on the said carriage and containing sand to be filled into the flasks, said belt passing through the said casing, a shaft journaled in the said casing, spiral plates secured to the said shaft to press the sand into the molds on the said belt, and arms held on the said shaft to agitate the sand in the said casing, substantially as shown and described.

5. In a molding and mold-distributing machine, the combination, with a carriage, of an endless belt mounted on the said carriage, a casing on the said carriage and containing sand, a box held in the said casing, being open at its ends and provided in its sides with openings, said belt passing through the said box, and means, substantially as described, for filling the flasks while passing through the said box, as set forth.

6. In a molding and mold-distributing machine, the combination, with a carriage, of an endless belt mounted on the said carriage, a casing on the said carriage and containing sand, a box held in the said casing, being open at its ends and provided in its sides with open-

ings, said belt passing through the said box, and means, substantially as described, for filling the flasks while passing through the said box, comprising a shaft journaled in the said casing, and spiral plates secured to the said shaft and abutting at their inner ends on the sides of the said box, to press the sand through the openings in the said box into the flasks, substantially as shown and described.

7. In a molding and mold-distributing machine, the combination, with tracks laid on the foundry-floor, of a carriage on the said tracks, a casing secured on the said carriage, a shaft journaled in the said casing and carrying spiral plates, and an endless belt mounted on the said carriage, passing through said casing and being operated from the said shaft, substantially as shown and described.

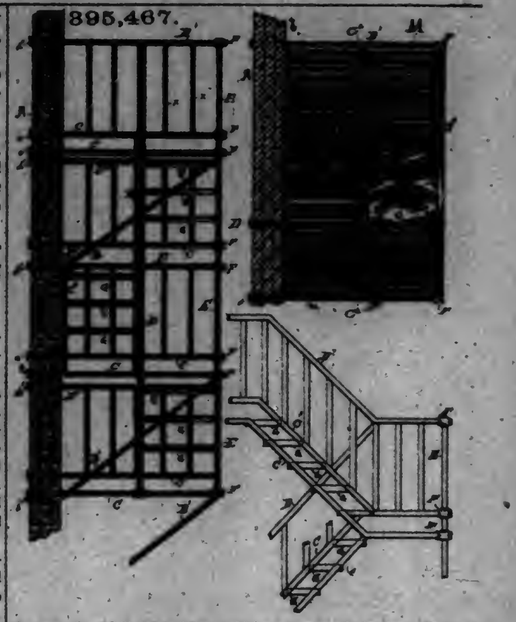
8. In a molding and mold-distributing machine, the combination, with tracks laid on the foundry-floor, of a carriage on the said tracks, a casing secured on the said carriage, a shaft journaled in the said casing and carrying spiral plates, an endless belt mounted on the said carriage, passing through said casing and being operated from the said shaft, and a frame held on the said carriage and having guideways which support the said belt, substantially as shown and described.

9. In a molding and mold-distributing machine, the combination, with tracks laid on the foundry-floor, of a carriage on the said tracks, a casing secured on the said carriage, a shaft journaled in the said casing and carrying spiral plates, an endless belt mounted on the said carriage, passing through said casing and being operated from the said shaft, a frame held on the said carriage and having guideways which support the said belt, and a sieve hinged on the upper guideway and discharging into the upper part of the endless belt, so that the sand passes into the casing, substantially as shown and described.

10. In a molding and mold-distributing machine, the combination, with tracks laid on the foundry-floor, of a carriage on the said tracks, a casing secured on the said carriage, a shaft journaled in the said casing and carrying spiral plates, an endless belt mounted on the said carriage, passing through said casing and being operated from the said shaft, a frame on the said carriage and having guideways which support the said belt, a sieve hinged on the upper guideway and discharging into the upper part of the endless belt, so that the sand passes into the casing, and means, substantially as described, for imparting a swinging motion to the said sieve from the shaft in the casing, as set forth.

11. In a molding and mold-distributing machine, tracks held on the foundry-floor, bottom boards located on the foundry-floor, and a shaft having a rotary motion and provided with pinions, in combination with a carriage on the said tracks, a casing mounted on the said carriage, a shaft passing through the said casing and provided with a gear-wheel meshing into one of the said pinions, spiral plates secured on the said shaft in the said casing, a box formed longitudinally in the said casing and provided with open ends and openings in the sides, an endless belt operated from the said shaft in the casing, passing through the said box and supporting the flasks to be filled, a frame held on the said carriage and provided with guideways supporting the said endless belt, and arms projecting from the lower guideway, substantially as shown and described.

12. In a mold and mold-distributing machine, the combination, with a casing containing the sand, of a box open at its ends and held longitudinally in the said casing, the sides of the said box being provided with openings, spiral plates journaled in the said casing and abutting at their inner ends at the sides of the said box, and a belt passing longitudinally through the said box and supporting the flasks to be filled, substantially as shown and described.



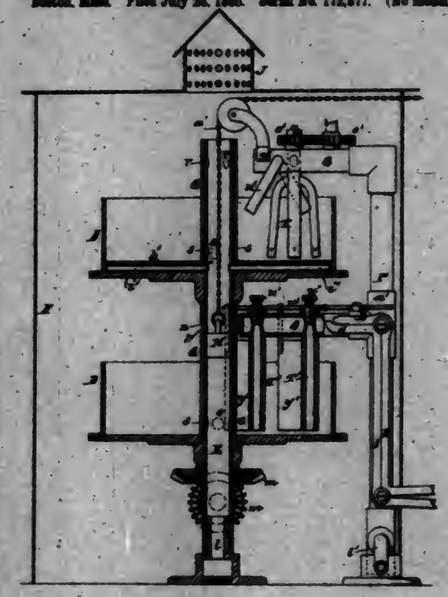
395,467. FIRE-ESCAPE. ALEXANDER WELSH and HAMILTON J. ROGERS, Bennett's Station, Pa. Filed Sept. 14, 1888. Serial No. 285,412. (No model.)

Claim.—1. In a stairway or fire-escape attached to the outside wall of a building, the outer hand-railing, the inner hand-railing, stringers, steps, uprights, and the braces secured to the building and to the uprights, all substantially as described.

2. In a fire-escape, the combination of the inner hand-railing secured to the wall of the building and formed of one continuous piece, and constructed substantially as described, the outer hand-railing composed of three sections, the double sets of stringers, the steps, and platforms, with the uprights and braces secured thereto by means of clamps, all constructed and arranged substantially as and for the purpose described.

3. In a permanent fire-escape attached to the outside wall of a building, the combination of the bars D', secured to the wall A and held therein by means of the nuts *d'*, the bars D^2, curved as described and secured to the rods D' and uprights E E by means of clamps F, the stringers C C, secured in the wall A and held therein by nuts *c*, the stringers C' C', attached to stringers C C and uprights E E by clamps F, and the stringers C^2 C^2 and C^3 C^3, secured to stringers C C, with the steps G, secured on stringers C' C' and C^2 C^2 and on stringers C^2 C^2 and C^3 C^3, uprights E E, braces B and B', clamps F and F', and

395,467.



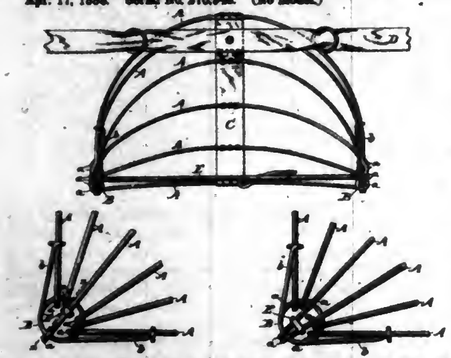
the nuts *b* and *b'*, for holding said braces securely in the wall A, all constructed and arranged substantially in the manner as and for the purpose described.

4. In a stairway or fire-escape, the combination, with the stringers C' C' and C^2 C^2, constructed and arranged as described and attached to stringers C C, of the steps secured thereto as shown, substantially as described.

5. In a fire-escape of the character described, the rod or inner rail, D', secured to the wall A by nut *d* and curved and bent upon itself substantially in the manner described, said rod being formed in one continuous piece, as set forth.

6. In a fire-escape, the combination of the uprights E E, rails D' D^2, the inner hand-rail, D, substantially as described, and the stringers C C C' C' C^2 C^2 C^3 C^3, with the braces B B', clamps F F', and nuts for securing said braces to the wall of the building, all constructed and arranged substantially in the manner as and for the purpose described.

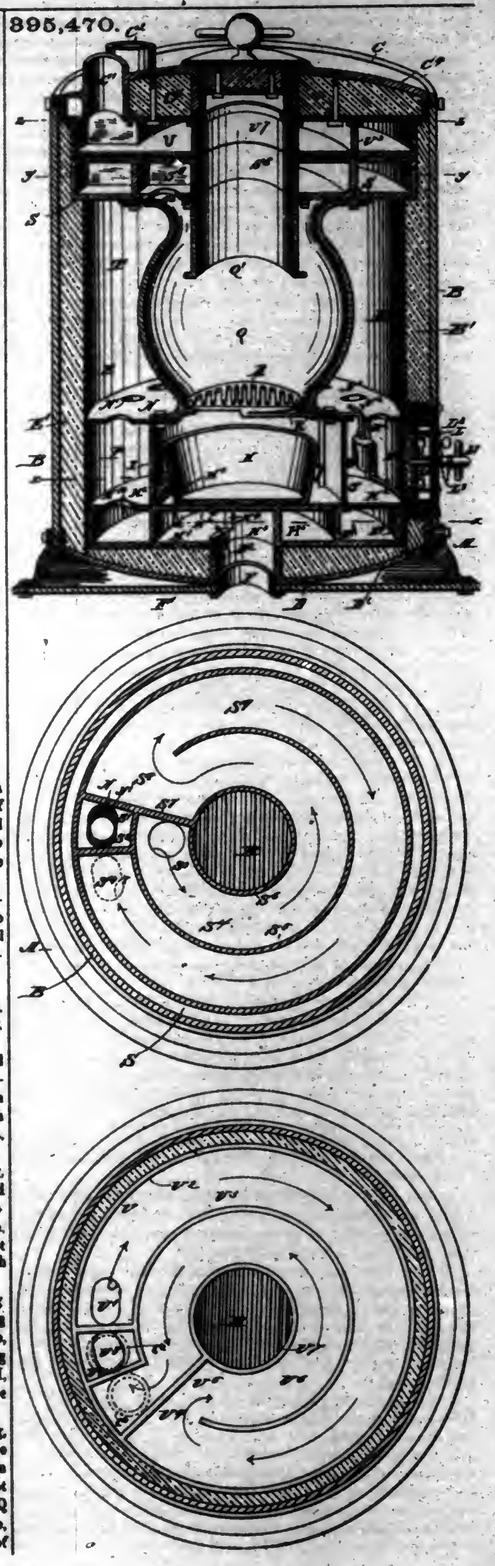
395,468. APPARATUS FOR MAKING MALT. JESSE WHITNEY, Boston, Mass. Filed July 26, 1888. Serial No. 279,677. (No model.)



Claim.—1. The combination, in a malting apparatus, of the horizontal pan or pans, the vertical hollow shaft E, to which they are attached, and means for rotating said shaft, which is provided with inlet and outlet apertures *r s*, one or more sleeves, G, provided with lateral apertures *s o*, and the valve H, which is vertically adjustable within said shaft, essentially as and for the purpose specified.

2. The combination, with a horizontal pan in which the grain to be treated is placed and on the vertical hollow shaft to which said pan is attached, and means for rotating the same, said shaft having one or more lateral outlets *s* for the grain from the pan, and an adjustable perforated sleeve or valve controlling said outlet or outlets, of a stirrer within the pan arranged to one side of the vertical axis of the pan and composed of axially-adjustable arms or legs T, provided with side wings or vanes, *y*, essentially as specified.

3. The combination, in a malting apparatus, of a horizontal pan for containing the grain to be treated, a vertical hollow shaft to which the said pan is attached, and means for rotating said shaft, the perforated pipes *i*, attached to and radiating from the latter at the bottom of the pan, and the screen *K*, all substantially as shown and described.



395,469. BUSTLE. HENRY C. WILLIAMS, New Britain, Conn. Filed Apr. 17, 1888. Serial No. 270,942. (No model.)

Claim.—1. The herein-described bustle, consisting, mainly, of a series of bows hinged at each end upon a pivotal eye, and a pair of springs, part of the bows being hinged upon one side of said eyes and a part of the bows extending across said pivotal eyes and hinged to the opposite side of said eyes, substantially as described, and for the purpose specified.

2. In a bustle, the combination of the series of bows and expanding springs, with a pivotal eye at the terminal ends of said bows, to which they are hinged, one of said bows extending across the pivotal eyes, and the cord E, attached to said bow at the center of said pivotal eyes, substantially as described, and for the purpose specified.

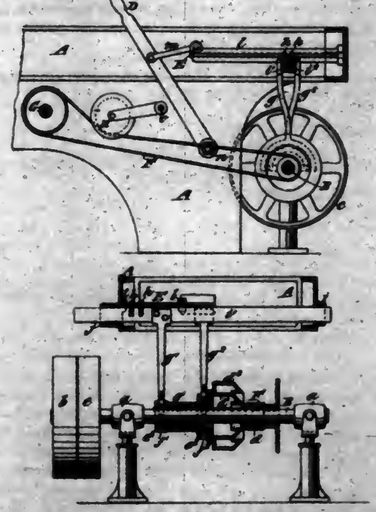
395,470. CAR-HEATER. JOHN G. WINFIELD and BENJAMIN H. STRICKLER, Broadway, Va. Filed Mar. 21, 1888. Serial No. 267,922. (No model.)

Claim.—1. In a car-heater, the combination, with a double-lined casing, of a cold-air casing held in the bottom of said first-named casing and provided with air-channels running in opposite directions, a third casing held on the top of the second casing and connected with the same, and doors leading from the said third casing to the ash-pit, substantially as shown and described.

2. In a car-heater, the combination, with a double-lined casing, of a cold-air casing held in the bottom of said first-named casing and provided with air-channels running in opposite directions, a third casing held on the top of the second casing and connected with the same, doors leading from the said third casing to the ash-pit, and a fire-pot resting on top of the said third casing and forming an air-space with the double-lined casing, substantially as shown and described.

3. In a car-heater, the combination, with a double-lined casing of the casing H, held in the bottom of the said double-lined casing and connected in its middle with the outside and leading to a space, P, a segmental partition, I, forming with the said double-lined casing the said space P, the doors J, held on the said segmental partition I, and the door L, registering with the said doors J and formed in the double-lined casing B, substantially as shown and described.

4. In a car-heater, the combination, with a double-lined casing, of the casing H, having channels running in opposite directions, the partition I, resting on top of the said casing H, the doors J, held on the said partition I, the plate N, having the apertures N', the fire-pot Q, resting on the said plate N, the grate R, held in the said fire-pot Q and provided with a shaking-rod, R', extending through an aperture, N², and the door L, held in the said double-lined casing in front of the said doors J and the outer end of the shaking-rod R', substantially as shown and described.

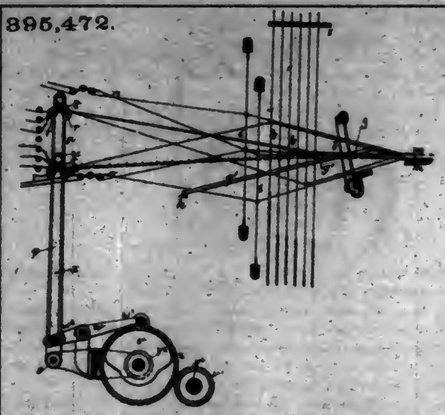


5. In a car-heater, the combination, with an outer casing and a fire-pot supported in the casing and forming with said casing an air-space, of a casing, S, supported upon the fire-pot and provided with chambers communicating with the fire-pot and space surrounding the same, and a second casing, U, supported upon the casing S and provided with chambers communicating with the chambers of the casing S, each of the casings S and U being provided with channels running in opposite directions, substantially as described.

6. In a car-heater, the combination, with an outer casing provided with hot-air and smoke outlets in its top and a fire-pot supported in the casing and forming with the said casing an air-space, of the casing S, supported upon the fire-pot and communicating with the fire-pot and the air-space surrounding the same and provided with channels running in opposite directions, and the casing U, arranged upon the casing S and communicating with the same and with the hot-air and smoke outlets and provided with channels running in opposite directions, substantially as herein shown and described.

7. In a car-heater, the combination, with a double-lined casing, of a fire-pot held in the said casing and forming a space between the said casing and the exterior of the fire-pot, the casing S, held on top of the said fire-pot and provided with channels leading in opposite directions, the casing U, held on top of the said casing S and provided with similar channels, the said casings S and U being provided with registering openings leading to the space formed between the said fire-pot and the double-lined casing, and an air-outlet pipe leading from the said casing U, substantially as shown and described.

8. In a car-heater, the combination, with a double-lined casing, of the fire-pot Q, the casing S, held on top of the said fire-pot Q and provided with channels leading in opposite directions, the casing U, held on top of the said casing S and also provided with channels leading in opposite directions, and central filling-pipes held in the said casings S and U, a threaded central filling-pipe held in the cover of the said double-lined casing, and a cover screwing on the said threaded central filling-pipe, substantially as shown and described.

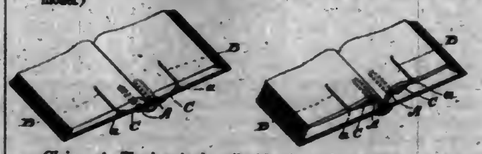


395,471. VARIABLE DRIVING MECHANISM FOR MACHINERY. ERNST F. AUTENRIETH, New York, assignor to the Glen Cove Machine Company, (Limited,) Green Point, Brooklyn, N. Y. Filed July 21, 1888. Serial No. 280,630. (No model.)

Claim.—The combination, with a driving-shaft and a series of pulleys thereon of different diameters sliding one over another and connected together and with the shaft, so as to turn with the shaft, of arms loosely connected with said pulleys, slider-bars to which said arms are rigidly connected near one of their ends, and a plate provided with cam-grooves engaging said slider-bars, adapted when moved to move said slider-bars in opposite directions, said cam-grooves being so constructed that they will lock the slider-bars against longitudinal movement when the latter are shifted to their farthest positions, substantially as specified.

395,472. DOUBLE-PILE-FABRIC LOOM. WILLIAM H. RAINBOW, Kidderminster, County of Worcester, England. Filed Dec. 2, 1886. Serial No. 220,615. (No model.) Patented in England Jan. 14, 1886, No. 610.

395,472.



Claim.—1. The combination of the lay and harness of a double-pile-fabric loom, operating mechanism for the harness, and devices for operating the ground-warps, with clamps to retain the pile warps at each operation of the harness to prevent their weights from drawing the cloths together, all substantially as described.

2. The combination of the harness, operating mechanism for the harness, and devices for operating the ground-warps, with the upper shuttle-race, a lay having two shuttles, and clamps to retain the pile-warp threads at each operation of the harness to prevent their weights from drawing the cloths together, all substantially as set forth.

3. The combination of the lay and harness of a double-pile-fabric loom, operating mechanism for the harness, and devices for operating the ground-warps, with upper and lower sets of clamping-bars to retain the pile-warp threads of the upper and lower fabrics at each movement of the harness to prevent the weights of the said warp-threads from drawing the cloths together, and devices, substantially as described, for operating the clamping-bars, all substantially as set forth.

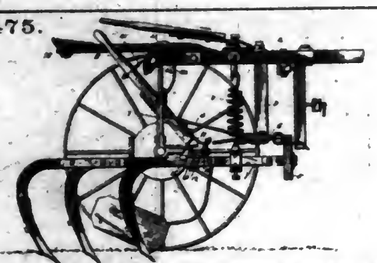
395,473. COMBINED BOOK MARK AND CLIP. JOSEPH D. BARTLEY, Bridgeport, Conn. Filed Aug. 24, 1888. Serial No. 283,467. (No model.)

Claim.—1. The herein-described book mark and clip made from a single piece of spring-wire, having terminal arms adapted to extend across the opposite faces of an open book, and intermediate fingers extending in the same direction with said arms and connected to the latter by cross-wires, substantially as set forth.

2. In a combined book mark and clip, the combination, with the terminal arms and fingers extending in the same direction, of cross-wires connecting said arms and fingers, substantially as shown and set forth.

3. In a combined book mark and clip, the combination of the fingers A, the cross-wires C, deflected at *a*, and the arms B, substantially as set forth.

395,474. MANUFACTURE OF DYE-STUFFS OR COLORING-MATTERS. FRIEDRICH BAYER, Elberfeld, Germany, assignor to Farbenfabriken, vormals Friedr. Bayer & Co., same place. Filed Jan. 17, 1887. Serial No. 224,500. (Specimens.)



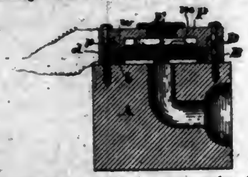
Claim.—The process of producing new red azo colors, which consists in combining a new monosulpho acid of betanaphthylamine, called "betanaphthylaminedeltasulpho acid," with the group of tetrazo compounds of paradiamines, such as tetrazodiphenyl, tetrazoditolyl, tetrazodiphenylether, tetrazostilben, or their sulphonic acids, substantially as described.

395,475. CULTIVATOR. JOSEPH C. BEER, Rising Sun, Md. Filed Oct. 13, 1888. Serial No. 288,051. (No model.)

Claim.—1. The combination, with a pivoted cultivator-beam capable of vertical and lateral movement, of a pivoted hand-lever capable of vertical and lateral movement for shifting the beam, and a lock for holding said hand-lever against lateral deflection when desired.

2. In a cultivator, the combination of a pivoted cultivator beam or beams, a pivoted hand-lever for controlling its lateral movement, a vertical projection on said hand-lever, and a folding arm secured to

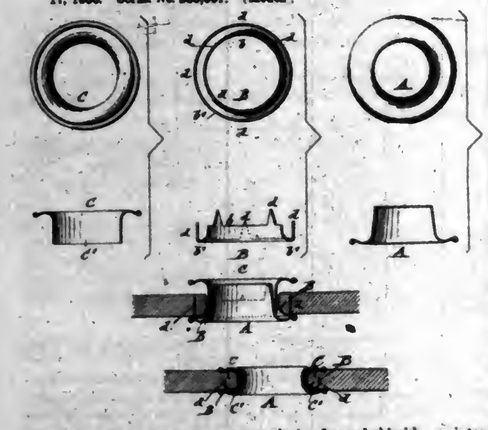
395,475.



the frame of the machine, adapted to be interposed in the lateral path of the projection, as and for the purpose described.

3. In a cultivator, the combination of a pivoted cultivator-beam, a pivoted hand-lever for controlling its lateral movement, a forked vertical projection on said hand-lever, and a folding arm secured to the frame of the machine and adapted to be thrown into the fork or to either side of the same, as and for the purpose set forth.

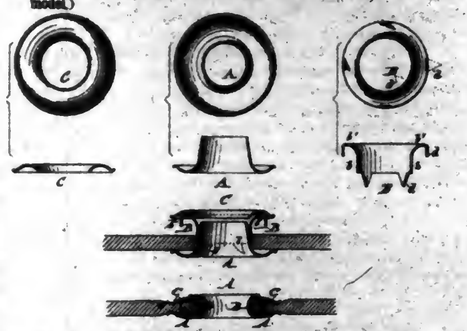
4. In a cultivator, the combination of a pivoted cultivator-beam, a pivoted hand-lever for controlling its lateral movement, a vertical projection secured to said hand-lever, and a folding arm secured to the frame of the machine and adapted to be interposed into the lateral path of the projection, the support of said arm being laterally adjustable, as and for the purpose set forth.



5. In a sulky-cultivator, the combination of a laterally-adjustable clevis, a cultivator-beam pivotally connected thereto, a pivoted hand-lever for controlling the lateral movement of the cultivator-beam, a laterally-adjustable hanger connecting the hand-lever and the cultivator-beam, a vertical projection on the hand-lever, a folding arm adapted to be interposed in the lateral path of said projection, said arm being within reach of the operator from his seat, and a laterally-adjustable support for said arm secured to the frame of the machine.

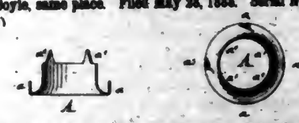
395,476. SPEAKING-TELEPHONE. FRANCIS BLAKE, Weston, Mass. Filed Aug. 14, 1886. Serial No. 210,576. (No model.)

Claim.—In a telephone employing a granulated conducting material—as the variable-resistance portion of a circuit—a transmitting-diaphragm carrying said granulated material loosely upon its upper surface, of a second electrode of large cross-section buried in said granulated material and mechanically connected with the center of the diaphragm to vibrate with it, the said second electrode having free edges, substantially as described.



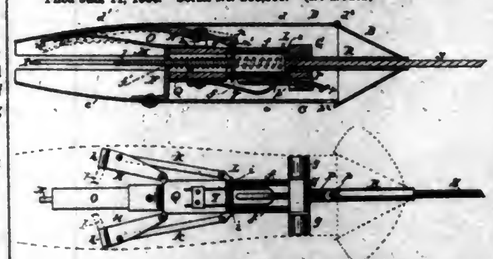
395,477. GROMMET. JOHN BOYLE, Brooklyn, N. Y. Filed Aug 17, 1888. Serial No. 283,001. (Model.)

Claim.—1. A grommet composed of a flanged thimble, an intermediate flanged eyelet provided with teeth or prongs at both edges said prongs alternating with each other, and a washer provided with a tubular shank interposed between the shank of the thimble and the eyelet, the shanks of the thimble and washer being securely clinched over the eyelet, substantially as set forth.



2. A grommet the flanged thimble and washer of which are provided at their outer circumferences with outwardly-bent and rolled-over rims, substantially as set forth.

395,478. GROMMET. ROBERT BLAIR, Brooklyn, N. Y., assignor to John Boyle, same place. Filed May 28, 1888. Serial No. 275,334. (No model.)



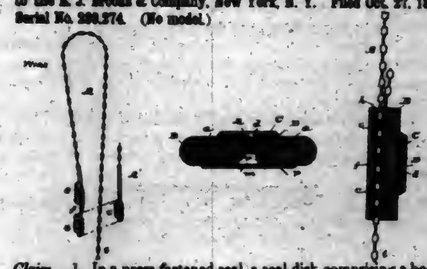
Claim.—A grommet composed of a flanged thimble, an intermediate flanged eyelet provided with teeth or prongs at both edges, said prongs alternating with each other, and a washer extending over the eyelet and secured by the clinched shank of the thimble, substantially as set forth.

395,479. EYELET. ROBERT BLAIR, Brooklyn, N. Y., assignor to John Boyle, same place. Filed May 28, 1888. Serial No. 275,335. (No model.)

Claim.—An eyelet provided at the edge of its flange with bent-up teeth or prongs and at the edge of its shank with teeth or prongs in line therewith, the teeth of the flange alternating with the teeth of the shank, so as to pierce the fabric at intermediate points when the shank is clinched, substantially as set forth.

395,480. FISH-HOOK. WILLIAM F. BREWSTER, East Orange, N. J. Filed Jan. 11, 1888. Serial No. 260,800. (No model.)

Claim.—1. The combination, substantially as set forth, of a yielding inclosing-case, a frame or support within said case, one or more hooks movably mounted in said frame or support, a hook-actuating spring, and a tripping-detent arranged between the hook or hooks and the yielding inclosing-case, whereby the hook or hooks are held within the inclosing-case while drawn through the water, and are thrown out from said case whenever the case is caused to yield by the bite of the fish upon it, and then move and release the tripping-detent.



2. The combination, substantially as set forth, of a case or support, one or more hooks movably mounted in said case or support, and a positive locking-detent located within the same, arranged to engage with some movably-mounted portion of the hook-supporting frame, or with the hook or hooks, when the hook or hooks are thrown outwardly from said case or support, whereby, whenever the hook or hooks are thrown outwardly or are being thrown outwardly, the hook or hooks are positively locked in such outward position and positively prevented from being moved inwardly until the locking-detent is unlocked or released.

3. The combination, substantially as set forth, of a yielding inclosing-case, one or more hooks movably mounted in said inclosing-case, a hook-actuating spring, a tripping-detent arranged between the hook or hooks, and the yielding inclosing-case, and a positive locking-detent located within the same, arranged to engage with some movably-mounted portion of the hook-supporting frame, or with the hook or hooks, when the hook or hooks are thrown out of the inclosing-case, whereby the hook or hooks are held within the inclosing-case when being drawn through the water, and are thrown from said case whenever the case is caused to yield by the bite of the fish upon it, and thus move and release the tripping-detent, and the locking-detent is caused to engage with the movably-mounted hook-supporting frame, or with the hook or hooks, and positively lock the hook or hooks against being moved backwardly into the inclosing-case until the locking-detent is unlocked or released.

4. The combination, substantially as set forth, of a case or support, one or more hooks movably mounted in said case or support, and a positive locking-detent located within the same arranged to engage with some movably-mounted portion of the hook-supporting frame, or with the hook or hooks, when the hook or hooks are thrown outwardly, or are being thrown outwardly, from the said case or support, and the said locking-detent being provided with two or more locking points or catches, whereby the hook or hooks, when thrown outwardly from the case or support for a distance less than the entire distance or range the said hook or hooks are capable of being thrown out, will be positively locked against being moved backwardly, but are at the same time free to move outwardly to a still greater distance and be again positively locked against being moved backwardly or inwardly until the locking-detent is unlocked or released.

5. The combination, substantially as set forth, of an inclosing-case provided with a hinged part or lid, a frame or support mounted in said inclosing-case, a pair of hooks, I, movably mounted in said frame or support and provided with the arms H and connecting-bars K, rods *f*, having mounted thereon sliding cross-head L, the tripping-detent N, arranged to engage with the hinged lid of the inclosing-case and sliding cross-head L, and the locking-detent P, arranged to engage with the sliding cross-head L, for the purposes described.

395,481. SEAL. EDWARD J. BROOKS, East Orange, N. J., assignor to the E. J. Brooks & Company, New York, N. Y. Filed Oct. 27, 1888. Serial No. 289,274. (No model.)

Claim.—1. In a press-fastened seal, a seal-disk comprising a body of soft metal, a dish-shaped crystal having its margin provided with holes perpendicular to its face and embedded in the soft metal, and a label bearing distinguishing-marks behind the face of said crystal, substantially as hereinbefore set forth.

2. In a press-fastened seal, a flexible shackle of flat wire having one end provided with a tubular coil or coils in which the wire is disposed flatwise, in combination with a seal-disk having a body of soft metal cast fast upon said coiled end, the other end of the shackle being provided with an anchoring-twist and inclosed at a point or points by said coils, substantially as hereinbefore set forth.

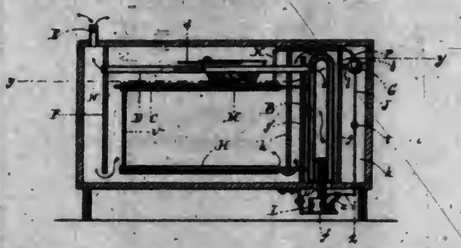
3. In a press-fastened seal, a flexible metallic shackle having one end provided with a pair of tubular coils in one and the same line separated by a fastening-space, in combination with a seal-disk having a body of soft metal cast fast upon said coiled end, the other shackle end extending lengthwise through said coils and securely embedded in the soft metal at said fastening-space, substantially as hereinbefore set forth.

4. The combination, in a press-fastened seal, of a flexible metallic shackle having one end provided with a pair of tubular coils in one and the same line separated by a fastening-space, and a seal-disk cast fast upon this end of the shackle, inclosing also the other shackle end, which extends lengthwise through said coils and is securely embedded in the soft metal at said fastening-space, and having a crystal with a central hole at the face of the disk and a label behind the face of said crystal, substantially as hereinbefore set forth.

5. The combination, in a press-fastened seal, of a flexible metallic shackle having one end provided with a pair of tubular coils in one and the same line separated by a fastening-space, and a seal-disk inclosing said coils, with said space at the center of the disk inclosing also the other shackle end, which extends lengthwise through said coils, and having a crystal with a central hole at the face of the disk and a central recess in its back, substantially as hereinbefore set forth.

395,482. WATER-ELEVATING DEVICE. CHAS. P. BURTON, Brooklyn, N. Y. Filed Feb. 7, 1888. Serial No. 263,293. (No model.)

Brief.—Water is delivered to the hollow axle through two series of convolute coils, one right-handed and the other left-handed with respect to the axis. Either coil is adapted to be put in communication with the hollow axle by means of a sliding internal sleeve, and thus the device will raise water independent of the way the motor is rotated.

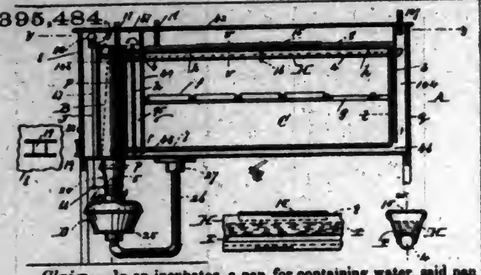


Claim.—1. The combination, in a water-elevating device, of two or more pump-wheels each forming a convolute passage having a receiving-mouth at its periphery and a substantially central discharge, said wheels being connected in reverse positions and having a common center of rotation, and a water-wheel concentric with said wheels and having floats or blades which by dipping into a tideway serve to rotate the wheels and to elevate water through one or the other of them according as the tidal flow is in one or other direction, substantially herein described.

2. The combination, with a central hollow shaft or pipe, of pump-wheels fast thereon, and each forming a convolute passage having a receiving-mouth at the outer end and delivering at the inner end into said shaft or pipe, the wheels being reversed in position on said shaft or pipe, of valves in said shaft or pipe for closing the communication of one or other of said convolute passages therewith, and a water-wheel upon said shaft or pipe having floats or blades which, by dipping into a tideway, impart rotary motion to said pump-wheels in one or other direction, and elevate water through one or other of them according to the direction of the tidal flow, substantially as herein described.

3. The combination, with a hollow shaft, B, of one or more pump-wheels, A, and one or more pump-wheels, A', reversed in position on said shaft relatively to each other, each wheel forming a convolute passage open at its outer end and communicating with the shaft at its inner end, and having its inner convolution closely hugging the shaft, an inner tube, E', adjustable in the shaft and having ports for controlling the communication of the inner ends of said passages with the shaft, and a water-wheel on the shaft having its floats or blades projecting radially beyond the pump-wheels, substantially as herein described.

395,483. INCUBATOR. JOHN F. CARR, Tiverton, R. I. Filed Sept. 8, 1887. Serial No. 249,066. (No model.)



Claim.—1. The combination of an egg-chamber having end walls provided with openings near their lower ends, a hot-air chamber at one end of the egg-chamber, a heating device in the hot-air chamber, and a partition-wall between the wall of the egg-chamber and the heating device, said partition-wall extending nearly to the top of the hot-air chamber.

2. The combination of an egg-chamber, a hot-air chamber, a heating device within the hot-air chamber, and a conduit open at its upper end to communicate with the hot-air chamber, and also open at its lower end to communicate with the egg-chamber, whereby a continuous supply of hot air may be conveyed from the hot-air chamber to the egg-chamber, substantially as and for the purpose set forth.

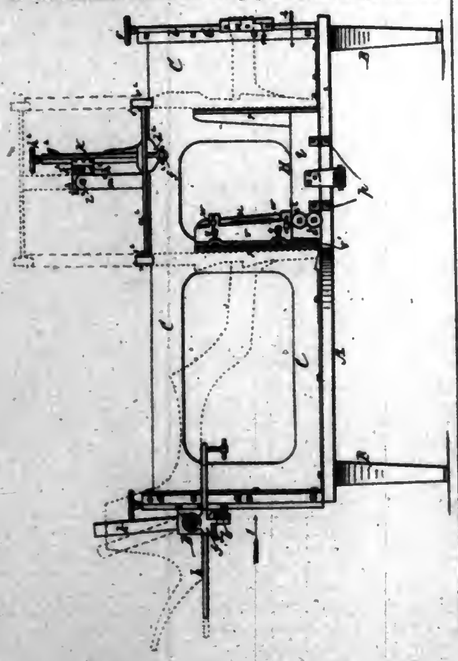
395,484. INCUBATOR. JOHN F. CARR, Tiverton, R. I. Filed Apr. 3, 1888. Serial No. 269,471. (No model.)

395,484.

Claim.—In an incubator, a pan for containing water, said pan being disposed in the egg-chamber, in combination with a smoke-pipe leading from the boiler through said chamber, a portion of said pipe being removed and the opening thus formed covered or closed by the pan, whereby the smoke and heated air from the lamp are brought into direct contact with the pan on their passage through said pipe, substantially as and for the purpose set forth.

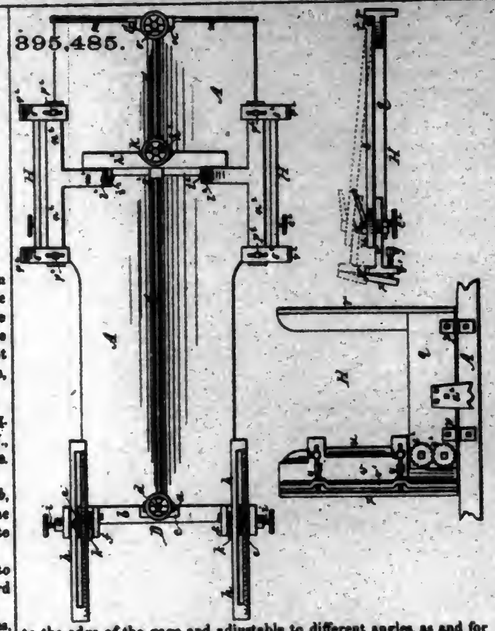
395,485. APPARATUS FOR FRAMING AND SETTING UP VEHICLE-BODIES. THOMAS CLEMENTS and GEORGE H. ROTCH, Rochester, N. Y., assignors to The James Cunningham Son & Company, same place. Filed Aug. 17, 1888. Serial No. 283,090. (No model.)

Claim.—1. The combination of the standard *a*, the cross-head *b*, the vertical screw *d*, the bearings *f f*, the right and left screw *g*, the adjustable rests *h h*, and the swinging arms *k k*, arranged to operate in the manner and for the purpose specified.



2. The combination, with the bearing *f*, of the arm *k*, pivoted to said bearing and capable of adjustment to different positions forward and back to fit the seat-riser of the rocker, as described.

3. In a machine for framing and setting up the sides of vehicles, the combination, with the bed-plate, of a side gage provided with upright arms for the fitting of the pillars of the rocker thereto, said side gage being hinged and capable of lateral adjustment by turning on its hinges, as and for the purpose set forth.

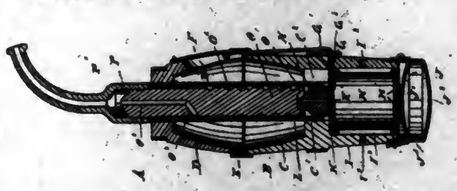


4. In a machine for framing and setting up the sides of vehicles, the combination, with the bed-plate, of a side gage hinged thereto to swing laterally, said gage consisting of two parts each provided with a vertical standard to gage the pillars of the rocker, one of said parts being hinged to the bed-plate, the other to the primary post, so as to swing inward horizontally, as and for the purpose specified.

5. The combination of the frame *q*, provided with the vertical standard *r*, the frame *s*, hinged to frame *q*, to swing inward horizontally, and a plate, *v*, attached to frame *q*, to be adjusted forward and back, as and for the purpose described.

6. The combination, with the side gage, H, of the flange *x*, pivoted

395,485.



to the edge of the gage and adjustable to different angles, as and for the purpose specified.

7. The combination, with the side gage, of a top gage provided with arms that extend outward and gage the height of the pillars of the rocker, as herein shown and described.

8. The combination, with the side gage, of a top gage provided with arms extending outward and having flanges at the outer ends for gaging the lateral position of the pillars of the rocker, as herein shown and described.

9. The combination, with the slide h^3, of the bearings l^3, the arms m^3, jointed thereto, so as to be reversed in position, the cross-heads n^3, and slides o^3, provided with the flanges r^3, as and for the purpose specified.

395,486. TOBACCO-PIPE. GEORGE F. CHLOUTT, Purcell, Ind. Ter. Filed Mar. 29, 1888. Serial No. 268,789. (No model.)

Claim.—1. A tobacco-pipe provided with a storage-chamber having an opening leading into the bowl thereof and with a valve for closing the said opening, substantially as described.

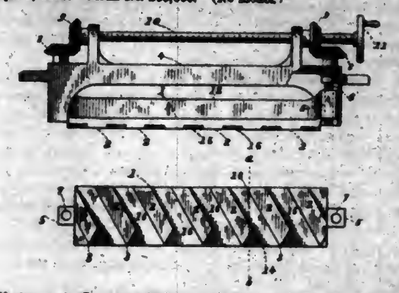
2. A tobacco-pipe having a storage-chamber surrounding its stem and communicating with the bowl, substantially as described.

3. A tobacco-pipe having a storage-chamber surrounding its stem and communicating with a combustion-chamber at one end of the said storage-chamber, substantially as described.

4. In a tobacco-pipe, the combination, with a barrel for storing tobacco having a combustion-chamber at one end communicating with said barrel, of a slide for opening and closing the opening that establishes communication between the said barrel and combustion-chamber, substantially as described.

5. In a tobacco-pipe, the combination, with a barrel for storing the tobacco and provided in its bottom with an outlet, of a slide adapted to close said outlet and to be operated from the outside, a combustion-receptacle held on the bottom of the said barrel, and a pipe-stem leading from the said combustion-receptacle through the said barrel, substantially as shown and described.

6. In a tobacco-pipe, the combination, with a barrel provided with a side door and serving for the storage of tobacco, and having an outlet at the bottom, of a slide held over said outlet in the bottom of the barrel, a combustion-receptacle held on the bottom of the barrel, a tube held in the barrel and opening on the combustion-receptacle, and a pipe-stem provided with a spiral groove leading to the central opening in the tube, substantially as shown and described.

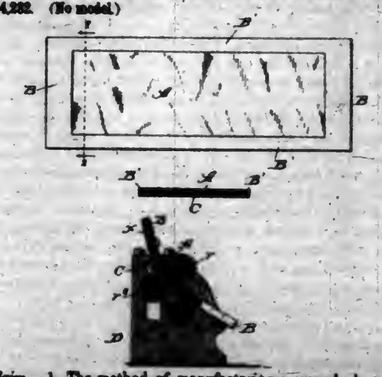


7. In a tobacco-pipe, the combination, with a barrel provided with a side door and serving for the storage of the tobacco and having an outlet in its bottom, of a slide held over the outlet in the bottom of the barrel, a combustion-receptacle held on the bottom of the barrel, a tube held in the barrel and opening on the combustion-receptacle, a pipe-stem provided with a spiral groove leading to the opening in the tube, and a mouth-piece held on the upper end of the said pipe-stem, substantially as shown and described.

8. In a tobacco-pipe, the combination, with a combustion-chamber, of a tube leading to the said chamber, a conical and apertured plug screwing into the tube, a pipe-stem in the tube and having a cone-shaped recess in its lower end, and provided with a spiral groove extending from its lower end to a central opening in its upper end, and a mouth-piece on the upper end of the said tube, substantially as described.

9. In a tobacco-pipe, the combination, with a central tube, of a plug having a central opening leading to the combustion-receptacle of the pipe, said plug having a cone-shaped upper end, a pipe-stem arranged in the tube and having a cone-shaped recess in its lower end and provided with a spiral groove extending from the bottom and leading to a central opening in its upper end, said pipe-stem being cone-shaped at its upper end, and a mouth-piece having a cone-shaped recess secured to the outer end of the said pipe-stem, substantially as shown and described.

10. In a tobacco-pipe, the combination, with a barrel having a recessed extension formed on its lower end and provided with openings in its side, of a combustion-receptacle provided with flanges at the top and bottom and fitted snugly into the recess of the said extension, so that outside air can pass through the said openings of the extension on the rim of the said combustion-receptacle, substantially as shown and described.

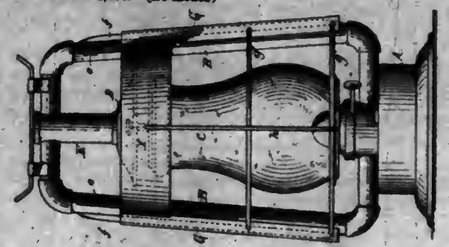


395,487. PRESSURE-PLATE FOR PLANING-MACHINES. FRANCIS H. CRAFTS, Buffalo, N. Y., assignor to R. & R. Holmes, same place. Filed Apr. 5, 1888. Serial No. 269,699. (No model.)

Claim.—1. In a wood-planing machine, a vertically-adjustable pressure-plate having a series of diagonal ribs, 2, and openings 15 between them on its under face, as and for the purposes specified.

2. An adjustable pressure-plate for wood-planing machines provided with a series of diagonal ribs, 2, having pointed ends 3 and open diagonal spaces 15 between them, substantially as and for the purposes described.

395,488. MANUFACTURE OF ELECTROTYPE OR STEREOTYPE PLATES. JAMES DALE, Chicago, Ill. Filed Feb. 16, 1888. Serial No. 264,282. (No model.)

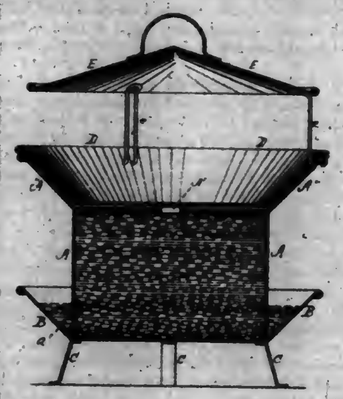


Claim.—1. The method of manufacturing a curved electrotype or stereotype plate, which consists in filling the spaces on the type-face of the flat plate and thus rendering the latter substantially uniform throughout, and then curving the plate, substantially as described.

2. The method of manufacturing a curved electrotype or stereotype plate, which consists in capping its flat type-surface and edges of the plate with a molten metal or the like, then, after the cap has become hard, passing the capped plate between bending-rollers, and finally removing the projecting edges of the cap to release the plate, substantially as described.

3. The method of manufacturing a curved electrotype or stereotype plate, which consists in capping its flat type-surface and edges of the plate with molten metal or the like, and having the article as much or substantially as much longer in the direction of the curve on both sides of the latter as will equal the tangential edges produced by bending it, then passing it between bending-rollers, and finally removing the tangential edges and laterally-projecting edges of the cap and releasing the plate, substantially as described.

4. The method of manufacturing a curved electrotype or stereotype plate, which consists in placing a flat electrotype or stereotype plate of the size required for the form in a suitable pan, pouring upon it molten metal or the like to form a cap, C, extending beyond and over the sides and adhering to the body of the plate, and forming at the opposite ends adhering extensions B, equal or substantially equal in width to the tangential edges to be produced by the bending, then passing the article thus produced between bending-rollers, and finally removing the tangential edges and lateral edges of the cap and releasing the plate, substantially as described.



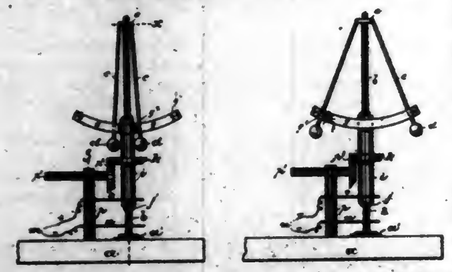
395,489. TUBULAR LANTERN. FREDERICK DIETZ, New York, N. Y., assignor to The R. E. Dietz Company, same place, and the Steam Gauge and Lantern Company, Rochester, N. Y. Filed Feb. 2, 1888. Serial No. 262,703. (No model.)

Claim.—1. The combination, with a tubular lantern, of a removable guard resting on the tubes and surrounding the body of the globe, and provided at its upper end with an annular shield which surrounds and protects the air-passages in the lantern-top, substantially as set forth.

2. The combination, with the channel-shaped uprights G G, adapted to rest on the tubes, of the horizontal guard-wires *g g*, secured to the lower portions of the uprights and connecting the same, and the annular shield I, secured to the upper portions of the uprights, substantially as set forth.

395,490. DEVICE FOR FEEDING AND WATERING POULTRY. MATTHEW FERRIN, Haverhill, Mass. Filed Apr. 16, 1888. Serial No. 270,966. (No model.)

Claim.—In a device for feeding and watering poultry, the combination of the tank A, formed up into pan shape at A', trough B, feed-pan D, canopy E, and detachable standards *c*, supporting said canopy, substantially as and for the purpose set forth.



395,491. BREAD-BOARD. CHARLOTTE W. FULLER, Lincoln, Me. Filed July 14, 1888. Serial No. 279,918. (No model.)

Claim.—1. The improved bread-board described, consisting of the kneading-board A, with back B, and ends E E, in combination with the hinged cover C, having front wall, F, secured thereto, and with interior partitions, K L, substantially as and for the purpose set forth.

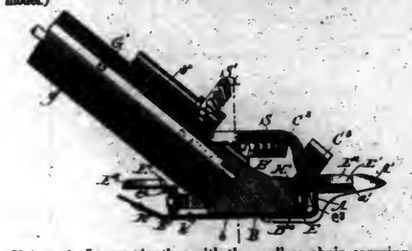
2. The kneading-board A, free at its front edge and having the ends E E and back B secured vertically along its other edges, in combination with the cover C, having front F and strengthening end pieces, I, and with interior partitions made removable, substantially as and for the purpose set forth.

395,492. REGULATOR. ALFRED GARDNER, Newark, N. J., assignor to Frederick T. Fearey, same place. Filed July 12, 1888. Serial No. 279,703. (No model.)

Claim.—1. In combination, in an electric governor, with the shaft *b* and weighted arms *c c*, and a sleeve, *i*, insulated from said shaft, a bar or bars, *g*, having bearings *g'*, adapted to make an electrical contact with said weighted arms, substantially as and for the purposes set forth.

2. In an electrical governor, the combination, with a revolving shaft and governing-arms adapted to be acted upon by centrifugal force, of contact bearings or points arranged on the path of said governing-arms and connected with a sleeve arranged on said shaft, and conducting-pieces *n o*, arranged in connection with said shaft and sleeve, respectively, substantially as and for the purposes set forth.

3. In an electrical governor, the combination of a revolving shaft having governing-arms adapted to be acted upon by centrifugal force, an insulated sleeve and bars *g'*, having bearings *g'* in electrical connection with said sleeve, a gear-wheel, *k*, arranged in connection with the main shaft of the motor, and springs *o n*, bearing on said sleeve and shaft, respectively, substantially as and for the purposes set forth.



4. In combination, in an electrical governor, revolving shaft, and governing-arms, and insulated sleeve *i*, bars *g g*, providing a way for the said arms and bearings *g' g'*, and electrical conductors connecting with said shaft and said bearings *g'*, respectively, substantially as and for the purposes set forth.

5. In combination with the shaft *b* and governing-arms, bearings *g'*, and conductors connecting with said bearings and shaft, and insulators interposed between said bearings and shaft, substantially as and for the purposes set forth.

6. In combination with the shaft and governing-arms, and bars *g g*, forming a way and providing bearings *g'*, an insulator, *h*, for disconnecting said arms *c* and bars *g*, substantially as and for the purposes set forth.

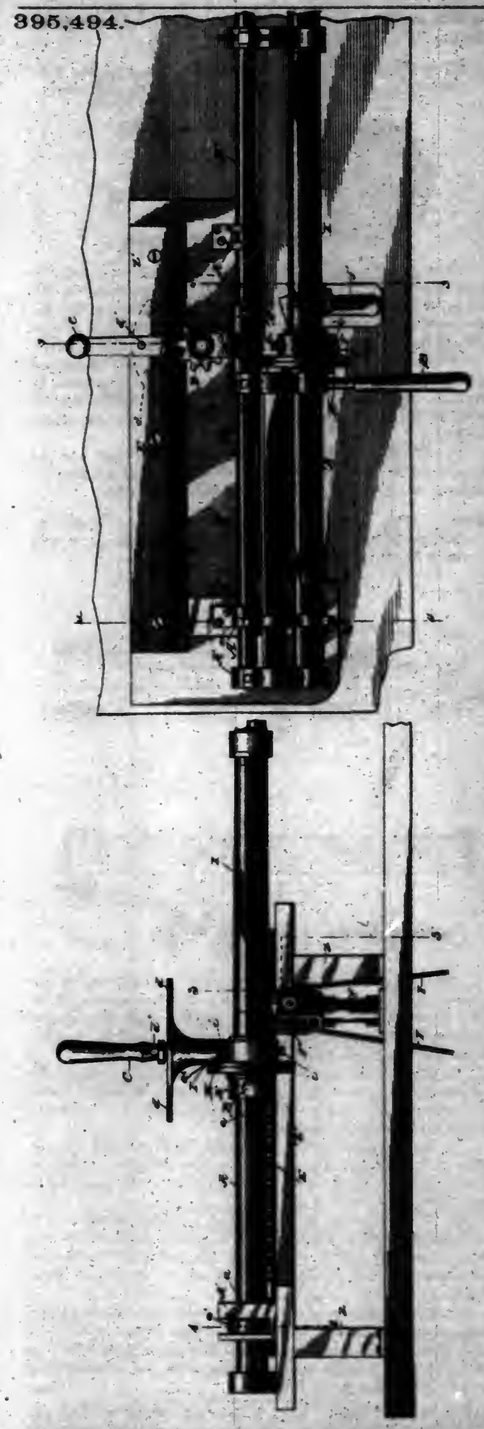
7. In combination with the rod *b* and means for causing the same to revolve, a cross bar or head, *c*, arms *c*, hinged thereto, an insulated sleeve, bars *g*, bearings *g'*, insulators *h k'*, post *p*, springs *o n*, and wires *m*, all arranged and combined substantially as and for the purposes set forth.

395,493. CUTTING MECHANISM FOR HARVESTERS. PAUL HARMON, St. Paul, Minn. Filed Sept. 24, 1887. Serial No. 250,694. (No model.)

Claim.—1. In combination with the endless chain carrying the grain-cutting knives, the stop-bar B, located between the two plies of the chain and having its rear edge beveled at the upper side, and the conveyer having its front side abutting against the said rear beveled edge of the stop-bar between the two plies of the cutter-chain and extending obliquely backward therefrom, substantially as set forth.

2. In combination with the finger-bar and the forwardly-projecting fingers thereon, the endless chain having its forward ply moving always stubbleward, said chain having knives which project forward and run upon the top of the fingers, said knives having each a cutting-edge at the stubbleward side, and having a flange projecting from their upper surfaces, respectively, and located directly grainward from the vertical plane of the cutting-edge when the knife is traveling stubbleward, substantially as set forth.

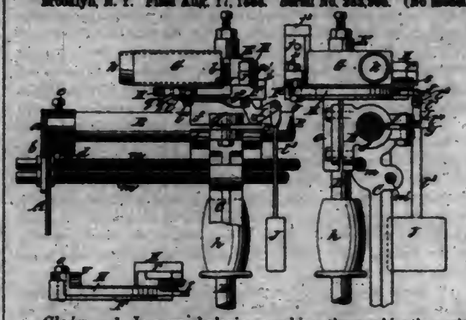
3. In combination, substantially as set forth, the angle-iron finger-bar, the stop-bar B, having its rear edge beveled on the upper side, secured to the horizontal lip of the angle-iron at a short distance back from the vertical lip of the angle-iron, the sprocket-wheels located in the horizontal plane of the stop-bar, at the ends thereof, the fingers secured to the finger-bar on the forward side, the chain carried by the sprocket-wheels and traveling around the stop-bar, and carrying knives which project forward over the edge of the vertical lip of the finger-bar, and the conveyer whose forward side abuts against the beveled rear edge of the stop-bar between the two plies of the cutter-chain, and which slopes obliqeely upward and rearward over the rear ply thereof.



395,494. MACHINE FOR ORNAMENTING BILLIARD-CUE HANDLES, &c. AXEL F. HUBY, Chicago, Ill., assignor to the Brunswick-Balke-Collender Company, same place. Filed Jan. 3, 1888. Serial No. 259,661. (No model.)

Claim.—1. In a machine for ornamenting billiard-cue handles and for other analogous purposes, a shaft having a groove cut thereon, said shaft rotating freely in a frame adapted to move horizontally in guides, and a set-screw fitting adjustably in said groove, in combination with concentric disks, one of said disks secured to said rotatory shaft and adjustably connected to the other of said disks, means in said last-named disk for securing thereto a billiard-cue or other material, and a cutting-tool adapted to engage therewith, all substantially as described.

2. In a machine for ornamenting billiard-cue handles and for other like purposes, the combination of a shaft having a groove thereon, said shaft turning freely in a frame adapted to move horizontally, a set-screw adjustably fitting said groove, whereby the horizontal movement of the frame and shaft will produce rotary movement in said shaft when said set-screw is engaged therewith, a disk secured to said rotatory shaft, a concentric disk adjustably attached to said first-named disk, and with means for securing therein a billiard-cue handle or other analogous material, a cutting-tool adapted to engage with such material, a handle secured to said horizontally-moving frame, and a handle actuating a gear secured in said horizontally-moving frame, intermeshing with an immovable gear-rack, whereby a horizontal movement may be given said frame by either of said handles, all substantially as described, and for the purpose set forth.



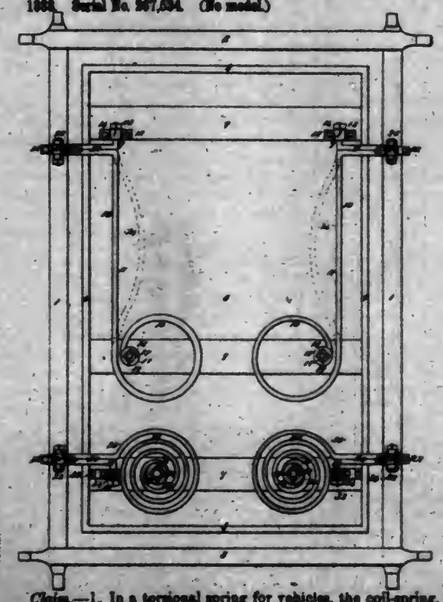
3. In a machine for ornamenting billiard-cue and other handles, the combination of a shaft rotating freely in a horizontally-moving frame, a disk concentric with said shaft, to which a billiard-cue handle or other analogous material may be secured, a cutting-tool adapted to engage with said material, said disk attached to said rotatory shaft

395,494.

and rotating therewith, a handle actuating a gear secured in said horizontally-moving frame, said gear intermeshing with an immovable gear-rack, and an immovable disk having holes therein, with which a pin in said handle adjustably engages, whereby the said horizontally-moving frame, together with the material secured to said disk, may be horizontally moved at regular intervals, all substantially as described.

395,495. WOOD-PLANING MACHINE. ALFRED B. HUTCHINSON, Brooklyn, assignor to the Gem Cove Machine Company, Green Point, Brooklyn, N. Y. Filed Aug. 17, 1888. Serial No. 282,962. (No model.)

Claim.—1. In a wood-planing machine, the combination, with the side cutter-head and a fixed head-plate below the said cutter-head, of a chip-breaker pivoted to the under side of said plate, but having its nose above said plate, substantially as herein described.



2. In a wood-planing machine, the combination with a side cutter-head and a head-plate below said cutter-head, of a chip-breaker pivoted to said plate and having the greater portion of its length outside of said plate, substantially as and for the purpose herein described.

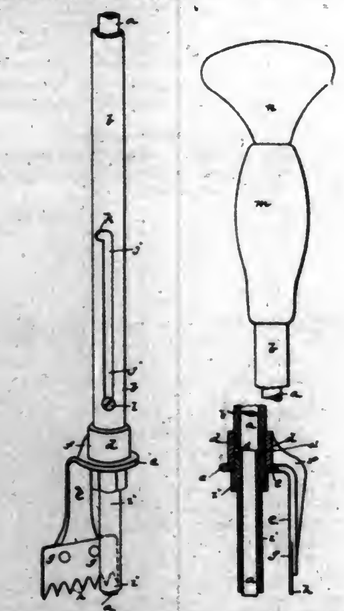
3. In a wood-planing machine, the combination, with a side cutter-head and a head-plate below said cutter-head, of a chip-breaker pivoted to said plate and having the greater portion of its length below the upper surface of said plate, substantially as and for the purpose herein described.

4. In a wood-planing machine, the combination, with a side cutter-head and a head-plate below said cutter-head, of a chip-breaker pivoted to said plate, having the greater portion of its length below the upper surface of said plate, and having an upward offset, whereby its nose is brought above said plate, substantially as and for the purpose herein described.

5. The combination, with the spindle-frame C, the bearing *c*, and the head-plate F thereon, of a side cutter-spindle, D, fitted to turn in said bearing *c*, the cutter-head E on said spindle, and a chip-breaker lever, H, fulcrumed at one end to the under side of said head-plate F, having the upward offset *s* near to its nose *r*, and having the part between the fulcrum and the offset below and outside of the head-plate F, substantially as specified.

395,496. VEHICLE-SPRING. EDWIN JARRELL, Harper, Kans., assignor of one-half to Harry W. McMinn, same place. Filed Mar. 17, 1888. Serial No. 267,534. (No model.)

Claim.—1. In a torsional spring for vehicles, the coil-spring, the perforated terminal at the inner end of said coil, the spring-bar to



which said terminal is screw-bolted, the crank-arm and its means of attachment to the side bar, the extension spring-bar projecting laterally from said crank-arm, the bearing-spindle and the shackle within which it works arranged when the side sills of the bed press on the crank-arm and are released therefrom for the spindle to turn in its bearings as the spring torsions, and the spring-coil is made to compensate the torsional movement and the consequent expansion and contraction and prevent end movement of the spring, substantially as and for the purpose set forth.

2. In a torsional spring for vehicles, an end coil, a perforated terminal at the inner end of said coil, the spring-bar to which said terminal is screw-bolted, an elongated uncoiled spring-bar integral with said coil, the crank-arm placed at about a right angle from said uncoiled spring-bar, the loop at the end of said crank-arm and clip, and screw-bolt that secures it to the side bar of the vehicle, the extension-bar at about a right angle to said crank-arm, the bearing-spindle, and the shackle within which it has its bearings, substantially as and for the purpose set forth.

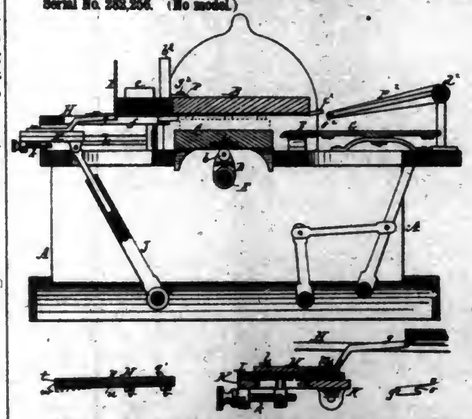
3. In a torsional spring for vehicles, the system of torsional springs, with a coil at one end and uncoiled extension at the other, the spring-bars to which said springs are secured, the rotating spindles at one end of said spring and shackles in which they have their bearings, the crank-arms that proceed at about a right angle from the springs, and means for securing them to the side bars, the said springs placed at both longitudinal and transverse position on the vehicle, so as to withstand concussions from any direction, substantially as and for the purpose set forth.

4. In a torsional spring for vehicles, the multiple-coil springs, the perforated center terminals to said coils, the spring bearer-arms 36, to which said terminals are bolted, the spring-bars to which said arms are bolted, the shackle-straps that re-enforce the attachment of said arms to said spring-bars and which are provided with journal-boxes, the spindles that rotate in said boxes when the spring torsions, and the crank-arms attached to said springs that support the side sills of the bed, and means for securing said crank-arms to the side bars, substantially as and for the purpose set forth.

395,497. CARPET-STRETCHER AND TACK-DRIVER. FERDINAND KOEPP and JOHN C. GUETH, Pittsburg, Pa. Filed May 9, 1888. Serial No. 273,273. (No model.)

Claim.—A carpet-stretcher and tack-driver consisting of a tube, *b*, having a slot, *j*, provided with an offset, *k*, a guide-tube, *i*, of less diameter than the tube *b* and arranged in line therewith, a hollow threaded casting, *d*, into opposite ends of which the meeting ends of the tubes *b i* are detachably screwed, having a laterally-bent arm, *c*, arranged at one side of said guide-tube *i* and terminating in a broad toothed head, *g*, and an endwise-movable rod, *a*, fitted in said tubes *b i*, and provided at an intermediate point of its length with a shoulder, *a'*, adapted to strike the tube *i*, and with a guide-pin, *l*, which works in the slot *j*, whereby the two tubes and the casting are united without bolts, and the tacks are guided to the proper position to be driven, substantially as described.

395,498. WOOL-WASHING MACHINE. WILLIAM LORD, Philadelphia, Pa. Filed June 14, 1888. Serial No. 277,072. (No model.)



Claim.—1. The combination of the carrier-apron and retainer-apron, bars having teeth projecting from the carrier-apron, rolls for said apron recessed to receive the bars, and cam-slots whereby the bars are retracted and their teeth withdrawn from above the carrier-apron at the delivery end of the latter, all substantially as specified.

2. The combination of the carrier-apron composed of jointed and perforated slats, the bars having teeth adapted to the perforations of said slats, the rolls recessed for receiving said bars, and cam-slots for retracting the bars at the delivery end of the apron, all substantially as specified.

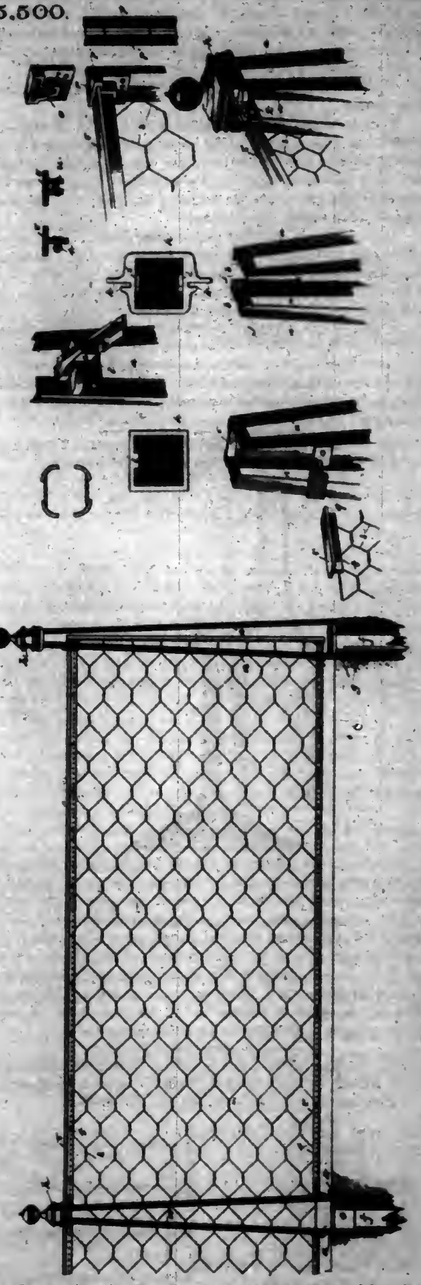
3. The combination of the carrier-apron and its teeth with the open-work retainer-apron engaging with said teeth and preventing the release of the wool therefrom, all substantially as specified.

395,499. MACHINE FOR PRINTING CARDS, &c. SAMUEL MCAULIFFE, Rochester, N. Y. Filed Oct. 19, 1885. Renewed Oct. 11, 1888. Serial No. 288,256. (No model.)

Claim.—1. The feed device consisting of the reciprocating carriage K, slide L, adjustable longitudinally upon the carriage, finger-plate M, attached to and adjustable up and down upon the slide, and the push-fingers *g g*, projecting forward and upward from the plate, substantially as herein specified.

2. The combination of the reciprocating carriage K, horizontally-adjustable slide L, vertically-adjustable finger-plate M, inclined fingers *g g*, adjustable gage I, and vertically-adjustable gage P, substantially as and for the purpose herein specified.

3. The combination of the reciprocating carriage K, slide L, finger-plate M, inclined fingers *g g*, having sharp-edged ends *n n*, and the slotted table or platform H, substantially as and for the purpose herein specified.



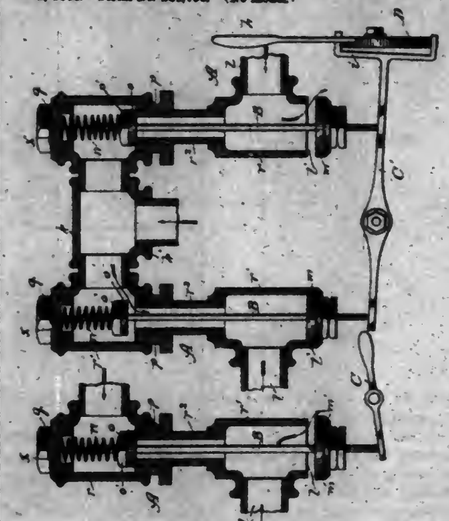
4. The combination of the guides N N, having standards b^9 b^9, and each provided with a groove, *t*, in its inner edge, the spring-strips *w w*, runways c^9 c^9 at the rear ends of the guides, and the delivering bands or tapes p^9 p^9, substantially as and for the purpose herein specified.

5. The combination of the reciprocating feed-carriage K, inclined push-fingers *g g*, actuated by the said carriage, guide I, guides N N, each provided with a groove, *t*, in its inner edge, spring-strips *w w*, and runways c^9 c^9 at the rear ends of the guides N N, substantially as and for the purpose herein specified.

395,500. FENCE. ROBERT B. MCMULLEN, Chicago, Ill. Filed Aug. 8, 1888. Serial No. 282,262. (No model.)

Claim.—1. In a fence, the combination, with a post composed of four bars secured together in pairs, of a removable cap adapted to embrace the upper end of said bars to prevent their separation, and provided with interior shoulders to fit the openings between the bars and prevent their inward movement, substantially as described.

395,500.



2. The combination, in a fence, of a post composed of four bars arranged in pairs to provide openings through which to pass a continuous fence-body, and a cap adapted to embrace the upper ends of said bars to prevent their separation, said cap provided with flanged bearings to receive the ends of the fence-rails, substantially as described.

3. The combination, in a fence, of a post composed of a plurality of bars disposed to provide an opening through which to pass a continuous fence-body, and said bars spread apart at their lower ends, a cap adapted to confine the upper ends of said bars, and rails joined to said cap and bars respectively, substantially as described.

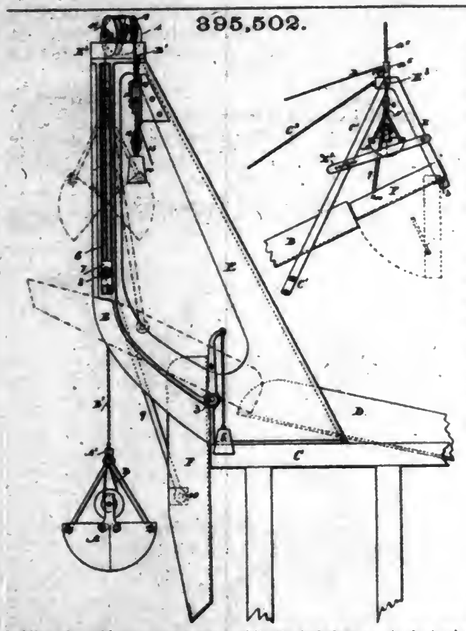
4. The combination, in a fence, of a post composed of a plurality of bars so disposed as to provide an opening for the passage of the fence-body, a fence-body composed of a woven-wire fabric secured along its side margins to suitable rails, and a clamp for the end of said fabric, said clamp and the end of the fabric being movably supported by the post, whereby to compensate for contraction and expansion of said fabric, substantially as described.

5. The combination, in a fence, of a wire fabric composing the fence-body, suitable rail-carrying posts, rails having attaching-flanges for the fabric, provided with transverse perforations to receive securing-pins, and split pins adapted to embrace the selvage of the fabric, pass through the perforations of the rail, and have their ends separated, whereby to secure the fabric, substantially as described.

395,501. VALVE. MONTGOMERY B. MILLS, Chicago, Ill. Filed Aug. 2, 1888. Serial No. 281,760. (No model.)

Claim.—1. A valve device comprising, in combination, a shell having a chamber at one end provided with an inlet-opening and containing a valve-seat, and a chamber at its opposite end having an outlet-opening, *l*, and a discharge-opening, *l'*, a rod, B, extending from the first-named chamber through and beyond the discharge-opening *l'*, and having a valve, *o*, at one end normally against the said valve-seat, and a valve, *m*, toward its opposite end normally away from its seat and beyond the discharge-opening *l'*, substantially as and for the purpose set forth.

2. A valve device comprising, in combination, two shells, A, each having a section, *r*, provided with an inlet-opening, a section, *r'*, communicating with the section *r* through a reduced passage, r^4, and having a discharge-opening, *l'*, and an outlet-opening, *l*, between the inlet and discharge openings for waste or return fluid, a valve, *o*, normally maintained against its seat in the section *r*, a valve, *m*, normally maintained away from its seat at the discharge-opening *l'*, and a rod, B, connecting the two valves, a pipe, *k*, connecting the sections *r* of the two shells and having an opening, *k'*, and a lever, C, fulcrumed in position to engage with the valves *m* at opposite sides of its fulcrum and provided with a fork, *i*, at one end, and a cam, D, in the fork, substantially as described.

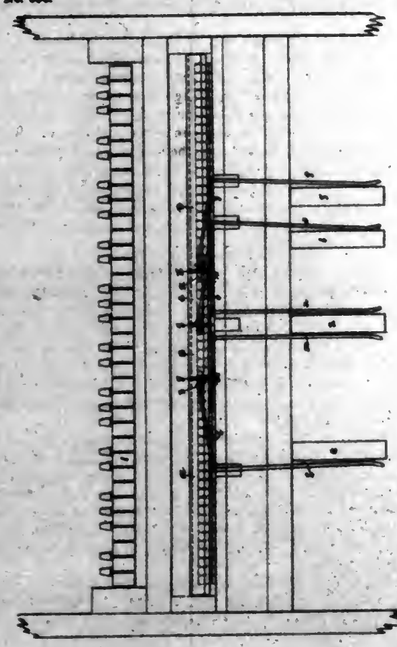


395,502. ELEVATING AND DISCHARGING APPARATUS. CHAS. A. MORSE, Bloomfield, N. J. Filed Aug. 17, 1886. Renewed June 1, 1887. Again renewed July 11, 1888. Serial No. 279,873. (No model.)

Claim.—1. The combination, with an elevating bucket having sections that swing in opening and closing and a rope or chain for hoisting the same, of a swinging chute, a yoke and links for drawing the chute up beneath the bucket, and a second rope or chain whereby the contents of the bucket are discharged into such swinging chute, substantially as specified.

2. The frames E, in combination with the swinging chute F, the cross-shaft for supporting the same, the yoke 8, guided at its ends in the frame E, the links 9, extending from the yoke to the chute, and the hoisting-rope and bucket having sections that swing in opening and closing for elevating the coal or other material, one rope or chain for closing and hoisting the bucket, and means for holding up the cross-head and parts as the rope is lowered to open the bucket, substantially as specified.

3. The combination, with the elevating-bucket and its hoisting-rope, of a second or discharge rope, a pulley over which the same passes, a weight to take up the slack of the rope, and a clamp for

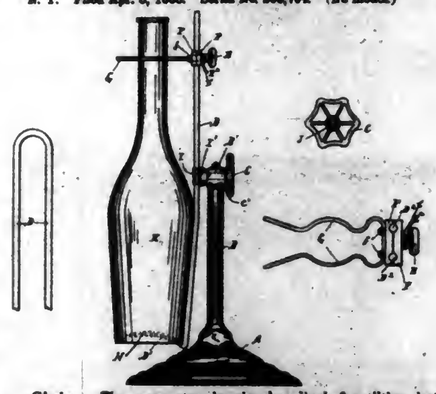


395,502.

holding the said rope and bucket while the hoisting-rope is slackened for opening the bucket, substantially as set forth.

4. The combination, with the hoisting-bucket having sections that swing in opening and closing and the rope or chain for the same, of a hoisting-pulley over which the rope or chain passes, a frame for supporting such pulley, a chute pivoted upon the frame, and connecting-links for swinging the chute up beneath the hoisting-bucket, and a weight to partially counterpoise the chute, and a stationary chute for receiving the materials from the swinging chute, and mechanism for sustaining the chute and other parts while the bucket is lowered and the sections swung open, substantially as set forth.

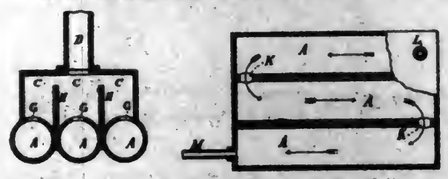
395,503. ORGAN STOP-ACTION. JOHAN P. NYTTRÖM, Carlstad, Sweden. Filed June 27, 1888. Serial No. 278,312. (No model.) Patented in Sweden Aug. 30, 1887, No. 1,556, and in Norway Sept. 16, 1887, No. 600.



Claim.—1. In an organ, the combination, with a series of organ-reeds in a single row divided into groups, a lid or valve hinged in front of each group, levers for operating the lids or valves, and a forte lid or valve pivoted to the wind-chest extending in front of the entire row of reeds and the hinged lids or valves of the same, substantially as set forth.

2. In an organ, the combination, with a series of organ-reeds divided into groups, a hinged lid or valve in front of each group of reeds, transverse partitions between the ends of the lids or valves, a forte lid or valve extending along the wind-chest in front of the above-mentioned lids, and levers for actuating the lids or valves, substantially as herein shown and described.

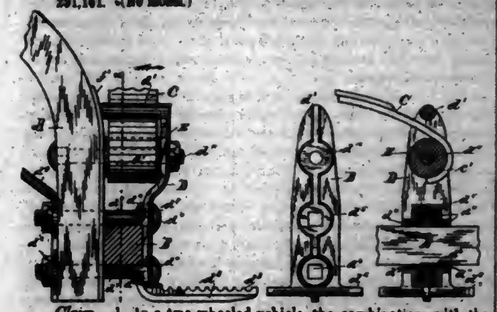
3. In an organ, the combination, with a series of organ-reeds divided into groups, of a lid or valve hinged in front of each group, clips secured on the ends of same and extending over upon the ends of the adjacent lids, and angle-levers for operating said lids or valves, substantially as herein shown and described



4. In an organ, the combination, with a series of reeds, of a hinged lid or valve in front of the reeds, an angle-lever, the upper end of which is connected with a lid or valve, and a swinging knee-lever at the side of the lower shank of said angle-lever but independent of the same, whereby, by pressing on the knee-lever, the angle-lever is operated, substantially as set forth.

395,504. BOTTLE-TILTING DEVICE. JAMES H. HASCH, Brooklyn N. Y. Filed Apr. 5, 1888. Serial No. 269,764. (No model.)

Claim.—The apparatus herein described for tilting bottles mechanically, consisting of a suitable stand having an upright bearing-column, a rod parallel to the column and bent at the lower end to form horizontal arms whereon the concave bed for holding the bottle rests, and having centrally a rigid yoke, wherefrom a pivotal operating-axis projects, to which a terminal hand-wheel is secured, and provided near the top with a sliding yoke having clamp-arms to encircle the neck of the bottle on one side, and a set-screw on the other side to adjust its position on the bent rod, in the manner and for the purpose herein fully shown and described.



395,505. APPARATUS FOR CONCENTRATING ACIDS. EDMUND C. HATCH, Passaic, assignor to William M. Johnson, Hackensack, N. J. Filed Oct. 25, 1888. Serial No. 289,103. (No model.)

Claim.—1. The cast iron or steel still for concentrating acid, composed of two or more tubes, A, chamber C, and partition H, all cast together, there being an opening between one still and the next and openings at the upper portions of the respective tubes for the passage of the vapors into the chamber C, substantially as set forth.

2. The three still-tubes A, having partitions between them with openings at K, and the chamber C above the openings G in the tubes A, and the partitions H, rising within the chamber C, these parts being of iron or steel and cast in one, and an inlet-pipe, L, at one end of one still-tube, and the outlet-pipe M, for the discharge of the concentrated acid, and a pipe, D, for carrying away the vapors from the still, the same being connected to the top of the chamber C, substantially as set forth.

395,506. TWO-WHEELED VEHICLE. DAVID M. PARRY and THOMAS H. PARRY, Indianapolis, Ind. Filed Nov. 17, 1888. Serial No. 291,161. (No model.)

Claim.—1. In a two-wheeled vehicle, the combination, with the shaft and spring, of a metallic plate secured to the rear side of the shaft, near the lower end, and having a spring-supporting projection at its upper end, substantially as described, and for the purpose set forth.

2. In a two-wheeled vehicle, the plate D, having a spring-supporting portion at its upper end and secured to the rear side of the shaft, near the lower end, the spring C, movably engaging said plate D, and the axle B, secured between the plate and shaft, substantially as described.

3. In a two-wheeled vehicle, the combination, with the shaft A, of a plate, D, having the loosely-mounted friction-roller E at its upper end, the spring C, loosely engaging said roller, and the axle B, secured between the plate D and shaft, substantially as set forth.

4. The combination, with the shaft A, of the plate D, having the forwardly-projecting spring-supporting portion E and guard d' at its upper end and being secured to the rear side of the shaft at its lower end, and the axle B, secured between said plate and shaft approximately in a vertical line with the spring-supporting portion E, substantially as and for the purpose set forth.

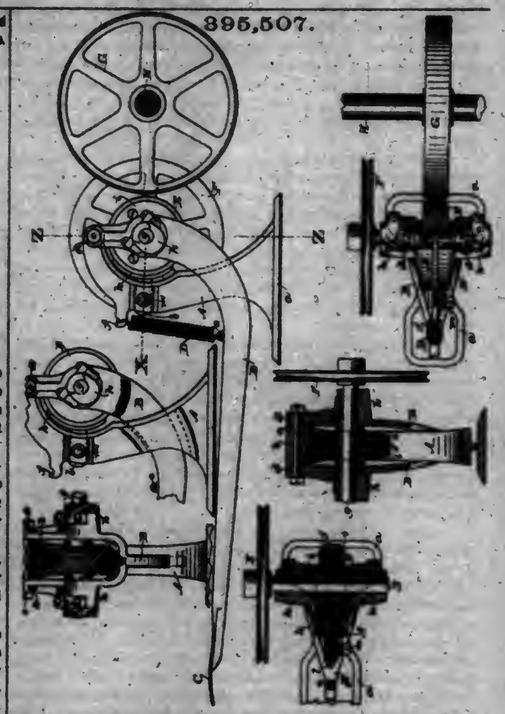
5. In a two-wheeled vehicle, the combination, with the shaft A, of a plate, D, having a spring-supporting portion at its upper end, and a step portion, d^3, at its lower end, and the axle B, interposed between the plate D and shaft A, the whole being preferably secured together by bolts, substantially as described.

6. In a two-wheeled vehicle, the plate D, having the friction roller E removably secured near its upper end, and the guard d' and the step portion d^3 at the upper and lower ends of the plate D, as shown, all secured to the rear of the shaft and to the axle, substantially as described.

7. The combination, with the shaft A, of the plate D, having a spring-supporting portion and a guard at its upper end, the washer f', formed a part with or separate from the plate D, the axle B, interposed between the plate D and shaft, and the spring C, having the bent end c', all secured and arranged substantially as shown and described.

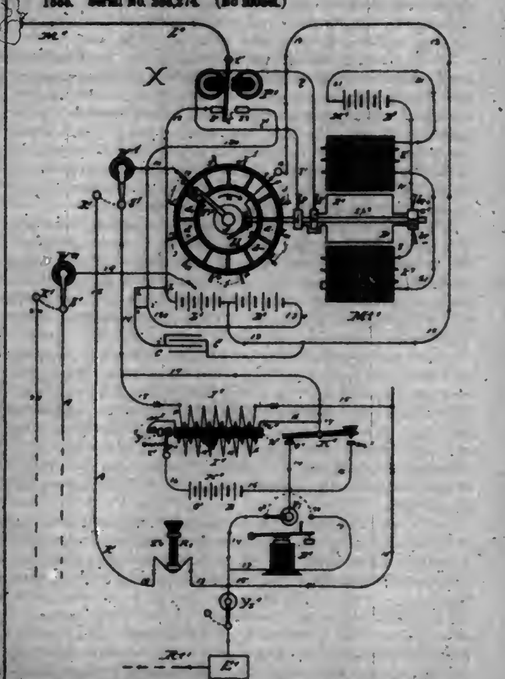
8. The plate D, having the spring-support E and guard at its upper end, and the transverse horizontal flanges d^3 at the inner face, the axle B resting between said flanges and the shaft A, all secured and arranged substantially as shown and described.

395,507. FRICTIONAL DRIVING MECHANISM. HENRY PARSONS, Marlborough, Mass. Filed Oct. 5, 1887. Serial No. 251,492. (No model.)



Claim.—1. In a frictional driving mechanism, the combination of a standard formed and adapted to be secured in position, a curved lever pivoted to said standard and provided with a foot-plate by which to actuate it as a treadle, a friction-wheel and band-wheel secured upon an arbor journaled in said lever, so that as the lever is actuated by the operator the friction-wheel will be forced into contact with a transmitting-pulley on another shaft, a brake duly arranged relatively to said friction-wheel, and a spring adapted to raise said lever and force said friction-wheel against said brake when the treadle is released from the foot of the operator.

2. The combination of standard A, upturned lever B, pivoted at its head to said standard, arbor g, journaled in said lever below its pivoted head, the frictional and band wheels secured on said arbor, and a foot-plate, C, on the rear end of said lever, all substantially as specified.



3. The combination of standard A, curved lever B, arbor g, wheels E F, brake k, and spring D, all combined and arranged substantially as specified.

4. In a driving friction mechanism, the combination of a standard, a lever thereto pivoted and adapted to be actuated as a lever, an arbor journaled in said treadle, and band and friction wheels secured on said arbor, all substantially as specified.

395,507.

395,508. MULTIPLEX TELEGRAPHY. FRANCIS J. PATTEN, New York, N. Y., assignor to J. M. Seymour, same place. Filed Oct. 16, 1883. Serial No. 288,274. (No model.)

Claim.—1. In a telegraph system, the combination of a line-circuit connecting different stations, synchronously-moving electric motors located at said stations, current-distributers driven by said motors, local branches successively connected to line by the distributer, a prac-

tically-continuous source of current for establishing synchronism, a source of current of different electro-motive force for signaling, and electric connections between said signaling source and the local distributer-segment, a controlling-key, and receiving-instruments to respond to said signaling-current, whereby the signaling-impulses are thrown upon the line during the continuance of the synchronizing current.

2. In a telegraph system, the combination of a series of synchronously-moving motors located at different stations, a line-circuit connecting the stations carrying a practically-continuous low-tension current for controlling the motors, a series of current-distributers driven by the motors, local branch circuits successively connected to line by the distributers, an induction-generator for throwing high-tension currents on line, and electric connections between the induced circuit of said generator and the local distributer-segment, a controlling-key, and receiving-instruments at the several stations to respond to the high-tension currents.

3. In a telegraph system, the combination of a line-circuit connecting different stations, synchronously-moving electric motors located at said stations, controlled by a low-tension current on said circuit, distributers driven by said motors, local branches successively connected to line by the distributers, a switch for connecting each branch through a low-tension or a high-tension receiving-instrument, being normally on the low-tension branch, and a transmitting-instrument at each station for throwing high-tension current through the distributer and line into a desired local branch, whereby any desired local may be first called and then communicated with.

4. In a telegraph system, the combination of a line-circuit connecting different stations, synchronously-moving electric motors located at said stations, current-distributers driven by said motors, local branches successively connected to line by the distributers, a practically-continuous source of low-tension current for establishing synchronism, a calling-instrument in normally-closed relation to each branch, an induction-generator, electric connections between said generator and the local distributer-segment, a controlling-key, and a receiving-instrument at each station to respond to said high-tension current.

5. In a telegraph system, the combination of a line-circuit connecting different stations, synchronously-moving distributing apparatus at each station, a source of low-tension current for controlling the same, local branches successively connected to line by said distributing apparatus, an induction-coil at each station having its fine wire in shunt relation to the local branch, a receiving-instrument in each branch adapted to respond to the induced current, and a key for throwing current through the primary of the induction-coil and simultaneously rupturing the low-resistance branch of the shunt.

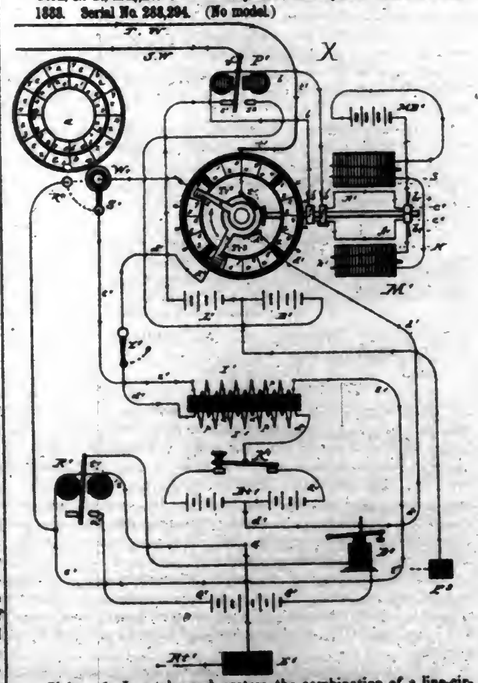
6. In a telegraph system, the combination of a line-circuit connecting different stations, synchronously-moving distributing apparatus at each station, a source of low-tension current for controlling the same, local branches successively connected to line by said distributing apparatus, an induction-coil at each station having its high-tension coil in shunt relation to the local branch, a vibrator for said induction-coil, a key for throwing current through the low-resistance coil of the induction-coil and to line, and a receiving-instrument in each branch adapted to respond to the induced currents.

7. A synchronizing system for multiplex telegraphy, consisting of a line-circuit connecting different stations, a current-changer in said line, controlled electric motors at the different stations having independent field-magnet and armature circuits, the polarity of one being constant and that of the other being reversed in accordance with the changes in the line-current, and a current-distributer driven by the moving part of each motor.

8. A synchronizing system for multiplex telegraphy, consisting of a line-circuit connecting different stations, a current-changer for reversing current in said line, a relay at each station actuated by the line-current, a local circuit periodically reversed by the armature of said relay, an electric motor having independent field-magnet and armature circuits, one of which is included in the circuit reversed by the armature of the relay, the other of which is excited by a current of one direction, and a current-distributer driven by the moving part of said motor.

9. A synchronizing system for multiplex telegraphy, consisting of a line-circuit connecting different stations, a controlling electric motor at one station, a series of controlled electric motors at the other stations, a pole-changer for the line-current operated by the controlling-motor, a relay at each station actuated by the reversals of the line-current, a local circuit periodically reversed by the armature of said relay, an electric motor having independent field-magnet and armature circuits, the field-magnet coils being included in the circuit reversed by the relay-armature, the armature-coils being excited by a current of one direction, and a current-distributer driven by said motor.

10. A synchronizing system for multiplex telegraphy, consisting of a line-circuit including polarized relays at different stations, a pole-changer for reversing current in the line, the armature of each relay playing between contact-points, a split battery having its two poles connected to the said contact-points, a motor having independent field-magnet and amature circuits, one of which circuits is connected to the relay-armature and the middle point of the battery, the other of which circuits is excited by a direct current, and a current-distributor driven by said motor.



11. A telegraph system comprising a main line connecting different stations, a current-controller for the line-currents periodically changing said currents, an electric motor at each station having independent field-magnet and armature circuits, a current-reverser operated by the line-currents for reversing current in one of said independent circuits, the other independent circuit being excited by a direct current, current-distributers at the several stations driven by the motors in a branch between the main line and return, and telegraphic transmitting and receiving instruments in each branch.

12. A system of multiplex telegraphy comprising synchronously-moving electric motors at different main stations, a line connecting said main stations and controlling the motors, a segmental distributer connected to line at each station driven by the motor, a series of return branches from the segments of the distributer passing through the several local stations, an inducing-generator for each branch having its induced circuit electrically connected with a local segment, and a key controlling the induced circuit, and a receiving-instrument at each local adapted to respond to the high-tension current.

13. A system of multiplex telegraphy comprising a main line connecting different stations, electric motors at the stations synchronously controlled by the main-line current, return branches at the stations including distributers driven by the motor, a low-tension receiver normally in the branch, an induction-generator and transmitting-key for throwing high-tension currents into the distributer and line, a high-tension receiver at each station adapted to respond to said high-tension current, and a rheostat in each branch.

14. A synchronizing system for multiplex telegraphy, consisting of a line-circuit connecting the different stations, electric motors at the different stations having independent field-magnet and armature circuits, the polarity of one being constant and having its poles ninety degrees apart, a current-changer in the line-circuit for reversing the polarity of the other independent circuit, and a current-distributer driven by the moving part of the motor.

395,509. MULTIPLEX TELEGRAPHY. FRANCIS J. PATTEN, New York, N. Y., assignor to J. M. Seymour, same place. Filed Oct. 17, 1888. Serial No. 288,294. (No model.)

Claim.—1. In a telegraph system, the combination of a line-circuit connecting different stations, synchronously-moving current-distributers at the respective stations, local branches successively connected to line by said distributers, a source of induced current, electric connections between the line and the induced circuit of said source, a circuit-closer in the inducing-circuit of said source, contacts engaged by said circuit-closer simultaneously with the connection of a branch to line, and receiving-instruments adapted to respond to the induced currents.

2. In a telegraph system, the combination of a line-circuit connecting different stations, synchronously-moving circuit-distributers at the respective stations, local branches successively connected to line by said distributers, an induction-generator, the induced circuit of the generator being connected to line when a local branch is closed, and a rotating circuit-closer driven by the same synchronizing device for simultaneously varying the current in the inducing-circuit of said generator.

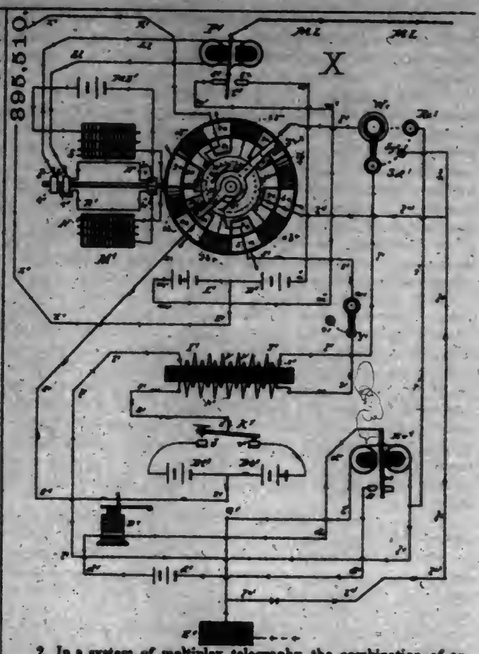
3. In a telegraph system, the combination of a line-circuit connecting different stations, synchronously-moving current-distributers at the respective stations, local branches successively connected to line by said distributers, signal transmitting and receiving instruments in operative relation to the local branches, an induction-coil having its high-resistance circuit connected to line when the local branch is closed, and a rotating circuit-closer driven by the same synchronizing device for simultaneously varying the current in its low-resistance circuit.

4. In a system of telegraphy, the combination of a line-circuit connecting different stations, an induction-generator, synchronously-moving current-distributers at the respective stations, and electrical connections from the distributer-segments to the inducing and induced circuits of said generator, each distributer simultaneously closing the two circuits pertaining to each local branch, the induced circuit being periodically connected to line and the inducing-circuit to a controlling-key by said distributer.

5. In a telegraph system, the combination of a line-circuit connecting different stations, an induction-generator, a synchronously-moving current-distributer having its trailer in both the inducing and the induced circuits of the generator, and contacts in the path of said trailer corresponding to the inducing and the induced circuits of the generator, the trailers simultaneously bearing on said contacts, whereby the inducing-circuit is varied and the induced circuit connected to line simultaneously.

6. In a system of multiplex telegraphy, the combination of a series of synchronously-moving current-distributers located at different stations, a controlling line-circuit for said distributers, an independent signaling line-circuit, local branch circuits successively connected to the signaling-circuit, an induction-generator having its induced circuit in operative relation to line, its inducing-circuit including a key, revolving circuit-closer, and a source of energy, and a receiving-instrument to respond to the induced current.

7. In a system of multiplex telegraphy, the combination of a series of synchronously-moving current-distributers located at different stations, a controlling line-circuit for said distributers, local branch circuits at the stations successively connected by said distributers, a source of high-tension current electrically connected through a key with the local distributer-segment, a polarized relay at each station to respond to the high-tension currents, and a sounder controlled by said relay.



8. In a system of multiplex telegraphy, the combination of a line-circuit connecting different stations, synchronously-moving current-distributers at the respective stations, local branches successively connected to line by said distributers, an induction-generator, a pole-changing key controlling said generator and normally throwing a current of one polarity to line, and polarized receiving-instruments in the local branches at the stations adapted to respond to a current of the other polarity.

9. A current-distributing apparatus for a multiplex telegraph system, comprising a series of insulated contact-segments and a trailing arm successively engaging said segments, said trailing arm being in two circuits, one from a local branch through its insulated segment to line and the other including the primary of an induction-coil and a controlling-key, the secondary of the induction-coil being connected with the line through a switch, as and for the purpose set forth.

395,510. MULTIPLEX TELEGRAPHY. FRANCIS J. PATTEN, New York, N. Y., assignor to J. M. Seymour, same place. Filed Oct. 24, 1888. Serial No. 289,026. (No model.)

Claim.—1. In a system of multiplex telegraphy, the combination of an insulated line-wire connecting different stations, synchronously-moving electric motors at the stations controlled by a practically continuous current on said line-wire, current-distributers driven by said motors, the segmental contacts of said distributers being all in the synchronizing-circuit, a source of synchronizing-current, direct return branches at the stations connected to insulated contacts at the distributer, local branches at the several stations successively connected with the line-wire and return by said distributers, a source of signaling-current of different electro-motive force from the synchronizing-current, transmitting-instruments for throwing the signaling-current on line, and receiving-instruments to respond to the signaling-current.

395,510

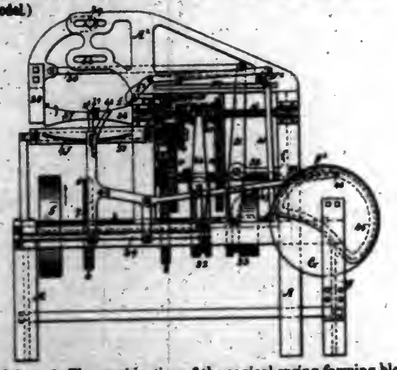
2. In a system of multiplex telegraphy, the combination of an insulated line-wire connecting different stations, synchronously-moving electric motors at the stations controlled by a practically continuous current on said line-wire, current-distributers driven by said motors, the segmental contacts of said distributers being all in the synchronizing-circuit, a source of synchronizing-current, direct return branches at the stations for said current controlled by the distributers, local branches at the several stations successively connected with the line-wire and return by said distributers, a source of signaling-current of different electro-motive force from the synchronizing-current, transmitting-instruments for throwing the signaling-current on line, and receiving-instruments to respond to the signaling-current.

3. In a system of multiplex telegraphy, the combination of an insulated line-wire connecting different stations, synchronously-moving electric motors at the stations controlled by a practically continuous current on said line-wire, current-distributers driven by said motors, the segmental contacts of said distributers being all in the synchronizing-circuit, a source of synchronizing-current, direct return branches at the stations connected to insulated contacts at the distributer, local branches at the several stations connected to independent contacts at the distributer, transmitting and receiving apparatus at the local stations, and a switch for connecting either with the local branch.

4. In a system of multiplex telegraphy, the combination of an insulated line-wire connecting different stations, synchronously-moving electric motors at the stations controlled by the current on said line-wire, current-distributers driven by said motors, a source of synchronizing-current, direct return branches for said current at the station connected to insulated contacts at the distributer, local branches at the several stations connected to independent contacts at the distributer, and a switch in each local branch provided with three contacts controlling receiving apparatus, sending apparatus, and a direct connection with the return-circuit, respectively.

5. In a system of multiplex telegraphy, the combination of an insulated line-wire connecting different stations, synchronously-moving current-distributers at the several stations, the segmental contacts of said distributers being all in the synchronizing-circuit, a source of synchronizing-current at one station, low-resistance return branches at the stations connected to insulated contacts at the distributers, independent signaling-contacts at the distributer, and a switch for connecting the signaling-contacts with transmitting and receiving apparatus.

6. In a system of multiplex telegraphy, the combination of an insulated line-wire connecting different stations, synchronously-moving current-distributers at the several stations, the segmental contacts of said distributers being all in the synchronizing-circuit, a source of synchronizing-current for controlling said distributers, low-resistance return branches at the stations connected to insulated contacts at the distributers, independent contacts at the distributers connected with local stations, a source of signaling-current of different tension from



the synchronizing-current, transmitting devices at the local stations for throwing said signaling-current on line when desired, and receiving-instruments at the local stations adapted to respond to the signaling-current.

7. In a system of multiplex telegraphy, the combination of an insulated line-wire connecting different stations, synchronously-moving current-distributers at the several stations, a source of practically continuous synchronizing-current for controlling said distributers, low-resistance return branches at the stations connected to insulated distributer-contacts, independent signaling-contacts connected to local branches, and induction-generator for developing the signaling-current, the induced circuit of the generator being connected to the line-circuit through the signaling-contact, a key in the inducing-circuit of the generator, and means for varying the current in the inducing-circuit of said generator when the station-signaling contact is engaged.

8. In a system of multiplex telegraphy, the combination of an insulated line-wire connecting different stations, synchronously-moving current-distributers at the several stations, a source of synchronizing-current for controlling said distributers, low-resistance return branches at the stations connected to insulated distributer-contacts, independent signaling-contacts connected to local branches, a constantly-driven dynamo-electric generator for developing the signaling-current, said generator having independent field-magnet and armature-circuits, connections between the induced circuit of the generator and the station-signaling contact, a key in the inducing-circuit, and means for varying the current in the inducing-circuit when a signaling-contact is engaged.

9. In a system of multiplex telegraphy, the combination of an insulated line-wire connecting different stations, segmental signaling-contacts connected to local branches, a trailer progressively engaging said contacts, synchronizing-contacts having a low-resistance return engaged by the trailer-arm, all of said contacts being in the synchronizing-circuit, an induction-generator having contacts in its inducing-circuit engaged by a distributer simultaneously with the signaling-contacts, a key and source of energy in said inducing-circuit, and a switch for connecting the induced circuit of said generator to line.

395,511. SPRING-COILING MACHINE. LEE J. PENNOCK, Jamestown, N. Y., assignor of two-thirds to Addison A. Taylor and Jesse W. Rice, both of same place. Filed June 8, 1888. Serial No. 276,454. (No model.)

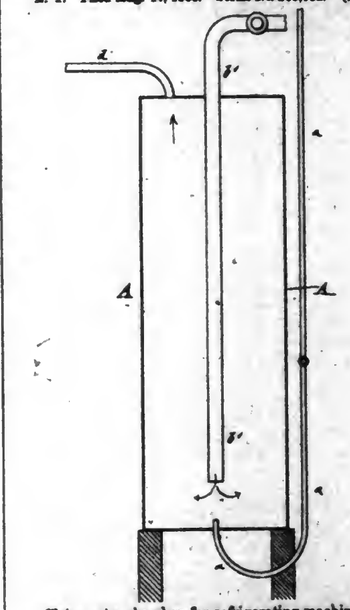
Claim.—1. The combination of the conical-spring-forming blocks, the wire-carriage, its operating-cam, connecting-rod 47, link g^6, and disk G, substantially as and for the purpose set forth.

2. The combination of the conical-spring-forming blocks and their shaft 16, the gear 1, having perforations in its side, and clutch 25, having spring clutch-pins, with the pinions 12 and 13 upon a stud, the gear 11 and pinion 9 upon one shaft, and the gear 8 upon the counter-shaft 3, with the clutch-lever 23 and cam 22, whereby the coiling of the spring is started, substantially as described.

3. The combination of the conical-spring-forming blocks and their shaft 16, the gear 2, having recesses in its side, and clutch 25, having spring clutch-pins, with the pinions 19 20, and gear 18, whereby a back motion is given to the forming-blocks, substantially as described.

4. The combination of the spring-forming blocks with the cutters $f f^3$, the horizontal rod F, bell-crank F^2, the vertical rod 41, pivoted lever 42, and revolving collar-arm 40, substantially as described.

5. The combination of the spring-forming blocks, their shaft, and collar-cam 53, the spring-dog 54, and spring-latch 55, with a rod secured to said latch, the pivoted vertical lever 56, and gear 8, having a lug, 8', on the side thereof, whereby the forming-blocks are stopped in proper location, substantially as described.



6. The combination of the spring-forming blocks and their shaft, the half-collar 34 on one side of said cone, the pivoted arm *e*, carrying said collar, the pivoted lever 36, the vertical rod 38, having a wedge-shaped upper end, the pivoted lever 39, and revolving arm E, whereby the spring formed on the cone-block is removed, substantially as described.

7. The combination of the spring-forming blocks, the arm 28, carrying one of them, the connecting-rod 30, lever 31, and cam 33, substantially as and for the purpose described.

8. The combination of the spring-forming blocks, the gears 1 and 2, the clutch between them, its clutch-lever, the gears 14, 12, 11, 9, and 8, and cam 22 on shaft 3, the elliptical gear 7 on said shaft, and the elliptical gear 6 on the main shaft, substantially as and for the purpose described.

9. The combination of two spring-forming blocks, one of which has its inner end provided with a screw having two prongs and the other with two grooves, and a solid central portion between said two grooves, substantially as and for the purpose described.

395,512. ABSORBER FOR REFRIGERATING-MACHINES. MICHAEL PIEL, East New York, assignor to Piel Brothers, Brooklyn, N. Y. Filed Aug. 17, 1888. Serial No. 283,062. (No model.)

Claim.—An absorber for refrigerating-machines, composed of a cylindrical vessel, a gas-induction pipe extending downward through the top of the absorber to near the bottom of the same, a supply-pipe for the weak ammonia-water entering at the bottom of the absorber, and a discharge-pipe connected to the top of the absorber for conducting off the strong ammonia-water, substantially as set forth.

395,513. FASTENER FOR MEETING-RAILS OF SASHES. DAVID J. POWERS, Chicago, Ill. Filed Aug. 18, 1887. Serial No. 247,233. (No model.)

Claim.—1. The combination of plate A, rotatable stud *a*, hinged lever D, having vertical and lateral motion, locking-bolt E, plate B, and the engaging-stud *b*, substantially as set forth.

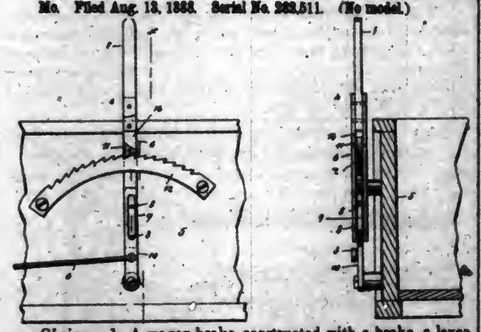
2. In a window-lock, the combination of plate B, provided with a ledge, *b'*, to form a fulcrum, a rotatable stud, *a*, hinged lever D, having vertical and lateral motion, and adapted to engage the ledge on plate B, whereby to bring the upper surfaces of the meeting-rails in the same plane, locking-bolt E, plate A, and engaging-stud *b*, substantially as described.

395,514. CANDLE-HOLDER FOR CHRISTMAS-TREES. CHRISTOPH REINHARDT, Newark, N. J. Filed Sept. 20, 1887. Serial No. 250,195. (No model.)

395,514.

Claim.—The combination, with a stem of a candle-holder, bent as described, of a sheet-metal plate having its outer portion divided by radial cuts into sections *a* and *c* and bent upward, as shown, the central portion of said plate being formed into a drip-bowl and the sections *c* into a candle-holder, as described, for the purposes set forth.

395,515. CHEWING-GUM LOCKET. CHRISTOPHER W. ROBERTSON, Somerville, Tenn., assignor of one-half to Carie Booth Robertson, same place. Filed Sept. 10, 1887. Serial No. 249,394. (No model.)



Claim.—1. A locket having hinged sections, each of which is fitted with an anti-corrosive lining, substantially as described, for the purpose specified.

2. A locket having hinged case-sections, each of which is fitted with a concave crystal removable from the case-sections, substantially as and for the purposes described.

3. The combination, in a locket, of the hinged case-sections, the concave linings, and separate rings forming rims for the protection of the edges of the linings, substantially as set forth.

4. The combination, in a locket, of the hinged case, the concave fragile lining, and the pad-lining placed between said case and concave lining, substantially as described.

395,516. WAGON-BRAKE. JAMES R. ROBINSON, Cornelia, assignor of two-thirds to Goodlet Crow and Charles Crow, both of Shawnee Mound, Mo. Filed Aug. 13, 1888. Serial No. 282,511. (No model.)

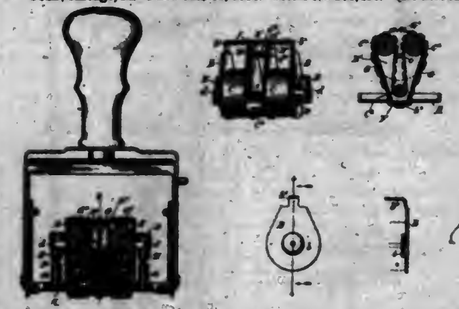
Claim.—1. A wagon-brake constructed with a brake, a lever-handle formed in two parts, the lower part pivoted to the wagon and the upper part having a pawl and a vertically-sliding connection with the lower part, a rack-bar on the wagon adapted to engage the pawl, and a connecting-rod pivoted to the brake and to the lower portion of the lever-handle, substantially as shown and described.

2. A wagon-brake constructed with a brake, a lever-handle pivoted to the wagon and formed in two parts, the upper part having a rotary pawl and being vertically movable on the lower part, a rack-bar with which the pawl is adapted to engage, and a connecting-rod pivoted to the brake and to the lower part of the lever-handle, substantially as shown and described.

3. A wagon-brake constructed with a brake, a lever, 4, pivoted to wagon 5 and formed with lower portion, 10, having vertical slot 9, and an upper portion with a handle, 7, having forked portion 6, and cross-pins 8, projecting through slot 9 in lower portion, 10, curved rack-bar 12, extending through forked portion 6, three-pointed pawl 11 in forked portion 6, located above rack-bar 12, and connecting-rod 3, pivoted to the brake and the lower portion, 10, of lever 4, substantially as shown and described.

395,517. LIFTING-JACK. BENDT A. SAHLMANN and JOSEF SCHEINOSKY, Marinette, Wis. Filed Sept. 10, 1888. Serial No. 285,008. (No model.)

Claim.—1. In a jack, the combination, with the frame thereof having a slotted front, of a gear-case mounted in the frame and carrying a train of gears, and a projecting power-shaft adapted to actuate the gears, and a rack-bar mounted for reciprocation within the case and arranged in mesh with one of said gears, and carrying a lifting-arm projecting and depending from the upper end of the rack-bar and adapted to operate in the slot of the frame, substantially as specified.



2. In a lifting-jack, a series of gears and a rack-bar adapted to be actuated thereby and provided with a trip, in combination with a bell and a hammer for the same adapted to be actuated by said trip, substantially as specified.

3. In a jack, a series of gears mounted in the gear-case, a rack-bar adapted to be actuated by the gears and provided with a tripping-pin, in combination with a bell, and a spring-actuated bell-hammer connected with the bell-crank lever, arranged in the path of the trip and adapted to be actuated thereby against the tension of the spring, substantially as specified.

4. In a jack, the combination, with the front and rear walls, 1 and 2, the former slotted, as at 23, and having the guide-plate 24, of the gear-case 3, having the shafts 9 15 18, carrying the gears 13, 14, 16, 17, and 19, the rack 20, meshing with the gear 19 and having the head 21, and depending lifting-arm 22, terminating in an angular end, 25, and adapted for reciprocation in the slot 23, substantially as specified.

5. The rack-bar 20, having the pin 35 and the gears for operating said rack-bar, in combination with the bell 26, the spring 28, terminating in the eye 30, bent as at 29 and having the hammer 31, and the bell-crank lever 33, pivoted, as at 32, and connected to the eye by the link 34 and projected in the path of the pin 35, substantially as specified.

395,518. DATING DEVICE FOR HAND-STAMPS. LOUIS K. SCOTTOAN, Chicago, Ill. Filed Jan. 12, 1888. Serial No. 260,496. (No model.)

Claim.—1. The combination, with the type-band, of a supporting-bar for sustaining said type-band at the point of printing, consisting of a sheet-metal strip bent into hollow or tubular form, substantially as described.

2. A type-band support for dating devices, comprising two side plates and a tubular cross-bar, said plates being provided with projecting lugs or ears entering the ends of said tubular cross-bar, substantially as described.

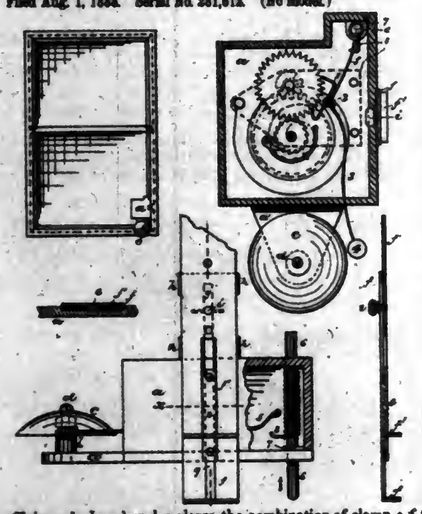
3. The combination, with a type-band, of a tubular cross-bar supporting the band at the point of printing, guides or rollers for the band, and side plates supporting the said guides or rollers, said side plates being provided with projecting lugs or ears entering the ends of the said tubular cross-bar, substantially as described.

4. A type-band support for dating devices, embracing two side plates, a tubular connecting-bar, and a rod passing through the plates, said plates being provided with projecting lugs or ears entering the ends of the tubular connecting-bar, and nuts upon the ends of the rod for holding together the parts of the frame, substantially as described.

5. The combination, with two or more type-bands, of a frame comprising side plates, an intermediate plate or plates located between the type-bands, and a tubular cross-bar, the outer plates being provided with projecting lugs or ears entering the ends of the cross-bar and the intermediate plate or plates being notched to engage said bar, substantially as described.

6. The combination, with a die-plate, of a type-band frame embracing side plates, a rod passing through said plates for holding said plates together, and nuts upon the ends of the rod, provided with ears

by which the frame may be connected with the die-plate, substantially as described.



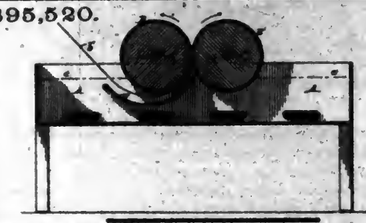
7. The combination, with a die-plate provided with standards screw-threaded upon their upper ends and grooved nuts upon said standards, of a type-band frame comprising side plates, a rod passing at its ends through the side plates, and nuts upon the ends of the rod, provided with ears engaging the nuts upon the standards, substantially as described.

8. The combination, with a die-plate provided with standards screw-threaded upon their upper ends and grooved nuts upon said standards, of a type-band frame comprising side plates provided with inwardly-extending lugs, a tubular cross-bar engaged at its ends with said lugs, a rod passing at its ends through said side plates, and nuts upon the rods, provided with ears engaging the grooves of the nuts upon the standards, substantially as described.

9. The combination, with a die-plate provided with standards screw-threaded at their upper ends and grooved nuts upon the standards, of a rod passing at its ends through said plates, and nuts upon the ends of said rod exterior to the plates, said nuts being made of sheet metal and having prongs or ears which are bent around and into the grooves of the nuts upon the standards, substantially as described.

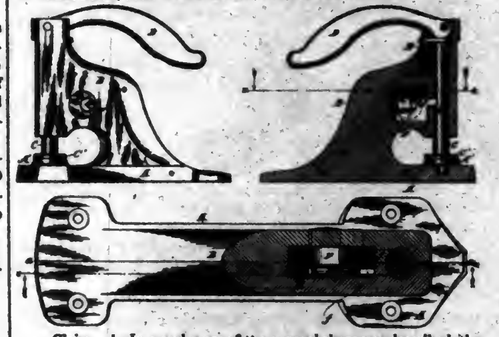
10. The combination, with a die-plate and the plates B B, provided with recesses *b b* in their outer faces, of a rod, *c*, and nuts D D upon the ends of the rod, provided with ears *d d*, which project outside of the faces of the plates to engage holding devices by which the said plates are secured to the die-plate, substantially as described.

395,519. BURGLAR-ALARM. ROBERT T. SHILLIE, Newark, N. J.
Filed Aug. 1, 1888. Serial No. 281,612. (No model.)



Claim.—1. In a burglar-alarm, the combination of clamp *e f*, the part *e* being secured to the case of the alarm, and the part *f* being adjustably secured to the part *e*, a train of wheels and a bell, a bell-hammer connected with said wheels, a spring for actuating said wheels and hammer, pin 6, detent 8, secured to said pin for automatically locking and releasing said wheels, as described, and a spring adapted to hold said pin and detent normally out of contact with the bell attachment, all said parts being arranged and combined as and for the purposes set forth.

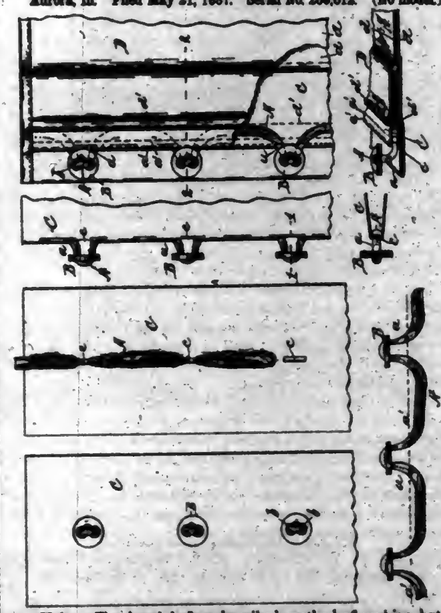
2. The combination, in the case of a burglar-alarm, with a train of wheels, a bell-hammer connected therewith, and a spring for actuating said wheels and bell-hammer, of a lever, 5, pivotally connected to said case and with the bell-hammer lever 3, pin 6, adapted to move in and through the upper and lower walls of the case, and detent 8, secured to said pin 6 and adapted to engage with the free end of lever 5 for automatically locking and releasing the pallet 1 from contact with the train of wheels, all said parts being arranged and combined substantially as and for the purposes set forth.



395,520. WAXED-PAPER BAG. EDWARD G. SPARKS, Brooklyn, N. Y. Filed Nov. 10, 1888. Serial No. 290,427. (Specimens.)

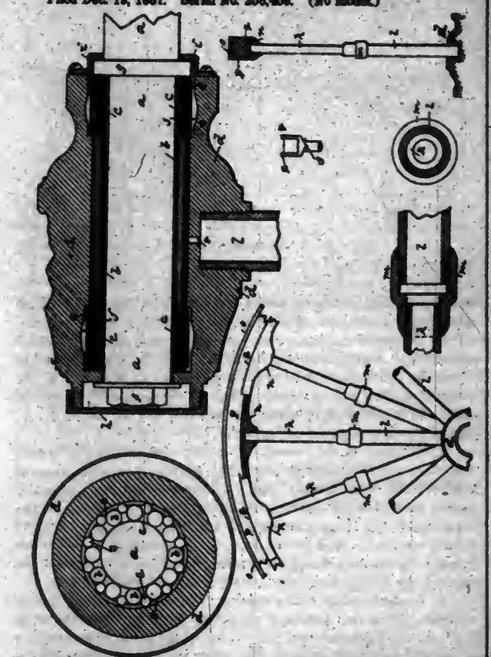
Claim.—As an improved article of manufacture, the within-described paper bag having its pores and interior surfaces charged with compressed wax and its exterior surfaces freed or nearly freed from the wax, as set forth.

395,520.



395,521. SEAL-PRESS. JOHN G. STROUTHAMER, Petersburg, Ill.
Filed Dec. 6, 1887. Serial No. 257,076. (No model.)

Claim.—1. In a seal-press of the general character described, the combination, with the standard and a plunger sliding therein and provided with a notch or shoulder, of a lock secured to the standard, the bolt of which lock engages the shoulder of the plunger, said shoulder being placed in position to secure the plunger-die in contact with or in close proximity to its opposing die, substantially as and for the purposes set forth.



2. A seal-press of the general character described, comprising a metal frame constructed of two parts permanently fastened to each other, a lock having its working parts embraced between the parts of the frame, and a plunger working in the frame engaged by the lock-bolt when said plunger is at its lower position, substantially as and for the purposes set forth.

395,522. METHOD OF MAKING BUTTON-STRIPS. JAMES STONE, Aurora, Ill. Filed May 31, 1887. Serial No. 239,013. (No model.)

Claim.—The hereinbefore-described method of making button-strips, which consists in applying to a continuous tape a series of buttons at fixed distances greater than the final distances which separate the buttons in the finished strip, then forming from the surplus of the intermediate portions of the continuous tape a series of loops, one for each button, whereby the buttons are brought into their final and proper position, and then securing the continuous tape to a suitable base by stitching, substantially as and for the purposes specified.

395,523. VEHICLE-WHEEL. CHARLES TAYLOR, Elizabeth, Pa.
Filed Dec. 19, 1887. Serial No. 258,409. (No model.)

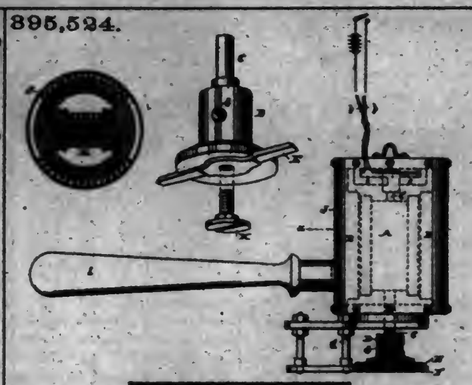
Claim.—1. In a journal-bearing such as described, the combination consisting of the journal *a* and hub *d*, and the parallel series of bearing-rollers *b*, having arranged at either ends short intermediate rollers, *c*, as and for the purpose set forth.

2. In a journal-bearing such as described, the hub *d*, having arranged therein a series of parallel rollers, *b*, and short intermediate rollers, *c*, the recesses *j*, for reducing the friction on the same, the cap *h*, and flexible covering *i*, for excluding dust from the journal, as and for the purpose described.

3. In a journal-bearing such as described, the hub *d*, having arranged therein and about the journal *a* a series of parallel rollers, *b*, and intermediate rollers, *c*, the recesses *j*, for reducing the friction on the same, the cap *h*, and flexible cover *i*, for excluding dust from the journal *a*, in combination with the adjustable and detachable metallic spokes, consisting of the tubes *k l*, of large and small diameter, and a suitably-constructed metallic bearing, *n*, for the reception of the tire *o* or felly *p*, substantially as described.

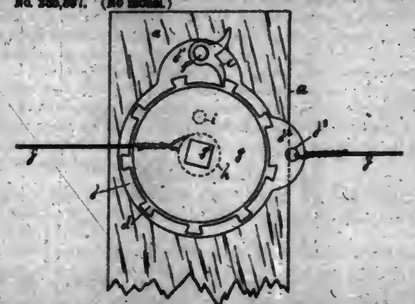
4. In a vehicle-wheel, the combination consisting of the metallic hollow spokes *k l*, divided into sections and secured together by a suitable coupling, *m*, and the segmental bearing *n*, recessed on its outer face for the reception of the tire *o* or felly *p*, substantially as set forth.

5. In a vehicle-wheel such as described, the hollow spokes *k l*, divided into sections for the purpose of reducing the weight and diameter of the outer ends of the same, and a means for securing the sections together.



6. In a vehicle-wheel such as described, consisting of the sectional spokes *k l*, the segmental bearing *n*, having a sharp inner edge, *s*, for the purpose of allowing the same to be easily lifted or raised out of soft or moist earth.

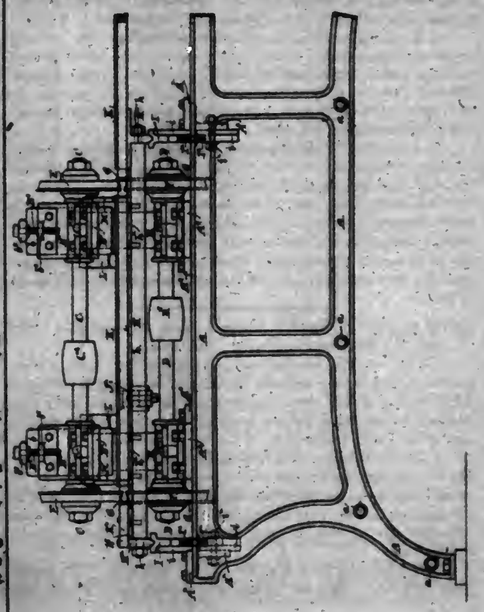
395,524. ELECTRICALLY-OPERATED CUTTING DEVICE. RUSSELL THAYER, Philadelphia, Pa. Filed Jan. 3, 1888. Serial No. 259,652. (No model.)



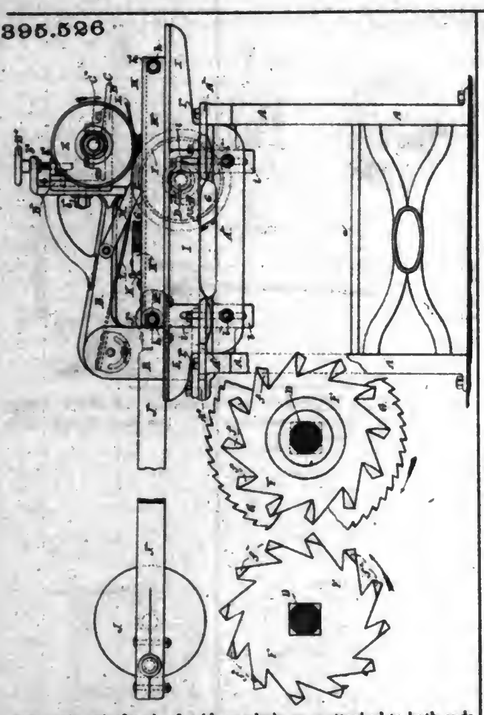
Claim.—1. In combination, an electric motor, a knife or series of knives connected to and revolved by said motor, a source of electric-current supply, and means to connect said electric-current supply with the motor.

2. In combination, an electric motor, a knife or series of knives connected to and revolved by said motor, a comb or guard, a source of electric-current supply, and means to connect said electric-current supply with the motor.

395,524.



395,525. TIGHTENER AND FASTENER FOR FENCE-WIRES. ADELBERT L. THURTON, East Avon, N. Y. Filed Sept. 20, 1888. Serial No. 285,807. (No model.)



Claim.—A wire-tightener consisting of a double ratchet-plate, *d* a central hub, *h*, provided with a transverse orifice, *h'*, a front plate, *g*, a projecting square end, *g'*, and a bolt, *k*, all integral with each other, in combination with washer *b*, having projections *b'* and *b²*, (projection *b²* being provided with a perforation, *b²*,) and with double pawl *e*, carried by projection *b'*, all substantially as shown.

395,526. TENONING-MACHINE. RUSSELL TURMAN, La Grange, Ill. Filed Apr. 21, 1888. Serial No. 271,493. (No model.)

Claim.—1. A tenoning-machine comprising a machine-frame, two parallel mandrels mounted therein, a revolving cutting-disk mounted

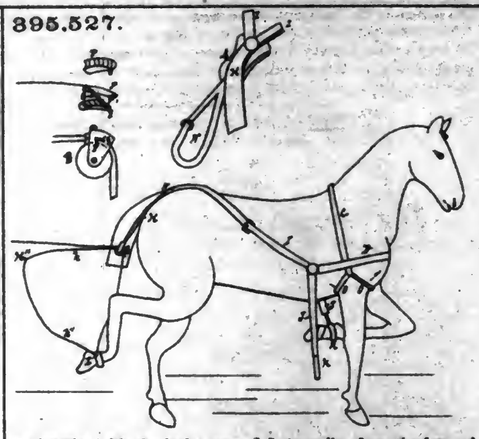
395,526.

upon each end of each of said mandrels, saws attached to both ends of one of said mandrels outside the cutting-disks, drive-pulleys upon the mandrels, and a reciprocating carriage provided with a ledge to sustain and carry forward the work between said cutting-disks, whereby dovetailed tenons are formed upon both ends of a piece or strip and the same is cut the proper length at each reciprocation of the carriage, substantially as described.

2. A tenoning-machine comprising a frame provided with two overhanging arms or goose-necks, a mandrel mounted horizontally upon the frame, a second mandrel mounted upon said arms above and parallel with the first mandrel, cutting-disks upon each end of each of said mandrels, and a reciprocating carriage located and moving beneath the said overhanging arms, said carriage being provided with a ledge arranged to support and carry forward the work between the opposite pairs of cutting-disks, substantially as described.

3. A tenoning-machine comprising a machine-frame, two pairs of revolving cutting-disks, a reciprocating carriage and pawls pivoted upon the machine-frame and located in position to engage at their free ends with the work at the forward limit of the movement of the carriage to prevent the work being drawn backwardly with the carriage, substantially as described.

4. A machine for making dovetailed tenons, comprising a reciprocating carriage provided with a ledge to sustain and carry forward the work and two pairs of revolving cutting-disks for cutting the dovetails, each of said cutting-disks having a series of oblique cutting-edges arranged with those parts of the edges which act upon the outer or thicker parts of the tenons in advance, referring to the direction of motion of the cutters, of those parts of said edges which act upon the inner or thinner parts of the said tenons, substantially as described.



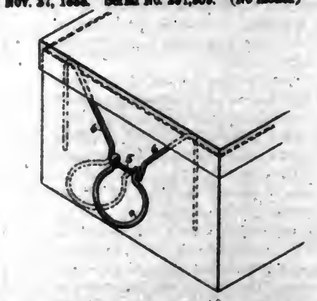
395,527. HARNESS. ALBERT F. TRASK, Onondaga, Mich. Filed Sept. 10, 1888. Serial No. 285,093. (No model.)

Claim.—1. The combination of a harness for a horse, a strap secured to said harness near the crupper and depending therefrom, a pulley secured to said depending strap near its lower end, and a rope passing through said pulley and provided with means for securing the hoof of the horse, substantially as shown and described.

2. The combination of a harness for a horse, a strap secured to said harness near the crupper and depending therefrom, a pulley secured to the lower portion of said depending strap and provided with a pulley-check, and a rope passing through said pulley and provided with means for securing the hoof of the horse, substantially as shown and described.

3. In a harness, the combination of the neck-strap C, the breast-strap, D, straps O, adapted to pass round the fore leg of a horse near

395,527.



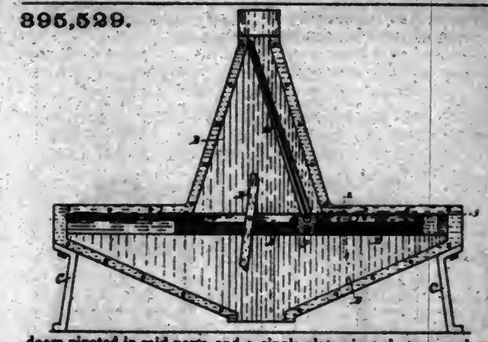
the junction with the body, straps J J, depending from the forward part of the harness and adapted to secure the fore feet of a horse, tugs I I, secured to the breast-strap and passing backward and upward and being secured together over the horse's back, the crupper attached to said tugs, the strap H, secured to said tugs on the back of the horse, a pulley secured to said strap H, and a rope passing through said pulley and provided with means for securing the horse's hoof, substantially as shown and described.

4. In a harness, the combination of the neck-strap C, the breast-strap D, straps K, adapted to pass round the fore legs of the horse at their junction with the body, tugs I I, secured to the breast-strap and passing backward and upward and being secured together over the horse's back, the crupper attached to said tugs, the strap H, secured to said tugs on the back of the horse, a pulley secured to said strap H, and a rope passing through said pulley and provided with means for securing the horse's hoof, substantially as shown and described.

5. In combination with a shoeing or breaking harness, a pulley consisting of the combination of the sheave, the pulley-case, and plugs F F', swiveled together by a link, G, said plugs being formed smaller at one end and enlarging toward the other end, and being inserted between the pulley-case and the sheave, and being limited in their motion by a projection from said plug extending into a slot in the pulley-case, substantially as shown and described.

395,528. BOX-HANDLE. JUDSON A. TRAUT, New Britain, Conn. Filed Nov. 27, 1888. Serial No. 291,959. (No model.)

Claim.—1. The herein-described box-handle, consisting of the handle-bar, the diverging and return arms adapted to clasp the box, and the drop-handle 4, hinged to said handle-bar, substantially as described, and for the purpose specified.



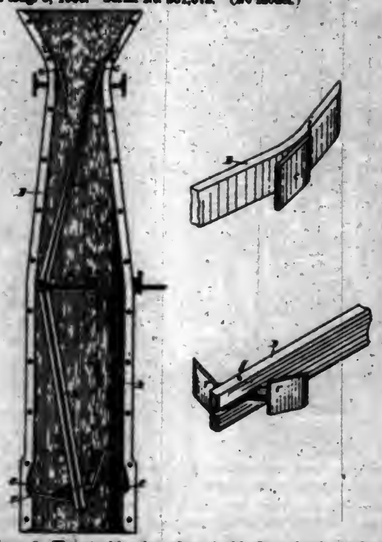
2. The herein-described box-handle, consisting of the handle-bar 5, diverging and return arms 6 and 7, for clasping the box, and the drop-handle, the diverging arms 6 6 being bent outwardly just above the handle-bar, substantially as described, and for the purpose specified.

395,529. WATER-MOTOR. HENRY B. TRIMBLE, Kalamazoo, Mich. Filed Aug. 3, 1888. Serial No. 281,571. (No model.)

Claim.—1. The combination of a suitable flume having induction and eduction ports, a piston consisting of an oscillating bar or plate in the plane of the flowing water through the flume, and a slide reciprocating transversely in the flume and to which one end of the piston is pivoted, substantially as set forth.

2. The combination of a suitable flume, a slide reciprocating transversely in said flume, having exhaust-ports, automatically-operative

395,529.



doors pivoted in said ports, and a single plate pivoted at one end to said slide and constituting an oscillating piston in the plane of the flowing water through the flume, substantially as set forth.

3. The combination of a suitable flume, a single-plate oscillating-piston in the plane of the flowing water in said flume, a slide reciprocating transversely to the flume, and to which slide said piston is pivoted at one end, and a piston-rod attached to said slide, substantially as set forth.

4. The combination of a suitable flume or chest, a reciprocating slide having exhaust-ports, said slide having bearings near the horizontal branches of the flume-walls, doors pivoted in the exhaust-ports off from the center of said doors, and a piston oscillating in the plane of the flowing water in said flume and pivoted to said slide between the exhaust-ports, substantially as set forth.

395,530. WATER-MOTOR. HENRY B. TRIMBLE, Kalamazoo, Mich. Filed Aug. 3, 1888. Serial No. 281,572. (No model.)

Claim.—1. The combination of a suitable flume having induction and eduction ports, automatic exhaust-valves in the latter-named ports, and the jointed piston, substantially as set forth.

2. The combination of a suitable flume, the jointed piston pivoted therein at one end, and the adjustable stop-gates consisting of the wings hinged in position for the free end of the piston to contact with, and the screws for adjusting the wings, substantially as set forth.

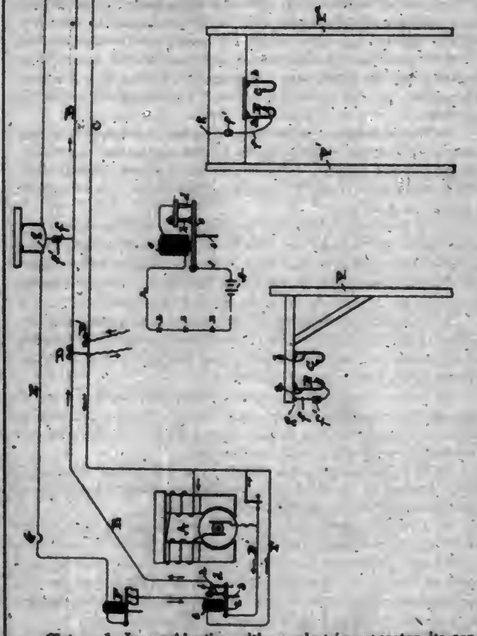
3. The combination of a suitable flume, an automatically-oscillating piston therein in the plane of the flowing water in the flume, and the adjustable stop-gates for the free end of the piston to contact with, consisting of the wings hinged in the induction-port, and means for swinging the wings in or out, substantially as set forth.

395,531. FEED-REVERSING ATTACHMENT FOR LATHES. GEO. G. WHITNEY, Hartford, Conn. Filed Aug. 21, 1888. Serial No. 283,220. (No model.)

Claim.—1. In combination with a lathe-head having the live-spindle and feed-shaft, the rocker mounted on the latter bearing the rocker-gears, and a pin that projects into a cam-slot in the shifter-spindle, the shifter-spindle having the cam-slot and having rotary movement in the socket in the lathe-head, all substantially as described.

395,531.

2. In combination with a lathe-head or like part of a machine-tool, a live-spindle, and a feed-shaft mounted in the head, the rocker loosely mounted on the feed-shaft and bearing the rocker-gears, the pin projecting from the rocker-arm, the shifter-spindle having a cam-slot for the reception of the pin on the rocker, and a threaded end fitting the threaded socket in the head, all substantially as described.



3. In a lathe-head gear-shifter, in combination with the rocker bearing the rocker-gears and a projecting pin, a rotary shifter-spindle having a threaded end fitting the threaded socket, and a cam-slot terminating in locking-sockets, and a handle located on the outer end of the spindle, all substantially as described.

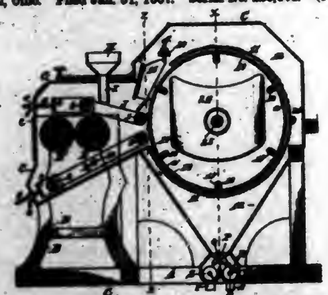
4. In a lathe-head gear-shifter, in combination with the lathe-head having a spindle-socket threaded as described, the tilting rocker bearing the rocker-gears and a projecting pin, a rotary shifter-spindle having a threaded end fitting the threaded socket in the head, a pin-plot, and a handle located in the outer end of the spindle, all substantially as described.

395,532. PHOSPHATIC FERTILIZER. WILLIAM J. WILLIAMS, Camden, N. J. Filed Mar. 16, 1888. Serial No. 267,305. (No specimens.)

Claim.—The herein-described mode of producing fertilizers, said mode consisting in, first, treating nitrogenous matters with sulphuric acid, separately mixing water with calcined phosphate of alumina or iron, or a mixture of the two, and then thoroughly incorporating the mixture of sulphuric acid and nitrogenous matter with the phosphate in the water.

395,533. AUTOMATIC SAFETY CUT-OUT FOR ELECTRIC CIRCUITS. GRANVILLE T. WOODS, Cincinnati, Ohio. Filed Aug. 13, 1887. Serial No. 246,944. (No model.)

Claim.—1. In combination with an electric generator, its conducting-line circuit, and devices—such as lamps or motors—for utilizing the current passing over such circuit, a break-circuit armature in circuit in or near the generator held to conducting control by a



magnet normally charged by the electric charge upon the conducting-circuit against an independent normally-active withdrawing force acting automatically to hold the circuit closed while the conducting-line is otherwise intact and charged, and to open the circuit when the conducting-line is broken or impaired at any other point, substantially as set forth.

2. In combination with a generator and outgoing conductor of an electric circuit, (as an electric light or power circuit,) a circuit-breaking armature in the outgoing conductor, an auxiliary wire constituting a return branch of the circuit, and an electro-magnet in said return branch controlling the circuit-breaking armature, substantially as and for the purpose set forth.

3. In combination with a generator and outgoing conductor of an electric circuit, (as an electric light or power circuit,) a circuit-breaking armature in the outgoing conductor, an auxiliary wire constituting a return branch of the circuit and arranged parallel therewith, an electro-magnet in said return branch controlling the circuit-breaking armature, and insulated links connecting the main conductor to the auxiliary wire in such manner that a displacement of the main conductor will sever the auxiliary wire, substantially as and for the purposes set forth.

4. In an electric light or power circuit, the combination of a circuit-breaker in the outgoing conductor and a fusible cut-out, a variable-resistance device, and a magnet controlling the circuit-breaker in the return-conductor, arranged and operating substantially as set forth.

395,534. ROLLER REDUCTION-MILL. JOHN H. WOOLCOTT, Cincinnati, Ohio. Filed Jan. 31, 1887. Serial No. 226,071. (No model.)

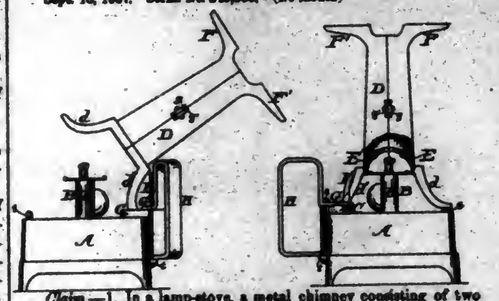
Claim.—1. In a gradual-reduction mill, the combination of one or more sets of reducing-rolls with conveying-aprons J and K, one above and the other below the said reducing-rolls, and an elevating-reel and concave separating-screen, substantially as herein specified.

2. In combination with one or more sets of reducing-rolls, an elevating-reel, the outside separating concave screen, 11½, and adjustable guides 15, with conveying-aprons J K, substantially as herein specified.

3. The combination of the concave screen 11, the reel 13, having recesses 17, and the radially-adjustable spring-actuated brushes 16, arranged in said recesses, the reel 13 being arranged concentrically within the concave screen 11, with an annular space, *a*, between, substantially as described.

4. In combination with the reducing-rolls and the conveying-aprons above and beneath said rolls, the elevating-reel having recesses 17, the spring-pressed brushes 16, radially adjustable in said recesses, the concave screen, and the adjustable guides 15, arranged adjacent to the opening in said screen, substantially as described.

5. In combination with one or more sets of reducing-rolls and conveying-aprons, the concave screen 11, an elevating-reel, 13, and a series of adjustable guides, 15, arranged above the apron lying over the reducing-rolls, substantially as described.

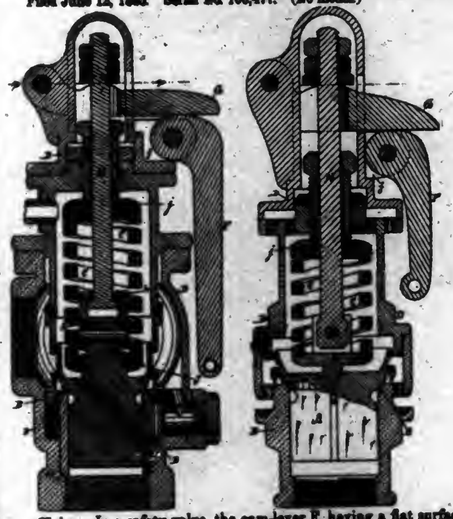


6. In combination with the conveying-aprons J and K, the reducing-rolls E E', arranged between said aprons and having their axes inclined to each other, the concave screen 11, and the elevating-reel revolving therein, substantially as described.

7. The combination, with the elevating-reel having recesses 17, of the brushes 16, having threaded shanks, the springs 18, nuts 19, and the concave screen 11, substantially as described.

8. A middlings-separator composed, substantially, of the revolving elevating-reel and brushes, a concave screen provided with an opening on one side, a conveying-apron delivering the product through said opening, another conveying-apron taking the tailings from the reel and delivering them to the reduction-rolls, and reduction-rolls arranged between said conveying-aprons, substantially as described.

9. The combination, with the roll E', journaled in fixed bearings, of the pressure-roller E, the L-shaped arms 27, the eccentric shaft 30, journaled in the knees of said arms, and the locking devices 36, for holding said shaft 30 in a fixed adjustment, substantially as described.



395,535. LAMP-STOVE. WILLIAM G. AMOS, Cleveland, Ohio. Filed Sept. 10, 1887. Serial No. 249,286. (No model.)

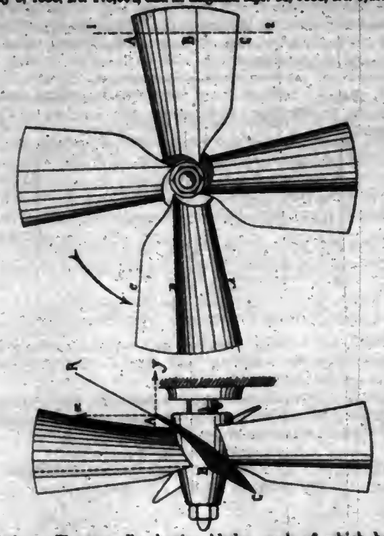
Claim.—1. In a lamp-stove, a metal chimney consisting of two parts, one part or half having arms F, one half, E, of the cone and one half of the chimney being cast integral, and the other half having arms F', one half, E', of the cone and one half the chimney being cast integral also, the said parts being fastened together by means of a screw or rivet passing through the ears, as a new article of manufacture.

2. The combination, with the base-fount A, provided with filling-neck C and wick-tube B, and the chimney D of a lamp-stove, of the handle H, pivotally attached to the fount and provided with covering-plate G, and arm I, for latching the chimney in its upright position, substantially as specified.

395,536. SAFETY-VALVE. HENRY G. ASHTON, Somerville, Mass. Filed June 12, 1885. Serial No. 168,477. (No model.)

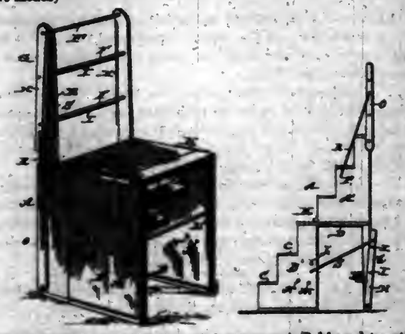
Claim.—In a safety-valve, the cam-lever F, having a flat surface, *f'*, in combination with a lever, G, having a flat surface, *f''*, and the valve-spring, the levers and the spring being arranged substantially as shown, to keep the spring compressed when the flat surfaces *f' f''* are against each other, all substantially as and for the purpose set forth.

395,537. PORTABLE GRAVE-VAULT. SILVIO B. BAKER, Springfield, Ohio. Filed Jan. 18, 1888. Serial No. 261,110. (No model.)



Claim.—1. In a portable grave-vault, a malleable-iron head having lugs formed integrally therewith to regulate the overlap of the top and bottom of the vault.

2. In a portable grave-vault, the combination, with a malleable-iron flanged head having lugs formed integrally therewith, of catches secured to said lugs, whereby the place of attachment of the catches to the head is not discoverable from the outer side.



3. In a portable grave-vault, the combination, with the lower portion and a stud secured to the inside thereof, of the upper portion adapted to fit over the lower and having a bracket secured to the inner side thereof, a part of which stands opposite said stud to prevent the lower portion being sprung in at its upper edge.

395,538. SCREW-PROPELLER. LOUIS ERRAULD, Lyons, France. Filed May 1, 1888. Serial No. 272,406. (Model.) Patented in France May 3, 1886, No. 173,694, and in England Apr. 11, 1888, No. 5,402.

Claim.—The propeller having blades, each of which has an inclined and convex front face, the curvature increasing toward the rear edge, and a concave rear face from the advancing edge A to the line B, and an inclined plane between the line B and the rear edge, C, substantially as set forth.

395,539. COMBINED CHAIR AND STEP-LADDER. CHRISTIAN DOCKENDORFF, Kenosha, Wis. Filed Apr. 17, 1888. Serial No. 270,862. (No model.)

Claim.—1. The combination of the frames A B, hinged together and having the notched steps formed on their opposing sides, said frame A having the extending arms E, the frame G, pivoted to the outer ends of arms E, and the frame O, pivoted to the opposite end of frame A, substantially as described.

2. The combination of the frames A B, hinged or pivoted together at one corner and provided with the notched steps, as described, said frame A having the arms E and provided with the openings P, and said frame B having the openings L M N, the frame G, hinged or pivoted to the outer ends of arms E and having the links R, and the frames O, hinged or pivoted to the opposite end of frame A and having the links, all combined and arranged to operate substantially as shown and described.

395,540. BOLT. CHARLES BORNHARD, Detroit, Mich. Filed May 23, 1888. Serial No. 275,267. (No model.)

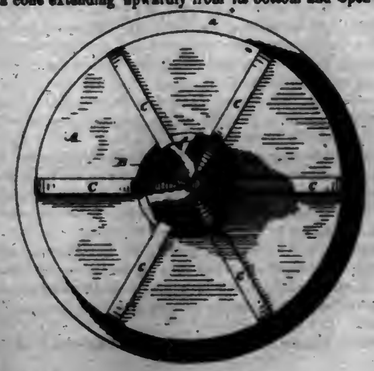
Claim.—1. In a lock for folding doors, the combination of the casing A, provided with the flanges B, the sliding bolt C, the curved arm D, provided with the notches *c c*, the retracting-spring E, the crank-shaft F, the crank G, engaging into the notch *c*, the crank H,

formed on the crank-shaft F, outside the casing, and the back plate I, provided with the guide-arm *d*, engaging into the notch *c*, the parts being arranged and constructed to operate substantially as described.

2. As a new article of manufacture, a lock for double doors consisting of an inclosing frame or casing, a sliding bolt secured therein, a spring arranged to normally retract the bolt, a crank-shaft journaled in the casing, a crank secured upon said crank-shaft within the casing and engaging with the bolt, and a crank on said crank-shaft outside the casing, substantially as described.

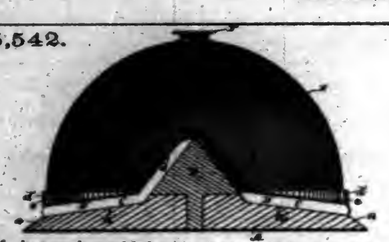
395,541. FENCE-POST. FRANCIS REGAN and WILLIAM J. REGAN, Hartford, Kans. Filed Sept. 27, 1888. Serial No. 286,586. (No model.)

Claim.—1. The combination of the post, the clamp-bar having a curved upper end and claws formed on its lower end, a stone or rock held between said post and clamp-bar, a screw-bolt passing through said bar and post, and a nut whereby said clamp-bar may be drawn tightly against said stone or rock to bind the same firmly against the post, substantially as described.



2. The combination, with an iron fence-post and a suitable base, of the clamp-bar having a curved upper end and a straight or flat lower end terminating in a bent and sharpened claw, a screw-bolt passing through said bar and post, and a nut for tightening the same, substantially as described.

3. The combination of the half-tubular iron post, the curved clamp having one end resting against said post, and the bolt for securing said post and clamp together, substantially as described.

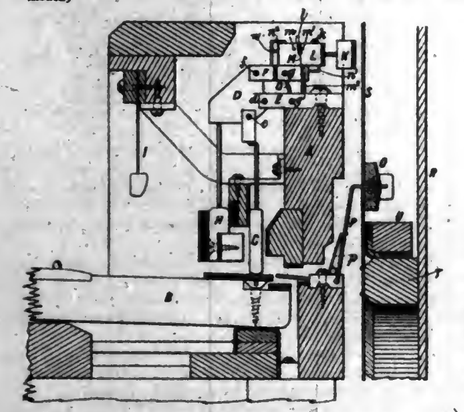


395,542. INSECT-TRAP. CLARA P. BROWN, New York, N. Y. Filed Nov. 7, 1888. Serial No. 290,211. (No model.)

Claim.—1. In an insect-trap, the combination, with a cage portion having a cone extending upwardly from its bottom and open at its vertex, of a plurality of passage-ways leading from the periphery of the bottom to the said cone portion to the vertex thereof, substantially as set forth.

2. In an insect-trap, the combination, with a cage portion having a cone extending upwardly from its bottom and open at its ver-

395,542.



tex, of a bottom located below the bottom of the cage portion and spaced therefrom, said bottom provided with a cone projecting upwardly within the cone of the bottom of the cage portion, said cone provided with a plurality of passage-ways leading from its base to its vertex, substantially as set forth.

3. In an insect-trap, the combination, with a cage portion having a cone extending upwardly from its bottom and open at its vertex, of a bottom located below the bottom of the cage portion and provided with a conical projection extending upwardly within the cone of the cage portion, the two bottoms and cone portions being spaced apart by a set of radial partitions, substantially as set forth.

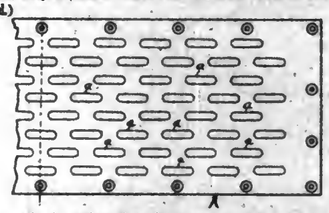
4. In an insect-trap, the combination, with a cage portion having a cone extending upwardly from its bottom and open at its vertex, of a bottom located below the bottom of the cage portion and provided with a conical projection extending upwardly within the cone of the cage portion, the two bottoms and cone portions being spaced apart by a set of radial partitions, a series of which terminate at the base of the cone, substantially as set forth.

395,543. KEY-BOARD MUSICAL INSTRUMENT. ANDREA L. CALDERA, Turin, Italy. Filed Aug. 25, 1888. Serial No. 283,787. (No model.)

Claim.—1. In the herein-described action for a key-board harp, the combination, with a mechanical finger or plectrum pivoted upon a vertical axis upon a jack receiving motion in a direction perpendicular to the string, as described, of a leaf-spring fixed at one end and applied to act at the other end against an abutment projecting laterally from the pivoted body of the plectrum for the purpose of effecting the escapement of the plectrum from the string, as described.

2. In the herein-described action for a key-board harp, the combination, with the mechanical finger or plectrum pivoted upon a vertical axis upon a jack receiving motion in a direction perpendicular to the string, as described, of escapement and counter-escapement abutments projecting laterally from the pivoted body of the plectrum, and of a leaf-spring fixed rigidly at one end and acting at the other end in opposite directions against the said abutments, the said spring being re-enforced, so as to be stiffer in one direction than the other, substantially as and for the purpose specified.

3. In the herein-described action for a key-board harp, the plectrum or mechanical finger having its acting head rigidly fixed to the pivoted body or elbow-lever by which it is carried and operated, as described, and having its acting face beveled, as described, for the purpose of facilitating its escapement from the string.

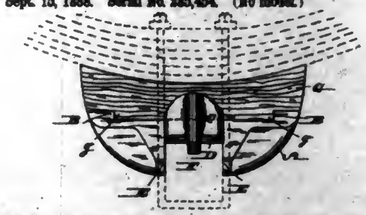


4. In an action for a key-board harp, the combination, with a lever or jack, of a hammer centered thereon, and connected thereto, as described, so as to be actuated thereby, and to have limited motion independently thereof by virtue of its own momentum, substantially as specified.

5. In an action for a key-board harp, the combination, with the hammer and its jack or lever, connected and operating as described, of the recoil and check springs, as specified.

6. A key-board harp in which the action acts partly by percussion and partly by plucking the strings, the percussive portion of the action being constructed and operating as herein specified, and being applied only at the bass-register, while the plucking part of the action is applied at the middle and upper registers, the strike-lines of the two parts of the action being continuous across the strings, as described.

7. The combination, with a key-board harp and its belly-bridge, of a mute or sourdine contiguous to the belly-bridge and applied, by means of a pedal or otherwise, against the strings while contiguous to the belly-bridge, as described.



395,544. SUCTION-PLATE FOR PAPER-MACHINES. CHALMERS CHAPIN, Holyoke, Mass. Filed June 17, 1887. Serial No. 241,583. (No model.)

Claim.—1. A suction-plate for paper-machines, having within its edges a series of slots extending longitudinally of the plate, substantially as and for the purpose set forth.

2. The suction-plate A, having the slots *a*, the walls of which slots diverge from the upper to the lower surface of the plate, substantially as and for the purpose described.

395,545. SPRING-BLOCK. MORRIS W. CLARK, Camden, N. J. Filed Sept. 15, 1888. Serial No. 285,454. (No model.)

Claim.—1. A spring-block casting having the transverse shoulders B on its upper face and the vertical side flanges, C, said side flanges being integral with said block and rising above the said upper face, substantially as described.

2. A spring-block casting having the transverse shoulders B on its upper face and the upwardly-projecting flanges C on its sides, the depending flanges E, and lateral wings D, extending beyond the sides of the flanges, said flanges E and wings D forming the recess F, substantially as and for the purpose set forth.

3. A spring-block casting having the vertical flanges for embracing the sides of the block to prevent lateral movement thereof, the lateral wings adjacent to the vertical flanges for supporting the casting on the axle, and the depending flanges providing a recess to receive the axle, all arranged substantially as described.

395,546. ELECTRIC CABLE. WILLIAM A. CONNER, Pittsburg, Pa. Filed July 30, 1888. Serial No. 281,384. (No model.)

Claim.—1. In an electric cable, the combination of one or more insulated electric conductors, a lead covering surrounding the conductor or conductors, and a coating or surfacing formed of a metal more durable than the lead and covering the same, substantially as set forth.

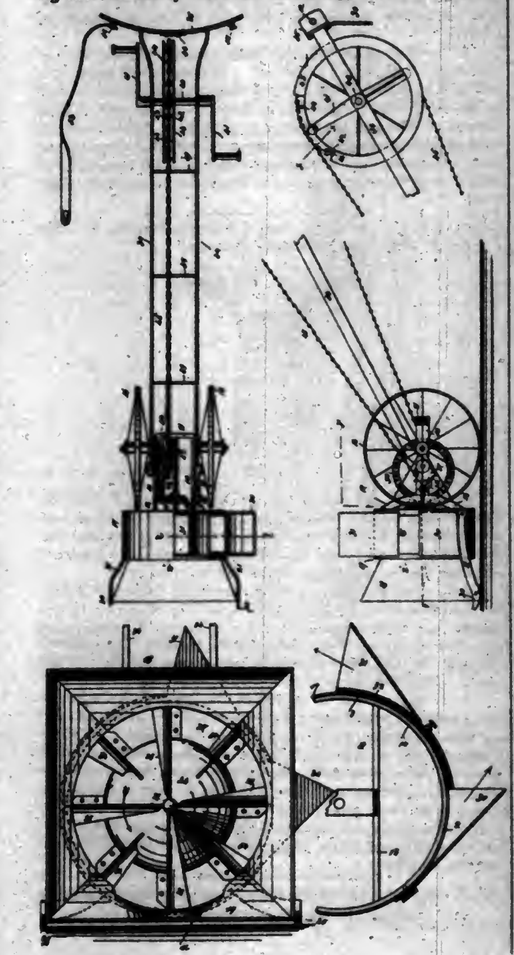
2. In an electric cable, the combination of one or more insulated electric conductors, a lead covering surrounding the conductor or conductors, and a coating or surfacing of tin or alloy thereof for the lead covering, substantially as set forth.

395,547. TRACTION-TONGUE FOR THRASHING-MACHINES. HENRY COOPRIDER, Jr., Clay City, Ind. Filed July 31, 1888. Serial No. 281,543. (No model.)

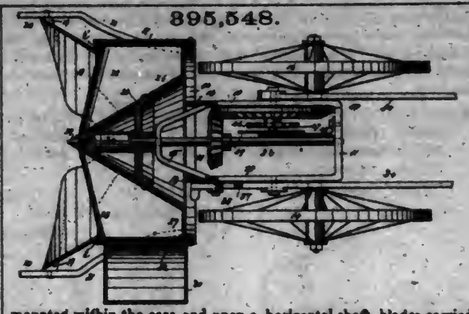
395,547.

Claim.—1. The combination of the pivoted tongue, the bar provided with braces, the chain connected to the braces, the sprocket-wheel around which the chain passes, the toothed wheel, and an operating-pinion for turning the tongue in any desired direction, substantially as shown.

2. The combination of the stationary bar, the braces secured thereto, the sprocket-wheel, the chain, the perforated wheel secured to the shaft of the sprocket-wheel, the operating-pinion, and a locking-lever whereby the wheels can be locked in any desired position, substantially as described.



395,548. SNOW-PLOW. JOSEPH CORBETT, New York, N. Y., assignor to George H. Hobart, Jersey City, N. J., and Samuel G. Donaldson, New York, N. Y. Filed Feb. 13, 1888. Serial No. 263,761. (No model.)

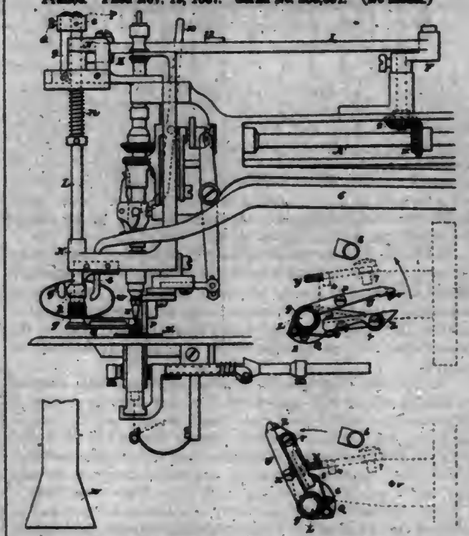


Claim.—1. In a snow-plow, a revoluble head provided with a series of blades, 26, and second series of short blades, 54, substantially as described.

2. In a snow-plow, a conical revoluble head provided with a series of blades, 26, and a second series of short blades, 54, substantially as described.

3. In a snow-plow, the combination, with a supporting-frame, of carrier-wheels upon which the frame is mounted, handle-bars pivotally connected to the frame, a rack formed at the lower end of one of the bars, and a weighted pawl pivotally connected to the frame and arranged to engage the rack, as and for the purpose stated.

4. In a snow-plow, the combination, with a main frame, of an apertured case carried thereby and formed with a forwardly-extending hood, runners by which the hood is supported, a conical head

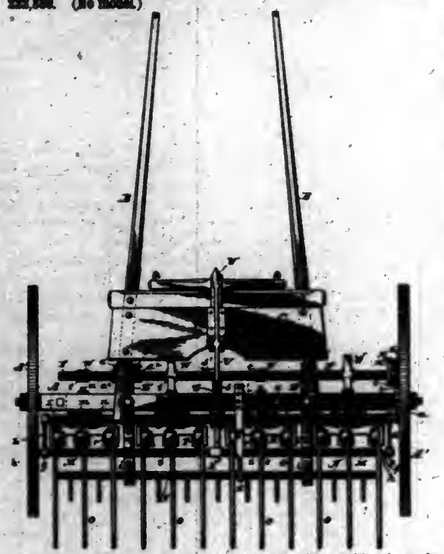


mounted within the case and upon a horizontal shaft, blades carried by the head, a gear carried by the horizontal shaft, a transverse shaft, a gear and sprocket wheel carried thereby, the gear of the transverse shaft engaging the gear of the horizontal shaft, a crank-shaft carrying a sprocket-wheel, and a drive-chain running in engagement with the two sprocket-wheels, substantially as described.

5. In a snow-plow, the combination, with a blade-carrying head and a means for revolving the head, of a case surrounding the head, and a flange, *i*, the lower portion of which is cut away, said flange being connected to the forward edge of the case, substantially as described.

6. In a snow-plow, the combination, with a revoluble blade-carrying head, of an open-faced case provided with hooded openings, one at the side and one at the top of the case, and a cover or slide arranged to close either of said openings and open the other, substantially as set forth.

395,549. EMBROIDERING-MACHINE. EMIL CORNELY, Paris, France. Filed Nov. 19, 1887. Serial No. 255,831. (No model.)



Claim.—1. The combination, with the stitch-forming mechanism, cutters, and means for operating said cutters to sever the thread at each ascent of the needle, of pliers composed of two jaws adapted to open and close, a vertical shaft carrying said pliers, connections for giving said shaft one complete oscillation for each reciprocation of the needle, devices for opening and closing said jaws at the proper times, a receptacle for receiving the cut threads at one end of the path of movement of said pliers, and a blast-pipe, substantially as described.

2. The combination, with the stitch-forming mechanism, including the reciprocating needle and nipple, and cutters arranged to sever the needle-thread at the completion of each stitch, of an oscillating shaft, a pair of pliers composed of two jaws carried by said shaft, one of said jaws being elastic or yielding, so that it can pass the nipple when the pliers are swung back into position to seize the thread, a projection—such as a pivoted latch—in the path of said pliers for opening said jaws to release the thread, and connections, as specified, for oscillating said shaft and the pliers carried thereby, substantially as described.

3. The combination, with the feed, feed-bar, and lever for rais-

ing the same, of the lever 10, having one end in proximity to said feed-lever, and a projection on one of the moving parts adapted to strike said lever 10, and through it to release the feed-bar from said feed-lever as soon as the machine is put in operation, substantially as described.

395,550. COMBINED HAY TEDDER AND RAKE. SAMUEL L. DEBNEY, Lancaster, Pa., assignor to Israel L. Landis, same place, and the Ohio Rake Company, Dayton, Ohio. Filed Dec. 20, 1886. Serial No. 222,880. (No model.)

Claim.—1. In a horse hay rake and tedder, the combination, with an axle, rearwardly-projecting limbs rigidly secured to said axle, the ground-wheels on the axle, and draft attachment, of a driving gear-wheel, a meshing pinion, a longitudinally-adjustable tappet-supporting shaft located in front and below the axle, a tooth-supporting shaft mounted in bearings on said rearwardly-projecting limbs, tooth-section plates mounted on the rear shaft, and corresponding tappets mounted on the front shaft, the tappets being adapted to bear on and elevate the tooth-plates, substantially as set forth.

2. The combination, with an axle, forwardly-projecting limbs carrying a tappet-shaft, the latter adapted to be moved endwise a limited distance, and a series of tappets mounted on said shaft, of rearwardly-projecting limbs secured to the axle, a shaft mounted in said limbs, and tooth-plates on the shaft adapted to be engaged by the tappets when the machine is operating as a tedder, substantially as set forth.

3. In a horse hay-rake, the combination, with an axle mounted on wheels and a driving gear-wheel, of a shaft carrying a series of independently-movable tooth-plates, teeth secured to said plates, a bar having hooks or loops adapted to engage the teeth of the several series and lock them against independent movement, a longitudinally-movable shaft carrying a gear-wheel adapted to engage the driving-gear, and tappets mounted on said shaft, substantially as set forth.

4. In a horse hay rake and tedder, the combination, with an axle and a rake-head mounted on a shaft, of a forked bracket-plate made to straddle a boss on a lever rigidly secured to the head-sustaining shaft, so as to permit a rise-and-fall motion of this lever, and at the same time prevent an end-play of the tooth-sustaining shaft, substantially as set forth.

5. In a horse hay-rake, the combination, with an axle and the two rearwardly-projecting limbs secured thereto, of a longitudinally-adjustable tappet-shaft, a tooth-supporting shaft journaled in boxes in said rearwardly-projecting limbs, tooth-sections mounted on said shaft and adapted to be engaged by tappets on the tappet-shaft, and a clearer-bar journaled in the outer ends of the limbs, substantially as set forth.

6. In a horse hay rake and tedder, the combination, with an axle, rearwardly-projecting limbs secured thereto, a tooth-supporting shaft journaled in boxes in the limbs, and a clearer-bar journaled in said limbs, near the rear ends thereof, of the longitudinally-adjustable tappet-shaft and the tappets mounted thereon to engage the arms of the tooth-sections, substantially as set forth.

7. In a horse hay rake and tedder, the combination, with an axle, a suitable draft attachment, and two wheels mounted on the axle, of a gear-actuated longitudinally-adjustable tappet-shaft located in front of the axle, rearwardly-projecting limbs secured to the axle, a series of tooth-sections mounted on a shaft journaled in rearwardly-projecting limbs, tappets mounted on the tappet-shaft and adapted to engage the tooth-sections and elevate them a limited distance, and a clearer-bar journaled in said limbs and provided with its downwardly-projecting teeth, substantially as set forth.

8. In horse rake and tedder, the combination, with a toothed section-plate having projections for two or more teeth, each projection having a substantially U-shaped groove in its face and a centrally-located spacing-flange between the ends of said groove, said flange being cut away at its forward end to form a seat for a washer, of a tooth bent into U form at its upper end, and a washer, bolt, and nut for each tooth, substantially as set forth.

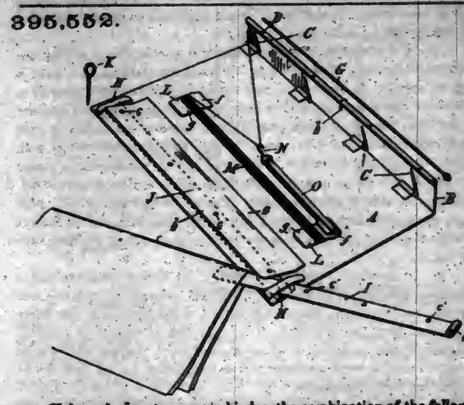
9. In a horse rake and tedder, the combination, with an axle, a longitudinally-adjustable tappet-shaft mounted in front of the axle, and tappets secured thereon, of the rearwardly-projecting limbs, a tooth-shaft journaled therein to the rear of the axle, tooth-sections mounted on said shaft and carrying teeth, arms rigidly secured to said tooth-sections and extending forward into the path of the tappets, and the adjustable tooth-bearing bar mounted in said arms and adapted to rest upon extensions of the rearwardly-projecting limbs when in its lowered position, substantially as set forth.

10. In a horse rake and tedder, the combination, with an axle, rearwardly-projecting arms secured thereto, and a clearer-bar journaled in said arms and provided with teeth, of an arm rigidly secured to the clearer-bar, and a link pivoted to the upper end of said arm and having a series of perforations in its forward end, said perforations being adapted to receive a pin on the axle to vary the inclination of the clearer-teeth, substantially as set forth.

11. The tooth-sections consisting, essentially, of a plate having a slotted boss or bearing and projections, each of which is grooved and perforated and provided with a spacing-flange, and the washers, bolts, and nuts for securing the teeth to the sections, substantially as set forth.

12. In a horse hay rake and tedder, the combination, with an axle, a pair of shafts, two wheels, and a platform on the shafts, of a geared longitudinally-adjustable tappet-shaft, tappets placed fixedly on this shaft, a tooth-supporting shaft, tooth-carrying section-plates mounted on this shaft, teeth affixed to these plates, the section-plates being adapted to engage with the tappets for a limited vertical movement, a tooth-bearing bar provided with a lever to operate it and raise or lower the rake-teeth, and a clearer-bar, substantially as set forth.

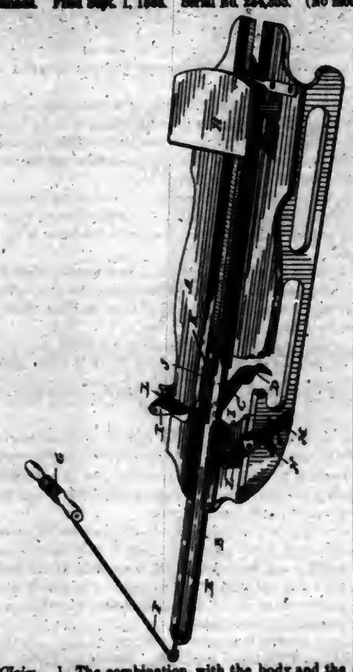
395,551. OIL-TANK. JOHN C. DILWORTH, Pittsburg, Pa. Filed Oct. 22, 1888. Serial No. 288,980. (No model.)



Claim.—1. The combination, with the diaphragm B of the oil-tank, provided with a waste-aperture, F, of an annular ring, G, secured in said aperture, provided with a horizontal flange, *g*, a strainer supported in said ring G, and a filtering-pocket secured to the lower end of the strainer, substantially as shown and described.

2. In an oil-tank, the combination, with the diaphragm B, having a waste-opening, F, of a strainer removably supported in said opening, said strainer consisting of a body portion, A, an apertured plate forming the top of said body, said body formed with a depending nipple, H', and a filtering-cloth extending over the mouth of said nipple, substantially as and for the purpose described.

3. As a new article of manufacture, a straining device for oil-tanks and the like, said device consisting of a ring, G, having an internal horizontal flange, *g*, said ring adapted to be secured in the waste-opening of the oil-tank diaphragm, a cup-shaped body portion, H, provided with a perforated horizontal plate across its upper face, the edge of said plate forming a flange whereby the body H may be supported on the flange *g* of the ring G, said body portion provided with a depending nipple, and a pocket, J, formed of filtering-cloth, detachably secured to said nipple, substantially as and for the purpose hereinbefore described.

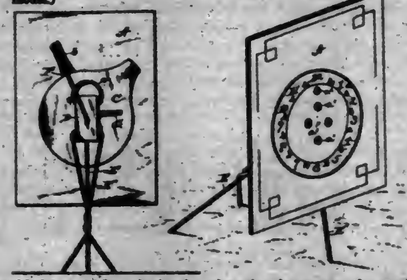


395,552. TEMPORARY BINDER. JACOB DORNBERGER, Sandusky, Ohio. Filed Sept. 19, 1888. Serial No. 285,764. (No model.)

Claim.—1. In a temporary binder, the combination of the following elements: the cover formed with the back, the thorns pivotally secured in the inner corner of the cover and back, the locking device for the thorns, the ruler removably secured upon the cover, the flap secured above the cover, the coincident holes through the flap, ruler, and cover, means for holding a supply of twine upon the cover, and the tension device of the twine, the parts being combined and arranged to operate substantially as and for the purpose described.

2. In a temporary binder, the combination, with the cover A and back B, of the thorns C, pivotally secured in the corner of the cover and back, the notched tabular seam F, formed on the edge of the back, the locking-rod G, detachably secured therein, the detachable ruler I, the loops H, secured to the cover to hold such ruler in position, the flap J, secured above the ruler, the coincident holes *c c' c''* in the flap, ruler, and cover, the ears L L, adapted to hold a supply of twine, and the hook N and spring O, forming a tension device for the twine, all the parts being arranged and constructed to operate substantially as and for the purpose described.

395,553. SLED-PROPELLER. JOHN DRAPER, Toronto, Ontario, Canada. Filed Sept. 1, 1888. Serial No. 284,303. (No model.)

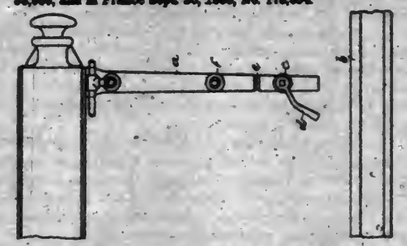


Claim.—1. The combination, with the body and the sliding bar working in guides thereon, of the leg pivoted to said bar, the foot pivoted to said leg, the rod E, parallel with the sliding bar and connected to said leg, and the rod F, pivotally connected to said rod E, substantially as described.

2. The combination, with the body and the sliding bar working in guides thereon, of the leg pivoted to said bar, the foot pivoted to said leg, the rod E, parallel with the sliding bar and connected to said leg, and the rod F, pivotally connected to said rod E, the notched holdfast K on the bar, and the chain J, fastened to the leg and engaging said holdfast, substantially as described.

3. The combination, with the body, of the arm L, pivoted to the side of said body and provided with a projection, M, and the spring N, acting on the under side of said arm, substantially as and for the purpose specified.

395,554. CHART FOR EDUCATIONAL PURPOSES. GEORGE I. REED, Wilmington, Ind. Filed Aug. 18, 1888. Serial No. 283,118. (No model.)



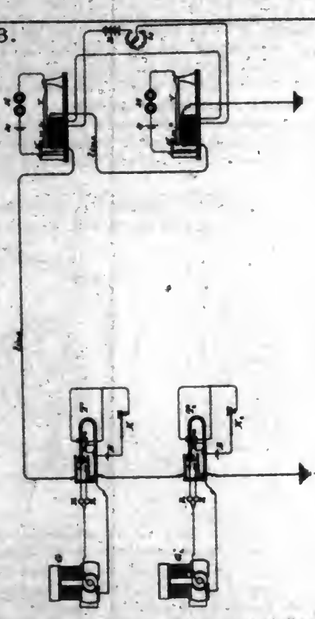
Claim.—1. In a device for educational purposes, the combination of a chart having a fixed figured dial and a number of openings, a pivot extending through the said chart, movable figured disks mounted upon the said pivot, and a block for keeping the disks in position against the chart, substantially as described.

2. In a device for educational purposes, the combination of a chart having a fixed figured dial and a number of openings, a pivot extending through the said chart, movable figured disks mounted upon the said pivot, a block for keeping the disks in position against the chart, and springs secured to the block for holding the disks at the desired point, substantially as described.

3. In a device for educational purposes, the combination of a chart having a fixed figured dial and a number of openings, a pivot extending through the said chart, movable figured disks mounted upon the said pivot, a block for keeping the disks in position against the chart, springs secured to the block for holding the disks at the desired point, and legs secured to the block to support the device, substantially as described.

395,555. AUTOMATIC BRAKE. PERCIVAL EVERITT, London, England. Filed Jan. 15, 1887. Serial No. 224,804. (No model.) Patented in England Dec. 8, 1886, No. 15,096; in Germany Sept. 19, 1886, No. 38,699, and in France Sept. 20, 1886, No. 173,694.

Claim.—1. The combination, with an air-brake pipe, of a pipe pendent therefrom, the same being weakened at a suitable point, a normally-closed valve in said pipe, and an external swinging arm connected with said valve for opening the same, substantially as set forth.



2. The combination, with an air-brake pipe, of a pipe pendent therefrom, the same being weakened at a suitable point, a normally-closed valve in said pipe, an external swinging arm connected with said valve for opening the same, and a valve for closing said pipe above said normally-closed valve and said weakened point, substantially as set forth.

395,556. VIBRATORY MULTIPLEX TELEGRAPHY. STEPHEN D. FIELD, Stockbridge, Mass. Filed June 13, 1888. Serial No. 276,994. (No model.)

Claim.—1. In a vibratory multiplex-telegraph system, two or more dynamo-electric generators having their armatures in series with each other and their fields each in plain shunt to its own armature, in combination with a group of pole-changing transmitting-keys, each adapted to change the polarity of its own generator with respect to the general circuit without opening the latter.

2. In a vibratory multiplex-telegraph system, a group of dynamo-

395,556.

electric generators in series, a corresponding group of vibratory pole-changers provided with vibrating mechanism and respectively adapted to change the polarity of their generators with respect to the general circuit at different rates of vibration, and a group of keys adapted to control the operation of the vibrating mechanism of said pole-changers.

3. In a multiplex-telegraph system, a pole-changing transmitter having two magnetic contact-levers and a vibrating magnet interposed between them adapted to exert an attractive effect on said levers, in combination with suitable pole-changing contacts on said levers and magnet, whereby springs may be dispensed with and their disturbing effects prevented.

4. In a multiplex-telegraph system, a pole-changing transmitter having iron contact-levers inductively polarized at their pivoted ends and a vibrating magnet-pole between their free ends, in combination with suitable pole-changing contacts on said levers and magnet, the polarity of said free ends and said interposed magnet-pole being of opposite sign, so as to produce mutual attraction of the levers toward said interposed magnet-pole, substantially as described.

5. In a vibratory telegraph system, a pole-changing transmitter composed of a U-magnet having suitable contact devices, an electro-magnet interposed between the legs of said magnet, and a local battery and key in circuit locally with said electro-magnet, whereby the operation of the key in the local circuit starts the U-magnet in vibration or stops it, according to position.

6. In a vibratory telegraph system, a pole-changing transmitter comprising, with suitable circuiting devices, a vibrator whose vibrations are controlled by intermittent magnetic attractions, in combination with an electro-magnet in circuit locally with a local battery and a key adapted to send the local current through said magnet, and thus control the vibrator, substantially as described.

7. In a vibratory telegraph system, a pole-changing transmitter comprising, with suitable circuiting devices, a tuned fork having between its legs an electro-magnet energized by a local battery and having a neutralizing-coil in addition to its energizing-coil, and contacts suitably arranged, the whole so constructed and adapted for operation that when said electro-magnet is energized it attracts said fork, and thereby closes the circuit of the neutralizing-coil and the attraction thereupon ceases, and thus the fork is automatically vibrated.

8. A relay or repeater for vibratory current impulses, consisting of a coil in the main line, a diaphragm arranged for free and unobstructed vibration responsively to said vibratory current impulses and located within inductive range of said coil, a local circuit having automatically-adjustable contacts actuated by said diaphragm, but depending for adjustment on devices in the local circuit, and receiving devices in said local circuit.

9. In a vibratory multiplex-telegraph system, a combined tone receiving and distributing apparatus comprising a coil in the main line, a vibratory diaphragm of inductive material arranged for free and unobstructed vibration responsively to all current changes in said coil, a local circuit having adjustable contacts actuated by said diaphragm, but dependent for adjustment on devices in the local circuit, one or more relays in said local circuit, and local sounders controlled by the relays.

10. In a vibratory multiplex-telegraph system, the receiving apparatus comprising the following elements in combination: first, a coil or helix in the main line, and within inductive range thereof a vibratory diaphragm capable of responding to the changes of current in the line; second, a single pair of back contacts controlled by said diaphragm and included in a local circuit containing tone-relays, and, third, a group of tone-relays in the local circuit respectively adapted to vibrate at rates corresponding to those of the various transmitting instruments, said diaphragm being adapted to operate its back contacts in accordance with the impulses on the main line, and said relays being adapted to selectively respond to the local current impulses thus set up.

11. A repeater or relay composed of an electro-magnetic coil, a vibrating diaphragm responsive to current changes in said coil and having back contacts, one moved by the diaphragm and the other controlled by a thermic wire or rod adapted to expansion and contraction by the presence or absence of current therein, and a local circuit including said contacts and thermic wire or rod and one or more receiving-instruments.

12. A vibratory or harmonic repeater or relay comprising, with a diaphragm and its actuating coil or coils, a wire controlling the back or local contacts and in the local circuit and adapted to be momentarily expanded by the local currents, substantially as described.

13. In a repeater or relay wherein the line-currents effect the vibration of a diaphragm, the combination therewith of a thermic wire in a local circuit containing a battery and contact devices for said local circuit controlled by the thermic wire, but actuated by the diaphragm, and mechanical connections between said thermic wire and contact device.

14. In a repeater or relay wherein the line-currents effect movement of one member of the relay, the combination, with such member, of a thermic wire in a local circuit containing a battery and contact devices for said local circuit controlled by the thermic wire, but actuated by said movable member, and mechanical connections between said thermic wire and contact device.

15. In a vibratory telegraph system, a tone-receiver comprising a tuned vibrating tongue or fork having suitably-arranged sounder-contacts and carrying an actuating annular helix fixed to said tongue and located in an annular field of force, whereby said helix sets the tongue vibrating in response to the current impulses sent through it.

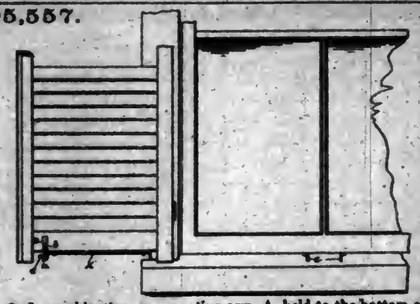
16. In a vibratory telegraph system, a tone-receiver comprising a tuned vibrating fork having an actuating annular helix fixed to it, in combination with a tubular field-magnet for polarizing the field in which said helix moves.

17. In a vibratory telegraph system, a tone-receiver comprising a tuned vibrating fork having an actuating annular helix fixed to it in an annular field of force and a second annular helix stationary in the same field, both said helices being included in a common circuit, and one helix movable in said field.

18. In a vibrating telegraph system, a tone-receiver composed of two similar reeds, each carrying an annular helix, the two helices being in circuit together and arranged one inside the other in the same field of force.

19. In a vibratory telegraph system, a tone-receiver composed of two similar reeds, each carrying an annular helix, the two helices being in circuit together in the same field of force and the reeds being adjustable as to pitch.

20. In a vibratory telegraph system, a combined tone-receiver and relay composed of two similar reeds of the same pitch, each carrying an actuating-helix, both helices being in circuit together in the same field of force and each reed provided with one of a pair of contacts for the local circuit.



21. In a vibratory telegraph system, a group of two or more tone-receivers of different pitch in the local circuit of a general repeating-instrument adapted to respond to and analyze the line-currents and repeat them into the local circuit, in combination with a local battery and sounders, one for each tone-receiver.

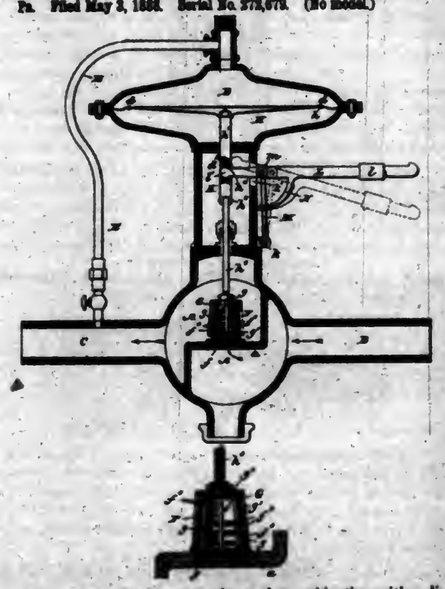
22. A receiving-instrument for alternating current impulses, consisting of a vibratory diaphragm and a pair of coils wound side by side and controlling said diaphragm, both coils being at one end connected to earth and at the other to the terminals of a battery to which the main line is connected at an intermediate point, whereby magnetic lag in such instrument is eliminated.

395,557. SHUTTER-FASTENER. GEORGE F. FOLSOM, Boston, Mass. Filed Sept. 17, 1888. Serial No. 285,696. (No model.)

Claim.—1. A shutter-fastener consisting of an operating-arm, A, a loop, *a*, adapted to engage with a locking-catch in the open and closed positions of the shutter, and a spring-extension for one end of the loop *a*, for holding said loop normally in a position to engage with the holding-catches, substantially as described.

395,557.

2. In combination, an operating-arm, A, held to the bottom of a shutter, a depending loop, *a*, having a spring-extension, *b*, with its bearings in a recess in the shutter, and holding-catches on the outer wall and window-sill in line with the loop *a*, substantially as described.



395,558. BOTTLE-STOPPER. GEORGE A. FULLERTON, Boston, Mass., assignor to the Pacific Bottle Stopple Company, of New York. Filed Feb. 4, 1888. Serial No. 262,973. (No model.)

Claim.—1. The bottle-stopper above described, composed of the ball D, with spring-legs *d*, and the holding device F, fast to the bottle, the legs of the ball extending down through the holding device and springing outwardly, as and for the purpose specified.

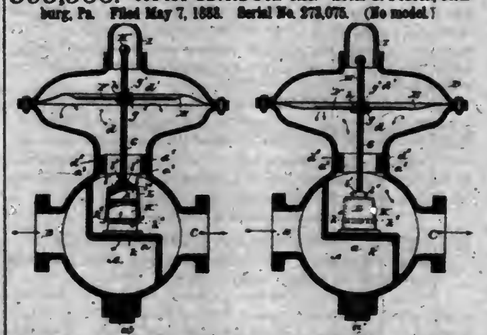
2. In a bottle-stopper, the combination of stopple B, with ball D, having its legs *d* hinged at *d'*, and holding device F, all substantially as described.

395,559. PRESSURE-REGULATOR. LOUIS R. FULTON, Pittsburg, Pa. Filed May 3, 1888. Serial No. 273,079. (No model.)

Claim.—1. In a pressure-regulator, the combination, with a diaphragm adapted to receive pressure from the pressure-regulator chamber, of a hollow valve-seat slightly tapered from its base to its top, and provided with an opening through its side wall, the valve adapted to fit the exterior wall of the valve-seat, and the valve-operating rod connecting the valve with the diaphragm, whereby the valve is relieved of frictional resistance when raised, but is not subject to any considerable lift from the high-pressure side when seated, substantially as set forth.

2. In a pressure-regulator, the combination, with a diaphragm adapted to receive pressure from the pressure-regulator chamber, of a slightly-tapered valve-seat provided with an opening through its side wall, the valve adapted to fit the exterior wall of the valve-seat, and provided with an opening in its side wall to register with the opening in the valve-seat when the valve is open, and the valve-operating rod connecting the valve with the diaphragm, whereby the valve is relieved of frictional resistance when raised, but is not subject to any considerable lift from the high-pressure side when seated, substantially as set forth.

3. In a pressure-regulator, the combination, with a diaphragm adapted to receive pressure from the pressure-regulator chamber, of a slightly-tapered valve-seat provided with a series of annular openings through its wall, the valve adapted to fit the exterior wall of the valve-seat and provided with a series of annular openings adapted to register with the openings in the valve-seat when the valve is open, and the valve-operating rod connecting the valve with the diaphragm, whereby the valve is relieved of frictional resistance when raised, but is not subject to any considerable lift from the high-pressure side when seated, substantially as set forth.



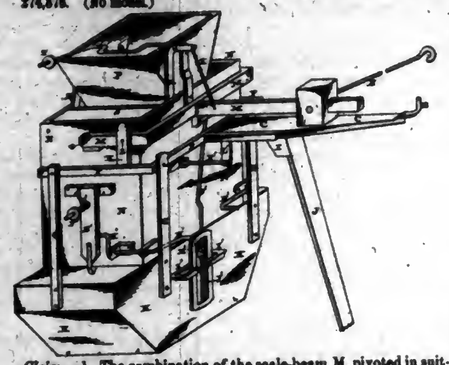
4. The combination, with a valve under pressure from the gas tending to close the valve, of a lever having a detachable connection with the valve and adapted to hold the valve open against the gas-pressure, a movable support for the lever, and means for moving the said support when the gas-pressure is removed, substantially as set forth.

5. The combination, with a diaphragm subject to gas-pressure from a gas-distributing pipe, a valve in connection with said diaphragm, and a lever having a detachable connection with the connected valve and diaphragm, of a movable support for the lever and means for automatically moving the said support when the gas-pressure is removed, substantially as set forth.

6. The combination, with the valve, the diaphragm connected therewith, and the lever having a detachable connection with the connected valve and diaphragm, of a vibrating support for the lever and means for vibrating the said support as the lever is tilted, substantially as set forth.

7. The combination, with the valve, the diaphragm connected therewith, and the lever having a detachable connection with the connected valve and diaphragm, of a swing-link forming a support for the lever, and an arm on the lever, whereby the swing-link support is automatically swung past center as the lever is abnormally tilted, and the lever thereby detached from the connected valve and diaphragm, substantially as set forth.

395,560. CUT-OFF DEVICE FOR GAS. LOUIS R. FULTON, Pittsburg, Pa. Filed May 7, 1888. Serial No. 273,075. (No model.)



Claim.—1. The combination, with a hollow valve-seat slightly tapered from its base toward its top and provided with an opening through its side wall, of a tapered valve fitted to shut down over the valve-seat, and means in connection with the gas-pressure for holding the valve normally raised from its seat, whereby the valve is relieved of frictional resistance when raised, but is not subject to any considerable lift from the high-pressure side when seated, substantially as set forth.

2. The combination, with a hollow valve-seat slightly tapered from its base toward its top and provided with an opening through its side wall, of a valve fitted to shut down over the valve-seat, a diaphragm under gas-pressure from beneath it, and a connection between the valve and the diaphragm, whereby the valve is held normally suspended and relieved of frictional resistance, but is not subject to any considerable lift from the high-pressure side when seated, substantially as set forth.

3. The combination, with the slightly-tapered valve-seat provided with an annular series of openings in its side wall, of the valve fitted to shut tightly over the valve-seat and having openings in its top, a diaphragm under pressure, and a connection between the diaphragm and valve, substantially as set forth.

395,561. MACHINE FOR AUTOMATICALLY WEIGHING GRAIN.

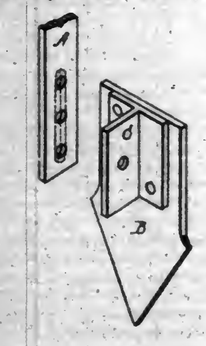
HORACE M. FULWIDER, Redmon, Ill. Filed May 22, 1886. Serial No. 274,578. (No model.)

Claim.—1. The combination of the scale-beam M, pivoted in suitable bearings connected to the support C, with the box N, which is pivoted upon the ends of the scale-beam, the automatically-operating bottoms for closing the lower ends of the compartments in the box N, catches for supporting the bottoms in position, tripping-rods for operating the catches, and pivoted blocks connected to the rod which extends downward from the scale-beam, substantially as described.

2. The combination of the scale-beam pivoted in suitable bearings, the box N, divided by a partition into two compartments, the hopper, a bent shaft which passes through the upper portion of the hopper, a weight connected to the shaft, rods connected to the shaft and to the cut-off which closes the bottom of the hopper, and a chain connected to a crank on the shaft and to the scale-beam, substantially as specified.

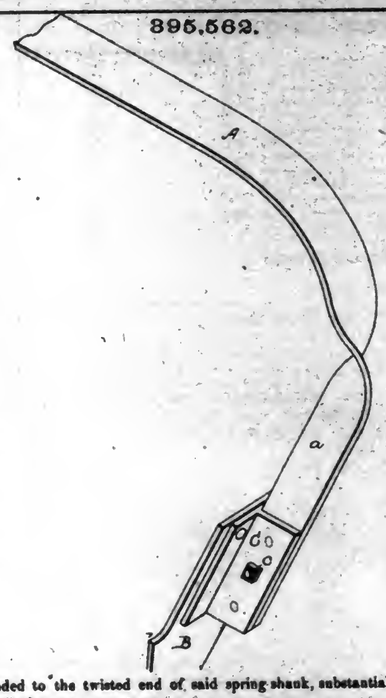
3. The combination of the hopper, the bent partially-revolving shaft placed therein, a weight connected to this shaft, a cut-off operated by the shaft, and a chain connected to the shaft and to the scale-beam, substantially as specified.

4. The combination of the hopper, the box N, divided by a vertical forked partition into two compartments, the shaft C, having the bottoms B' secured thereto, a crank, D', upon the end of the shaft, the connecting-rod, the crank Z', and the deflector Y, substantially as shown.



5. The combination of the box N, divided by a vertical partition into two compartments, the shaft C', the bottoms B', connected to the shaft, the catches E', the rods H', for operating the catches E', the vertically-moving rods, and the automatically-operating tripping-blocks pivoted to the vertically-moving rod secured to the scale-beam, substantially as described.

6. The combination of the box N, divided by a vertical partition into two compartments, the shaft C', the bottoms B', connected to the shaft, the crank M', secured to one end of the shaft and provided with suitable guiding eyes or loops, the vertically-moving rod J', connected to the scale-beam, the tripping-blocks secured thereto, the bent rods H', and the catches E', substantially as set forth.



395,562. SPRING-TOOTH FOR CULTIVATORS.

HORATIO GALE, Albion, Mich., assignor to the Albion Manufacturing Company, same place. Filed Oct. 8, 1883. Serial No. 287,517. (No model.)

Claim.—A spring-tooth for cultivators, consisting of a spring-shank turned near its lower end at right angles to itself so as to present its edge to the front, and a shoe having a web or flange projecting back at right angles to its face parallel with and adapted to be fastened to the twisted end of said spring-shank, substantially as described.

395,562.

395,563. RAISED STONE INCRUSTED LETTER.

CHARLES GOSLING, Brooklyn, N. Y. Filed Sept. 3, 1883. Serial No. 284,962. (No model.)

Claim.—As a new article of manufacture, an onyx or other stone for jewelry, the same having a letter or other design in metal incrusted or inlaid in the stone, said design having a border of stone completely surrounding the same, the design and the border being in relief, raised above the surface of the surrounding stone, substantially as set forth.

395,564. SPONGE-TOP BOTTLE.

ISAAC N. HALEY, Baltimore, Md. Filed Nov. 1, 1888. Serial No. 289,727. (No model.)

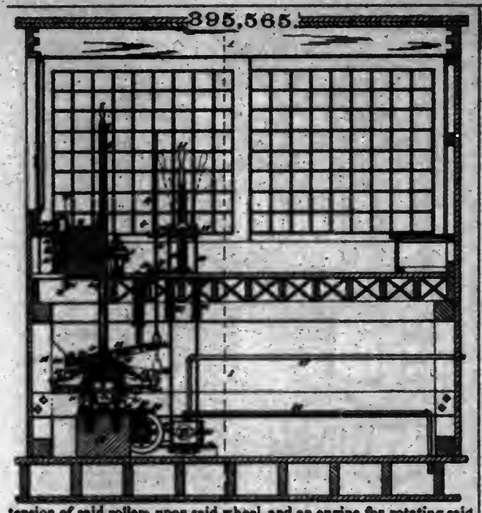
Claim.—A sponge-spreader for bottles having, in combination, a cork for insertion in the neck of a bottle and provided with a passage, *d*, a tapered plug, *c*, inserted in the cork-passage, a sponge, F, connected directly to the top of the cork, and a tabular metal union, G, which surrounds both sponge and cork and is fastened to the cork to prevent separation.

395,565. STEERING APPARATUS.

JOHN HAYES, St. Louis, Mo. Filed Apr. 6, 1888. Serial No. 269,826. (No model.)

Claim.—1. In a steering device for boats, the combination, with the pilot-wheel, of tension-rollers adapted to bear against said wheel and toggle-levers for enforcing and a spring for releasing the tension of said rollers on said wheel, substantially as and for the purpose set forth.

2. In a steering device for boats, the combination, with the pilot-wheel and tension-rollers adapted to bear on opposite sides of said wheel, of toggle-levers for enforcing and a spring for releasing the tension of said rollers upon said wheel, and an engine for rotating said rollers to turn said wheel, substantially as set forth.



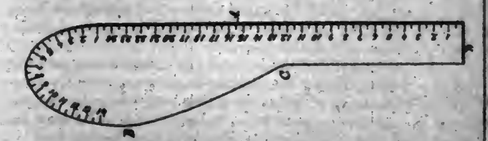
3. The combination, with the pilot-wheel and shaft upon which it is mounted, of the pinion on said shaft, a segment-rack engaged by said pinion, a finger carried by said rack, and bells arranged to be sounded by the movement of said finger, as set forth.

4. In a steering device for steamboats, the combination of the tension-rollers, the push-rods 29, the grip-bolts 30, that lock the push-rods, and connecting-levers and toggle-links for enforcing and releasing the tension of the rollers, substantially as and for the purpose set forth.

5. In a steering device for steamboats, the combination of the tension-rollers, means for enforcing and releasing their tension, throttle-lever 48, and reciprocating piston-rods 50, an engine whose reciprocating valves are operated by said rods, a drive-shaft, 51, actuated by said engine, the gear driven by said shaft, and the vertical shaft 24 of the tension-rollers arranged, as the throttle-lever is thrown relatively to the one hand or to the other, to rotate the rollers in corresponding directions, and when said rollers are under tension to turn the pilot-wheel and the rudder it commands to either hand, as required, substantially as and for the purpose set forth.

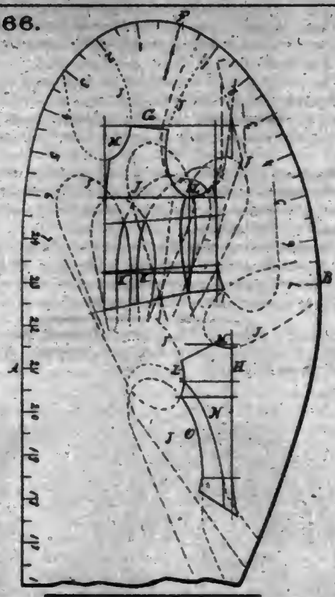
6. In a steering device for steamboats, the tension-rollers, means for enforcing and releasing their tension, means for utilizing steam-power from an engine by the throw of the throttle-lever in either direction to turn said tension-rollers and pilot-wheel against which they press, and the rack 11, trip-finger 12, and pivoted triggers 13, that as the pilot-wheel turns are actuated by their connecting-gear to trip the hammers 14 and strike the bells 15 to record the position of said rudder, substantially as and for the purpose set forth.

395,565.



395,566. DRESS-CUTTER'S SCALE.

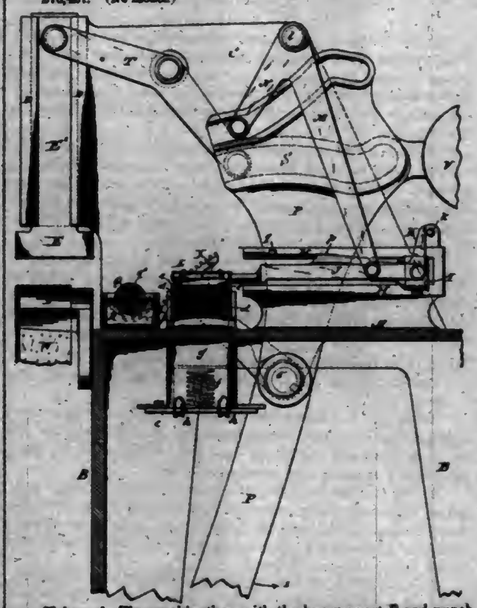
REBECCA HURDLE, Washington, D. C. Filed Oct. 12, 1888. Serial No. 287,898. (No model.)



Claim.—1. A dress-cutter's scale of semi-elliptical form at one end, and having one edge extending in a straight line tangent from one side of the said semi-ellipse and the other edge sloping inward on a long graceful curve from the other side of the said semi-ellipse to a narrow point about midway the scale, the remaining portion of the scale being narrow, substantially as shown and described.

2. A dress-cutter's scale having curved edges, substantially as described, and provided with a diagram of a dress-pattern printed on it, and showing the outline of the said scale in various positions partly coinciding with the curves of the pattern, substantially as shown and described.

3. The combination of a dress-cutter's scale having curved edges and a printed diagram showing a dress-pattern and the outline of the said scale in various positions partly coinciding with the curves of the pattern, substantially as shown and described.



395,566.

395,567. MACHINE FOR APPLYING CORNER-STAYS TO BOXES.

GUSTAV L. JAEGER, New York, N. Y. Filed Apr. 12, 1888. Serial No. 270,427. (No model.)

Claim.—1. The combination, with the box-support F and punch E, of the holder G, the fountain R, the transmitter Q, the picker L, and mechanism, substantially as described, for imparting motion to the picker and to the punch.

2. The combination, with the box-support F and the punch E, of the holder G, the fountain R, the rotary transmitter Q, the picker L, and mechanism, substantially as described, for imparting motion to the picker and to the transmitter.

3. The combination, with the box-support F and the punch E, provided in its working-face with the cavity *b*, of the picker L, composed of two hinged wings, *j j'*, and mechanism, substantially as described, for imparting motion to the picker and to the punch.

4. The combination, in a machine for applying corner-stays to boxes, of a box-support, a reciprocating punch for pressing the stay on the box, a holder for containing the stays, a reciprocating picker

for picking up the stays from the holder and carrying them to the box, and means, substantially as described, for operating the punch and the picker.

5. The combination, in a machine for applying corner-stays to boxes, of a box-support, a reciprocating punch, a holder for containing the stays, a reciprocating picker for picking up the stays from the holder, and means, substantially as described, for rendering the stays adhesive.

6. The combination, with a reciprocating punch, a box-support and a holder for the corner-stays, of a picker for carrying the stays from the holder to the box, and means, substantially as described, for rendering the picker adhesive.

7. The combination, with the box-support F, the punch E, the fountain R, the transmitter Q, and the picker L, of yielding projections *l'*, fitted in the picker, and mechanism, substantially as described, for imparting motion to the punch and to the picker.

395,568. CAR-WHEEL. SAMUEL B. JEROME, New York, N. Y., assignor of one-half to Thomas F. Rowland, same place. Filed Sept. 15 1888. Serial No. 285,479. (No model.)

Claim.—1. In a car-wheel, the combination, with a hub and tire, of an annular spring arranged between the same, bearings for the spring arranged between the inner face thereof and the hub, and similar bearings arranged between the outer face of the spring and the tire, and located intermediate to the positions of the bearings on the hub.

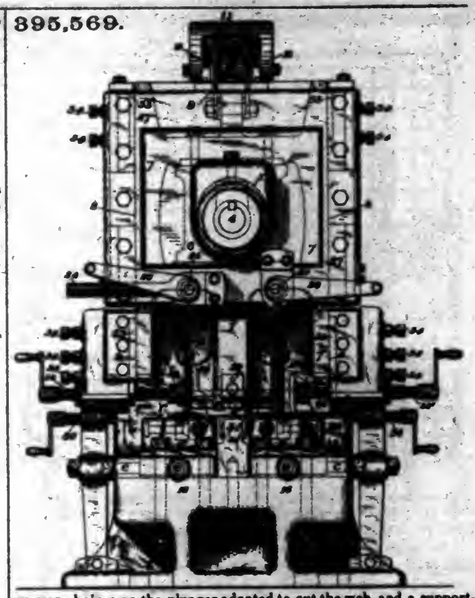
2. In a car-wheel, the combination, with the hub and tire, of an annular spring arranged between the same, bearings for the spring, arranged between the inner face thereof and the hub, similar bearings arranged between the outer face of the spring and the tire and located intermediate to the position of the bearings on the hub, and side plates bolted to the hub and to each other.

3. In combination, in a car-wheel, a hub having radial projections, an annular spring supported upon the projections, cylindrical sleeves arranged between the springs and the tire and located intermediate to the positions of the said projections, and side plates which are bolted to the hub and to each other through said sleeves.

395,569. MACHINE FOR CUTTING FLANGED BEAMS. JULIAN KENNEDY, Latrobe, Pa. Filed Oct. 29, 1888. Serial No. 289,406. (No model.)

Claim.—1. In a machine for cutting the flanges of flanged beams, a plunger or knife-head having oppositely-directed right and left knives for separately cutting the right and left flanges of the beam, substantially as and for the purposes described.

2. In a machine for cutting the flanges of flanged beams, a plunger or knife-head having knives on opposite sides thereof for separately cutting the right and left flanges of the beam, in combination with bed-knives adapted to act in conjunction therewith, substantially as and for the purposes described.



3. In a machine for cutting the ends of flanged beams, a moving knife and a bed-knife, each of angular shape, having a blade which cuts the flange of the beam transversely, and a blade which cuts the flange longitudinally in proximity to the web, substantially as and for the purposes described.

4. In a machine for cutting the flanges of flanged beams, a plunger having a laterally-projecting knife, and adjusting mechanism by which the web of the beam is held against the side of the knife, substantially as and for the purposes described.

5. In a machine for cutting the flanges of flanged beams, a plunger having a laterally-projecting knife, and adjusting mechanism by which the web of the beam is held against the side of the knife, said plunger being recessed to permit insertion of the beam beneath the knife within the limits of the plunger, substantially as and for the purposes described.

6. In a machine for cutting the ends of flanged beams, a plunger or knife-head having a knife on each side thereof for separately cutting the right and left flanges of the beam, in combination with one

395,569.

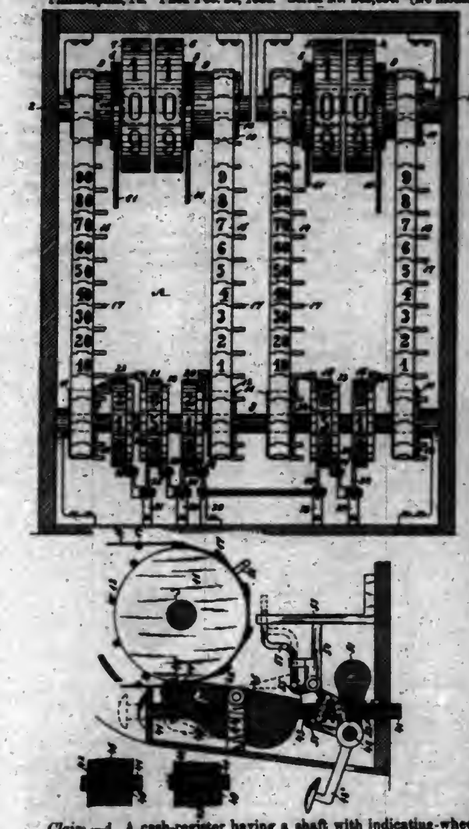
or more knives on the plunger adapted to cut the web, and a supporting block or anvil adapted to support the beam vertically during cutting of the flanges and to support the same horizontally during the cutting of the web, substantially as and for the purposes described.

7. In a machine for cutting the ends of flanged beams, the combination of a bed-knife having cutting-edges *d d'*, formed at an angle to each other, and an outer cutting-edge, *e*, and moving knives set on a single plunger, one of which knives acts in conjunction with the cutting-edges *d* and *d'*, while the other works in conjunction with the cutting-edge *e*, substantially as and for the purposes described.

8. In a machine for cutting the ends of flanged beams, the combination of right and left bed-knives oppositely placed, each having cutting-edges *d* and *d'*, formed at an angle to each other, and an outer cutting-edge, *e*, and right and left moving knives set on a single plunger and adapted to work in conjunction with the bed-knives, substantially as and for the purposes described.

9. In a machine for cutting the ends of flanged beams, the combination of a supporting-anvil adapted to receive the web of the beam and made of narrow surface, so as to be capable of receiving beams of different widths, knives for cutting the said web, and a stop adjacent to the supporting-anvil, against which the lateral edge of the beam abuts, substantially as and for the purposes described.

10. In a machine for cutting the ends of flanged beams, the combination of a supporting-anvil adapted to receive the web of the beam and made of narrow surface, so as to be capable of receiving beams of different widths, knives for cutting the said web, a stop adjacent to the supporting-anvil, against which the lateral edge of the beam abuts, and an adjusting-screw by which the beam is held against the stop, substantially as and for the purposes described.



11. In a machine for cutting the ends of flanged beams, the combination of a supporting-anvil adapted to receive the web of the beam and made of narrow surface, so as to be capable of receiving beams of different widths, knives for cutting the said web, a stop adjacent to the supporting-anvil, against which the lateral edge of the beam abuts, and adjusting mechanism—such as liners—by which the distance between the stop and the anvil is variable, substantially as and for the purposes described.

12. In a machine for cutting the ends of flanged beams, the combination, with a supporting block or anvil for receiving the web of the beam, of knives for cutting the web, and a clamping-post which bears upon the web, substantially as and for the purposes described.

13. In a machine for cutting the flanges of flanged beams, a plunger or knife-head having on each side thereof a laterally-projecting portion, and a knife for separately cutting the right and left flanges of the beam, said laterally-projecting portions fitting in suitable slideways and extending to or nearly to the bases of the knives, substantially as and for the purposes described.

14. In a machine for cutting the ends of flanged beams, the combination, with right and left supporting blocks or anvils for receiving the web of the beam, of knives for cutting said web, and a stop between the said anvils, against which the lateral edge of the beam on either anvil abuts, substantially as and for the purposes described.

395,570. CASH INDICATOR AND REGISTER. GEORGE F. KOLB, Philadelphia, Pa. Filed Feb. 20, 1888. Serial No. 265,050. (No model.)

Claim.—1. A cash-register having a shaft with indicating-wheel loosely mounted thereon, a drum connected to said wheel and having pins on its periphery, a second shaft with a wheel rotatable thereon, said wheel having pins on its periphery, and an endless belt on said drum and last-mentioned wheel, said belt having pins projecting from its side and adapted to engage the peripheral pins of the said drum and wheel, said parts being combined substantially as and for the purpose set forth.

2. A cash-register, having the shaft 1, with indicating-wheel 4, having drum 9 secured thereto, and with pins 10 on the periphery thereof, the endless belt 13, with pins 17 projecting at the side thereof, the shaft 3, with wheel 11, having peripheral pins 12 thereon, a pawl connected to wheel 11, and registering-wheel 18, with ratchet-wheel 23 secured thereto, said parts being combined substantially as and for the purpose set forth.

3. A cash-register having a shaft with an indicating-wheel having a grooved pulley and a drum with peripheral pins secured thereto, the said wheel, pulley, and drum mounted on said shaft, a second shaft with wheel having peripheral pins thereon, an endless belt with pins projecting therefrom and engaging the peripheral pins of said drum and wheel, and a cord with weight, said cord secured to said grooved pulley, said parts being combined substantially as and for the purpose set forth.

4. A cash-register having the shafts 1 and 3, indicating-wheel 4, the drum 9, secured to said wheel, the wheel 11, with pins 12 and a pawl, the endless belt operating said drum and wheel 11, the pawl 59 and shaft 3, and the wheel 18, with ratchet 60 thereon, said parts being combined substantially as described.

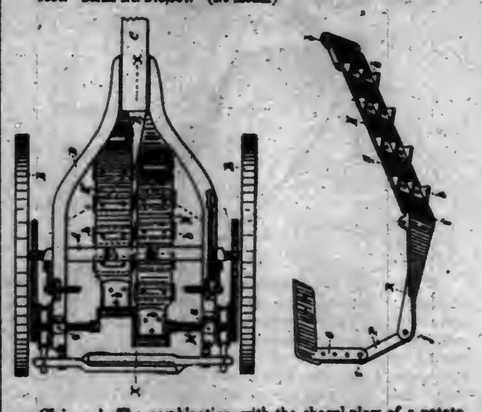
5. In a cash-register, the shafts 1 and 3, the drum 10 on shaft 1, and wheel 11, with pawl, on shaft 3, the endless belt 13, with projecting pins operating said drum and wheel 11, the wheel 18, mounted on said shaft 3 and provided with lug 26, the wheel 19, mounted on shaft 3 and having ratchet-wheel secured thereto, and the pivoted lever 32, with pawl 37, the latter adapted to engage said ratchet-wheel, said parts being combined substantially as and for the purpose set forth.

6. In a cash-register, an endless belt with lug 58 thereon, the shaft 3, with wheel 11, operated by said belt, a plunger with a pin thereon, the pivoted arm 45, with the bayonet-slot 49 therein, and the sliding bar 57, said parts being combined substantially as and for the purpose set forth.

7. In a cash-register, the casing having the shafts therein bearing the indicating and registering wheels, the endless belts having the pins for operating the said wheels, and plungers carrying retaining-arms to engage the pins to retain the belts at the desired points, and devices for retaining and releasing the plungers, substantially as described.

8. In a cash-register, the shafts having the indicating-wheels thereon carrying pin-rollers, the shaft carrying the registering-wheels and pin-rollers, devices carried by the endless belts passing over said pin-rollers and engaging the pins or projections thereon to operate the indicating and registering wheels, the plungers operating the retaining-arms to cause them to engage the endless belts, and devices for releasing the plungers and returning them to their original position, substantially as described.

9. In a cash-register, the combination, with the endless designating-belts having the pins for operating the indicating and registering wheels, of the plungers, the retaining-arms operated by said plungers for engaging the pins on the belts, and the mechanism for holding and releasing the plungers, substantially as and for the purpose described.



10. In a cash-register, the shaft 48, with key 48×, the arm 50 on said shaft, the standard 53, with arm 54, having the catch 55 pivoted thereto, and the sliding bar 57, said parts being combined substantially as and for the purpose set forth.

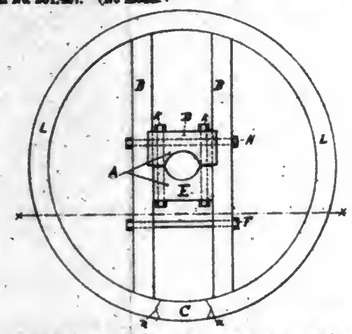
11. In a cash-register, the combination, with the endless designating-belts having pins for operating the indicating and registering wheels, of the spring-plungers having pins, retaining-arms having slots engaged by said pins to cause the retaining-arms to engage the pins on the belts, and mechanism for releasing the retaining-arms and allowing the plungers to return to their normal position, substantially as and for the purpose described.

12. In a cash-register, a designating-belt with pins, a wheel mounted on a shaft and operated by said belt, a pivoted arm, 48, with bayonet-slot 49 and engaging portion 46, a plunger with pin working in said bayonet-slot and the notch 43, and a rocking shaft with catch connected thereto and provided with a weighted arm, said parts being combined substantially as described.

13. In a cash-register, a designating-belt with projecting pins and lugs 58, a rotary wheel operated by said belt, a pivoted arm with the bayonet-slot 49, a plunger with the pin 42, a horizontal sliding bar with support, a rocking shaft with arm 50, and a pivoted catch resting on said arm 50 and in contact with said sliding bar, said parts being combined substantially as and for the purpose set forth.

395,571. POTATO-DIGGER. JAMES H. LEWIS, Detroit, Mich., assignor of one-half to Charles G. Hampton, same place. Filed May 11, 1888. Serial No. 273,667. (No model.)

Claim.—1. The combination, with the shovel-plow of a potato-digger, of a carrier-rake adjusted above that plow and actuated by mechanism to impart thereto a rake motion, said mechanism consisting of a crank or cranks carrying the rear end of the rake and provided with drive-connection from the ground-wheels, and of self-adjusting compensating hangers for suspending the front end of said rake, substantially as described.



2. The combination, with the shovel-plow of a potato-digger, of two inclined reciprocating carrier-rakes mounted above said shovel-plow side by side, of self-adjusting compensating hangers suspending the front end of the rakes independently of each other, and a double-throw crank supporting the rear end of the rakes and imparting motion in opposite direction to such rakes, substantially as described.

3. The combination, with the forwardly-inclined rakes N N' of the double-throw crank-shaft M, upon which the rear end of each rake are mounted, of the arms R, hinged to the front ends of the rakes, the hangers O, secured to the frame, and the links P, pivotally connecting said hangers with the arms R, substantially as described.

4. The combination, in a carrier-rake for potato-diggers, substantially as described, of the V-shaped rake-teeth *h*, arranged in rows, and a rake-head, *g*, to which the teeth are secured, substantially as described.

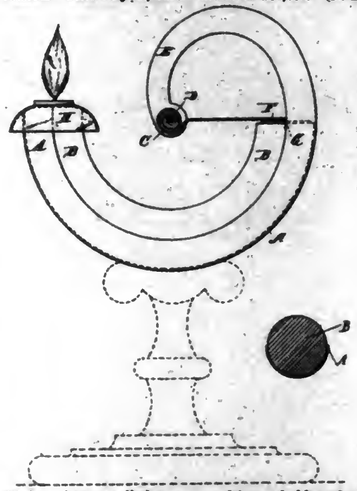
5. The combination of the rake-head *g*, the rake-teeth *h*, secured thereto in rows, and the arm R, hinged to the forward end of the rake-head, and the rake-teeth *i*, formed on the lower side of said arm, substantially as described.

395,572. PULLEY. FRANCIS A. LOMONT, Fort Wayne, Ind., assignor of one-half to John Drefsbilbis, same place. Filed July 30, 1888. Serial No. 281,627. (No model.)

Claim.—1. The combination of a pulley-rim provided with a single removable section, the arms B B, securely attached to the larger portion of the rim, the hub-section D, permanently secured to the arms B B, the cap or hub-section E, removably secured to the fixed hub-section, the bolts K, to clamp the hub-sections to the shaft, and the bolt F, to clamp the ends of the rim against the ends of its removable section, all substantially as described.

2. The combination of the arms B B, securely attached to the rim of a pulley, the hub-section D, permanently secured to the arms B B, the cap or hub-section E, removably secured to the fixed hub-section, and the bolts K, to clamp the hub-sections on the shaft, all substantially as described.

395,573. PLOW. ALONZO R. MALLORY, Madison, Ga. Filed June 20, 1888. Serial No. 277,627. (No model.)



Claim.—1. A plow comprising the customary standard and draft appliances, a foot adapted to connect with the customary plow-standard, and having a curved upper or front portion adapted to independently receive and connect therewith a soil-turner and a point, an independent soil-turner and a point, each adapted to fit said foot and be independently connected thereto, said point having a central bevel-shaped beak, as explained, a landside secured at its front end to said foot, and a bevel-ended slab removably connected to the rear under face of said landside, substantially as set forth.

2. A plow comprising the customary standard and draft appliances, a soil-turner having an upwardly-projecting longitudinal rib on its upper face, a concaved side wing or wings, and at its front end a bevel-shaped beak, a foot having at its upper end a transverse bolt-hole for the attachment of the plow-standard and at its lower portion similar bolt-holes for the connection thereto, respectively, of the soil-turner and point, said foot also having depending side wings and a recessed base portion, a landside adapted to fit within the recessed base portion of the foot and having a recessed front end, and a nut-locking plate adapted to fit within said recess in the landside, substantially as set forth.

3. The foot or frame herein described, having a curved upper portion provided with bolt-holes for removably and independently connecting thereto, respectively, a plow-standard, soil-turner and point, depending side wings, and a recessed base portion, in combination with a landside adapted to fit and be secured within the recessed base of said foot, and a slab having a beveled front end and removably secured to the under face of the rear end of said landside, substantially as set forth.

4. The combination, with the foot or frame herein described, having a recessed base portion, of a landside having a recessed front end, a slotted nut-locking plate adapted to fit the recessed front end of said landside and the recess or step in the base of the foot, and a slat removably secured to the under face of the rear end of the landside, substantially as set forth.

395,574. CANDLE-LAMP. JOHN MARTIN, Kew, near Melbourne, Victoria. Filed July 16, 1888. Serial No. 280,366. (No model.)

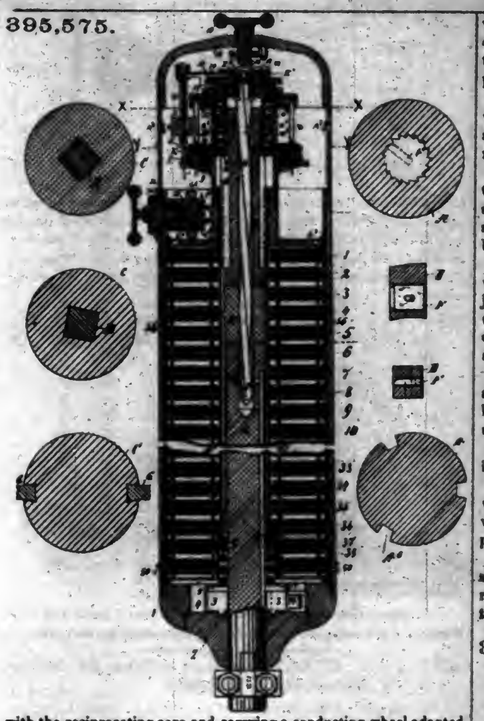
Claim.—1. A candle-lamp comprising a holder of substantially the form of a volute, that portion of the volute designed for the reception of the candle being semi-cylindrical in cross-section, in combination with the cap H, the spring C on the end of arm E of the volute, and the spring-arm, substantially as and for the purposes specified.

2. A candle-lamp comprising a holder of substantially the form of a volute, that portion of the volute designed for the reception of the candle being semi-cylindrical in cross-section and provided at the burner end with the cap H and at the opposite end with the coiled spring C, and spring-arm extending into the semi-cylindrical portion of the holder, in combination with a stand to which said holder is secured, substantially as and for the purposes specified.

395,575. ELECTRO-MAGNETIC ROCK-DRILL. HARRY H. MARVIN, Syracuse, N. Y. Filed July 13, 1887. Serial No. 244,150. (No model.)

Claim.—1. In an electro-magnetic drill, the combination, with the reciprocating magnet-core, of the actuating pawl or dog carried thereby, and a magnet for throwing the same into engagement with a ratchet connected with the drill-tool, as and for the purpose described.

2. The combination, with the magnet A, provided with ratchet-teeth, of a pawl of magnetic material mounted, as described, so as to be capable of moving into and out of engagement by the magnetism of the magnet when the magnet and pawl come into proximity.



3. The combination, with the magnet-core A, of a pawl of magnetic material mounted on a non-magnetic support independent of the core, and a ratchet carried by the core, as and for the purpose described.

4. The combination, with the reciprocating magnet-core, of the rod of non-magnetic material, whose end is adapted to enter a cavity in the head of the core, and a loose pawl of magnetic material mounted on the end of the rod, and a ratchet connected with the drill-tube.

5. In an electro-magnetic drill or similar tool having a reciprocating core, magnet-coils spaced as described, to permit circulation of air between the coils and guide-tube for the reciprocating core.

6. The combination, with the reciprocating magnet-core, of a commutator actuated thereby and having the plane of its cylinder transverse to the line of movement of the core, said cylinder consisting of a fixed trundle or lantern wheel whose bars or teeth are insulated from one another, and a commutator-brush-holding arm connected

395,575.

with the reciprocating core and carrying a conducting-wheel adapted to gear with the lantern-wheel, as and for the purpose described.

7. The combination, with the cylindrical commutator, of a rotary brush-supporting plate loosely pivoted on its support concentrically with the commutator-cylinder, and a spring exerting a transverse pressure on said plate, whereby the brushes may be held in contact with the commutator-bars, as and for the purpose described.

8. The combination, with the reciprocating drill-rod, of a reciprocating core or rod, a ratchet and pawl for connecting the latter with the drill-rod, and a collar engaging with the drill-rod provided with a dog or pawl arranged to permit said rod to rotate when connected with the reciprocating and rotating rods, but arranged to prevent rotation of the collar in the opposite direction.

9. A combined reciprocating magnet-core and air-pump in which the guide-tube for the core serves as the cylinder of the pump, in combination with an air-delivery passage leading from said pump and arranged to deliver a current of air upon the magnet-coils, as and for the purpose described.

10. The combination, with the commutator-actuating devices, of the attached rod D and the reciprocating core having a longitudinal hole which receives the rod, said rod and core being connected together by devices, as described, whereby the reciprocation of the core may impart a rotary movement to the rod.

11. The combination, with the series of coils and the rotary commutator adapted to rotate in a plane parallel to the plane of the coils, of the actuating-core and the rod D, extending through or into the core and rotated thereby as said core reciprocates.

12. The combination, with the magnet-core and a series of actuating-coils, of a commutator and connections between the core and commutator for imparting movement positively to said commutator by the core on its downstroke, said connections being of adjustable length or extent, as and for the purpose described.

13. The combination, with a magnet-core and a series of actuating-coils, of a commutating device actuated thereby, but movable independently thereof at the end of the upstroke, and an adjustable stop in the connections between the core and commutator, whereby the position of the actuating set of coils with relation to the core on the downstroke will be varied according to the force of stroke desired.

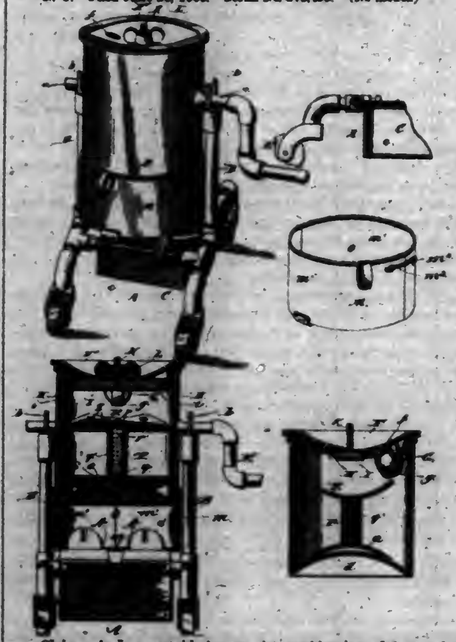
14. The combination, with the reciprocating core, of the rotary commutator-driving arm moving with the core, and an adjusting device engaging with said arm for changing the relation of the same with regard to the portion of the commutator upon which the arm abuts.

15. The combination, with the two reciprocating cores and their actuating-coils, of a commutator actuated by the core through devices having an adjustable lost motion, whereby the extent of the shift of current in the series of coils in an upward direction may be determined, and the consequent force with which the upper core is impelled on the downstroke may be varied.

16. The combination, with the rotary arm 22, adapted to engage with the commutator and adjustably mounted on its support, of the adjusting-block 18, engaging with the arm at or about the center of rotation of the support, as and for the purpose described.

17. The combination, with the drill, of the switch arranged between two sets of resistance-coils, and having its contacts at either side arranged with reference to one another and the two sides of the switch, as described, to throw the coils of each set into circuit singly but alternately with the coils of the other set.

18. The combination, with the drill, of the two bands, one of which carries one adjustable leg, while the other carries two legs adjustable independently of one another, means for clamping the bands upon the drill, and nuts independent of said clamping devices for clamping the shoulders of the legs against the face of the bands, as and for the purpose described.



19. The combination, with the reciprocating magnet-core A, of a mechanism engaging with said core for rotating the same on its longitudinal axis, and a simultaneously-reciprocating core, U, connected with said rotating mechanism, as and for the purpose described.

20. The bodily-moving commutator-wheels carrying contacts I K, in combination with the fixed conducting-rings I' K'.

21. In an electro-magnetic reciprocating tool, the combination, with the reciprocating core, of a buffer-spring, W', the superposed washer, and the shouldered core or drill-holder, as and for the purpose described.

22. The combination, with the drill, of a buffer-spring, W', consisting of a coiled spring resting upon the lower head-plate and surrounding the drill-rod, said spring being engaged by said rod in case the rod is thrown below its normal limit of movement.

395,576. PORTABLE HEATER. DEWITT C. McINTIRE, Salamanca, N. Y. Filed June 28, 1888. Serial No. 278,453. (No model.)

Claim.—1. In a portable heater, the combination of the truck or frame provided with the uprights or standards, the heating device arranged between the uprights or standards, the boiler provided with lateral trunnions mounted in bearings on the upper ends of the uprights or standards, and the crank to enable the same to be rotated, and the cover on the upper end of the boiler, provided with a vent-opening and a gravity-valve adjacent thereto, substantially as specified.

2. In a portable heater, the uprights or standards and the heating device arranged between them, in combination with the boiler mounted between the uprights or standards and provided with the concave bottom adapted to concentrate the heat, and the concave cover fitting on the upper end of the boiler and provided with a vent-opening covered by a gravity-valve, substantially as specified.

3. In a portable heater, the uprights or standards and the heating device arranged between the same, in combination with the boiler mounted between the uprights or standards and provided with a concave bottom, the concave cover fitting on the upper end of the boiler and bearing on an elastic packing-ring, and the transverse bar arranged in the upper end of the boiler and provided with an upright threaded stud extending through a central aperture in the cover and engaged by a thumb-nut, substantially as specified.

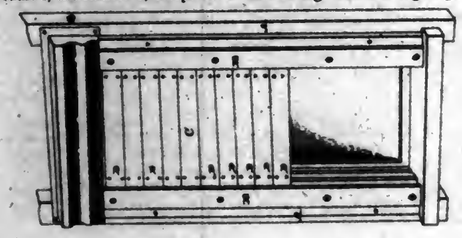
4. In a portable heater, the combination of the boiler provided with interior ears near its upper end, the transverse removable bar provided with notches in its ends engaging the said ears, the threaded stud affixed to the center of the said bar, the cover fitting on the upper end of the boiler and provided with a central aperture fitting over the said threaded stud, and the thumb-nut engaging the projecting end of the stud and bearing on the outer side of the cover, substantially as specified.

5. In a portable heater, the uprights or standards and the heating device arranged between the same, in combination with the boiler mounted between the uprights or standards and provided with a suitable cover, and the agitator arranged in the boiler and comprising two perforated plates connected by a perforated tube and adapted to move longitudinally in the boiler as the latter is rotated, substantially as specified.

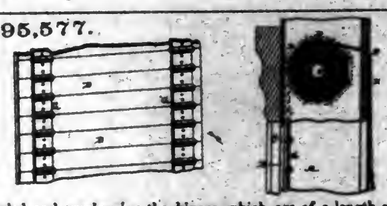
6. In a portable heater, the uprights or standards and the heating device arranged between the same, in combination with the boiler and the agitator comprising the upper and lower plates provided with central apertures, the perforated tube q' on the lower plate, arranged over the central aperture therein, and the perforated tube r' on the upper plate, arranged over the central aperture therein and fitting within the tube q', substantially as specified.

7. The boiler provided with a concave bottom, and the cover on the upper end of the boiler, in combination with the agitator arranged in the boiler and comprising the lower curved and perforated plate, Q, provided with a central aperture, the perforated tube q', affixed to the plate over the said aperture, the oppositely-curved and perforated upper plate, R, provided with a central aperture, and the perforated tube r', affixed to the under side of the plate under the central aperture and fitting in the tube q', all constructed and arranged substantially as and for the purpose specified.

8. In a portable heater, the uprights or standards and the heating device provided with the burners c' c', in combination with the revoluble boiler mounted between the uprights or standards, and the cap fitting on the lower end of the boiler and provided with a perforated bottom having apertures N N, fitting on the burners, the interior of the said cap forming a combustion-chamber to concentrate the heat on the bottom of the boiler, substantially as specified.



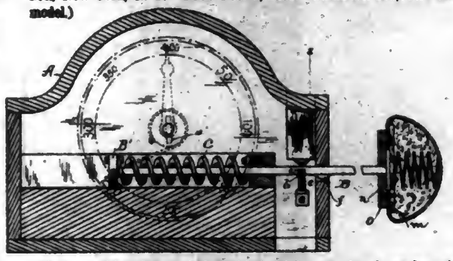
9. In a portable heater, the uprights or standards and the heating device arranged between the same, in combination with the boiler and the cap fitting on the lower end of the boiler, and comprising a perforated bottom and the semi-cylindrical side sections hinged to the bottom, substantially as specified.



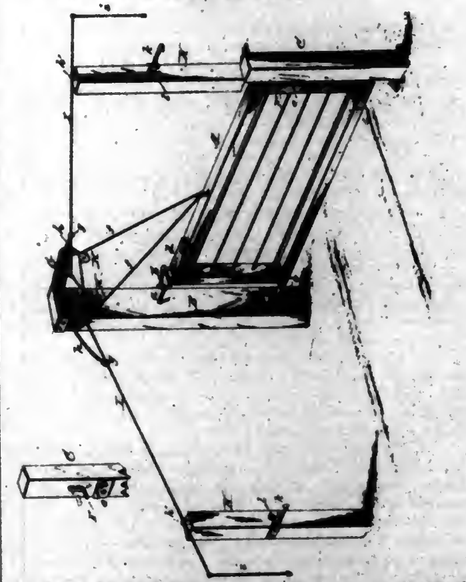
10. In a portable heater, the heating device provided with burners c', and the boiler mounted over the burners, in combination with the removable cap fitting on the lower end of the boiler, and comprising the perforated bottom m, provided with the apertures N N, fitting over the burners, and the sides formed of the semi-cylindrical sections m' m', hinged at their centers to the edges of the bottom and provided with hooks m^2 and keepers m^3, substantially as specified.

11. The truck or frame A, composed of hollow pipes or sections of pipes connected by couplings, the base of the frame being in the form of a rectangle with the ends or corners bent or turned down and provided with rollers, and the standards B, rising from the base of the frame and having the bearings or forks b b at their upper ends, and the boiler D, arranged between the standards and journaled in the bearings or forks, as set forth.

395,577. WINDOW-SHUTTER. JOHN T. MILLER and SOLOMON W. MILLER, Thayer, Kans. Filed June 16, 1888. Serial No. 277,361. (No model.)



Claim.—In a window-shutter, the combination of the frame, the shaft I, the shutter C, composed of slats having their meeting edges

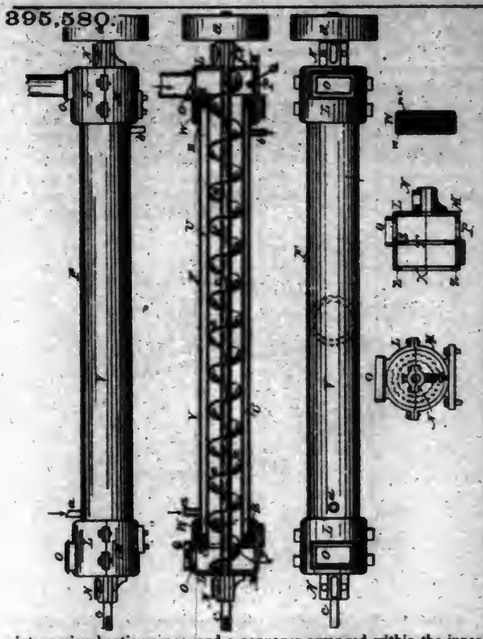


beveled and overlapping the hinges, which are of a length equal to the width of the slats and secured thereto upon their inner sides at opposite ends thereof, the operating-cord, and the pulley P, the shutter and cord being secured to the shaft and wound thereon in opposite directions, all combined to operate substantially in the manner described.

395,578. COIN-OPERATED BLOW-TESTER. THOMAS F. O'CONNOR, New York, N. Y. Filed Feb. 6, 1888. Serial No. 263,067. (No model.)

Claim.—The drive-rod provided with cam f and notch e, the spring C, the lever b, and the spring c, substantially as described.

395,579. FARM-GATE. ISAAC OLSEN, Manitowoc, Wis. Filed Sept. 24, 1888. Serial No. 286,227. (No model.)



Claim.—The combination, with the hinged gate A and pivoted crank-stop F, of the mechanism for operating the gate, consisting of the hangers G, having pulleys H, the rods A, extending out from said arms and provided with eyes g, and the cords or ropes f, connected to the gate, passing over the pulleys in opposite directions and connected to the ends of rods I, said rods passing through the eyes of the rods A, which form guides therefor, substantially as and for the purpose set forth.

395,580. APPARATUS FOR TREATING MIDDLINGS. ALLEN R. PARKISON and JAMES PULLINGER, Monongahela City, Pa., assignors of one-third to James M. McGrew, same place. Filed Oct. 3, 1887. Serial No. 251,339. (No model.)

Claim.—1. In apparatus for heating middlings and similar product, the combination of the inner tube, the outer tube forming the

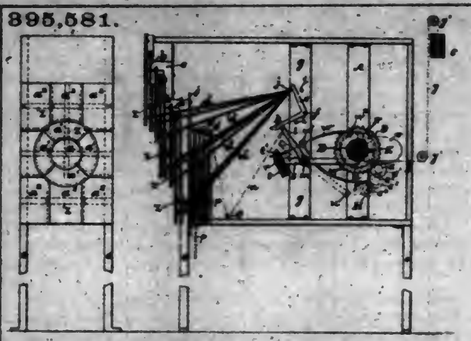
395,580.

intervening heating-space, and a conveyer arranged within the inner tube, with chambered parts secured upon the ends of said tubes, each part having a chamber into which the conveyer-tube opens at each end, and having, also, a chamber for receiving the ends of the outer tube, and a screw-ring within said chamber closing the ends of the outer tube, as described, and for the purpose specified.

2. In apparatus for heating middlings and similar product, the combination of the chambered-end parts each having a top and a bottom opening, O and P, an interior partition, S, and an inward-projecting end flange, Z, the removable lids Q, the outer tubular casting having the steam inlet and outlet pipes a b, and provided at both ends with exterior screw-threads, the inner tubular casting provided at both ends with exterior screw-threads, the rings W, having the interior screw-threads, w w^2, of different diameters, and the conveyer, substantially as described, for the purpose specified.

3. The middlings-heater herein described, consisting of the inner and the outer tubes forming an intervening chamber for containing steam, the outer tube provided with a pipe at one end at the top and at the other end at the bottom, the end-chambered parts having top and bottom openings, the lids for closing one of these openings in each chambered part, the rings W, each having two interior screw-threaded parts of different diameters adapted to fit upon the ends of the said tubes, and a conveyer having its shaft C mounted in bearings in said chambered parts and projecting alike at each end outside of said chambered parts to receive the pulley D on either end, whereby the conveyer may be driven from either end of its shaft, and the operation of the conveyer reversed in the manner and for the purpose stated.

4. The combination, with the inner and the outer tubes and a screw-conveyer operating within the inner tube, of the chambered parts formed of two equal box parts arranged upon these tubes at each end, each box part having bearing parts of different diameters with their centers in the same axial line, and a screw-ring adapted to be screwed upon the ends of said tubes, in the manner and for the purpose described.



395,581. SELF-INDICATING TARGET. JAMES PATERSON, Glasgow, County of Lanark, Scotland. Filed Mar. 26, 1888. Serial No. 268,560. (No model.) Patented in England Apr. 20, 1887, No. 6,368.

Claim.—1. In a self-indicating target, the combination of the central section or bull's-eye and a congeries of overlapping sections arranged in overlapping concentric series, substantially as and for the purpose set forth.

2. In a self-indicating target, the combination of a series of overlapping sections or plates constituting the face of the target and a series of indicator-operating rods against which the sections have bearing, all of said rods being adapted to be operated separately and independently by said sections, substantially as and for the purpose set forth.

3. In a self-indicating target, the combination of a series of over-

395,581.

lapping sections suspended by tangs or straps at their top, arranged around a central section, and constituting the face of the target, and indicating devices individually operated by each of said sections, substantially as set forth.

4. In a self-indicating target, the combination of a series of overlapping sections disconnected from one another and arranged one back of the other, and a series of bridge pieces or strips arranged between the sections, substantially as and for the purpose set forth.

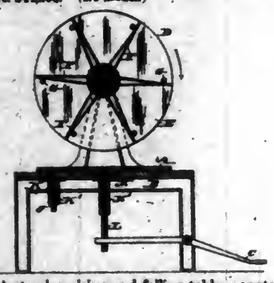
5. In a self-indicating target, the combination of the value-plates constituting the face of the target, disconnected rods bearing on the rear sides of said value-plates, a guide-strip through which the rear ends of the rods project, bell-crank levers arranged on a single pivot-pin and engaged at their upper ends by the rear ends of said rods, catches at the lower ends of said bell-crank levers, indicators, hammer or fall bars engaged by said catches, suspension-cords connecting the indicators and hammer or fall bars, and means for returning the indicators to their hidden position, substantially as set forth.

6. In a self-indicating target, the combination of the value-plates constituting the face of the target, the rods operated by said plates, the bell-crank levers engaged at their upper ends by said rods, catches at the lower ends of said bell-crank levers, stop-pins behind the upper ends and below the lower ends of said bell-crank levers, as explained, indicators, hammer or fall bars engaged by said catches, suspension-cords connecting the indicators and hammer or fall bars, and means for returning the indicators to their hidden position, substantially as and for the purpose set forth.

7. In a self-indicating target, the combination of the value-plates constituting the face of the target, indicators suspended by cords, pivoted hammer-bars to which the said cords are secured, mechanism, substantially as described, operated by the value-plates and provided with catches for supporting said hammer-bars, pivoted levers having a cross-bar pivoted between them, and cam mechanism for depressing the free ends of said levers, substantially as set forth.

8. In a self-indicating target, the combination of the indicators and mechanism for returning them to their hidden position, consisting of hammers l, drum B, operated by a cord wound upon it having a weight attached, loose ratchet-wheel D on the drum, pawl or detent w, engaging the teeth of the ratchet, said detent being adapted to be disengaged from the ratchet through the medium of suitable mechanism by the fall of the hammers l, and automatically-operated clock mechanism having a cam actuated thereby, whereby it is brought into engagement with the disengaging mechanism of the detent, substantially as set forth.

9. In a self-indicating target, the combination of the indicators suspended by cords, levers s, having bar t pivoted to them, pins projecting from said bar, detents w, engaged by said pins, fall-bars or hammers l, having the suspending-cords of the indicators attached to them, a shaft having a drum, gear-wheel and ratchet-wheel mounted thereon, the latter being loose and engaged by detent w, means for rotating the drum, and cam v, mounted on said shaft and engaging the ends of levers s, substantially as set forth.



395,582. HAIR-PIN. WALTER F. PRET, Philadelphia, Pa. Filed May 26, 1888. Serial No. 275,213. (Model.)

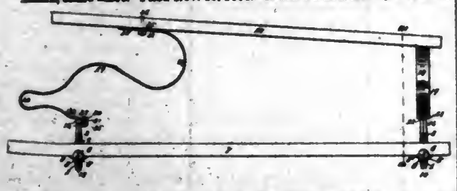
Claim.—1. A hair-pin having a limb with coils, a portion of which has its convolutions in one direction and another portion on the same limb having its convolutions in the reversed direction, substantially as described.

2. A hair-pin having a limb with coils in reverse direction and a guiding portion between said coils, substantially as described.

395,583. APPARATUS FOR SCOURING, CLEANSING, AND POLISHING METAL, &c. JOHN PFEIFER, Philadelphia, Pa. Filed July 14, 1887. Serial No. 244,206. (No model.)

Claim.—1. A stand, a rising and falling table mounted on said stand, and a treadle connected with said table, in combination with a brush secured to a rotary axle which is mounted on said stand above said table and provided with cross-bars back of the brush material, forming together an improvement in apparatus for scouring and cleaning metal, as stated.

2. An apparatus for cleansing metal, consisting of the rotary brush D, journaled in bearings on the stand B, the latter having the bosses M' and K', the table A on said stand and having the rod L and pin J, and the treadle C, secured to said rod L, said parts being combined substantially as described.

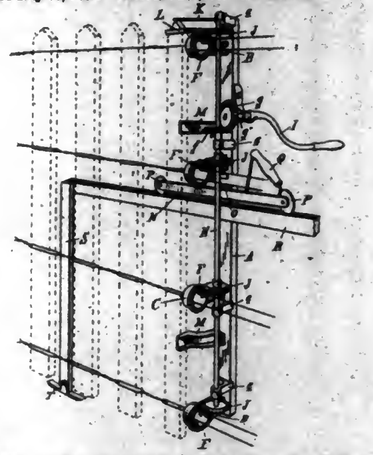


395,584. CONDUIT FOR ELECTRIC WIRES OR CABLES. EDWARD H. PHIPPS, New Haven, Conn., assignor to Edward S. Perot and James P. McQuaide. Filed July 26, 1887. Serial No. 245,326. (No model.)

Claim.—1. A conduit for electric conductors, consisting of a sheet-metal shell or tube provided with a lining of hydraulic cement, substantially as described.

2. A multiple-system conduit for electrical conductors, consisting of a suitable number of sheet-metal pipes lined with hydraulic cement, insulating-supports therefor, intervening filling of cementitious or like matter, and an inclosing-casing, substantially as described.

395,585. SPRING-GEAR FOR CHILDREN'S CARRIAGES. HENRY G. PORTMANN, St. Louis, Mo., assignor of one-half to William W. Portmann, same place. Filed Nov. 10, 1888. Serial No. 290,435. (No model.)



Claim.—1. In a child's carriage, the combination of the arch-bar that supports the springs, the foot-clamps on the ends of said bar, and the legs that project from said foot-clamps and clutch the axles beneath and the side bar above, substantially as and for the purpose set forth.

2. In a child's carriage, the combination of the arch-bars that support the springs, the foot-clamps on the ends of said bars, provided with bed-plates S, that carry the side bars, said plates integral with the foot-clamps, and the legs that project transversely from said foot-clamps and clutch the axles beneath and the side bars above, substantially as and for the purpose set forth.

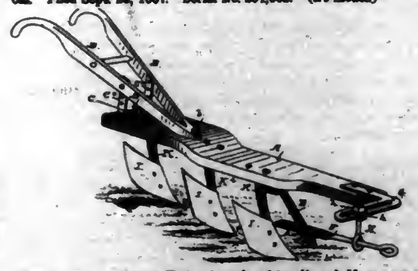
3. In a child's carriage, the combination of the arch-bars, the spring-bars seated on said arch-bars, and the double-fold ogee tester-springs 29, that couple the rear spring-bar to the bed of the carriage and provide the means of teetering said carriage-bed and of its elastic rear support, substantially as and for the purpose set forth.

4. In a child's carriage, the combination of the arch-bars, the foot-clamps provided with transversely-presenting legs that clutch the axles beneath and the side bars above, the spring-bars that surmount said arch-bars, the loop-ended three-quarter elliptic spring that is secured to the front spring-bar and to the front of the carriage-bed, and the double-fold ogee tester-springs that couple the rear spring-bar to the bed of the carriage, arranged to provide the means of teetering said carriage-bed and of its elastic support, substantially as and for the purpose set forth.

395,586. PICKET-FENCE MACHINE. BELA RAMSON, Flint, Mich., assignor of two-thirds to Oren Stern and Edwin R. Woodin, same place. Filed May 15, 1888. Serial No. 273,906. (No model.)

Claim.—1. The combination, with the standard and the bracket B, secured thereto, of the hollow twister journaled in said bracket, and provided with circumferential gear and with bar *b*, and a detachable head formed with wire-passages and having lugs *c* engaging the bar *b*, substantially as described.

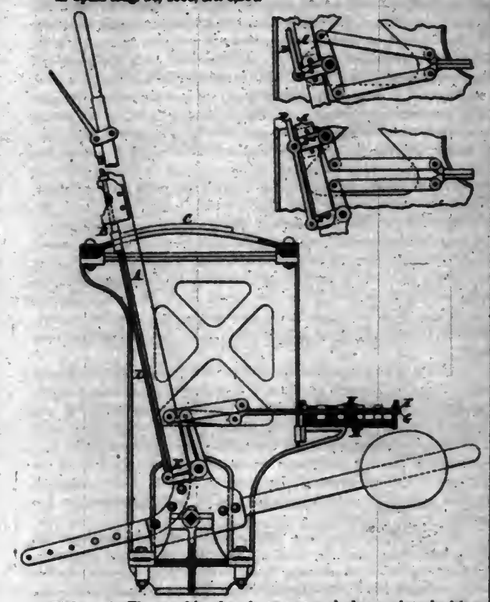
2. The combination, with the twister-frame and a carriage pivotally secured to said frame near the vertical middle of the machine, of a guide-rail independently and movably supported above the ground, and a handle secured to said carriage, substantially as described.



3. The combination, in a picket-fence machine, of the twister-frame, the carriage pivotally secured thereto, the clamp-screw and slotted clamping-plate adjustably securing the carriage to the standard, the guide-rail upon which said carriage is supported from the ground, and the shoe, substantially as described.

4. The combination, with the picket-fence machine provided with the carriage, substantially as described, of the guide-rail, the supporting-legs to the guide-rail, and the curved shoes secured to the legs of the guide-rail.

5. The combination, with the twister-frame of the picket-fence machine, of the picket-clamp L, consisting of the adjustable jaws *h h'* and clamp-screw *i*, substantially as described.

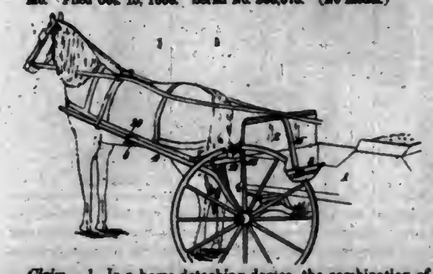


6. The herein-described tension, consisting of the twister-frame U, the tension-wheel W, mounted on the shaft V, the friction-disks *m n*, the tension-spring *o*, the tension-wire *q*, and the loose pulley *r*, the parts being combined and arranged to operate substantially as described.

395,587. VINEYARD-CULTIVATOR. CHRISTIAN REIMANN, Napa, Cal. Filed Sept. 20, 1887. Serial No. 251,062. (No model.)

Claim.—The standard K, having the sides *k'* and *k²* arranged at an angle to each other, said side *k²* having the lower vertical extension, *k⁴*, the point or landside L, bolted to said extension, the mold-board I, bolted to the side *k'*, the plate *k³* on the upper end of the standard and extending rearward therefrom, said plate having the opening *m'* in the rear end and the concentric opening *m²* in its front end, for the purpose set forth, and the brace-rod M, having its upper end bolted under the rear end of plate *k³* and its lower end bolted to the inner side of side *k'* at a suitable distance from the lower end of the standard, substantially as described.

395,588. SWITCH AND SIGNAL INTERLOCKING APPARATUS. HUGH REID, Derby, County of Derby, England. Filed May 23, 1888. Serial No. 274,868. (No model.) Patented in England Jan. 5, 1888, No. 153; in France May 3, 1888, No. 190,574; in Belgium May 2, 1888, No. 81,065; in Victoria June 8, 1888, No. 5,334; in New South Wales June 12, 1888, No. 718; in Italy July 3, 1888, XLIV, 365; in India July 11 and Aug. 14, 1888, No. 117/110; in Canada Aug. 4, 1888, No. 30,638, and in Spain Aug. 20, 1888, No. 8,264.



Claim.—1. The combination, in tappet and plunger interlocking apparatus for railway point and signal levers, of plungers made in two layers, tappets, levers, and spring-catches, said layers of the plungers moved, respectively, by the levers and the spring-catches, and having inclined notches which actuate the tappets and receive the latter only when the spring-catches are down, substantially as described.

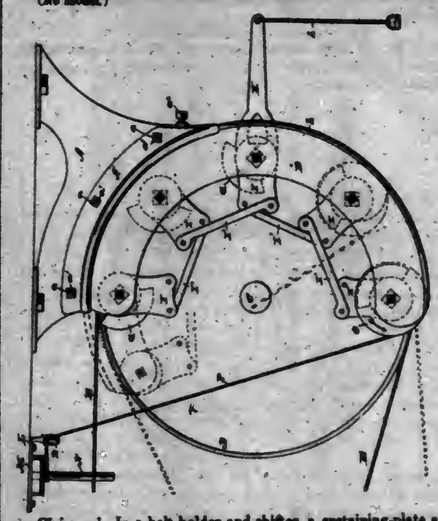
2. The combination, in tappet and plunger interlocking apparatus for railway point and signal levers, of the plungers made in two layers, F and G, having inclined notches *f* and *g*, the levers A, the spring-catches B, the rods D, said levers and rods respectively connected with the layers of a plunger, and transverse slides H, having wedge-shaped tappets which are actuated by the inclined notches of the layers of the plungers when the latter are moved lengthwise, substantially as described.

3. The combination, with the levers and the spring-catches therefor, of plungers made in two layers and provided with inclined notches and wedge-shaped tappets which are thrust laterally out of engagement with one plunger by the inclined notches thereof when such plunger is moved lengthwise and into engagement with the inclined notches of the adjacent plunger, substantially as described.

395,589. HORSE-DETACHER. HARRY RIEMERSMA, St. Louis, Mo. Filed Oct. 15, 1888. Serial No. 288,078. (No model.)

Claim.—1. In a horse-detaching device, the combination of the sectional-cut singletree, the knockdown hinge that connect the sections of said singletree, the sectional dovetail tapered catch-block 9, and the clamping-block 13, substantially as and for the purpose set forth.

2. In a horse-detaching device, the combination of the sectional-cut singletree, the knockdown hinge that connects the sections of said singletree in front, the sectional catch-blocks at its back, the clamping-block, and the metal equalizing-straps 18, with their pendent lugs 19, substantially as and for the purpose set forth.



3. In a horse-detaching device, the combination of the sectional-cut singletree, the knockdown hinge that connects the sections of said singletree in front, the sectional dovetail tapered catch-block 9 at its back, the clamping-block 13, that clutches and couples the sections of said catch-block, the ball 16 on said clamping-block, the draw-strap 15 attached to said ball, and the snap-hook 17, that attaches said strap to the foot-bar, substantially as and for the purpose set forth.

4. In a horse-detaching device, the combination of the sectional-cut singletree, the knockdown hinge 8, sectional-tapered catch-block 9, clamping-block 13, attachment ball 16, the draw-strap 15, by which the detachment is operated, the metal equalizing-straps 18, with pendent lugs 19, and the holdback-hooks 6, secured to the shafts, with which the holdback-straps engage, substantially as and for the purpose set forth.

395,590. PROCESS OF MAKING BRICK. GEORGE SATTLER, Sr., and CARL HAGEL, St. Louis, Mo., assignors of one-half to George Sattler, Jr., East St. Louis, Ill. Filed Feb. 16, 1888. Serial No. 264,272. (No specimens.)

Claim.—The described method or process of making bricks, blocks, &c.—namely, by powdering the clay, heating it uniformly to a cherry-red heat, cooling, mixing it with sufficient water for molding, and then molding, drying, and burning, as usual.

395,591. BELT HOLDER AND SHIFTER. UNDO H. W. SCHENCK, Brooklyn, assignor to the Schenck Belt Holder and Shifter Company of New York, New York, N. Y. Filed Mar. 28, 1888. Serial No. 268,949. (No model.)

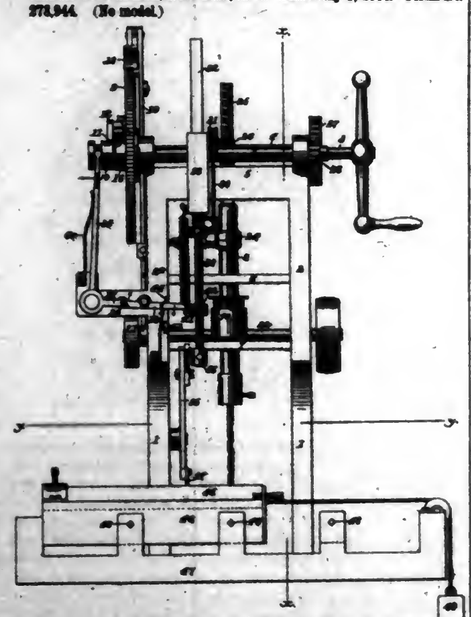
Claim.—1. In a belt holder and shifter, a sustaining-plate and a series of belt-supports arranged in a segmental line thereon, in combination with a series of vibratory spiral shifters mounted on axes transverse to the line of movement of the belt and adapted to engage with the under side of said belt, and suitable mechanism for operating said shifters, all constructed, arranged, and operating substantially as shown and described, whereby as said shifters are moved without the segmental line of the supports they will engage with the under side of the belt, lift the same, and shift it from said supports.

2. In a belt holder and shifter, a sustaining-plate and a series of belt-supports arranged in a segmental line thereon transverse to the line of movement of the belt, in combination with a series of vibratory spiral shifters mounted on said supports and mechanism, as described, for operating said shifters, all constructed, arranged, and operating substantially as set forth, whereby as the shifters are vibrated they will engage with the under side of the belt, lift the same, and shift it from the supports.

3. In a belt holder and shifter, the combination, with the sustaining-plates B and F, the series of bolts c and sleeves *d*, and bearings H, mounted thereon, of the vibratory spiral shifters G, mounted on the sleeves *d* and having the levers I and links I', connecting said

levers, and the operating-lever K, all constructed, arranged, and operating substantially as shown and described.

4. In a belt holder and shifter, the combination, with a bracket secured to a suitable support, an adjustable sustaining-plate secured thereto, and a series of belt-supports arranged in a segmental line on said plate, of a series of vibratory spiral shifters mounted on axes secured to the sustaining-plate and transverse to the line of movement of the belt and adapted to engage with the under side of said belt, and suitable mechanism for operating said shifters, all constructed, arranged, and operating substantially as shown and described.



5. In a belt-holder, the combination, with a bracket secured to a suitable support and an associated pulley, of a sustaining-plate secured to said bracket and adjustable in the arc of a circle concentric with the associated pulley, and having a series of belt-supports arranged in a segmental line thereon, all constructed and arranged substantially as shown and described, as and for the purpose set forth.

6. In a belt holder and shifter, a suitable belt-holder frame arranged in close proximity to an associated pulley and belt, and a sheave mounted on said frame and connected with a suitable operating-lever, in combination with a sliding bar mounted in bearings and having a shifter-arm adapted to engage with the belt on its side away from the belt-holder, and a rope or chain secured at one end to the sheave and at the other to the sliding bar, all constructed, arranged, and operating substantially as shown and described, whereby when the sheave is turned the rope or chain will be wound around the same and draw the pending arm toward the holder and cause it to engage with and shift belt onto said holder.

7. In a belt holder and shifter, the combination, with the sustaining-plate B, having a series of belt-supports arranged in a segmental line thereon in proximity to an associated pulley and belt, of the sheave O, mounted on one of said supports and connected with a suitable operating-lever, the sliding bar M, mounted in bearings and having the shifting-bar N, engaging with the belt on its side away from the supports, and the rope or chain P, connecting the sliding bar and sheave, all constructed, arranged, and operating substantially as shown and described.

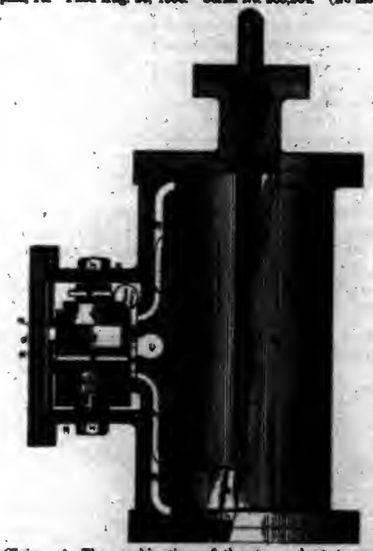
395,592. FEED ATTACHMENT FOR DRILLING-MACHINES.

MARTIN SCHWARZLER, New York, N. Y. Filed July 3, 1888. Serial No. 278,944. (No model.)

Claim.—1. In a feed mechanism for drills, the combination of the supporting-frame, the main driving-shaft, a rack-bar mounted to reciprocate vertically in said frame and terminating in a tripping-rod at its lower end, adjustable fingers on said rod, means, substantially as described, for automatically elevating said bar, a pinion on a counter-shaft meshing with said rack-bar, a ratchet-wheel revolving loosely on said counter-shaft, a clutch connecting the ratchet-wheel and shaft, a pawl operated by the main driving-shaft and engaging said ratchet-wheel, a second counter-shaft parallel with the first, a pinion thereon, a second vertically-reciprocating rack-bar parallel with the first and engaged by said pinion, a drill-spindle coupled to said second rack-bar, gearing coupling the two shafts, a bent lever actuating the clutch, and a second pivoted lever jointed to the outer arm of said clutch-lever and extended to contact with the pins on the vertically-reciprocating rod, all substantially in the manner and for the purpose herein set forth.

2. The combination, in a drilling-machine, with the vertically-reciprocating rod 38, the fingers 40 and 41 thereon, the clutch 10, and the interposed levers 35 and 39, of the spring-actuated catch 44, substantially in the manner and for the purpose herein set forth.

3. The combination, in a drilling-machine, with the vertically-reciprocating rod 38, the fingers 40 and 41 thereon, the spring 43, automatically elevating said rod, the clutch 10, and the interposed levers 35 and 39, of the auxiliary spring 60, bearing upon said lever 35, substantially in the manner and for the purpose herein set forth.



4. In a drilling-machine, the combination of its bed-plate and supporting-frame, the rack-bar 32, terminating in a tripping-rod, 38, and mounted to reciprocate vertically in said frame, a spring, 43, operating automatically to carry said rod upward, a finger, 56, projecting from the lower end of the rod, a counter-shaft meshing with said rack, a second rack-bar, to which the drill-spindle is coupled, gearing between the two rack-bars, means, substantially as described, whereby the counter-shaft is rotated and the rack-bars thereby fed downward, a carriage, 46, traversing upon the bed-plate under the drill-spindle, a weight, 49, to move the carriage automatically in one direction, a spring-actuated catch, 57, engaging the carriage to prevent said movement, a pivoted lever, 53, jointed to the catch, a second pivoted lever, 55, having one arm in position to contact with the finger 56 on the reciprocating tripping-rod, and a swinging latch, 54, on the opposite arm of said lever to engage and slide over the free arm of the catch-lever 53, all substantially in the manner and for the purpose herein set forth.

5. In a drilling-machine, the drill-spindle, the automatically-moving carriage 46 beneath it, the spring-actuated catch engaging the carriage to arrest its movement, the vertically-reciprocating rod mounted parallel with the drill-spindle to move in synchronism with it, the gearing between the rod and spindle, an adjustable finger projecting from the rod, and means for disengaging the catch from the carriage by the movement of the finger, consisting of the interposed pivoted levers 53 and 55, all substantially in the manner and for the purpose herein set forth.

6. The combination, in a drilling-machine, of the carriage 46, the lateral spring-actuated catch 51, and the detachable, reversible, notched cage-bar secured upon the carriage to be engaged by the catch, substantially in the manner and for the purpose herein set forth.

395,598. STEAM-ACTUATED VALVE.

THOMAS SMALL, Philadelphia, Pa. Filed Aug. 20, 1888. Serial No. 283,304. (No model.)

Claim.—1. The combination of the steam-chest, two stationary pistons secured therein, and a combined slide-valve and cylinder provided with a chamber for each piston, and having inlet and exhaust ports, and the port O, with both a stationary and a movable valve, and an extra steam-port extending from each end of the cylinder, and which slide-valve and cylinder is moved back and forth by the action of the steam between the two pistons, substantially as set forth.

2. The combination of the steam-chest, two stationary pistons secured therein, the combined slide-valve and cylinder, which is moved back and forth between the pistons by the action of the steam, and which is provided with inlet and outlet ports, a stationary valve, which rests upon the top of the slide-valve and cylinder, and a movable valve placed inside of the stationary valve, and which is operated by the movement of the slide-valve and cylinder, substantially as described.

3. The combination of the steam-chest, the two pistons secured thereto, a slide-valve and cylinder provided with the two chambers M, the inlet-ports X, the outlet-ports P, the exhaust-port O, extending through the partition L, the stationary valve S, and the movable valve R, placed in the opening in the valve S, substantially as set forth.

395,594. INK-ERASER.

GEORGE T. SMALLWOOD, Washington, D. C. Filed Mar. 12, 1888. Serial No. 267,014. (No model.)

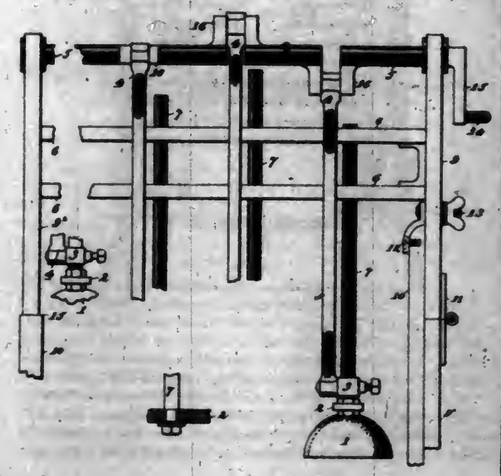
Claim.—1. A burnishing attachment for an eraser formed in one piece and shaped so as to have one part form a clamp to secure it to the eraser and the other part to form a burnisher and extractor, substantially as shown and described.

2. A burnishing attachment for an eraser, shaped substantially as shown, its upper and lower portions serving for an attaching clamp and burnisher, respectively, as and for the purpose set forth.

395,595. WRENCH.

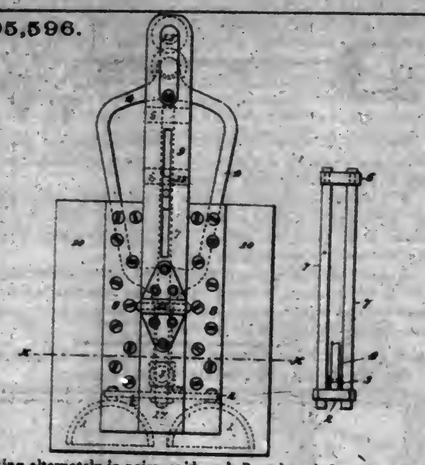
ALBION K. SPAULDING, North Bolgrade, Mo. Filed Apr. 13, 1888. Serial No. 270,562. (No model.)

Claim.—In wrenches, the swiveled handle H, carrying cam *g*, in combination with the loose ratchet E, held against said cam by a spring at its front end and provided with a lug, *e*, at the other end, as and for the purpose specified.



395,596. WASHING-MACHINE.

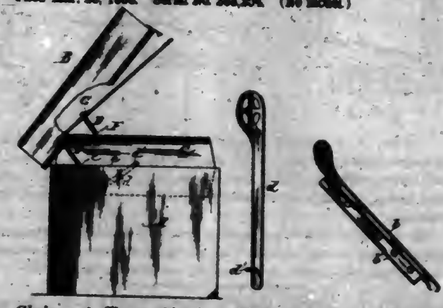
GEORGE J. SQUIRE, Aurora, Ill. Filed Sept. 3, 1887. Serial No. 248,696. (No model.)



Claim.—1. In combination with the box or case, the slotted supports 9 9^a, cleats 8 8, the alternating stamps and crank-shaft upheld by said supports, hinge 11, slotted angle-iron 12, and thumb-screw 13, all substantially as and for the purposes set forth.

2. In a washing-machine, the combination of a tank, a frame hinged at one side of said tank, said hinged frame carrying and supporting the crank-shaft and crank-rods, vertical guide-rods, and a series of inverted cups, the combination serving, upon lifting the frame on its hinge, to lift with it all said devices, substantially as shown, and for the purposes set forth.

3. In combination, the box 10, frame or supports 9 9^a, hinged at 11, crank-shaft 5, cross-pieces 6 6, skeleton rods 4, inverted cups 1,



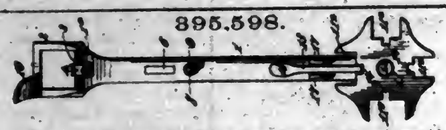
working alternately in pairs, guide-rods 7, and angle-iron 12, all substantially as shown and described.

395,597. TRUNK-FIXTURE.

CHARLES A. TAYLOR, Chicago, Ill. Filed Mar. 23, 1888. Serial No. 268,254. (No model.)

Claim.—1. The combination, with the body of a trunk and lid hinged to the rear upper edge thereof, of a brace, *b*, pivotally secured to the inner wall of the lid near its pivotal point and extending a suitable length, as shown, and having projecting outward a lateral rib or flange which terminates at a point near its end, which flange rests between the meeting edges of the lid and body when said trunk is closed, and the end of which forms a shoulder that rests upon the upper side edge of the body when the lid is open.

2. The combination, in a trunk, of the body part thereof, the lid thereof, and a tray hinged at the back to the rear upper edge of said body, with a brace, *d*, pivotally secured at a suitable point to the side edge of said tray, near the bottom thereof, having a projecting stud near the outer end which rests upon the upper side edge of the body of the trunk, which is provided with a transverse notch to afford a purchase for said stud when said tray is open.

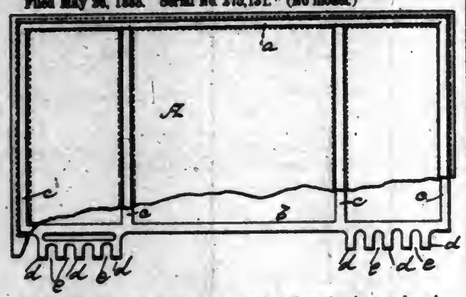


3. The combination, with the body of a trunk, the lid thereof, the tray hinged to the rear upper edge of said body, the lid of said tray hinged to the rear upper edge of said tray, and the knuckle-plate G, secured to the upper surface of said lid next the side edge, of the brace D, having a stud, *f*, projecting laterally and journaled in the knuckles of said plate G, so as to oscillate alongside of said edge of the lid, and having an inwardly-projecting finger, F, which projects inward and rests upon the upper side edge of the tray, so that when the tray-lid is open the gravity of said brace keeps the finger resting upon the adjacent edge of the tray, and when the lid is opened as far as desired maintains it open.

395,598. COMBINATION-TOOL.

ALBERT WAGGONER, Columbus, Ohio, assignor of one-half to William R. Dawson, same place. Filed Apr. 20, 1887. Serial No. 236,480. (No model.)

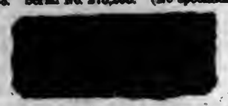
395,598.



Claim.—1. A wrench having one or more sockets and provided with a wiper consisting of a plate of rubber set in or mounted on the shank or handle, substantially as described.

2. A wrench having one or more sockets and provided with a wiper consisting of a plate of suitably-vulcanized rubber set in or mounted on the shank and having a rigid supporting-plate lying on one side thereof, substantially as described.

3. A wrench having one or more sockets and provided with the knife 10, for detaching hardened oil from the axle-spindle, and the spindle-cleaning wiper 6, composed of a rubber plate set in or mounted on the shank, substantially as described.



395,599. VEHICLE-DASH. ALBERT WAGGONER, Columbus, Ohio. Filed May 26, 1888. Serial No. 275,131. (No model.)

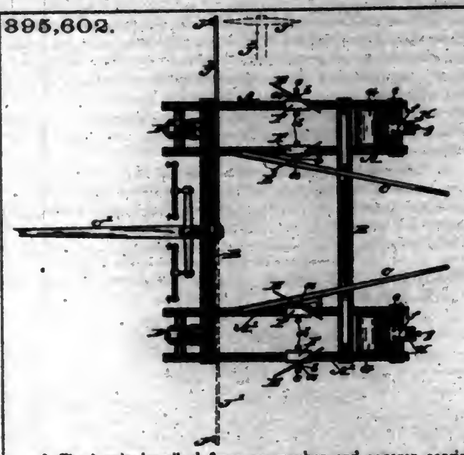
Claim.—1. A vehicle-dash provided with projections or lugs having spaces between them, as at *c*, and said spaces open at one end, in combination with the bolt *f*, having the nut A, and L-shaped perforated iron *g*, substantially as described, for securing the dash to the vehicle.

2. A vehicle dash-board having open slots formed by projecting lugs or fingers, in combination with the fastening-bolt and L-shaped iron, substantially as described, and for the purpose set forth.

395,600. DENTAL RUBBER. GILBERT WALKER, London, England. Filed May 8, 1888. Serial No. 273,236. (No specimens.)

Claim.—As a new article of manufacture, a variegated vulcanizable compound for artificial dentures, composed of variously-colored rubber finely comminuted and commingled, whereby the natural gum of the human mouth may be closely imitated in the vulcanized dentures, substantially as set forth.

395,601. ARTIFICIAL DENTURE. GILBERT WALKER, London, England. Filed July 5, 1888. Serial No. 279,066. (No model.)

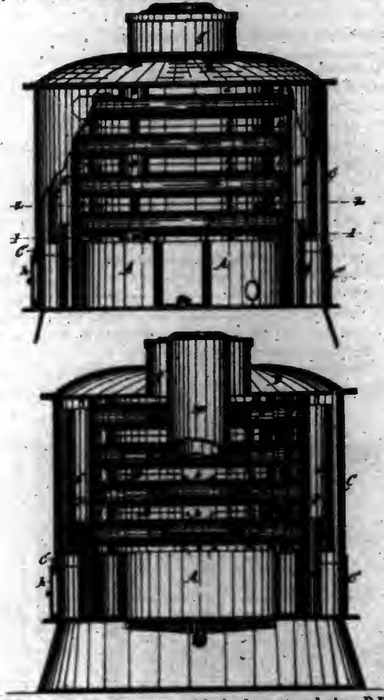


Claim.—An artificial denture the gum portion of which is of variegated vulcanized rubber in imitation of the natural gum of the human mouth, substantially as described.

395,602. FURROWER, MARKER, AND COVERER. JEREMIAH S. WATSON, Yorktown, and CHARLES S. ABERNETHY, Elmer, N. J. Filed May 3, 1888. Serial No. 272,675. (No model.)

Claim.—1. The herein-described combined furrower, marker, and coverer, consisting of the two connected frames, said frames having guiding-wheels in their forward ends, furrowers in their rear ends, and coverers intermediate of the said guiding-wheels and furrowers, the coverers being capable of a vertical and horizontal adjustment on the frames, substantially as described.

2. In a combined furrower, marker, and coverer, a frame having a pair of coverers each of which is vertically and horizontally adjustable, a roller in the rear of said coverers for smoothing or rolling the land after the coverers have thrown the same in the furrows, substantially as described.



395,602.

3. The herein-described furrower, marker, and coverer, consisting of two connected frames carrying the guiding-wheels, vertically and horizontally adjustable coverers, land-rollers, furrowers, and the marker pivoted to one of the connecting-beams, all arranged and adapted to serve in the manner and for the purpose described.

4. In a combined furrower, marker, and coverer, a frame having parallel bars, a beveled roller between the forward ends of said bars, coverers adjustably connected with said bars, a land-roller journaled in said bars in the rear of the coverer, and a furrower behind said roller, said parts being combined substantially as described.

395,603. BOILER. CORTON WHEAT, Geneva, N. Y. Filed July 14, 1887. Serial No. 244,347. (No model.)

Claim.—1. In combination with the fire-pot and pipes P P P, the walls *a a*, provided with ports *b b*, the annular flues *c c*, formed between the pipes outside of the walls *a a*, ports *b' b'*, leading from the said flues, the case C, inclosing the aforesaid parts, and the exit-flue *f*, extended from said case, substantially as described and shown.

2. In combination with the hollow fire-pot shell and pipes P P P, the supporting-walls *a a*, provided with ports *b b*, separate annular flues *c c*, formed between the pipes outside of the walls *a a*, ports *b' b'*, leading from said flues, baffle-plates surrounding the flues *c c*, the case C, surrounding the baffle-plates, and the exit-flue *f*, extended from the case, substantially as described and shown.

3. In combination with the hollow fire-pot shell and inclosing-case C, the annular water-pipes P P, of different circumferences and arranged concentric over the fire-pot, pipes O O, connecting the pipes P P with each other and with the fire-pot shell, radial pipes *p p*, connecting the smaller with the larger annular pipes, and the magazine *m*, arranged concentric in the smaller pipes, P', and formed separate from said pipes, substantially as described and shown.

4. In combination with the hollow fire-pot shell A and inclosing-case C, the water-pipes P P, walls *a a*, interposed between said pipes, the dome D, pipes O O O, connecting the pipes P P with each other and with the fire-pot shell and dome, the flue *g*, extending vertically through the center of the dome, the magazine *m*, extending through said flue, and the direct exit-flue *f'*, extended from the flue *g*, substantially as described and shown.

5. In combination with the hollow fire-pot shell A and inclosing-case C, the pipes P P, arranged one above the other, the dome D, pipes O O, connecting the said pipes with each other and with the fire-pot shell and dome, the walls *a a*, interposed between the pipes P P and provided with ports *b b*, and separate flues *c c* between the pipes and provided with the ports *b' b'* diametrically opposite the ports *b b*, substantially as described and shown.

6. In combination with the hollow fire-pot shell A and inclosing-case C, the pipes P P, arranged one above the other, the dome D, pipes O O, connecting the said pipes with the fire-pot shell and dome, walls *a a*, interposed between the pipes P P and provided with ports *b b*, separate flues *c c* between the pipes P P, outside of the walls *a a*, and provided with ports *b' b'* diametrically opposite the ports *b b*, and the baffle-plates *d d'* between the flues *c c* and case C, substantially as described and shown.

7. In combination with the hollow fire-pot shell A and inclosing-case C, the water-pipes P P and P' P', of different circumferences and arranged concentric over the fire-pot, radial pipes *p p*, vertical pipes O O, dome D, flue *g*, extending vertically through the dome, the magazine *m*, separate from the pipes P' P' and extending through the flue *g*, walls *a a* between the pipes P P and provided with ports *b b*, separate flues *c c* between the pipes at the outside of the aforesaid walls and provided with the ports *b' b'* diametrically opposite the ports *b b*, the exit-flue *f*, provided with the damper *i*, and the direct exit-flue *f'*, extended from the flue *g* to the flue *f* and provided with the damper *n*, substantially as described and shown.

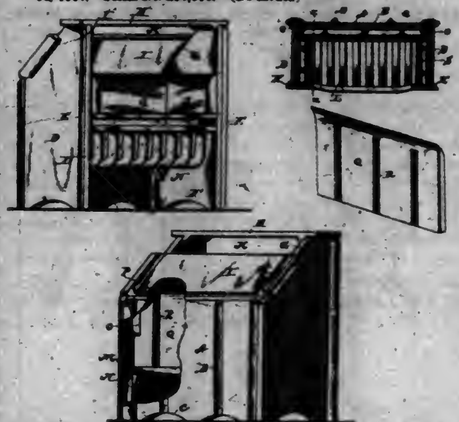
8. The combination, with the horizontal pipes P P and vertical pipes O O, connecting said horizontal pipes, of the partitions *t t*, extending through the pipes O O and across the pipes P P, substantially as described and shown.

9. The combination of the horizontal pipes P P, arranged one above the other, the vertical pipes O O, connecting the horizontal pipes alternately at diametrically-opposite points, and partitions *t t*, extending through the vertical pipes and across the horizontal pipes, substantially as and for the purpose set forth.

10. In combination with the fire-pot A, pipes P P, and flues *c c* around said pipes, the case C, having the base C', provided with the door A, and the baffle-plate *d*, adapted to be lifted from the bottom of the case, substantially as and for the purpose set forth.

395,604. DENTAL PLUGGER. JOHN D. WILKES, New York, N. Y. Filed July 12, 1888. Serial No. 279,760. (No model.)

Claim.—1. The combination, in a dental plugger, of the handle, the plunger-rod playing longitudinally in said handle and having a lateral transverse slot in its upper end, the sleeve or nut adjustable longitudinally upon said rod, the controlling-pin, and the wheel journaled in the upper end of the handle and carrying an actuating-pin to engage the slotted end of the plunger-rod, substantially in the manner and for the purpose herein set forth.

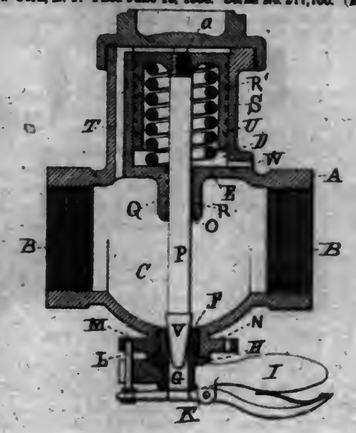


2. The combination, in a dental plugger, of the handle, the longitudinally-reciprocating plunger-rod fitted therein, the wheel journaled in the upper end of the handle and actuating said rod, substantially as set forth, the spindle carrying said wheel having a conical bearing at its inner end within the handle, the conical washer encircling the outer end of the spindle to fit in a counterpart seat formed on the outside of the handle, and a nut screwing upon the spindle to bear against said washer, all substantially in the manner and for the purpose herein set forth.

395,605. METHOD OF MANUFACTURING PLANISHED SHEET-IRON. WATERS D. WOOD, Pittsburg, Pa. Filed Nov. 15, 1883. Serial No. 260,950. (No specimens.)

Claim.—1. As a step in the method of manufacturing planished sheet-iron, applying to the sheet a deoxidizing-gas intermediate between the withdrawal of the sheet from the preliminary deoxidizing operation and the application thereto of an oxidizing agent, substantially as set forth.

2. As a step in the method of manufacturing planished sheet-iron, applying hydrogen or other gas containing a considerable proportion of hydrogen to the surfaces of the sheet intermediate between the preliminary deoxidizing operation and the application thereto of an oxidizing agent, substantially as set forth.

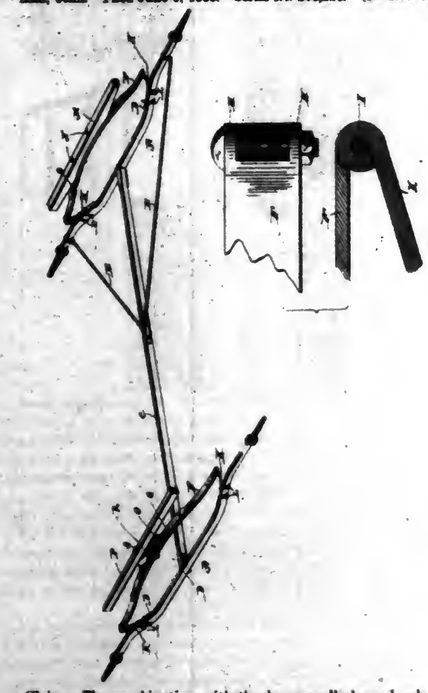


395,606. GRATE. LEWIS P. WOODS, Blairsville, Pa. Filed Dec. 14, 1887. Serial No. 257,893. (No model.)

Claim.—1. The combination of the rear piece having vertical ribs or projections, the side pieces each provided with an inclined upper portion terminating in a squared-off or horizontal surface and having edge ribs or strips, the horizontal top piece secured to the squared-off portions of the side pieces and having extending ends, and the inclined top piece provided with strips, the ends of said inclined piece extending beyond the side pieces and formed or provided with downward flanges engaging therewith, said inclined top piece being also of a width less than the width of the inclined portions of said side pieces, whereby a space or smoke-outlet is formed between the upper edge of said inclined piece and the rear edge of the horizontal top piece.

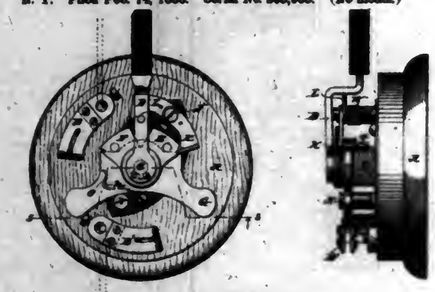
2. The combination of the frame having the vertical outer strips or ribs, the rear fire-plate having a curved upper edge and provided with vertical ribs or strips upon its rear surface, the side fire-plates having the upper parts of their rear edges curved, their outer or front edges provided with steps or shoulders, their upper edges curved outward and their rear surfaces provided with vertical strips or ribs, the corner-strips, and the cross-strip having the ends thereof resting upon the tops of said corner-strips.

395,607. DRAIN-VALVE FOR STEAM-PIPES. JAMES C. BAYLIS, New York, N. Y. Filed June 18, 1888. Serial No. 277,700. (No model.)



Claim.—1. In a drain-valve for steam-pipes, the combination, with the shell A, provided with the port-openings B and waste-opening F, of the means for controlling the area of the waste-opening, consisting of the diaphragm E, piston S, spring U, and stem P, substantially as set forth.

2. The combination, in a drain-valve for steam-pipes, with the shell A, provided with the port-openings B B and waste-opening F, of the means for adjusting the area of the waste-opening, consisting of the adjustable thimble G.



3. A drain-valve for steam-pipes, consisting of a shell or body having opposite port-openings in the sides thereof, a drip-opening in the lower portion of the body of said valve, and a device for controlling the area of the drip-opening actuated by the differential action of a spring and the pressure of the steam transmitted through the valve, substantially as described.

395,608. VEHICLE-SPRING. GEORGE H. BLAKEMAN, Birmingham, Conn. Filed June 6, 1888. Serial No. 276,226. (No model.)

Claim.—The combination, with the downwardly-bowed axle and the semi-elliptical springs F, of the short straight springs having their outer ends hinged to the ends of the semi-elliptical spring and their inner ends secured to the axle, the intermediate portions of said springs resting on the inclined portions of the axle, as specified.

395,609. ELECTRICAL SWITCH. PAUL H. BRADEN, Newark, N. J., assignor to the United States Electric Lighting Company, New York, N. Y. Filed Feb. 14, 1888. Serial No. 263,965. (No model.)

Claim.—1. The combination, with the pivoted contact-plate of an electric switch, of a spindle about which the plate turns, two spring-actuated parts adapted to encounter the plate on opposite sides of its fulcrum, detents for engaging with and locking the said pivots in a state of tension, and a handle or key adapted when turned to force the spring-actuated parts into position to engage with the detents and to release the detents from such engagement alternately, as set forth.

2. The combination, with the shifting contact plate or lever, of two spring-actuated arms adapted to bear upon or encounter said lever upon opposite sides of its fulcrum, detents in position to engage with and restrain the said arms, and a lever or handle for alternately shifting or turning the arms against the tension of their actuating-springs into a position to engage with the detent and to release them from such engagement, as set forth.

3. The combination, with a spindle and a contact plate or lever mounted loosely thereon, of two spring-actuated arms secured with lost motion to the spindle and adapted to encounter the contact lever on opposite sides of its fulcrum, and detents for restraining the arms placed in the path of the handle or key that turns the spindle where a given movement of said handle will release the detents from engagement with the spring-actuated arms, as set forth.

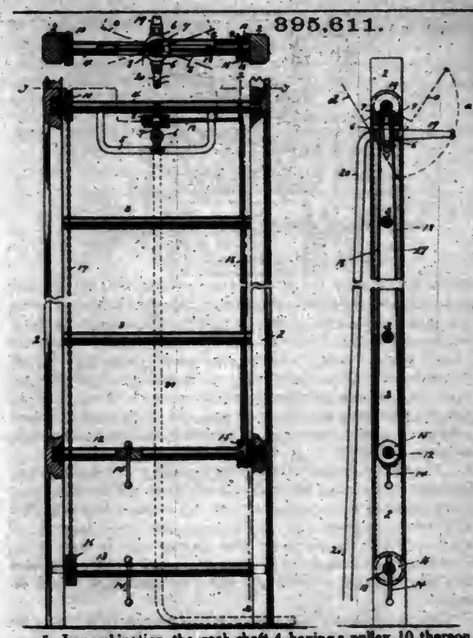
4. The combination, with a spindle and a contact lever or plate mounted loosely thereon, of two arms secured to the spindle, but with a lost motion around the same, and adapted to encounter the contact-lever, a spiral or coiled spring surrounding the spindle and having its ends connected to the two arms, respectively, detents for engaging and restraining the arms, and a handle or lever adapted to turn said arms into position to engage with the detents and to release the detents from such engagement alternately, as set forth.

5. The combination, with the spindle, a contact-plate turning loosely thereon, and a handle or lever for turning the spindle, of two arms capable of a limited lost motion around the spindle, a spiral spring surrounding the spindle, with its ends connected to pins set in said arms, that are adapted to encounter the contact-lever on opposite sides of the fulcrum, and two spring-detents for engaging with the arms, and a pin on the operating handle or lever adapted to force back or release either of said detents when caused to bear thereon.

395,610. REACH-CONNECTION FOR VEHICLES. JOHN H. BROWN, New London, Conn. Filed Mar. 17, 1888. Serial No. 267,447. (No model.)

Claim.—In combination with an axle and reach, an upper and lower plate secured to said reach and projecting outward to the axle, as set forth, an intervening washer-arm engaging the axle, a king-bolt passing through said upper, lower, and washer plates and the axle, and a spring located between the free ends of the said lower and washer plates, substantially as described, and for the purpose specified.

395,611. DEVICE FOR SUPPORTING AND GIVING VIBRATING MOTION TO HOSE-PIPES. HARRY C. COLLINS, Springfield, Mass. Filed Apr. 23, 1888. Serial No. 271,533. (No model.)



Claim.—1. Devices for supporting and imparting vertical and horizontal vibratory motions to a hose-pipe, consisting of a horizontal rock-shaft, 4, having an auxiliary shaft, 7, supported thereon at right angles to the axis of said rock-shaft, a hose-pipe attached to said auxiliary shaft, a movable frame, substantially as described, in which said horizontal shaft is supported, and two other rock-shafts, 12 and 13, supported in said frame having cord-connections, substantially as described, respectively with said auxiliary shaft and said shaft 4, whereby the hose-pipe-supporting shafts 4 and 7 have rocking motions in horizontal and vertical planes imparted thereto, combined and operating substantially as set forth.

2. The horizontal rock-shaft 4, provided with a pulley, 10, and having an auxiliary shaft, 7, supported thereon at right angles to the axis of said rock-shaft, a hose-pipe attached to said auxiliary shaft, a frame, substantially as described, in which said horizontal shaft is supported, and a pending cord or chain connected with said pulley, combined and operating substantially as described.

3. The horizontal shaft 4, having an auxiliary shaft, 7, having a pulley, 8, thereon, supported on said shaft 4 at right angles thereto, a hose-pipe attached to said auxiliary shaft, a frame, substantially as described, in which said horizontal shaft is supported, and a cord connected with said pulley 8, combined and operating substantially as set forth.

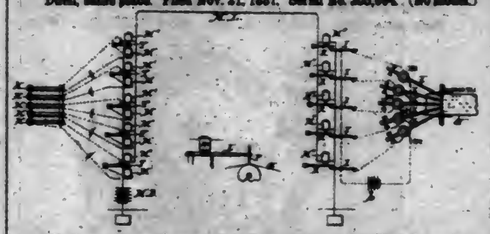
4. In combination, the rock-shaft 4, having a pulley, 10, thereon, the shaft 7, supported on said rock-shaft and having a pulley, 8, thereon, the tube 6, rigidly attached to said shaft 7 and having its ends screw-threaded, a frame, substantially as described, in which said rock-shaft is supported, and the two rock-shafts 12 and 13, having bearings in said frame and cord-and-pulley connections, substantially as described, with said shafts 4 and 7, substantially as set forth.

395,611.

5. In combination, the rock-shaft 4, having a pulley, 10, thereon, the shaft 7, supported on said rock-shaft and having a pulley, 8, thereon, the tube 6, rigidly attached to said shaft 7 and having its ends screw-threaded, a hose-pipe and a hose connected to the opposite ends of said tube, a frame, substantially as described, in which said rock-shaft is supported, and the two rock-shafts 12 and 13, having bearings in said frame and cord-and-pulley connections, substantially as described, with said shafts 4 and 7, substantially as set forth.

6. The horizontal rock-shaft 4, the auxiliary shaft 7, supported on said horizontal shaft at right angles thereto, a hose-pipe attached to said auxiliary shaft, and a frame, substantially as described, in which said horizontal shaft is supported, combined and operating substantially as set forth.

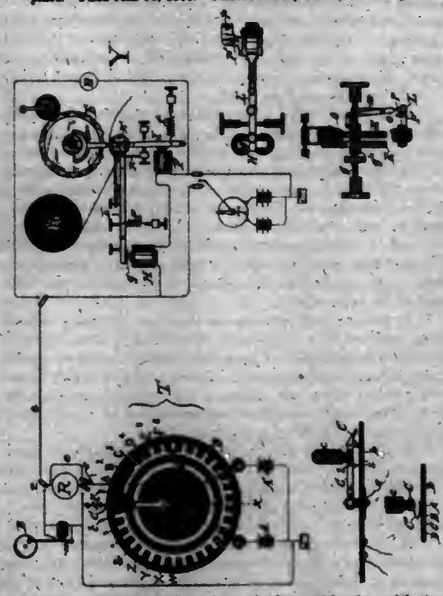
395,612. DECOY. SETH CURLER, Union City, Tenn. Filed Oct. 17, 1888. Serial No. 288,237. (No model.)



Claim.—1. A decoy comprising a buoyant collapsible body and a metallic air-valve depending from the middle of the body on the under side thereof, and having at an intermediate point of its length an exteriorly-accessible turning plug, the weight of said valve serving as a counter-balance to the buoyant body, substantially as and for the purpose set forth.

2. A decoy comprising a hollow collapsible body having at the middle of its under side a depending nozzle, E, made integral therewith, and a metallic air-valve detachably inserted in said nozzle and having a turning plug at a point below said nozzle, substantially as described.

3. A decoy comprising a hollow collapsible body having a nozzle depending from the under side thereof, a metallic air-valve having a flared upper end inserted in said nozzle, and a fastening for detachably connecting the air-valve to the nozzle, said air-valve also having a turning plug located in its longitudinal bore or passage *f'* at a point below the nozzle and accessible at all times, substantially as described.

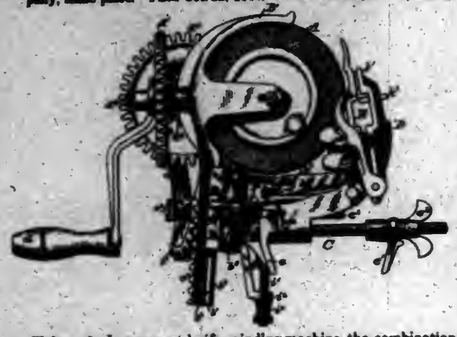


4. In a decoy, a buoyant body having means for inflating the same with air, a line connected to the body and having an anchor at its lower end for preventing dislodgment of said body, and a series of anchor-weights detachably connected to said line at suitable intervals to submerge the buoyant body to a greater or less degree, according to the number of anchor-weights employed, substantially as described.

395,613. ELECTRO-HARMONIC TELEGRAPHY. MARK W. DEWEY, Syracuse, N. Y., assignor of two-thirds to Emil Lasan and Charles H. Doell, same place. Filed Nov. 21, 1887. Serial No. 255,994. (No model.)

Claim.—In an electro-harmonic system, a plurality of manipulative transmitters arranged to be operated either separately or two or more simultaneously by one person, and a corresponding number of printers or markers actuated, respectively, by the aforesaid transmitters and arranged at right angles to the line of travel of the paper, and to produce by the simultaneous action of two or more of said printers or markers a corresponding number of marks in a row at right angles to the travel of the paper, and the row of marks so disposed representing a letter or character, as set forth.

395,614. PRINTING-TELEGRAPH. MARK W. DEWEY, Syracuse, N. Y., assignor of two-thirds to Emil Lasan and Charles H. Doell, same place. Filed Jan. 30, 1888. Serial No. 262,267. (No model.)



Claim.—1. In a printing-telegraph, the combination, with the recording or receiving instrument, of the transmitting-instrument, consisting of two concentric insulated annuli, one having a series of equidistant contact-points and the other being continuous, and a rotating key having contact-points adapted to be brought into contact with the respective annuli to transmit currents of different strength to the type-wheel-operating mechanism and the printing-lever, respectively, through suitable electrical connections and batteries, substantially as specified.

2. The transmitting-instrument consisting of two concentric insulated annuli, one having a series of interrupted contact-points and the other being continuous, in combination with a rotating and vibrating lever and proper electrical connections, whereby intermittent pulsations of different strength may be sent to the receiving-instrument when the transmitting and receiving instrument are electrically connected, substantially as specified.

3. The combination, with the printing-lever L and pivoted shaft *g*, of the laterally-movable type-wheels E E, connected to the said

shaft by groove and feather, the arm *m*, projecting from said shaft, the lever *o*, pivoted to said arm and connected at one end with the type-wheels, and the cams *p p'*, projecting from the printing-lever, one back of the other in the direction of the length of said lever and adapted to engage the free end of the lever *o* at opposite sides thereof, substantially as described and shown.

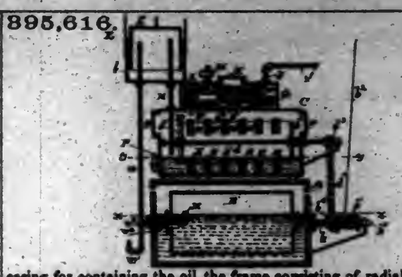
395,615. MACHINE FOR GRINDING MOWER-KNIVES. ROYAL DUTTON, New York, N. Y., assignor to the Mower Knife Grinder Company, same place. Filed Oct. 22, 1887. Serial No. 253,077. (Model.)

Claim.—1. In a mower-knife-grinding machine, the combination, substantially as hereinbefore described, of a flat-faced grinding-wheel, a knife-clamp, a knife-clamp frame, and a grinding-wheel frame, said frames being pivotally coupled with relation to each other to provide for lateral swinging adjustment, and said grinding-wheel frame being composed of two parts, one serving as an arm in which the wheel is mounted and sliding in said other part or base portion of said frame, a driving-crank mounted on a pivot on said arm portion of the frame at right angles to the axis of the grinding-wheel, and gearing, also mounted on said arm portion of the frame, for rotatively coupling said crank with the grinding-wheel.

2. In a mower-knife-grinding machine, a flat-faced grinding-wheel, a pivoted knife-clamp normally inclined toward the grinding-face of said wheel, a spring forcing said clamp toward the grinding-surface, and a sliding frame carrying said wheel and mounted in guide-bearings which are inclined toward said knife-clamp, substantially as described, whereby as the grinding-wheel is lifted by the sliding movement of its frame it will also be advanced toward a knife held in said clamp, and by forcing the latter rearward increase the force of said spring, and thus enable the tips of a knife-edge to be ground under abrasive pressure equal to that afforded while grinding the lower portion of the same edge.

3. In a mower-knife-grinding machine, the combination, substantially as described, of a knife-clamp, its frame, a flat-faced grinding-wheel and its frame, the latter being constructed in two parts, one sliding upon the other, a driving-crank standing at right angles to the axis of the grinding-wheel and coupled to said wheel by gearing, and a lever for lifting and lowering that portion of the wheel-frame in which said grinding-wheel is directly mounted.

4. In a mower-knife-grinding machine, the combination of a knife-clamp and a flat-faced grinding-wheel, both mounted in frames which are pivotally connected to admit of lateral swinging adjustment, stops for restricting said pivotal movement, and latches which confine or lock said stops when in position for service, substantially as described.



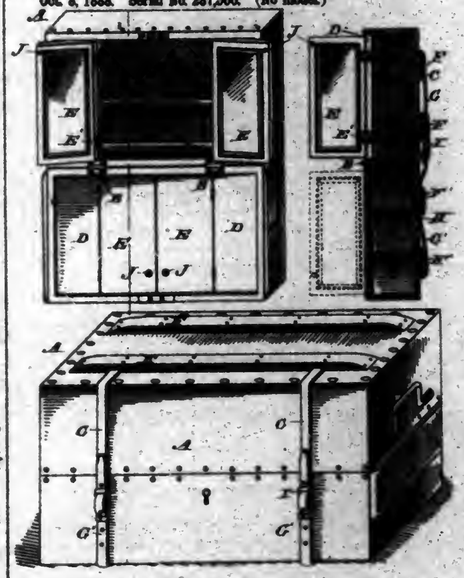
5. In a mower-knife-grinding machine, the combination, with the grinding-wheel, of a detachable wheel-frame arm in which said wheel is mounted, a hand-crank standing at right angles to the axis of the wheel and mounted on a stud projecting from said frame at the rear of said wheel, and gearing, also mounted on studs projecting from said frame, for coupling the crank with the grinding-wheel, substantially as described.

6. The combination, substantially as described, of the knife-clamp, the grinding-wheel, the sliding wheel-frame arm provided with a tail-piece having a rack-gear thereon, and a hand-lever having a segmental gear engaging with said rack-gear for lifting and lowering said grinding-wheel while its face is in contact with a mower-knife held in said clamp.

7. The combination of the wheel-frame arm having a flat tail-piece provided with a central spine or web and the wheel-frame base provided with a central vertical groove for receiving said web, and also provided with guide-bearings for receiving the two edges of said tail-piece, substantially as described.

395,616. CARBURETOR. HOSE J. DYER, Berkeley, Cal. Filed Nov. 5, 1887. Serial No. 254,430. (No model.)

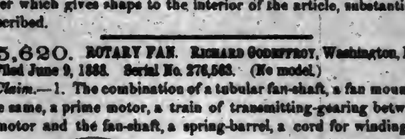
Claim.—1. In a carburetor, the combination of the cylindrical



casing for containing the oil, the frame consisting of radial end arms and horizontal removably-secured wires, the wicks within the casing and suspended from said wires, power mechanism to rotate the frame, the air-pump, and the intervening aerometer or regulator connected with oil-casing, the feed-casing for oil, containing absorbent material mounted on top of the oil-casing and communicating therewith through apertures, said casing conforming to the curvature of the oil-casing, whereby depressions are formed in each side of the base of the feed-casing and on each side of the communicating apertures, substantially as herein described.

2. In a carburetor, the casing for containing the oil and having hand-holes for reaching its interior, the air-pump, and the intervening aerometer or regulator connected with the oil-casing, in combination with frame mounted within the oil-casing, said frame consisting of arms and removable peripheral wires hooked into the arms, power mechanism for rotating the frame, and strips of wicking suspended from the peripheral wires of said frame, substantially as herein described.

3. In a carburetor, the combination of the cylindrical casing for the oil, the frame consisting of radial end arms and horizontal removably-secured wires, with their suspended wicks, means for rotating said frame, the air-pump, and connected aerometer or regulator, the casing for feeding the oil, said feed-casing containing absorbent material and conforming to the curvature of the oil-casing, whereby depressions are formed on each side of the communicating apertures, an inlet-pipe for feeding the oil to the feed-casing, and a deflecting-plate under the inlet-pipe for directing the oil primarily into the depressions of the feed-casing, substantially as described.



4. A carburetor comprising an air-pump consisting of a casing for water and inclosed rotary cylinder, a carbureting-chamber mounted on the air-pump and consisting of a casing for oil and airand inclosed rotary wick-carrying frame, a feed-casing mounted on the carbureting-casing and packed with absorbent material, said feed-casing communicating with the oil and air casing and having an oil-inlet pipe and a carbureted-air exit-pipe, and an aerometer or regulator above the feed-casing and connected with the air-pump and with the oil and air casing, substantially as described.

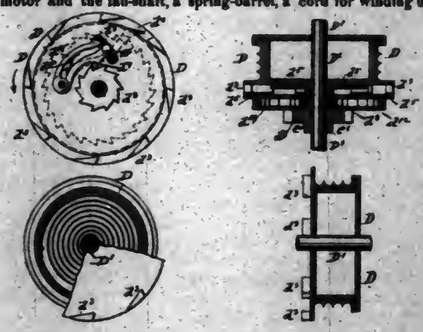
395,617. TRUNK. MINERVA J. EATON, Hot Springs, Dak. Filed Oct. 3, 1888. Serial No. 287,500. (No model.)

Claim.—In a convertible trunk made in two parts hinged together, the combination in each part of the longitudinal partitions C C, the transverse frame-pieces D D, and the doors hinged to the transverse pieces, with the bumpers J J, for holding the doors shut when closed, substantially as set forth.

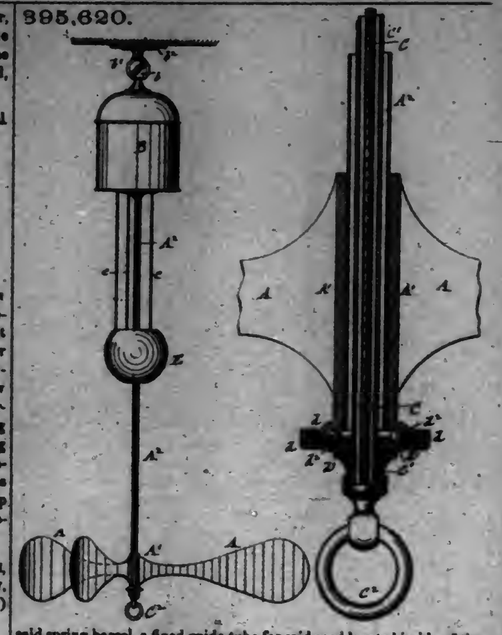
395,618. CORK-EXTRACTOR. GEORGE HOWARD, Berkeley, Cal. Filed May 12, 1888. Serial No. 273,722. (Model.)

Claim.—An improved cork-extractor consisting of a frame or stock having an annular foot and a tubular top with notches, a tubular power-screw carried in the top and having a free linear movement therein, said screw having a top disk, a corkscrew the twist or thread of which is the reverse of that of the power-screw, said cork-screw having a stem passing freely through the tubular power-screw and provided with a head-flange fitting in the top disk of said power-screw, the pawl or catch-bar in the top disk and having projecting ends, and the notches in the stem-head flange, the handle-cap fitting over the top disk and engaging the projecting ends of the catch-bar, and the nut seated on the power-screw and having projections or teeth, whereby it is detachably connected with the notched top of the frame or stock, substantially as and for the purpose herein described.

395,619. HORIZONTALLY-DIVIDED DIE. JOHN A. FURMAN, Newark, N. J., assignor of one-half to the Celluloid Novelty Company, New York, N. Y. Filed Sept. 20, 1886. Serial No. 214,531. (No model.)



Claim.—1. In a horizontally-divided die for molding a number of hollow articles simultaneously, a bottom plate having a number of recesses therein adapted to give shape to the exterior of the lower portions of the articles and a central plate having a number of apertures corresponding in position with the recesses in the lower plate and adapted to give shape to the exterior of the upper portions of the articles, said plates being horizontally separable from each other, in combination with a top plate carrying plungers corresponding with the said recesses and apertures and adapted to give shape to the interior of the hollow articles, substantially as described.

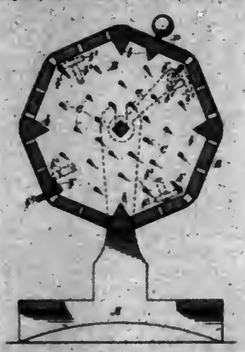


2. A die for giving shape to the exterior of hollow articles, consisting of a bottom plate having a recess therein enlarged at its upper portion and a central plate adapted to fit upon and be united to the bottom plate and having an aperture corresponding in position with the recess in the bottom plate enlarged at its lower portion, whereby the article formed is thickened or enlarged on the line of division between said plates, in combination with a plate carrying a plunger which gives shape to the interior of the article, substantially as described.

395,620. ROTARY FAN. RICHARD GODFFROY, Washington, D. C. Filed June 9, 1888. Serial No. 276,563. (No model.)

Claim.—1. The combination of a tubular fan-shaft, a fan mounted on the same, a prime motor, a train of transmitting-gearing between said motor and the fan-shaft, a spring-barrel, a cord for winding up

395,620.



said spring-barrel, a fixed guide-tube for said cord located inside of the tubular fan-shaft, and a pawl-and-ratchet mechanism between the spring-barrel and train of gearing for winding up the spring-barrel and motor, whereby the latter is either wound up or released for actuating the clock-train and fan-shaft, substantially as set forth.

2. The combination of a tubular fan-shaft, a fan mounted on the same, a prime motor, a train of gear-wheels between said motor and the fan-shaft, a winding-up spring-barrel, a cord for winding up said barrel, a fixed guide-tube for said cord located inside of the tubular fan-shaft, an anti-friction bearing for the fan-shaft at the lower end of the guide-tube, a second anti-friction bearing for the upper end of the fan-shaft, and a pawl-and-ratchet mechanism between the spring-barrel and motor-barrel, substantially as set forth.

3. The combination of a supporting-frame having fixed sleeves, a guide-tube secured to said sleeves, a tubular fan-shaft inclosing said guide-tube, a fan mounted on said fan-shaft, a prime motor, an intermediate train of gear-wheels between said motor and the fan-shaft, a spring-barrel, a cord for winding up said spring-barrel, said cord being passed through the guide-tube and attached to the spring-barrel, and a pawl-and-ratchet mechanism between the spring-barrel and motor-barrel, substantially as set forth.

395,621. DRIED-FRUIT CLEANER. JOHN HARRELL, Plymouth, Cal. Filed May 31, 1888. Serial No. 275,651. (No model.)

Claim.—An improved fruit-cleaning machine consisting of a rotary hollow drum formed of separated or spaced slats, some of which are triangular in cross-section, forming buckets or elevators, the movable flat strips *b'*, forming other buckets or elevators, each provided with a crank and holding mechanism, and the yielding wires throughout the whole interior of the drum, for removing the fuzz as the fruit passes between them, as herein described.

395,622. DYNAMO-ELECTRIC MACHINE. JOHN F. KELLY, New York, N. Y., assignor to the United States Electric Lighting Company, same place. Filed July 25, 1888. Serial No. 280,962. (No model.)

Claim.—1. In an electrical generator, the combination, with an armature-core and conductors wound longitudinally thereon, of fan-blades at the end of the core and constructed or placed in such relation to the core as to create a current of air along or over the exterior of the core and coils when the armature is rotated, as set forth.

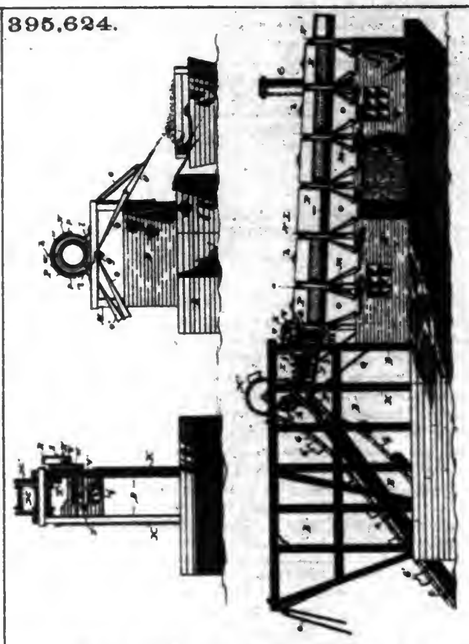
2. In an electrical generator, the combination, with field-magnets and a cylindrical armature-core with longitudinally-wound conductors thereon and mounted to rotate between said magnets, of fan-blades secured to the ends of the armature and constructed or placed in such relation thereto as to create a current of air along or over the exterior of the core and coils when the armature is rotated, as set forth.

395,623. THEATRICAL APPLIANCE. JOHN T. KILHAM, Lowville, N. Y. Filed June 15, 1888. Serial No. 277,187. (No model.)

Claim.—1. A scene composed of sets of interchangeable reversible sections, substantially as described.

2. A scene composed of interchangeable reversible hinged sections, substantially as and for the purpose described.

3. A scene composed of sets of interchangeable sections, the sections of one set constructed to alternately hide and expose those of the other set, and the whole adapted to be reversed to expose the opposite side of said sections, substantially as described.



395,624. APPARATUS FOR DREDGING, WASHING, AND SEPARATING SAND AND GRAVEL. JAMES M. MILLER, Washington, D. C. Filed Mar. 31, 1888. Serial No. 269,092. (No model.)

Claim.—1. The combination, with a barge, of a dredge, a washer into which the dredge empties the dredged material, means, substantially as described, for supplying clear water to the washer, a revoluble screen in communication with the washer, and mechanism for operating the dredge, the washer, and the screen, as set forth.

2. The combination, with a barge provided with a cabin, of a dredge located at one end of the barge, a washer into which the dredge empties the dredged material, means, substantially as described, for supplying clear water to the washer, a revoluble screen mounted longitudinally of the barge above the cabin and in communication with the washer, aprons inclined outwardly and downwardly from underneath the screen and supported by the cabin, and mechanism for operating the dredge, the washer, and the screen, as set forth.

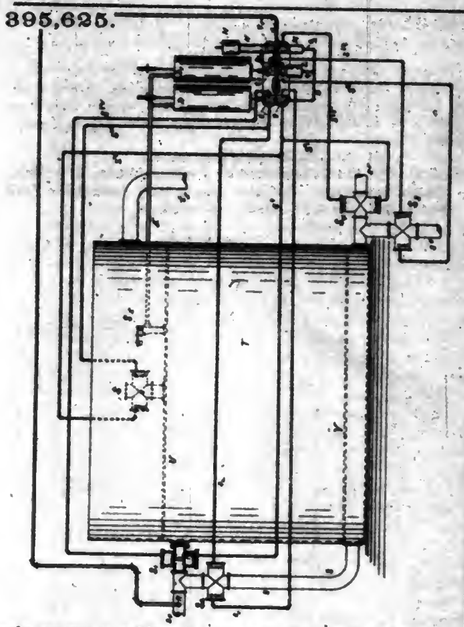
3. The combination, with a barge and a dredge and revoluble screen mounted on the barge, of a washer located between the dredge and screen, so as to receive the dredged material from the former and empty it into the latter, said washer consisting of a box having a

395,624.

concave inclined bottom, and an agitator-shaft mounted in a horizontal plane in said box and provided with a series of blades of various lengths reaching to near the inclined bottom of the box, pipes for supplying clear water to the washer, and mechanism for operating the dredge, the washer, and the screen, substantially as described.

4. The combination, with the barge and a dredge and revoluble screen mounted on the barge, of a washer located between the dredge and screen, so as to receive the dredged material from the former and empty it into the latter, said washer consisting of a box having a concave inclined bottom, and an agitator-shaft mounted in a horizontal plane longitudinally in said box and provided with rearwardly-curved blades of unequal lengths reaching to near the inclined bottom of the box, pipes for supplying clear water to the washer, and mechanism for operating the dredge, the washer, and the screen, substantially as described.

5. The combination, with the revoluble screen and downwardly and outwardly inclined aprons secured underneath the same on each side, of swinging deflectors adapted to be swung to either side of the screen for the purpose of deflecting the screened material onto either one of the aprons, as desired, substantially as described.



395,625. FILTER AND APPARATUS FOR AUTOMATICALLY CLEANING THE SAME. GEORGE H. MOORE, Norwich, Conn. Filed June 17, 1887. Renewed Dec. 5, 1888. Serial No. 292,756. (No model.)

Claim.—1. The combination, with a filter, of a primary valve governing one of the inlet or outlet openings thereof, said valve being operated by fluid or liquid under pressure, a conduit leading from a primary source of fluid or liquid under pressure to said valve, a secondary valve operated by gravity located in said conduit, and a pipe connecting the filter with said secondary valve, whereby the weight of water expelled from the filter through said pipe will operate said secondary valve to govern the admission of the fluid or liquid under pressure to said primary valve, substantially in the manner set forth.

2. The combination, with a filter having one of its inlet or outlet openings governed by a primary valve operated by fluid or liquid under pressure, of a reservoir, conduits connecting said reservoir with a primary source of fluid or liquid under pressure and with said valve, a secondary valve located in the conduit connecting said reservoir with the primary source of fluid or liquid under pressure, a pipe connecting said secondary valve with the filter, whereby said valve is operated by liquid expelled from the filter in one direction and a weight for operating said secondary valve in the opposite direction, arranged and operating substantially as and for the purpose described.

3. In combination with a filter, a primary valve comprising oppositely-located cylinders containing pistons, and a gate or closing device connected to and operated by said pistons, a pipe connecting each of said cylinders with a primary source of fluid or liquid under pressure, and a secondary valve governing the admission of said fluid or liquid

395,625.

under pressure to and its exhaustion from both of said cylinders, substantially in the manner and for the purpose described.

4. In combination with a filter, a primary valve comprising two oppositely-located cylinders containing pistons, and a gate or closing device connected with and operated by said pistons, two distributing-reservoirs for fluid or liquid under pressure, pipes connecting each of said reservoirs with one of the cylinders of said primary valve, and a secondary valve regulating the admission of the fluid or liquid under pressure to and its exhaustion from both of said reservoirs, substantially in the manner set forth.

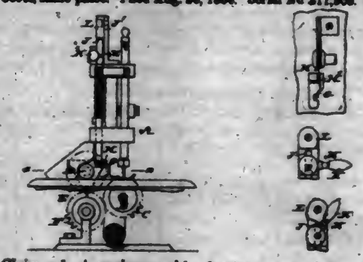
5. In combination with a filter, a primary valve adapted to be opened and closed by fluid or liquid under pressure, two reservoirs having pipe-connection with said valve, and a secondary valve regulating the admission of the fluid or liquid under pressure to and its exhaustion from said reservoirs, said secondary valve having suitable connections with the filter, whereby it is operated in one direction by liquid expelled from the filter, and a weight for moving said secondary valve in the opposite direction, substantially as shown and described.

6. In combination with a filter, a series of primary valves, each comprising two oppositely-located cylinders containing pistons, and a gate or closing device connected with and operated by said pistons, two reservoirs, pipes connecting each of said reservoirs with opposite cylinders of each of said valves, and a secondary valve regulating the admission of fluid or liquid under pressure to and its exhaustion from both of said reservoirs, said secondary valve having suitable connections with the filter, whereby it is operated in one direction by water expelled from the filter, and a weight for moving said suction-valve in the opposite direction, arranged and operating substantially in the manner and for the purpose set forth.

7. In combination with a filter, a series of primary valves governing inlet and outlet openings thereof, a series of reservoirs arranged in pairs, pipes connecting each pair of reservoirs with one or more of said primary valves, secondary valves regulating the admission of fluid or liquid under pressure to and its exhaustion from each pair of reservoirs, intermediate connections with the filter, whereby said secondary valves are operated in one direction by liquid expelled from the filter, weights for moving said secondary valves in the opposite direction, and pipe-connections between said reservoirs and said secondary valves, whereby the latter are prevented from operating synchronously, substantially as and for the purpose described.

8. A high-pressure filter divided into three compartments, having open passages for liquid between its middle and lower compartments, and passages governed by valves between its middle and upper compartments, said filter also having a supply-pipe leading into its middle compartment, cleansing-liquid inlet and filtered-liquid outlet pipes communicating with its lower compartment, and a cleansing-liquid escape-pipe leading from its upper compartment, substantially as and for the purpose set forth.

9. In combination with a filter, valve A, having openings a^3 a^4 a^5 in the rear side of its shell and opening a^6 and passages a^2 in the front side thereof, piston B, having stem b', extending above the shell, and cylinder D, secured to said stem, said cylinder having inlet-passages a and outlet-passages a', substantially as and for the purpose set forth.



10. In combination with a filter, a valve having a vertically-movable piston, a hollow cylinder secured to said piston, a weight secured to the upper end of said cylinder by a belt passing over a pulley, a pipe leading from the filter extending through the top of said cylinder, a pipe leading from the bottom of said cylinder into a waste-pipe, and an inwardly-opening valve normally closing the mouth of the pipe at the bottom of the cylinder, substantially as shown and described.

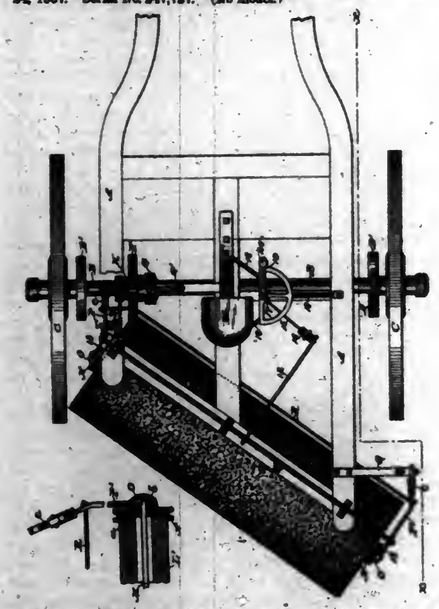
11. The combination, with a filter and a primary source of fluid or liquid under pressure, of a series of pressure-actuated primary valves governing inlet and outlet openings of the filter, reservoirs f f^6 f^8, located between said primary source of fluid or liquid under pressure and said primary valves, secondary valves A A', connected to said reservoirs, as shown, said valves having suitable connections with the filter, whereby they are operated in one direction by water expelled from the filter, weights for moving said valves in the opposite direction, pipes connecting said primary valves with said reservoirs and said secondary valves with the primary source of fluid or liquid under pressure, cylinder L, connected to the bottom of valve A', said cylinder containing piston l, the stem of which projects into the chamber of said valve, and pipes c' O, connecting said cylinder with reservoir f, arranged and operating substantially as described, whereby said secondary valves are prevented from operating synchronously.

12. The combination, with a filter and a primary source of fluid or liquid under pressure, of a series of pressure-actuated primary valves governing inlet and outlet openings of the filter, reservoirs f f' f^6 f^7 f^8 f^9, located between said primary valves and the primary source of fluid or liquid under pressure, secondary valves A A' A^2, connected to said reservoirs, as shown, suitable connections between said valves A A' and the filter, whereby they are operated in one direction by water expelled from the latter, weights for moving said valves in the opposite direction, cylinder L, connected to valve A', said cylinder containing a piston the stem of which projects into the valve-chamber, cylinders M N, connected to valve A^2 and containing pistons operatively connected with the piston of said valve, weight H, also connected with the piston of said valve, for moving said piston in one direction, pipes connecting said primary valves with said reservoirs and said secondary valves with the primary source of fluid or liquid under pressure, and pipes connecting cylinders L M with reservoir f and cylinder N with reservoir f^2, whereby said secondary valves A A' are operated directly from the filter, while said secondary valve A^2 is operated by the fluid or liquid under pressure governed by said valves A A', substantially as and for the purpose described.

13. The combination, with the filter T, having head U and false bottom V, as shown, and having pipe c^4, leading into its middle compartment, pipes s s^2 s^3, communicating with its lower compartment, and pipes E c^5, leading from its upper compartment, of primary valves S S' S^2 S^3 S^4, arranged and operating substantially as shown and described, the distributing-reservoirs connected by pipes with said valves, as described, secondary valves A A' A^2, connected to and operating with said reservoirs and a waste-pipe, substantially as set forth, pipe R, connected to each of said secondary valves and to pipe s^4, cylinders D D', secured to the pistons of valves A A', weights connected to said cylinders for normally retaining them in their highest position, connections between each of said cylinders and pipe E and also between the cylinders and a waste-pipe, weight H, connected with valve A^2 in such manner as to normally retain its piston in its lowest position, cylinder L, connected to valve A', as shown, and having pipe-connection with one of the reservoirs connected with valve A, cylinders M N, connected to valve A^2, as shown, and pipe-connection between cylinder M and one of the reservoirs governed by valve A, and between cylinder N and one of the reservoirs governed by valve A', arranged and operating substantially in the manner and for the purpose set forth.

395,626. TRIMMING ATTACHMENT FOR SEWING-MACHINES. THOMAS B. MOORE, Philadelphia, Pa., assignor of one-half to John H. Scott, same place. Filed Aug. 26, 1886. Serial No. 211,903. (No model.)

Claim.—1. A sewing-machine having an upwardly-cutting trim-



ming-knife journaled above the cloth-plate, mechanism, substantially as described, connected therewith and to the driving-shaft for rotating said knife, a presser-bar with foot, the latter having a slot in its heel portion in which the rotating knife operates, an operating-lever for said presser-bar, and a latch pivoted to an extension of the goose-neck above the presser-bar, whereby the presser-foot is held rigid during the process of trimming, said parts being combined substantially as and for the purpose set forth.

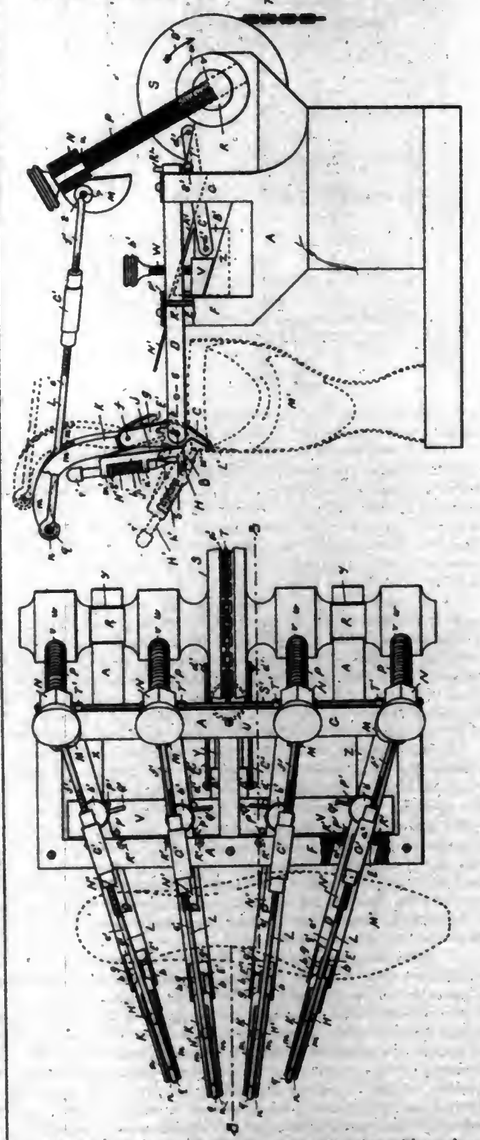
2. A sewing-machine having a presser-bar, a latch pivoted to the head of the goose-neck and normally lying in the path of the presser-foot, and means, substantially as described, attached to said presser-bar for removing the said latch from the path of said presser-bar, substantially as described.

3. A sewing-machine having a presser-foot, a movable latch connected with the frame of the machine over the presser-foot bar, and a projection on the presser-bar lifting-lever adapted to deflect said latch from the path of said bar, substantially as described.

4. A sewing-machine having a presser-foot, the latch L, pivoted to an upper extension of the head of the goose-neck, the eccentric lever K, pivoted to the presser-foot bar, and the stud M, secured to the lever K and operating on the latch L, all substantially as described.

395,627. STREET-SWEEPING MACHINE. CHARLES Z. O'NEILL, New York, N. Y., assignor to William Chapman, same place. Filed Aug. 24, 1887. Serial No. 247,727. (No model.)

Claim.—1. The combination, in a street-sweeping machine, of a broom revolving upon an axis inclined at an angle with the axle of the machine, a driving-shaft rotating parallel with the axle and geared thereto, sprocket-wheels upon the proximate ends of the driving-shaft and broom-shaft, intermediate guide-rollers whose pivotal axes oscillate freely and have free vertical play in their bearings, and a drive-chain carried over the two sprocket-wheels and said interposed guide-rollers, substantially in the manner and for the purpose herein set forth.



2. The combination, with the hollow wooden core of the cylindrical broom in a street-sweeping machine, of a central shaft carried through said core, transverse pins passing diametrically through the core and shaft at or near the ends thereof, a circular cap-plate fitted upon the ends of the core to embrace the same and formed with a central rectangular aperture to receive the counterpart angular end of the shaft, and a notched peripheral groove adapted to engage the links of a drive-chain, substantially in the manner and for the purpose herein set forth.

395,628. METALLIC SHANK FOR BOOTS OR SHOES. SILAS T. PETERSON and MARSHALL REED, Whitman, Mass. Filed July 28, 1888. Serial No. 281,262. (No model.)

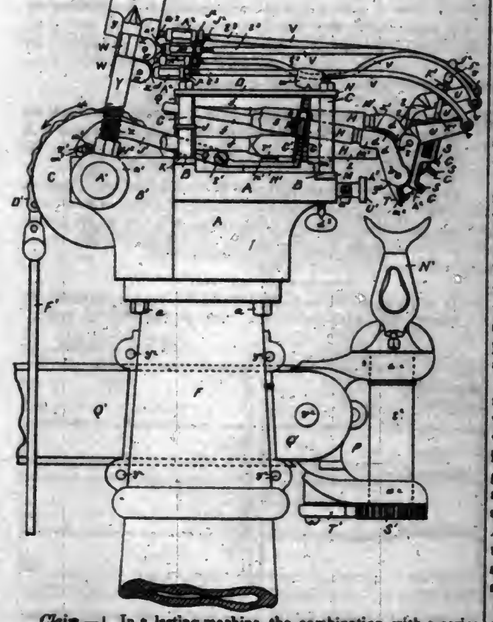
Claim.—The self-fastening metallic shank for boots and shoes, consisting of the arched strip of plate-steel oppositely beveled at its ends and having the lateral extremities of said beveled ends B on opposite sides turned upward at right angles, presenting diagonally-opposite points.

395,629. LASTING-MACHINE. ALBERT F. PRESTON, Lynn, Mass., assignor to the Preston Lasting Machine Company, Portland, Me. Filed Sept. 5, 1887. Serial No. 248,894. (No model.)

Claim.—1. In a lasting-machine, the combination, with two jaws pivoted to a bar, D, arranged to move backward and forward in suitable guideways and provided with a shoulder, g', of a lever pivoted to one and arranged to engage with the other of said jaws and connected to means for operation thereof.

2. In a lasting-machine, the combination, with a series of bars, D, arranged to move backward and forward in suitable guideways, each bar carrying two jaws adapted to grasp and hold the upper of a boot or shoe between them, of a transverse bar, V, arranged to move backward and forward on inclined guideways, and on which transverse bar the bars D are adapted to rest and bear, and said bars D and V being connected to suitable mechanism for operation thereof, for the purpose specified.

3. In a lasting-machine, the combination, with a series of bars, D, provided with regulating-screws W, arranged to move backward and forward in suitable guideways, and each bar carrying two jaws, of a transverse bar, V, arranged to move backward and forward on inclined guideways, and on which transverse bar are adapted to rest and bear the bars D by said regulating-screws, substantially as and for the purpose specified.



4. In a lasting-machine, the combination, with a bar, D, carrying two jaws, C H, and arranged to move backward and forward in suitable guideways in a frame, and provided with a series of holes or sockets, y', of a pin, R^3, adapted to fit said socket to abut against said frame to limit the forward movement of the said bar.

5. In a lasting-machine, the combination, with a series of bars, D, arranged to move backward and forward in suitable guideways, each bar carrying two jaws, and a lever, K, pivoted to one and arranged to engage with the other of said jaws, of an arm or lever, P, adjustably secured to a rock-shaft and connected to said lever K, for the purpose specified.

6. In a lasting-machine, the combination, with a series of bars D, arranged to move backward and forward in suitable guideways each bar carrying two jaws, and a lever, K, pivoted to one and arranged to engage with the other of said jaws, of an arm or lever, P, adjustably secured to a rock-shaft and connected to said lever K by a rod, L, formed of two parts and connected at their contiguous ends by a sleeve provided with a right and left screw-thread, for the purpose specified.

7. In a lasting-machine, the combination, with a series of bars, D, arranged to move backward and forward in suitable guideways, each bar carrying two jaws, and a lever, K, pivoted to one and arranged to engage with the other of said jaws, of an arm or lever, P, adapted to screw into a rock-shaft and provided with a swiveling sleeve, N, connected to said lever K by a rod, L, formed of two parts, connected together by a right and left screw-thread.

395,630. LASTING-MACHINE FOR BOOTS OR SHOES. ALBERT F. PRESTON, Lynn, Mass., assignor to the Preston Lasting Machine Company, Portland, Me. Filed Dec. 7, 1887. Serial No. 257,231. (No model.)

Claim.—1. In a lasting-machine, the combination, with a series of pairs of pivoted jaws arranged diagonally upon a suitable frame or support, all on one side and adapted to pull in diverging lines, of means, substantially as described, to close said jaws and grasp and hold one side of the upper of a boot or shoe at or about its edge at or substantially at one and the same time, so that each pair of jaws will pull upon said upper and stretch the same over the inner sole in a direction at right angles, or substantially at right angles, to the edge of the inner sole, where each pair of jaws grasps and holds the upper.

2. In a lasting-machine, the combination, with a series of pairs of pivoted jaws suitably attached and connected to bars or rods arranged diagonally in grooves or guideways upon a suitable frame or support, all on one side and adapted to pull in diverging lines, of means, substantially as described, connected to and arranged to pull said bars or rods in such diverging lines, for the purpose specified.

3. In a lasting-machine, the combination, with a series of pairs of pivoted jaws suitably attached and connected to bars or rods arranged diagonally upon a suitable frame or support in grooves or guideways and adapted to pull in diverging lines, and another series of pivoted jaws suitably attached and connected to bars or rods arranged diagonally on said frame or support in grooves or guideways and to pull in diverging lines opposite to or crossing more or less the diagonal and diverging lines of the first series of jaw-guiding bars or rods, of means, substantially as described, connected to and arranged to pull said guide bars or rods in such diverging lines, for the purpose specified.

4. In a lasting-machine, the combination, with a series of bars or rods arranged to move backward and forward in suitable guideways and each carrying two jaws, of a transverse bar, H', provided with ribs or shoulders m' and arranged to move backward and forward on inclined guideways h', and on which transverse bar rest and bear the guide-bars H, each provided with a shoulder to abut against its respective rib or shoulder m' on the transverse bar, substantially as and for the purpose specified.

5. In a lasting-machine, the combination, with a series of bars or rods arranged to move backward and forward in suitable guideways and each carrying two jaws, of a transverse bar, H', provided with ribs or shoulders m' and arranged to move backward and forward on inclined guideways h', and on which transverse bar rest and bear the guide bars or rods, &c., by a regulating-screw, G', for each screw to abut against its respective rib or shoulder m' on the transverse bar, substantially as and for the purpose specified.

6. In a lasting-machine, the combination, with a series of bars or rods, H, arranged to move backward and forward in suitable guideways and each carrying two jaws, of a transverse bar, H', provided with ribs or shoulders m' and arranged to move backward and forward on inclined guideways h', and on which transverse bar rest and bear the guide bars or rods H, arranged to engage with or abut against their respective ribs or shoulders m' on the transverse bar, and all connected to a rock-shaft or other suitable means for operation thereof, for the purpose specified.

7. In a lasting-machine, the combination, with a series of bars or rods, H, arranged to move backward and forward in suitable guideways and each carrying two jaws, of a transverse bar, H', provided with ribs or shoulders m' and arranged to move backward and forward on inclined guideways h', and on which transverse bar rest and bear the guide bars or rods H by regulating screws G' in position for such screws to engage with or abut against their respective ribs or shoulders m' on the transverse bar, and all connected to a rock-shaft or other suitable means for operation thereof, for the purpose specified.

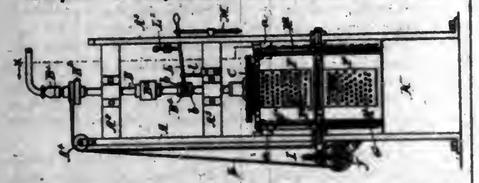
8. In a lasting-machine, the combination, with a series of bars or rods, H, arranged to move backward and forward in suitable guideways and each carrying two jaws, of a transverse bar, H', provided with ribs or shoulders m' and arranged to move backward and forward on inclined guideways g', and on which transverse bar rest and bear the guide-bars H, and arranged to engage with or abut against their respective ribs or shoulders m' on the transverse bar, said transverse bar being connected by pitman-rods J' to a rock-shaft, A', by a slot-bearing, v', and pin w', and said guiding-bars to said rock-shaft by pitman-rods to levers or arms V, adjustably secured to said rock-shaft, all for operation substantially as and for the purpose specified.

9. In a lasting-machine, the combination, with a series of bars or rods, H, arranged to move backward and forward in suitable guideways and each carrying two jaws, of a transverse bar, H', provided with ribs or shoulders m' and arranged to move back and forward on inclined guideways g', and on which transverse bar rest and bear the guide-bars H by regulating screw G' in position for such screw to abut against their respective ribs or shoulders m' on the transverse bar, said transverse bar being connected by pitman-rods J' to a rock-shaft, A', by a slot-bearing, v', and pin w', and said guiding-bars to said rock-shaft by pitman-rods to levers or arms V, adjustably secured to said rock-shaft, all for operation substantially as and for the purpose specified.

10. In a lasting-machine, a bar or rod, H, arranged to move back and forth in suitable guideways made in two parts, connected together by an adjustable connection, one of said parts carrying two jaws pivoted thereto, for the purpose specified.

11. In a lasting-machine, a bar or rod, H, arranged to move backward and forward in suitable guideways made in two parts, one part provided with a tenon, n^3, adapted to fit within a socket, r^3, in the other part and secured thereto by a set-screw, s^3, and carrying two jaws pivoted thereto, for the purpose specified.

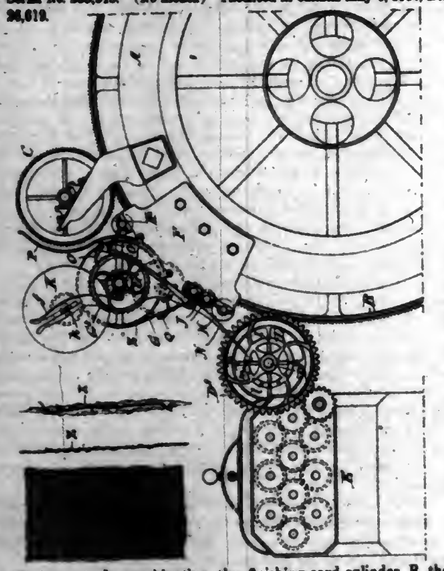
12. In a lasting-machine, the combination, with a bar or rod, H,



carrying two jaws pivoted thereto adapted to move backward and forward in a guideway provided at the front with friction-rolls and at the rear by a universal swiveling connection with the support, for the purpose specified.

13. In a lasting-machine, the combination, with two jaws pivoted to a bar or rod, H, arranged to move backward and forward in suitable guideways and provided with shoulders x' and h^3, of a lever pivoted to one of said jaws, having a shoulder, g^3, on its under side and arranged to engage with the other of said jaws and connected to means for operation thereof, for the purpose specified.

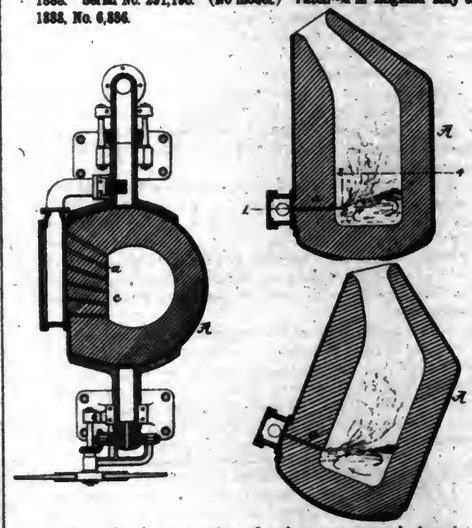
14. In a lasting-machine, the combination, with two jaws pivoted together for operation, substantially as described, and provided with openings, of a spring rod or driver, K', adapted to slide up and down in suitable guideways on one of said jaws, for the purpose specified.



15. In a lasting-machine, the combination, with two jaws pivoted together, provided with openings for operation, substantially as described, the upper one having pivoted thereto blocks w^2, and each provided with a tapering groove, c^2, on its contiguous side or end, of a spring rod or driver, K', adapted to slide up and down in suitable guideways on said jaw, for the purpose specified.

395,631. SURFACING-MACHINE. RICHARD M. PRICHARD, New Rockland, Quebec, Canada, assignor of one-half to John James Williams, same place. Filed July 25, 1887. Serial No. 245,209. (No model.)

Claim.—In a school-slate-surfacing machine, the combination of a vertical hollow revolving shaft adapted to be rotated by any suitable means, frame of machine having suitable bearings for such shaft, an annular grinder rigidly secured on end of said shaft and revolving with it, the endless band of plane-surface slate-carriers for carrying the slates under the grinder, supports for such endless band while passing under said grinder, drums adapted to be rotated by any suitable means for operating such band, and a water-trough through which such endless band passes, as set forth.

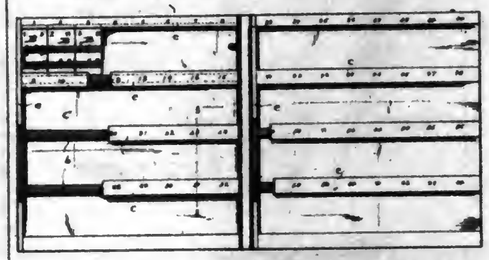


395,632. CARDING-MACHINE FOR MAKING MOTTLED ROVINGS. JOHN ROSS, Oxford, Nova Scotia, Canada. Filed Apr. 22, 1887. Serial No. 235,815. (No model.) Patented in Canada May 6, 1887, No. 26,619.

Claim.—1. In combination, the finishing-card cylinder B, the doffer D, a cylinder, G, means for supporting the spool carrying the rovings in frictional contact with the cylinder G, a gear on the shaft D', and an adjustable pin or pins set in said gear, a lever, N, provided with a pawl on one end, its free end projecting into the line of the pin on the gear of the shaft D', and a ratchet-wheel on the shaft of the cylinder G operated by the pawl of the lever N, leading-rolls J J, and a train of gearing between the shaft of cylinder G and said rolls, whereby the movement of the cylinder and rolls is simultaneous, substantially as described.

2. In combination with the finishing-card cylinder B, the frame carrying the same, the leading-rolls J J, and the doffer D, of the wipe-roll H, placed between said leading-rolls and the doffer and in close contact with the cylinder, for the purpose described.

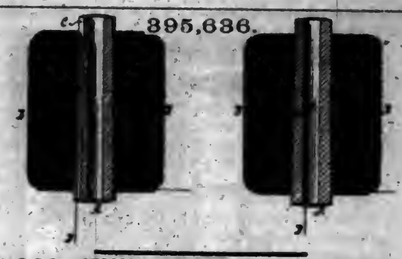
395,633. PROCESS OF CONVERTING CRUDE IRON INTO MALLEABLE IRON OR STEEL. GUSTAVE L. ROBERT, Stenay, France, assignor to John Wesley Bookwalter, Springfield, Ohio. Filed Nov. 19, 1883. Serial No. 291,190. (No model.) Patented in England May 9, 1883, No. 6,336.



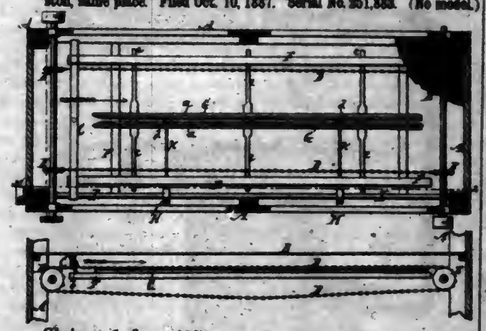
Claim.—In the conversion of molten cast or crude iron into malleable iron or steel, the mode, substantially as hereinbefore described, consisting in applying the air-blast to a portion only of the molten metal at the surface of the bath and directing the blast toward one side of the mass, creating thereby a gyrating circulation of the metal, substantially as described.

395,634. ORANGE AZO DYE-STUFF. CHRISTIAN RUDOLPH and BERNHARD PRIEBS, Offenbach-on-the-Main, Germany, assignors to K. Oehler, same place. Filed June 12, 1888. Serial No. 276,876. (No specimens.)

Claim.—The orange azo dye-stuff herein described, produced from tolidin by diazotation and subsequent heating with cresotinic acid and toluylendiaminesulpho-acid, and which is a red-brown powder which dissolves easily in hot water, and the solution of which in concentrated sulphuric acid is violet-red.



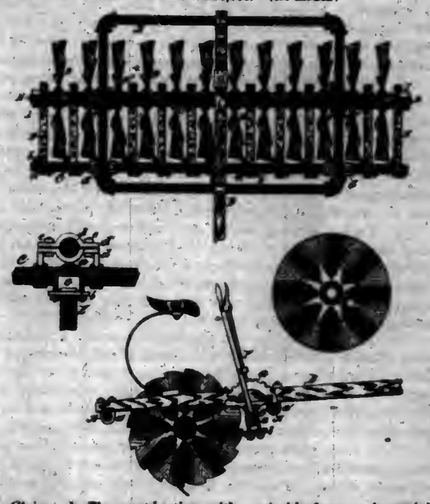
395,635. MUSICAL GAME APPARATUS. AUGUST SCHEMMEL, Milwaukee, Wis. Filed Nov. 3, 1887. Serial No. 254,590. (No model.)



Claim.—In a game apparatus, the combination, with a box having a series of compartments, of a portfolio having a flexible center and a series of horizontal retaining-strips, and a series of interchangeable cards having music printed thereon, substantially as described

395,636. BALL OF THREAD. SIEGMUND STIELGLITZ, New York, N. Y. Filed Aug. 9, 1888. Serial No. 282,316. (No model.)

Claim.—As a new article of manufacture, a ball of thread provided with a central core having a channel in which the starting or inner end of the thread is arranged, substantially as described.



395,637. MIDDLINGS-PURIFIER. STEPHEN STONE and JOHN W. KINGSTON, Rochester, N. Y., assignors of one-third to Charles P. Kingston, same place. Filed Oct. 10, 1887. Serial No. 251,863. (No model.)

Claim.—1. In a middlings-purifier, the combination, with the screen, endless chains, and brush, of the stationary frame F, the ways G G, resting loosely on the frame, and devices for giving lateral vibration to the ways, as herein shown and described.

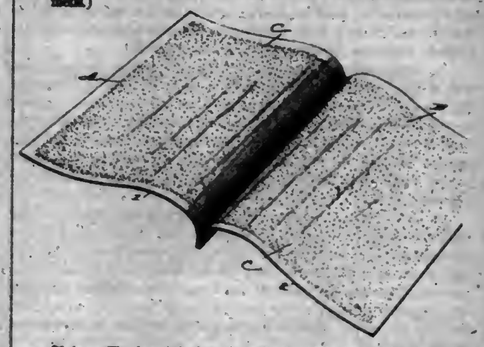
2. In a middlings-purifier, the combination, with the screen, endless chains, and brush, of the stationary frame F, the parallel angle-irons G G, forming an open-ended slot, a pin on the bottom of the brush which runs in the slot, and eccentrics H H and rods K K, for giving motion to the ways, as described.

395,638. HARROW. ADDISON A. STUART, Cedar Rapids, Iowa. Filed June 5, 1888. Serial No. 276,090. (No model.)

Claim.—1. The combination, with a suitable frame, substantially as described, of a series of the herein-described corrugated disks mounted on an axle, and a series of harrow-teeth mounted to operate between said disks and in connection therewith, substantially as and for the purpose set forth.

2. In a harrow, the described disk having radial corrugations and a serrated periphery, substantially as and for the purpose set forth.

3. In a harrow, the combination, with the frame thereof, substantially as described, of a series of the herein-described corrugated disks mounted on a suitable axle, and a series of intermediate spring harrow-teeth, mounted at or near their forward ends to a rotating shaft in front of said disks, adapted to stir the soil between said disks, and a hand-lever adapted to turn said shaft a limited distance and thereby adjust the relative depth of said teeth in the soil, substantially as specified.



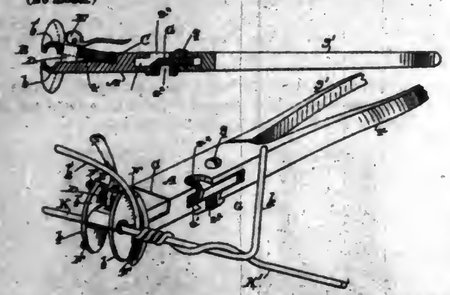
4. In a harrow, the combination, with a frame, substantially as described, of a series of revolving disks, a series of intermediate backwardly-extending spring-teeth, attached at their forward ends to a rotating shaft by means of clips *a a*, strap *b b*, and casting *c c*, and the yoke *d d*, the lower portion thereof forming the bearing for said shaft, substantially as described.

395,639. FLOUR AND MEAL BIN AND SIFTER. JEROME B. SWEETLAND, Pontiac, Mich., assignor to Enoch M. Beebe, Huron, Dak. Filed Dec. 20, 1887. Serial No. 258,334. (No model.)

Claim.—The combination of the body of the cabinet A, provided with a hinged cover, A', a funnel, G, the neck of which is inserted in a central aperture in the said cover, the parallel rubbing-bars K, secured to the lower end of the said funnel, the reciprocating board D, mounted on ways immediately below the cover of the cabinet, a lever, F, pivotally attached to the board D, for operating it, the pan E, inserted in an opening in the said reciprocating board D, this pan being provided with a reticulated bottom, *c*, the neck of the said funnel G being somewhat smaller in diameter than the pan E and extending down into the same in close proximity to the reticulated bottom *c*, whereby the rubbing-bars K upon the lower end of the neck of the funnel will disintegrate and force the flour through the said reticulated bottom *c*, substantially as herein set forth.

395,640. FLY-PAPER. WILLIAM THUM and OTTO THUM, Grand Rapids, Mich. Filed July 26, 1888. Serial No. 280,998. (No specimens.)

Claim.—The hereinbefore-described article, consisting of a sheet of sticky fly-paper composed of two leaves, each having a surface composed of sticky material on the interior faces, the two sheets being glued to each other on the margins, as and for the purpose set forth.



395,641. SHAFT-SUPPORTER FOR VEHICLES. HOWARD F. WELCH, Richfield Springs, assignor to Margaret Howard Chase, New York, N. Y. Filed Oct. 30, 1888. Serial No. 289,576. (No model.)

Claim.—As a new article of manufacture, a metal shaft-supporter made in a single piece, to sustain the shafts of vehicles, with

opposed open hooks upon each end and provided with a soft or yielding covering, substantially as shown and described.

395,642. WIRE SPLICER AND CUTTER. HENRY VORDE WILBECK, San Francisco, Cal. Filed June 29, 1888. Serial No. 278,567. (No model.)

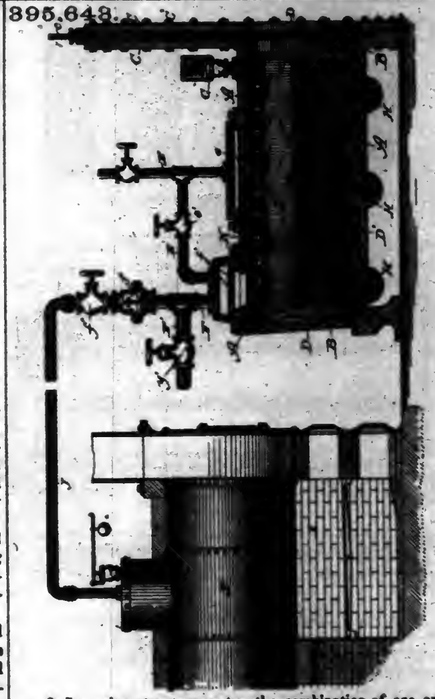
Claim.—1. A wire-splicing implement consisting of a stock having a head with a fixed jaw and a movable jaw hinged to the fixed jaw, said jaws having grooved faces whereby the head of the implement may turn upon the wire, and laterally-extending flanges adapted to bear against the free end of the opposing wire, and to twist said wire around the wire upon which the implement turns, substantially as herein described.

2. A wire-splicing implement consisting of a stock having a fixed jaw and a movable jaw hinged to the fixed jaw, the said jaws being each provided with a grooved face for one of the wires and with outwardly-projecting curved flanges for engaging the free end of the opposing wire, substantially as herein described.

3. A wire-splicing implement consisting of a stock having a head with a fixed jaw and a movable jaw hinged to the fixed jaw, said jaws having a semicircular opposing groove in their faces, whereby the head of the implement may be fitted upon the wire which serves as a journal about which the implement may turn, and a fixed flange projecting outwardly from one side of each head for bearing against the free end of the opposing wire and forcing it to twist around the wire upon which the implement is pivoted, substantially as herein described.

4. A wire-splicing implement consisting of a stock having a head with a fixed jaw and a movable jaw hinged thereto, whereby the head of the implement may be pivoted upon the wire, and curved flanges on the sides of the head for bearing against the free end of the opposing wire and forcing it to twist about the wire upon which the implement is pivoted, substantially as herein described.

5. A wire-splicing implement consisting of a stock having a head with a fixed jaw and a movable jaw hinged to the fixed jaw, whereby the head of the implement may be pivoted upon the wire, a cam or eccentric lever acting against the movable jaw to hold it against the fixed jaw, and curved flanges on the sides of the head for bearing against the free end of the opposing wire and causing it to twist around the wire on which the head is pivoted, substantially as herein described.



6. A wire-splicing implement consisting of a stock having a head with a fixed grooved jaw and a lug or ear extending from its face, a movable grooved jaw hinged to the fixed jaw and guided upon the lug or ear, a spring for holding the movable jaw back, a cam or eccentric lever pivoted upon the lug or ear of the fixed jaw and operating against the back of the movable jaw to force it up to the fixed jaw, and the curved grooved side flanges on the jaws, substantially as herein described.

7. A combined wire splicer and cutter consisting of a stock having a handle and a head with a fixed and a movable jaw, whereby the head may be pivoted on the wire, and curved flanges upon the sides of the head for twisting the end of the opposing wire, and the cutting-blade pivoted in the stock and having a handle opposing the handle of the stock, substantially as herein described.

395,643. SMELTING-FURNACE SLAG STEAM-GENERATING FURNACE AND PLANT. ORRERAS T. X. ADAMS, Chicago, Ill., assignor to the American Slag Furnace Company. Filed Apr. 2, 1888. Serial No. 269,230. (No model.)

Claim.—1. The combination, with a slag steam-generator having one or more steam-generating chambers wherein steam is generated by the heat from hot or molten slags, of a steam-generating boiler provided with a fuel-combustion chamber whereby steam is generated by the heat of fuel-combustion and one or more passages whereby the steam may flow from the slag steam-generating chamber to and in the fuel-combustion steam-generating boiler, the said passages having means for stopping or checking the flow of steam through them when desired, substantially as described.

395,643.

2. In a slag steam-generator, the combination of one or more steam-generating chamber having a passage thereto for the introduction of hot or molten material, means for closing and opening the said passage, water-supply and steam-exhaust passages communicating with the said chamber, and an automatic check-valve located in the steam-exhaust passage, through which the steam generated may pass from the generating-chamber, and which will be permitted to close or be closed by a cessation of the flow of steam from the generating-chamber or by a sufficient back steam-pressure, whereby steam is permitted to pass from the generating-chamber, but is prevented from returning, entering it through this passage, substantially as described.

3. The combination, with a slag steam-generator having one or more steam-generating chambers, a passage for the introduction of hot slags thereto, means for closing and opening such passage, water-supply and steam-exhaust passages thereto, and an automatic check-valve located in such steam-exhaust passage, of a steam-receiving chamber into which the steam generated in one or more of the said generating-chambers may pass, and means whereby the steam may pass into the said receiving-chamber, substantially as described.

4. In a slag steam-generator, the combination of a steam-generating chamber having a passage for the introduction of hot slags thereto, means for closing and opening such passage, water-supply and steam-exhaust passages, an automatic check-valve located in the said steam-passage, and a safety-valve communicating with the said generating-chamber, substantially as described.

5. In the combination of a slag steam-generator, a steam-generating chamber provided with one or more suitable water-supply and steam-exhaust pipes or passages and having a passage for the introduction of hot or molten material thereto, and a valve having a sliding valve-plate, whereby the said passage may be closed and opened, and means for operating the said plate, substantially as described.

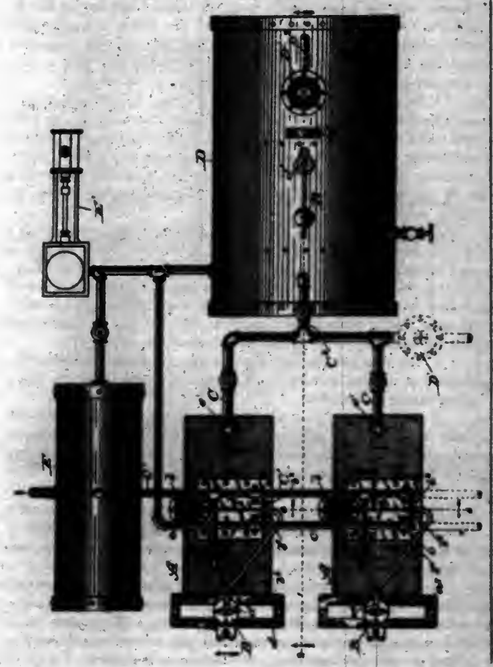
6. In a slag steam-generator, the combination of a steam-generating chamber having a passage for the introduction of hot slag thereto, means for closing and opening the same, one or more steam-exhaust passages, one or more main water-supply passages, and one or more auxiliary water-supply passages, substantially as described, and for the purposes set forth.

7. In a slag steam-generator, the combination of a steam-generating chamber having a passage for the introduction of hot slags thereto, means for closing and opening the same, one or more water-supply passages thereto, one or more main steam-exhaust passages therefrom, and one or more auxiliary steam-exhaust passages therefrom having means for closing and opening the same, substantially as described, and for the purposes set forth.

8. In a slag steam-generator, the combination of a steam-generating chamber having a passage thereto for the introduction of hot slag, one or more water-supply and steam-exhaust passages thereto, and a perforated plate placed over the entrance of one or more of the said water and steam passages, substantially as described, and for the purposes set forth.

9. In a slag steam-generator, the combination of steam-generating chamber having a passage thereto adapted to admit a slag-containing vessel, means for closing and opening said passage, water-supply and steam-exhaust passages, a slag-containing vessel located therein, and a perforated plate or cover over the said slag-containing vessel, substantially as described.

10. In the slag steam-generator, the combination of a steam-generating chamber having a passage for the introduction of a slag-containing vessel thereto, means for closing and opening the said passage, water-supply and steam-exhaust passages, and one or more supports fixed within the said chamber, adapted to revolve and carry a vessel containing slag that may be placed therein, substantially as described.



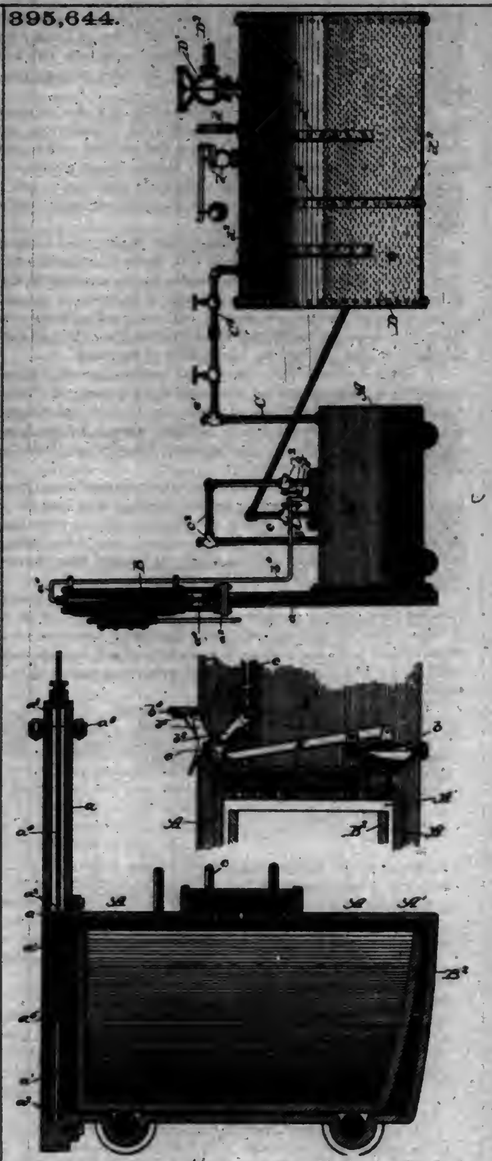
11. In a slag steam-generator, the combination of a steam-generating chamber having a passage thereto for the introduction of a slag-containing vessel, means for closing and opening said passage, water-supply and steam-exhaust passages, one or more supports adapted to revolve within the chamber, and a frame or supporting device outside of the said chamber, carrying-supports for the slag-containing vessel that are adapted to revolve, and placed in such a manner in relation to the entrance to the said chamber as to assist in supporting and carrying the slag-containing vessel to, into, and out of the said chamber substantially as described.

12. In a slag steam-generator, the combination of a steam-generating chamber having a passage thereto for the introduction of a vessel containing slags, means for closing and opening said passage, water-supply and steam-exhaust passages, a vessel containing slag adapted to be passed into said chamber, and a hinged or dumping supporting device located in such a manner as to receive the said vessel from through its passage to the chamber and support and hold it while being dumped, substantially as described.

395,644. SLAG-FURNACE. ORRERAS T. X. ADAMS, Chicago, Ill., assignor to the American Slag Furnace Company. Filed May 21, 1888. Serial No. 274,453. (No model.)

Claim.—1. In a slag-furnace, the combination of one or more generating-chambers having feed and steam-exhaust pipes or passages thereto, one or more passages to the said chamber or chambers for the introduction or removal of slags, one or more valves having a sliding valve-plate composed of two plates provided with means for raising and lowering said plates, and means for spreading or forcing them to their seats to close the said passage and render it steam-tight when they are lowered, substantially as described.

2. In a slag-furnace, the combination of a steam-generating chamber, water feed and steam-exhaust passages thereto, means for opening and closing the same, a passage to the said chamber for the introduction or removal of slag, a valve having a sliding valve for opening and closing the same, and a packing for rendering the steam-valve tight when down and in place, substantially as described.



3. In a slag-furnace, the combination of a steam-generating chamber having one or more passages for the introduction or removal of slag, means for opening and closing the same, one or more water-supply and steam-exhaust pipes, and means for opening and closing one or more of the pipes, substantially as described.

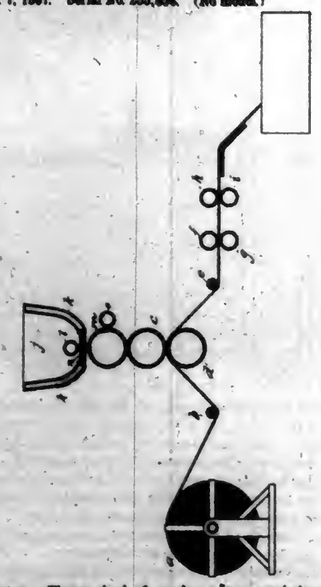
4. In a slag-furnace, the combination of a steam-generator chamber having one or more passages for the introduction or removal of slag, means for opening and closing the same, one or more water-supply and steam-exhaust pipes or passages, means for opening and closing the same, and a diaphragm-regulator communicating with the said chamber and connected with pipe or pipes, as described.

5. The combination, with a slag-furnace having one or more steam-generating chambers, one or more passages thereto for the introduction or removal of slag, means for opening and closing the same, one or more water-supply and steam-exhaust passages or pipes, and means for opening and closing the said pipes or passages, of a steam wash and storage drum or chamber having plates for forcing, driving, or deflecting the

395,644.

steam that may pass through it into or through the water that may be contained in the said chamber or drum, and a pipe or passage for the steam to pass from the generating-chambers to the said wash and storage chamber, and a pipe or passage for the steam to pass therefrom, substantially as described.

6. The combination, with a slag-furnace having one or more steam-generating chambers adapted to receive hot or molten slag, and means for opening and closing the same and provided with water-supply and steam-exhaust passages, of a steam-exhaust pressure-reducer communicating with the said chamber or chambers in such a manner that the steam will pass through the pressure-reducer before being used, substantially as described.



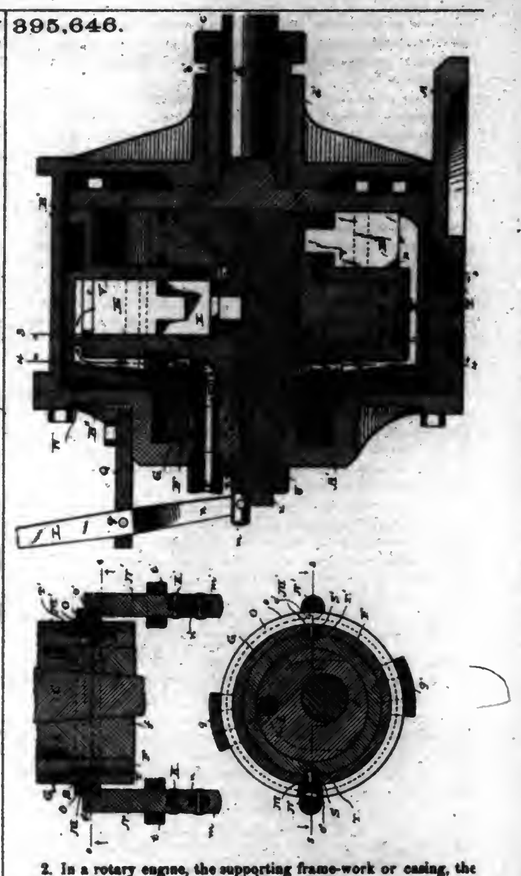
7. The combination, with a slag-furnace having one or more steam-generating chambers provided with means for operating the same, of a steam-generating storage-chamber having a passage for the steam to flow from the generating chamber or chambers to the said storage-chamber and a steam-pressure reducer communicating with the said storage-chamber through which the steam from the said storage-chamber must pass for use, substantially as described.

8. In the combination of a slag-furnace, a steam-generating chamber having a main passage for the introduction or removal of slag, means for opening and closing the same, one or more water-supply and steam-exhaust passages, and an auxiliary passage for the introduction of hot or molten slag, having means for opening and closing the same, substantially as described.

9. In a slag-furnace, the combination of a steam-generating chamber having one or more passages for the introduction or removal of slag, means for opening and closing the same, one or more water-supply and steam-exhaust pipes or passages thereto, means for opening and closing the same, and a drainage pipe or passage from the said chamber, substantially as described.

10. In a slag-furnace, the combination of a steam-generating chamber having one or more passages for the introduction or removal of slags, means for opening and closing the same, water-supply and steam-exhaust pipes, and a groove in the bottom of said chamber communicating with a recess at one end, and a pipe or passage from such recess, substantially as described.

395,645. METHOD OF WAXING PAPER. J. BURNHAM ANDERSON, Boston, Mass., assignor to George H. Heath, same place. Filed Apr. 7, 1887. Serial No. 233,936. (No model.)



Claim.—The method of waxing paper, consisting in simultaneously heating the paper and applying wax to one side thereof, then subjecting the paper to heat and pressure, and finally cooling and pressing it, as set forth.

395,646. ROTARY-ENGINE REVERSING-GEAR. CYRUS BAILEY, Akron, Ohio. Filed Feb. 8, 1888. Serial No. 263,326. (No model.)

Claim.—1. In a rotary engine, the combination of the casing, the revolving crank-cylinder, the piston rigidly mounted thereon, and the rotary packing-cylinder mounted therein, together with a suitable valve on the crank-cylinder for introducing steam at either side of the piston, substantially as described.

395,646.

2. In a rotary engine, the supporting frame-work or casing, the rotary crank-cylinder having the rotary packing-cylinder mounted therein, and the piston rigidly mounted thereon and having the peripheral valve-ports, one on each side of the piston, in combination with suitable valve-passages connecting one port with the steam-inlet and the other port with the steam-exhaust, together with a valve mounted on the crank-cylinder, substantially as described.

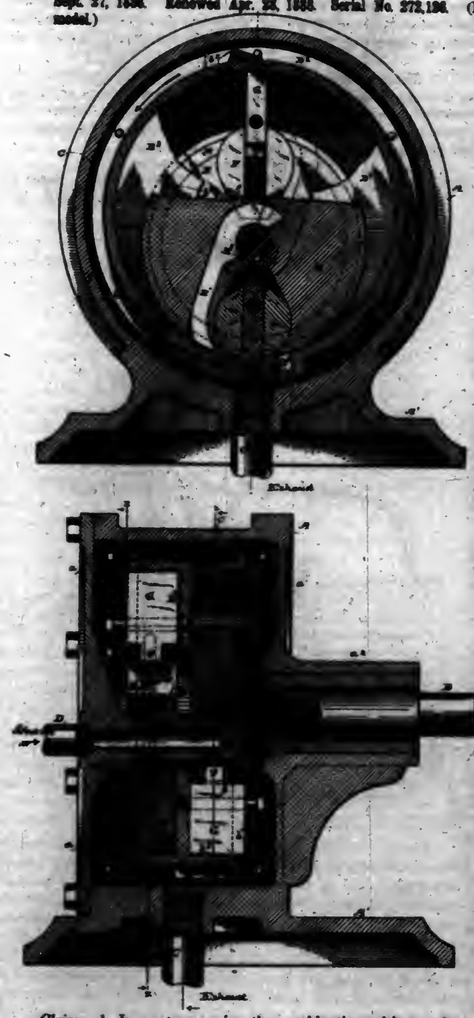
3. In a rotary engine, the revolving crank-cylinder containing a suitable piston and packing-cylinder and having peripheral valve-ports and radial valve-passages leading to the same, in combination with an adjustable valve mounted on and revolving with the crank-cylinder, whereby either radial valve-passage may be thrown into connection with the steam-inlet and the other valve-passage opened to the exhaust, substantially as described.

4. In a rotary engine, the revolving crank-cylinder containing a suitable piston and packing-cylinder and having peripheral valve-ports and radial passages, in combination with the steam-inlet passage in the bearing on which the cylinder turns and an adjustable valve mounted on and revolving with the crank-cylinder, whereby either radial valve-passage may be thrown into connection with the said steam-inlet and the other opened to the exhaust, substantially as described.

5. In a rotary engine, the combination of a revolving crank-cylinder and an adjustable valve mounted on and revolving with the same, substantially as described.

6. In a rotary engine, the combination of a revolving crank-cylinder having radial valve-passages and a circumferentially-adjustable valve mounted on and revolving with the cylinder and registering with the valve-passages, substantially as described.

7. In a rotary engine, the combination of a revolving crank-cylinder having a projecting boss in which there are axial slots, a valve mounted on and surrounding said boss, having oblique slots in its shell, and pins passing through or engaging with both said slots, substantially as described.



8. In a rotary engine, the combination of a revolving crank-cylinder having a projecting boss in which there are axial slots, a valve mounted on and surrounding said boss, having oblique slots in its shell, and radial pins set in an adjustable ring and passing through or engaging with both said slots, substantially as described.

9. In a rotary engine, the combination of a revolving crank-cylinder having a projecting boss in which there are axial slots, a valve mounted on and surrounding said boss, having oblique slots in its shell, and radial pins set in a grooved ring and passing through or engaging with both the said slots, together with axially-adjustable sliding pieces meshing with the groove in said ring, substantially as described.

10. In a rotary engine, the combination of a revolving crank-cylinder having a projected boss in which there are axial slots, a valve mounted on and surrounding said boss having oblique slots in its shell, and radial pins set in a grooved ring and passing through or engaging with both said slots, together with axially-adjustable sliding pieces meshing with the groove in said ring, and a hand-lever pivoted to the engine-frame and controlling the adjustment of said sliding pieces, substantially as described.

11. In a rotary engine, the rotary packing-cylinder mounted on an adjustable eccentric tapered stud, in combination with suitable mechanical devices for drawing the tapered stud into its bearing and holding it in any position of circumferential adjustment, substantially as described.

395,647. ROTARY ENGINE. CYRUS BAILEY, Akron, Ohio. Filed Sept. 27, 1886. Renewed Apr. 28, 1888. Serial No. 272,126. (No model.)

Claim.—1. In a rotary engine, the combination, with a main or driving shaft, of a rotating cylinder axially secured thereon, said shaft extending to one line only, a fixed piston extending into said cylinder, and a piston-wheel eccentrically supported within the cylinder and positively but flexibly connected with the piston, the wheel and piston together forming the abutment, substantially as described.

2. In a rotary engine, the combination, with an axially-mounted rotating cylinder, of an eccentrically-mounted rotating piston-wheel valve within the said cylinder arranged to control the ingress and egress of steam to and from the cylinder, substantially as described.

3. In a rotary engine, the combination, with a rotating axially-mounted cylinder, of a non-rotating steam-pipe projecting into said cylinder and a rotating piston-wheel mounted upon the steam-pipe and formed with steam passages and ports corresponding to those in its support and acting to control the entrance to and egress of steam from the cylinder, substantially as described.

4. In a rotary engine, a cylinder rotating upon its central axis, a non-rotating steam-pipe projected into the cylinder upon a different axis, a piston-wheel mounted on the steam-pipe and provided with steam ports and passages corresponding with the ports, and passages upon the steam-pipe for admitting live steam to the cylinder, substantially as described.

5. In a rotary engine, the combination of a rotating cylinder mounted upon the main shaft, a fixed steam-pipe projected into the rotating cylinder, and a piston wheel or wheels mounted upon the fixed steam-pipe and arranged to be rotated within the cylinder by the motion thereof and to control the ingress and egress of steam therefrom, substantially as described.

6. The combination, with a casing and shaft, and a cylinder mounted on the shaft inside the casing, the parts being arranged substantially as described, of one or more piston-wheels operating inside of the cylinder and eccentric therewith, said piston wheel or wheels being journaled on a non-rotating steam-pipe and held thereby in contact at the bottom with the cylinder, substantially as set forth.

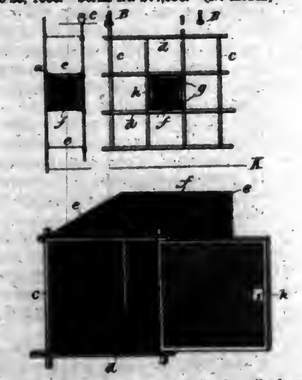
7. The combination, with a rotating cylinder, piston-wheels, and steam-pipe arranged substantially as indicated, of a piston for each piston-wheel, such piston or pistons being set radially with the cylinder and rigidly secured thereto, and oscillating piston-seats seated in the piston-wheels and made to embrace and slide on the respective pistons, substantially as set forth.

8. The combination, with a casing, cylinder, pistons, piston-wheels, and non-rotating steam-pipe arranged substantially as described, of corresponding ports in the steam-pipe and piston-wheels for admitting steam rearward of the piston, and open exhaust-ports made through the casing of the cylinder in advance of the respective pistons, substantially as set forth.

9 The combination, with a rotating cylinder operating inside of a stationary casing, the parts being arranged substantially as indicated, of open exhaust-ports corresponding in number with the compartments of the cylinder, said ports being made in the periphery of the cylinder, the walls of said ports being shaped, substantially as described, to direct the exhaust-steam rearward or opposite the motion of the cylinder, substantially as set forth.

10. In a rotary engine, the combination, with the driving-shaft, of a revolving cylinder attached to and supported thereon, said shaft extending to one line only, a piston radially attached to the cylinder, and a piston-wheel operating inside the cylinder and arranged eccentric therewith, said piston-wheel having an oscillating seat made to embrace the piston and slide thereon, substantially as set forth.

11. In a rotary engine, the combination, with the driving-shaft, of a revolving cylinder attached to and supported thereon, a piston set radial with and rigidly secured to the cylinder, a piston-wheel operating in said cylinder and arranged eccentric therewith, said piston-wheel being journaled on a non-rotating steam-pipe, and induction-ports arranged in the piston-wheel and steam-pipe, the parts being arranged substantially as described.

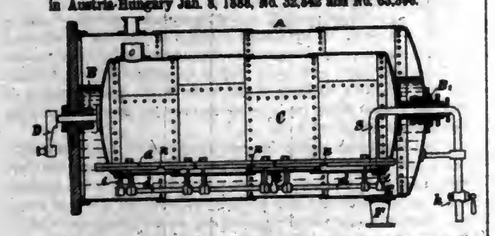


12. In a rotary engine, a revolving cylinder having a central opening at one side, an eccentrically-mounted steam-pipe projecting thereinto, and at the other formed with a central projection adapted to carry the driving connection or pulley, substantially as described.

13. In a rotary engine, a revolving cylinder having a central opening at one side, an eccentrically-mounted steam-pipe projecting thereinto, and at the other formed with a central projection or extension integral therewith, said extension constituting a portion of the main or driving shaft and acting to support and carry the cylinder, substantially as described.

14. In a rotary engine, the combination, with a stationary casing and a revolving cylinder operating inside the casing and of smaller diameter to form an annular exhaust-space between their walls, of a piston rigidly attached to the cylinder, and a piston-wheel operating inside the cylinder and arranged eccentrically therewith, said piston-wheel having an oscillating seat made to embrace the piston and slide thereon, substantially as set forth.

15. In a rotary engine, the combination, with a stationary casing and a revolving cylinder operating inside the casing and of smaller diameter to form an exhaust-space between them, of a piston set radially with and rigidly secured to the cylinder, a piston-wheel operating inside the cylinder and arranged eccentrically therewith, said piston-wheel being journaled on a steam-pipe, and induction-ports arranged in the piston-wheel and steam-pipe, the parts being arranged substantially as set forth.

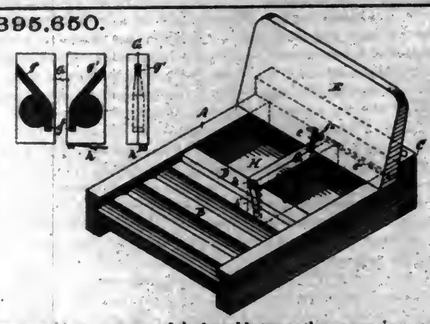


395,648. SHIP'S LOCKER. FRANCIS M. BARBER, Washington, D. C. Filed June 23, 1888. Serial No. 277,268. (No model.)

Claim.—1. The series of lockers herein described, consisting of a supporting-frame and sheets of open-work or reticulated material separating adjacent lockers from each other, and forming the tops, bottoms, and sides of all the lockers, substantially as described.

2. The series or tiers of lockers arranged against a bulk-head or partition of the vessel and comprising a frame-work of vertical, horizontal, and cross pieces, tops, bottoms, and side walls of wire cloth or mesh for each locker, and doors of the same material, said bulk-head or partition forming the backs of the lockers, substantially as described.

395,649. BOILER-CLEANER. JOSEPH BAUCHER, Breslau, Prussia, Germany, assignor to Emile Maurice Heber, same place. Filed Dec. 27, 1887. Serial No. 259,165. (No model.) Patented in England Aug. 18, 1887, No. 11,310; in Belgium Aug. 18, 1887, No. 78,611; in France Aug. 18, 1887, No. 185,389; in Germany Aug. 18, 1887, No. 42,693, and in Austria-Hungary Jan. 8, 1888, No. 32,842 and No. 63,396.

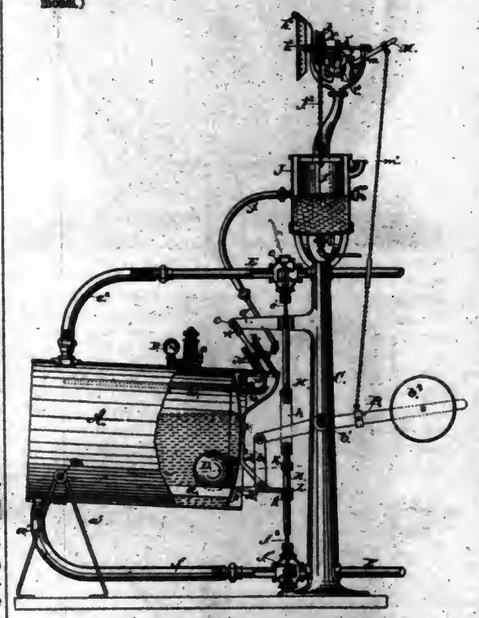


Claim.—1. The combination, with an exterior cylindrical boiler supported above a furnace with its axis in nearly a horizontal position, and having in either end bearings, substantially as specified, of an interior cylindrical boiler within said exterior cylindrical boiler and of such size as to allow for water and steam space between the interior of the exterior boiler and the exterior of the interior boiler, said interior boiler to contain no water, but being adapted for the admission of steam, and being mounted upon journals moving in the bearings aforesaid in the ends of said exterior boiler, one of the journals of said interior boiler being provided with a crank, by means of which the said boiler may be oscillated around its axis upon its said journals, having a series of scrapers attached to the exterior of said inner boiler within said outer boiler, so that when the said inner boiler is oscillated the scrapers moving therewith operate upon the inner surface of the bottom part of the said exterior boiler to remove the sediment, scales, and depositions of feed-water therefrom, substantially as and for the purpose set forth.

2. In a steam-generator, the combination, with the exterior boiler, A, having bearings B B', outlet-pipe F, valve G, and bulb H, having a waste-pipe closed with a valve, J, of the inner boiler, C, journaled in said boiler A at B and B', having the winch D attached to one of its journals, and the siphon-pipe S, passing from within through one of its journals and closed without by the cock A, the bearings *e*, attached to said inner boiler, the rod *d* in said bearings, the arms *c*, mounted on said bar *d*, and the scrapers *a*, mounted upon said arms *c*, to operate upon the interior of the said exterior boiler, A, substantially as and for the purpose set forth.

395,650. WASH-BOARD. SOLON BINGHAM, Onondagaville, assignor to Alanson A. Sumner, Albany, N. Y. Filed Feb. 7, 1888. Serial No. 263,256. (Model.)

Claim.—1. The combination, with a wash-board, of a lid or protector connected with and supported by a spring held centrally in a



space in the upper part of the board between the crown-piece and the supporting cross-bar, substantially as shown, and for the purposes set forth.

2. The combination, with a wash-board, of two protectors pivoted to the arms of a spring supported in a block which is held within an opening in the upper part of the board between the crown-piece and the supporting cross-bar, substantially as and for the purposes set forth.

3. The combination, with a wash-board, of two protectors pivoted to the arms of a spring supported in a two-part block adjustably mounted in an opening in the upper part of the board between the crown-piece and the cross-bar, whereby either lid may be opened or closed, substantially as and for the purposes set forth.

395,651. APPARATUS FOR PURIFYING WATER. JAMES H. BLENNER, Albany, N. Y. Filed Dec. 4, 1886. Serial No. 220,702. (No model.)

Claim.—1. The combination of an oscillating water-receiver whose movement in one direction is effected by the weight of its contained liquid, and in the opposite direction by means of a counter-balance, said receiver being provided with a shifting weight, as herein described, an inlet water-pipe provided with an upwardly-opening valve, an outlet water-pipe provided with a downwardly-opening valve, said inlet and outlet valves being connected together, so that as one is opened the other will be reciprocally closed by the oscillations of said receiver, a tank containing liquid coagulant, and mechanism, substantially as described, whereby a given charge of coagulant will be fed into the receiver at each oscillation of the latter, as and for the purpose specified.

2. The combination of an oscillating water-receiver whose movement in one direction is effected by the weight of its contained liquid, and in the opposite direction by means of a counter-balance, said receiver being provided with a shifting weight, as herein described, an inlet water-pipe provided with an upwardly-opening valve, an outlet

water-pipe provided with a downwardly-opening valve, said inlet and outlet valves being connected together, so that as one is opened the other will be reciprocally closed by the oscillations of said receiver, a tank containing liquid coagulant, and an injecting-pump, operated by the oscillations of said receiver, by which a given charge of the coagulant is forcibly fed into each charge of water held in said receiver, as and for the purpose herein specified.

395,652. AUTOMATIC MEASURING DEVICE FOR LIQUIDS. BENJAMIN BURTON, Chicago, Ill., assignor of one-half to Edwin A. Giles, same place. Filed Aug. 9, 1886. Serial No. 209,336. (No model.)

Claim.—1. In an automatic measuring device for liquids, the combination, with a support for a barrel or tank, of a series of measuring-chambers arranged beneath or within such support and adapted to be connected with the barrel or tank by a pipe, and a cock in each measuring-chamber having a two-way valve, whereby the outlet from the measuring-chamber may be opened and the communication with the barrel cut off, or vice versa, substantially as and for the purpose described.

2. In an automatic measuring device for liquids, the combination, with a support for a barrel or tank, of a receptacle containing a series of measuring-chambers adapted to be placed beneath or within the support, a cock in each measuring-chamber having a two-way valve, a pipe connecting with each cock and adapted by means of an adjustable screw-collar to connect with the discharge-faucet of the barrel or tank, and one or more ventilating-tubes connecting with the measuring-chambers, substantially as described.

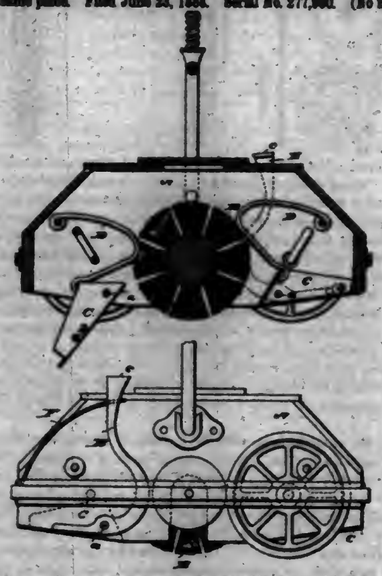
3. In an automatic measuring device for liquids, the combination, with the support A for a barrel or tank, of the removable receptacle C, containing the series of measuring-chambers D, the cocks G, having the two-way valves, the pipes H I *b*, connecting the cocks of the measuring-chambers, and the adjustable collar or coupling *c*, adapted to connect the measuring-chambers with the faucet of a barrel or tank, substantially as described.

4. The combination, in a measuring device for liquids, of the support A for a tank or barrel, the series of measuring-tanks D, the removable drawer or receptacle C, containing the measuring-tanks, the series of two-way cocks G, communicating with the measuring-tanks, the series of ventilating-pipes F, connecting with the measuring-tanks, the horizontal and vertical pipes H I *b*, connecting the two-way cocks, and the adjustable collar *c*, all constructed and arranged substantially as and for the purpose described.

5. The combination, in a measuring device for liquids, of the support for a barrel or tank, the series of measuring-chambers, each provided with a two-way cock and with ventilating-tubes, the receptacle containing the measuring-chambers adapted to be placed beneath or within the support, the pipes connecting the cocks of the measuring-chambers, the adjustable screw-collar adapted to connect said pipes with the discharge-spigot of a tank or barrel, and the wedges designed to enter the space beneath the receptacle for the measuring-chambers, substantially as described.

6. In an automatic measuring device for liquids, the combination, with a barrel or tank, of the independent support provided in its interior with a removable receptacle containing a series of measuring-chambers having ventilating-tubes and each provided with a two-way cock, and a pipe connecting said cocks having at its outer end an adjustable collar or flange-union for connecting it with the spigot of the barrel or tank, substantially as described.

7. The independent automatic measuring device for oil or other fluids, consisting of the support, the series of measuring-chambers provided with two-way cocks and ventilating-tubes, the removable drawer or receptacle containing the chambers, and the pipe connecting the two-way cocks having at its upper or outer end an adjustable flange-union for connecting said pipe with the spigot of a barrel or tank placed upon the support, all constructed and arranged substantially as and for the purpose described.



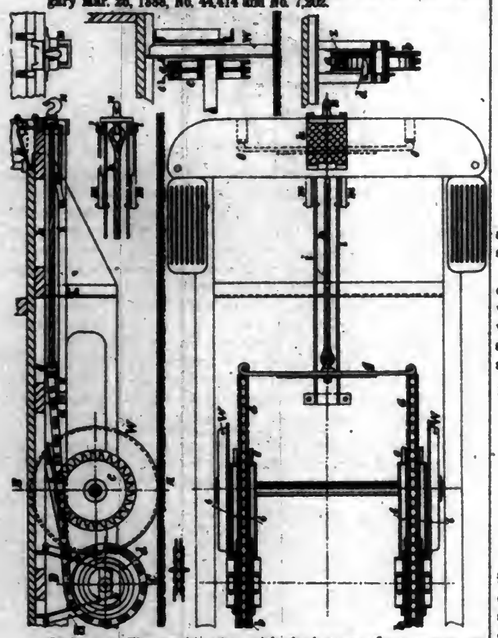
395,653. RUNNER FOR WHEELED VEHICLES. FREDERICK DEFFELL, Sterling, assignor to the Eureka Company, Rock Falls, Ill. Filed Oct. 18, 1888. Serial No. 288,050. (No model.)

Claim.—1. In combination with the body and running-gears of a road-cart, the rods E E, relatively downwardly divergent, the loop F, the cross-plate G, provided with the enlarged opening H and flange N, the rod J, provided with loop J' and lower threaded exterior, the plate L, provided with boss M and threaded opening M', and the cushion P, provided with the opening R, substantially as shown, and for the purpose described.

2. In combination with the body and axle of a road-cart, the thills C, rods J, provided with the loop J', adapted to be attached to said thills, the rods E E, relatively downwardly divergent and provided with the loop F, adapted to be attached to the body of the vehicle, cross-plate G, provided with the enlarged opening H and flange N, the plate L, provided with boss M, and the cushion P, provided with the opening R, substantially as shown, and for the purpose described.

395,654. CARPET-SWEEPER. HENRY A. GORE, Goshen, Ind., assignor of two-thirds to Edward W. Walker and Hiram W. Ra Ton, same place. Filed June 23, 1888. Serial No. 277,992. (No model.)

Claim.—In a carpet-sweeper, the combination, with the case and the dust-pans pivoted therein, of operating-levers pivoted to the side walls of the said case at the pivots of the dust-pans, with the forward ends of said levers engaging the said pans in advance of their pivotal points and their opposite ends extending slightly above the roof of the case, substantially as specified.

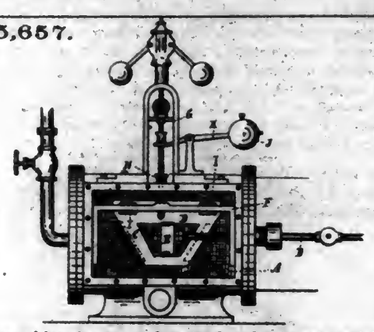


395,655. PLANTER. BENJAMIN P. GREEN, Rothetah, Mont. Filed Apr. 6, 1888. Serial No. 269,820. (No model.)

Claim.—1. The combination, with the seed-slides *b* D, of the vertical lever C, sliding head b^3, pivoted yoke b^4, eccentric b^5, shaft b^6, crank-disks *e e*, connected by the pivoted bar *e'*, and the roller-shaft *f*, whereby both of said slides are operated by the ground-roller, as described.

2. The combination, with the depth-gage wheel, of the V-frame beam-guides, the notched bar *n*, and the sliding lock-bolt O, as and for the purpose specified.

395,656. CAR-STARTER. ADOLF JENSEL, Breslau, Prussia, Germany. Filed Nov. 23, 1887. Serial No. 256,027. (No model.) Patented in Germany Sept. 14, 1887, No. 42,565; in Belgium Nov. 10, 1887, No. 79,486; in England Nov. 11, 1887, No. 15,306, and in Austria-Hungary Mar. 26, 1888, No. 44,414 and No. 7,202.



Claim.—1. The combination, with the bottom of a tramway-car and the wheel and axle thereof, of a hollow revoluble drum or barrel mounted in bearings upon suitable brackets fastened to the bottom of said car, a spiral spring placed within said drum or barrel, having one end attached to one of said brackets and the other end attached to the interior of said drum or barrel, a sprocket-wheel mounted upon the axle of said vehicle, a chain attached by one end to said drum or barrel, wound around said drum or barrel, passing over said sprocket-wheel, and extending under the bottom of said car far enough forward to be attached to a rope or chain, and a rope or chain one end of which is attached, as hereinbefore specified, to the end of said chain, extending forward over said sprocket-wheel from said drum or barrel, and, reaching far enough forward, is attached by its other end to the draft apparatus of the car, substantially as and for the purpose set forth.

2. The combination, with the bottom of a tramway-car and the wheel and axle thereof, of the drum or barrel *b*, mounted in bearings upon the brackets H, said brackets fastened to the bottom of said car, a spiral spring, *d*, wound within said barrel or drum *b*, having one end attached to the said bracket H and the other end attached to the interior of said drum or barrel *b*, a sprocket-wheel, *c*, mounted upon the axle of said vehicle, a chain, *e*, attached by one end to the periphery of said drum or barrel *b*, wound around said drum or barrel *b*, extending over and engaging the teeth of said sprocket-wheel with its links, and reaching far enough forward to be attached to one end of the draw-bar *g*, and a like chain accompanied by a like sprocket-wheel and a like drum or barrel, both mounted like the said drum or barrel and sprocket-wheel, and the drum or barrel being provided with a like spiral spring, the said chain being in like manner attached to the other end of the draw-bar *g*, the chain or rope *h*, attached by one end to the middle of said draw-bar *g*, reaching forward and attached to the draft-hook *n*, the guides *i* and *i*, attached to the bottom of said car, the stops *m*, *k*, and *o*, attached to the bottom of said car, the projection *f* of the said chain *e*, and the guide *e'*, attached to the bottom of said car, all substantially as and for the purpose set forth.

395,657. CUT-OFF VALVE FOR ENGINES. OTTO KROMER, Sandusky, Ohio, assignor of one-half to Frank Rinkleff, same place. Filed May 28, 1888. Serial No. 275,338. (No model.)

Claim.—1. In an automatic cut-off, the combination, with the governor, of the frame F, connected to the governor and having its ends fitted to the inner ends of the valve-chest, with a valve, B, having projecting guides I, fitting the frame F, and a slotted wrist, E, and

a valve-rod loosely connected to the slotted wrist, substantially as described.

2. In an automatic cut-off, the combination, with the governor, of the frame F, connected to the governor and counterbalanced by a weight, J, and having its end fitted to the inner ends of the valve-chest, with a valve, B, having projecting guides I, fitting the frame F, and a slotted wrist, E, and a valve-rod loosely connected to the slotted wrist, all substantially as described and shown.

395,658. VEHICLE-TOOL. LEROY S. LEWIS, Hartford, Conn., assignor of one-half to Harris B. Mitchell, Malden, Mass. Filed Sept. 11, 1888. Serial No. 285,138. (No model.)

Claim.—1. In a vehicle-tool, in combination with the body having upturned ends, one of which is bent at right angles to the plane of the tool, while the other is perforated, a movable spindle borne in said perforation, one end of the spindle being mortised to fit the end of the axle, while the other end bears a handle, substantially as described, and for the purpose specified.

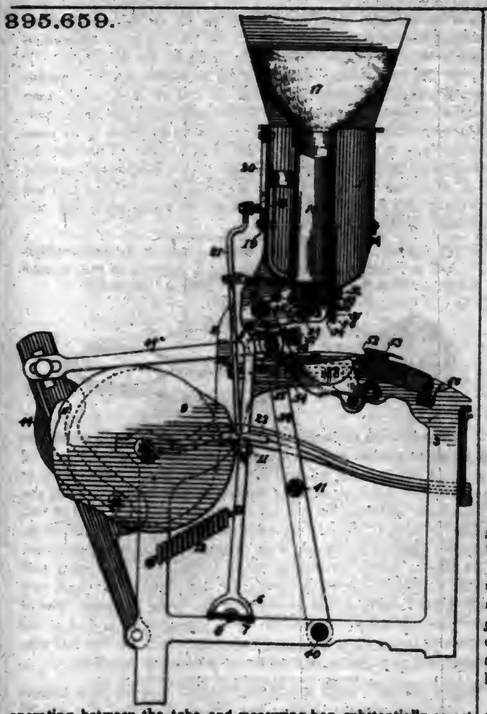
2. In a vehicle-tool, in combination with the body having upturned ends, one of which is bent at right angles to the plane of the tool, while the other bears a movable spindle, the movable spindle and a locking device to prevent the slipping of the spindle when it is desired, substantially as described, and for the purpose set forth.

3. In a vehicle-tool, in combination with the body having upturned ends, one of which bears the hook 4 and the socketed lug 15 and the other is perforated and bears a sliding spindle, a locking device for the spindle and the clamp, substantially as described.

4. In a vehicle-tool, in combination with the body having upturned ends, one of which bears a hook, 4, and the other is perforated and bears in said perforation a rotary and sliding spindle, one end of which terminates in a handle, while the other is mortised to receive the end of the axle and is perforated to receive the shank of a clamp, the clamp 11, with a shank adapted to fit into the end of the spindle, substantially as described.

5. In a vehicle-tool, in combination with the body having upturned ends, one of which bears the hook 4 and the socketed lug 15 and the other is perforated and bears the locking device 9, a rotary and sliding spindle borne in said perforation, said spindle having a mortise to receive the end of the axle and a socket to receive the end of the shank of the clamp, a clamp, 11, chain 12, ring 13, encircling the body, and the socket 14, substantially as described.

395,659. CIGAR-BUNCHING MACHINE. RALPH H. LOGAN, Allegheny, assignor to the Eclipse Cigar Machine Company, (Limited,) Pittsburg, Pa. Filed June 1, 1888. Serial No. 275,706. (No model.)



Claim.—1. In a cigar-bunching machine, the combination of a filler-feeding tube having a flexible support, mechanism for vibrating said tube, and a cut-off for regulating the escape of the filler from the tube, substantially as set forth.

2. In a cigar-bunching machine, the combination of a filler-feeding tube having its sides inwardly inclined from its lower to its upper end and having a flexible support, mechanism for vibrating said tube, and a cut-off for regulating the escape of the filler from the tube, substantially as set forth.

3. In a cigar-bunching machine, the combination of a hopper, a filler-feeding tube having a flexible mouth-piece connecting the hopper and tube, mechanism for vibrating the tube, and a cut-off for regulating the escape of the filler from the tube, substantially as set forth.

4. In a cigar-bunching machine, the combination of a filler-feeding tube having a flexible support, mechanism for vibrating said tube, a filler-measuring receptacle located below the tube, and a cut-off

395,659.

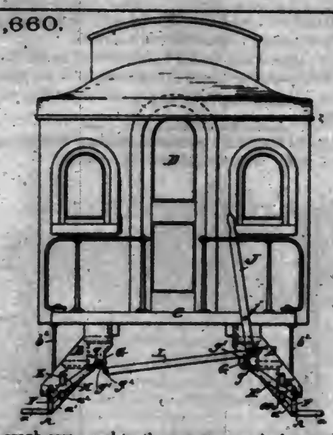
operating between the tube and measuring-box, substantially as set forth.

5. In a cigar-bunching machine, the combination of a filler-feeding tube having a flexible support, a blade for regulating the discharge from the tube, a cam provided with a groove having waved or serpentine walls, and connecting devices for operating the tube and blade, substantially as set forth.

6. In a cigar-bunching machine, the combination of a table, a bunching-roller, a smoothing and tension roll movable with the bunching-roll, an apron passing over the table and between the bunching and tension rolls, and a movable plate arranged transversely of the table and above the apron for supporting the binder after bunching operation, substantially as set forth.

7. In a cigar-bunching machine, the combination of a table, a bunching-roll, a tension-plate having its operative edge shaped to correspond to the contour of the bunch to be formed and located above the bunching-roll and movable therewith, and an apron passing over the table and tension-plate and in front of the bunching-roll and movable therewith, substantially as set forth.

8. In a cigar-bunching machine, the combination of a table, a bunching-roll, an adjustable tension-plate located above the bunching-roll and having its operative edge shaped to correspond to the bunch to be formed, and an apron passing over the table and tension-plate and in front of the bunching-roll, substantially as set forth.



395,660. EXTENSIBLE CAR-STEP. HENRY A. MERRITT, Brooklyn, N. Y. Filed July 23, 1888. Serial No. 281,206. (No model.)

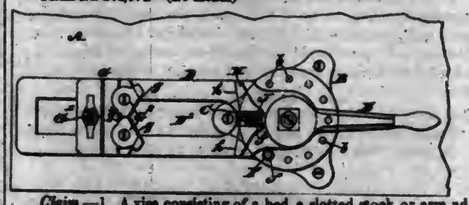
Claim.—1. The herein-described extensible car-step, comprising a foot-plate hung by parallel end pairs of links from the permanent car-steps, a transverse shaft journaled on the permanent steps and having crank-arms, and bars connecting said crank-arms with the suspension-links of the extensible step or foot-plate, substantially as herein set forth.

2. The herein-described extensible car-step, comprising a foot-plate hung by end pairs of links from the permanent car-steps, a transverse shaft journaled on the permanent steps and having crank-arms, bars connecting said crank-arms with the suspension-links of the extensible step or foot-plate and holding it extended, and a spring connected to the car-body or permanent steps and to a crank-arm on the shaft and locking the steps in either folded or extended positions, substantially as herein set forth.

3. The combination, with the permanent car-steps B, of an extensible step, A, formed with a foot-plate, *a*, and riser *a'*, pairs of links E F, pivoting each end of the step A to the steps B, a shaft, G, journaled on the steps B and having crank-arms *g g* at each end, a bar, H, connecting the arms *g* and links F, and a spring, as K, connected

395,660.

to one crank-arm *g* and to the car steps or body or a rod thereon, substantially as described, for the purposes set forth.



4. The combination, with permanent car-steps B, of an extensible step, A, links E F, connecting the steps A B, a shaft, G, having crank-arms *g g*, bars H, connecting said arms with the links F, a crank-arm, *g'*, on the shaft G, and a lever, J, fulcrumed on the car and engaging the crank-arm *g'*, substantially as herein set forth.

5. The combination, with permanent car-steps B, of an extensible step, A, links E F, connecting the steps A B, a shaft, G, having crank-arms *g g*, bars H, connecting said arms with the links F, a crank-arm, *g'*, on the shaft G, a lever, J, fulcrumed on the car and engaging the crank-arm *g'*, and a spring, K, connecting one crank-arm *g* of the shaft G with the car steps or body or a rod thereon, substantially as herein set forth.

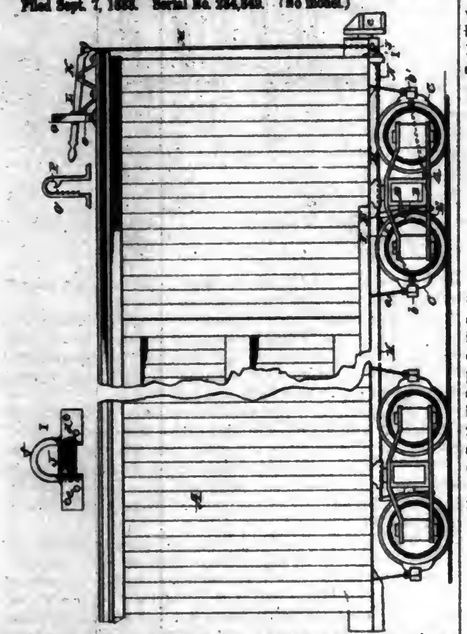
6. The combination, with permanent car-steps B at each side of a car-platform, of extensible steps arranged therewith, links connecting the extensible steps with the permanent ones, a shaft, G, journaled at each series of steps B and provided with crank-arms *g g'*, bars H, connecting the crank-arms *g* with the extensible-step suspension-links, and a bar, I, connecting the crank-arms *g' g'* of both shafts G G, substantially as described, whereby the extensible steps at each side of the car-platform will be operated simultaneously, as set forth.

7. An extensible car-step hung to the permanent steps and formed with a foot-plate, *a*, and with a riser, *a'*, which closes the space between the plate *a* and the permanent steps above it when the step is extended, substantially as herein set forth.

395,661. VISE. EDWARD D. MORGAN, Delair, N. J., assignor of one-half to Charles M. Gordon, Philadelphia, Pa. Filed June 11, 1888. Serial No. 276,674. (No model.)

Claim.—1. A vise consisting of a bed, a slotted stock or arm adjustably connected with said bed, a head having jaws and arranged in the slot of the stock, a clamping-jaw pivoted to the stock, and an eccentric or cam lever for operating upon the said clamping-jaw, all arranged and operating in the manner described.

2. A vise consisting of a bed, a slotted arm or stock pivoted thereto, an adjustable head carried by the slotted stock, jaws having variable contact-faces pivoted to the head, a clamping-jaw carried by the stock and having a sliding and circular adjustment, and an eccentric or cam lever for operating upon said clamping-jaw, said parts being combined and operating in the manner and for the purpose described.

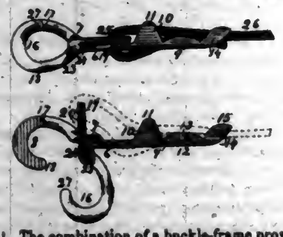


3. A vise consisting of a bed, a slotted stock adjustable thereon, an adjustable head in said stock-carrying jaws, a clamping-jaw pivoted in the stock, a nut carried by the pivot of said jaw and in a channel or groove in the stock, and an eccentric or cam lever for operating upon the clamping-jaw, said parts being combined and operating in the manner described.

4. A vise consisting of a bed, a slotted arm and a cam-lever, both pivotally connected to said bed, a head adjustable in said slotted arm and carrying two pivoted jaws, and a jaw pivotally connected with

said slotted arm and in contact with and operated by said cam-lever, said parts being combined substantially as described.

5. In a vise, a slotted arm having a head secured in said slot and provided with two pivotal jaws, and a block adapted to be placed between said jaws, whereby the same are secured in position, substantially as described.



395,662. CAR-BRAKE. CHARLES W. MURRAY, Westborough, Mo. Filed Sept. 7, 1888. Serial No. 284,849. (No model.)

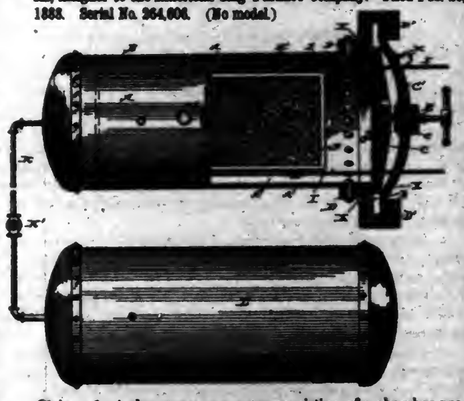
Claim.—1. In a car-brake, the combination, with brake beams and shoes, a pulley attached to the car at the lower edge of one end thereof, and brake-operating mechanism connecting the beams, of a chain connected to the brake-operating mechanism and passing under the pulley, a rod connected to the chain, a lever pivoted at a point between its ends to the car and provided with a hook at one end to engage a loop in one end of the rod, and a rack-bar secured to the top of the car-body in a position to engage the lever at a point behind the fulcrum of said lever, substantially as set forth.

2. In a car-brake, the combination, with brake shoes and beams and brake-operating device, of the lever pivoted at a point between its ends and provided with a hook at one end and a handle at its opposite end, and the rack-bar having a hook or rest to support the handle end of the lever in an elevated position, substantially as set forth.

395,663. COMBINED SNAP-HOOK AND BUCKLE. ANDREW J. MCCORD, Louisville, Ky., assignor of one-half to J. F. McGregor, Columbia, Tenn. Filed June 23, 1888. Serial No. 277,942. (No model.)

Claim.—1. The combination of a buckle-frame provided with the loop 6, having a shoulder, 24, extending the length of its front cross-bar and provided with a hook, 8, having a shank, 7, raised from the face of the said cross-bar, and another hook, 16, provided with a loop, 20, having a shoulder beneath its forward bar pivotally engaging the shoulder 24, the said forward bar being slotted to receive the shank 7, substantially as shown and described.

2. The combination of the hook 8, having the shank 7, the loop 6, having the shoulder 24 extending the length of its front cross-bar, the said shank being joined to the face of the cross-bar, and another hook, 16, provided with a loop, 20, having a shoulder beneath its forward bar pivotally engaging the shoulder 24, the said forward bar being slotted to receive the shank 7, and the two loops adapted to register with each other, substantially as shown and described.



3. The combination of the hook 16, provided with the cross-bar 19 and a shoulder facing rearward at 24, and the hook 8, provided with a corresponding shoulder at 24, facing forward, and further provided with a buckle at its rear end, comprising the frame 9, the posts 10, the bars 11, 12, and 15, the stud 13 on the bar 12 and the elevated cross-bar 19, the pivotal shoulder of the hooks being below the level of the bar 19 and the plane of the lower faces of the bars 11 and 15 nearly on a level with the bar 19 when the hooks are closed, substantially as shown and described.

395,664. BOOT. WILLIAM MCKIE, Albany, N. Y., assignor of one-half to Francis C. Huyck and Chauncey R. Argersinger, both of same place. Filed Oct. 25, 1888. Serial No. 288,919. (No model.)

Claim.—As an improved article of manufacture, a composite boot which consists of a leg and upper composed of an outer body of sail-duck and an inner lining of felt or woven fabric, a sole of felt or india-rubber, and a sole-filling of leather or other flexible material, the outer body and lining of said leg and upper being composed of two pieces of each of the said materials cut to a uniform size and shape, secured together by a single seam at the front and rear, and turned inwardly to form a continuous flange around the lower edge, said front and rear seams being covered by stay-pieces of sail-duck, said sole-filling forming a flush surface with the upper and lower faces of said inturned flange, and said sole being cemented to the foot of the boot and then secured by a line of stitching which involves said sole, flange, and inner sole, as and for the purpose herein specified.

395,665. SLAG STEAM-GENERATOR. ORRIN B. PECK, Chicago, Ill., assignor to the American Slag Furnace Company. Filed Feb. 20, 1888. Serial No. 264,606. (No model.)

Claim.—1. A slag steam-generator consisting of a chamber provided with suitable water-supply and steam-exhaust pipes, in combination with a vessel adapted to receive heated or molten materials, said vessel being constructed to be placed in said chamber, and means for closing the chambers, substantially as described.

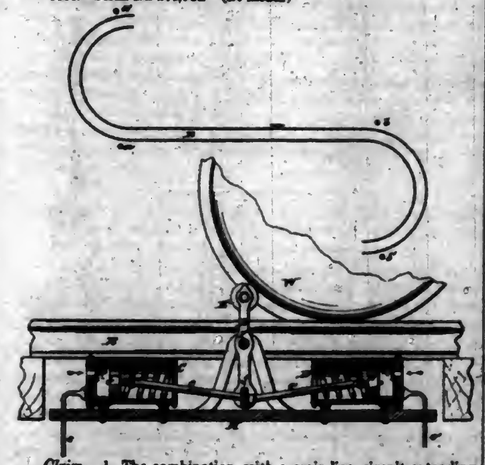
2. A slag steam-generator consisting of a jacketed chamber provided with suitable water-supply and steam-exhaust pipes, in combination with a vessel adapted to receive heated or molten materials, said vessel being constructed to be placed in said chamber, and means for closing the chambers, substantially as described.

3. A slag steam-generator consisting of a chamber provided with rails on the interior of the chamber and with suitable water-supply and steam-exhaust pipes, and means for closing the chamber, in combination with a wheeled vessel adapted to receive heated or molten materials and to be used in connection with the aforesaid chamber in the generation of steam, substantially as described.

4. The combination of a slag steam-generator having one or more steam-generating chambers and adapted to receive hot or molten materials and provided with suitable water-supply and steam-exhaust pipes or passages, and means for closing the said chambers, with a steam-receiving drum or chamber having a steam pipe or passage communicating with the steam-generating chamber or chambers, whereby the steam may pass from the generating-chambers to the storage or receiving chamber, substantially as described.

5. The combination of a slag steam-generator having one or more chambers wherein steam is generated by bringing water into direct contact with hot or molten material, with a chamber containing water and a steam-passage from the steam-generating chamber, whereby the steam may pass from the generating-chambers into the said chamber containing water and in contact with the water, whereby the steam may be washed or cleansed of its impurities and its temperature equalized, substantially as described.

6. In a slag steam-generator having a chamber wherein steam is generated by bringing water in direct contact with hot or molten slag and having water-supply and steam-exhaust pipes or passages, a lining in said chamber to protect the shell or walling that forms the chamber and prevent it from being destroyed by the intense heat of the slag or the steam within, substantially as described.



395,666. DUST-GUARD FOR VEHICLE-HUBS. JOHN T. RICHARDS and JOHN F. NEWELL, Gardiner, Me. Filed Apr. 11, 1888. Serial No. 270,303. (No model.)

Claim.—1. A dust-guard consisting of a cup or ring having a polygonal gripping-flange in its interior, substantially as set forth.

2. The combination, with a hub, an axle, and a shouldered spindle, the shoulder of the latter having a screw-thread thereon and an integral hub-band in close proximity thereto, of a removable cupped dust-guard, said guard having a screw-threaded opening in the center, and a polygonal gripping-flange integral with the interior of the guard, substantially as set forth.

395,667. ELECTRIC RAILWAY-SIGNAL. DANIEL G. SMITH, Pocatello, Idaho, assignor to Reinhart L. Brown, same place. Filed Apr. 17, 1888. Serial No. 270,944. (No model.)

Claim.—1. The combination, with a main-line circuit extending between two points, a local circuit connected with and of a higher resistance than the main circuit, an air-compressor mechanism actuated by a passing train, and a circuit-breaker operated by air from the air-compressor mechanism to break the main-line circuit, substantially as described.

2. The combination, with a main-line circuit extending between two points, a local circuit connected with and of a higher resistance than the main circuit, a pivoted lever operated by a passing train, an air-compressor mechanism, and a circuit-breaker operated by the air from the air-compressor mechanism to break the main-line circuit, substantially as described.

3. The combination, with a main-line circuit extending between two points, a local circuit connected with and of a higher resistance than the main circuit, a lever arranged to be operated by a passing train, an air-compressing cylinder having a piston connected with the lever, an air-reservoir connected with the cylinder, and a circuit-breaker operated by air from the reservoir to break the main-line circuit, substantially as described.

4. In combination with a main-line circuit and a local circuit, including electric signals directly connected therewith and of higher resistance that the main-line circuit, a circuit-breaker consisting of a U-shaped vessel, *f*, containing the mercury *m*, metallic plate *A*, and insulated terminals *s s*, connected with a reservoir for compressed air adapted to be operated by a passing train, substantially as and for the purposes set forth.

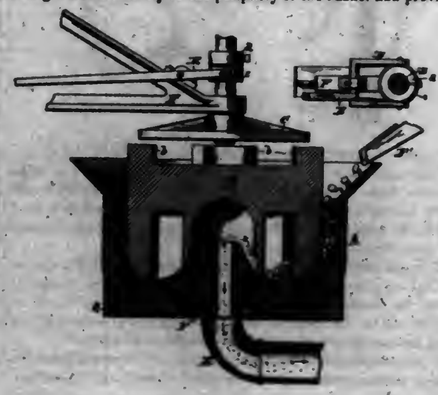
395,668. LAST. GEORGE E. SMITH, Haverhill, Mass., assignor of one-half to William A. Knipe, same place. Filed May 7, 1888. Serial No. 273,077. (No model.)

Claim.—1. In a last, the combination of the sections *a* and *b*, connected by a hinge, *c*, and separated above said hinge by a V-shaped space, a block, *e*, formed to fill said space, and a locking device, whereby said block may be detachably secured to one of the sections, as set forth.

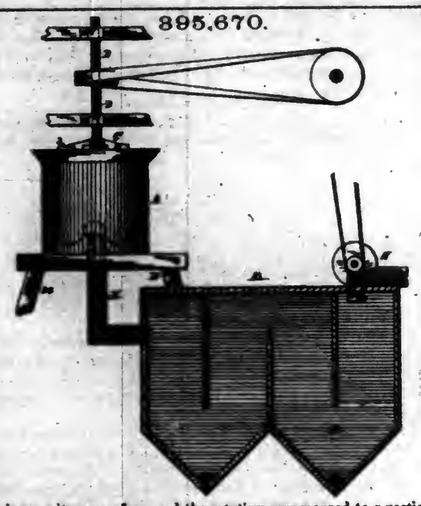
2. A last divided transversely through its body and bottom into two sections, each having a solid bottom, said sections being connected by a hinge at or near the bottom portion of the last, whereby the rear section is enabled to swing upward and forward, as set forth.

3. In a last, the sections *a* and *b*, connected by a hinge or pivot located at or near the bottom of the last, whereby the section *b* is enabled to swing forward and upward, as shown, combined with a holder, whereby the section *b* may be rigidly secured in operative relation to the section *a*, as set forth.

395,669. PULLEY. GEORGE SERGEON, New Bedford, Mass., assignor, by direct and mesne assignments, of two-thirds to James Brunnad, same place, and Covel & Osborn, Fall River, Mass. Filed Aug. 28, 1888. Serial No. 283,977. (No model.)



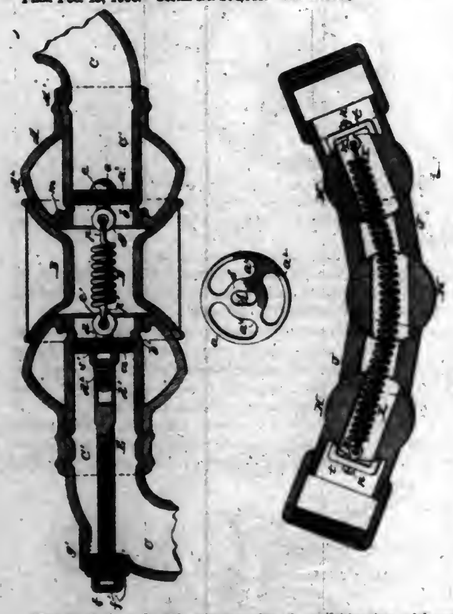
Claim.—A pulley having its peripheral face covered with a compound of Venice turpentine, glue, and acetic acid, and over said primary coating a coating of a compound of white lead, shellac, and pulverized chalk.



395,670. QUARTZ-MILL. PRINCE A. SURLL, Philadelphia, Pa., assignor to himself and Joseph H. Armbruster, same place. Filed Feb. 23, 1888. Serial No. 264,990. (No model.)

Claim.—1. The combination, in a quartz-mill having an annular matrix and central escape-passage, of the annularly-formed runner provided with passages extending from the central cavity to the periphery, whereby the quartz is carried from the outside to the center of the mill to be discharged, substantially as described.

2. The combination, in a quartz-mill having an annular matrix, of the annular runner having a central cavity, diverging passages extending from said cavity to the periphery of the runner and provided



395,670.

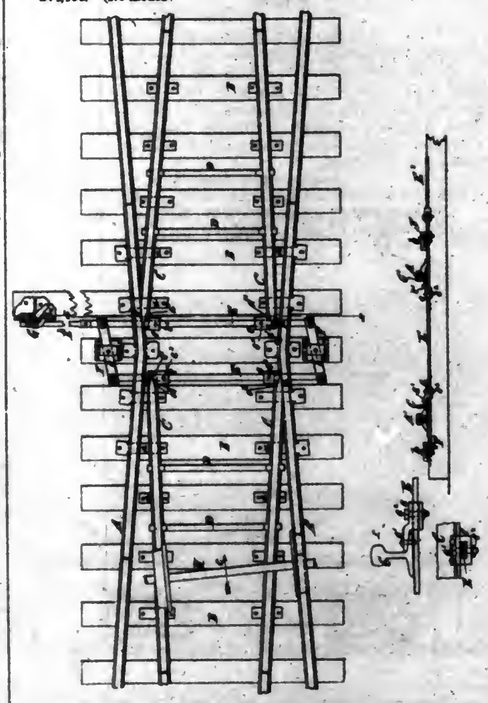
with lugs on its upper face, and the rotating arm secured to a vertical driving-shaft, substantially as and for the purpose specified.

3. The combination, in a quartz-mill having an annular matriz and a central opening and an annular runner having a central cavity, and passages extending from the cavity to the periphery of the runner, adapted to conduct pulverized quartz into the said cavity, of the draft or escape passage and suitable exhaust mechanism whereby the pulverized quartz is drawn off and removed from the mill, substantially as specified.

395,671. PIPE-COUPLER. CHARLES G. THAYER, Dunkirk, N. Y. Filed Feb. 15, 1888. Serial No. 264,116. (No model.)

Claim.—1. In a flexible pipe-coupler, the combination, with convex heads and means of securing the heads to pipe ends with tight joints, of a sleeve having concave ends that fit the convex heads, and a spring located longitudinally in the sleeve and heads, which is so secured to the heads as to hold the parts together elastically, substantially as set forth.

2. In a flexible metallic pipe-coupler, the combination, with elbows, heads having convex or spherical faces, and a sleeve-piece interposed between the heads having concave ends that engage the convex or spherical ends of the heads, of a spiral spring, and a means for connecting the spring to the heads, substantially as set forth.



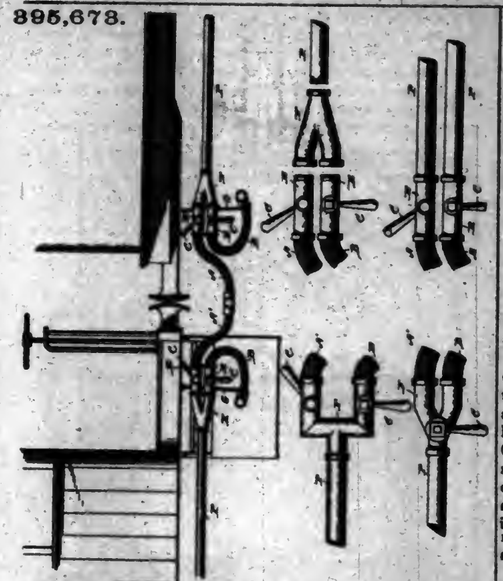
3. In a flexible metallic coupler for pipes, the combination, with elbows or sockets, perforated balls or oblate spheres, and a sleeve having capped ends that are adapted to form tight joints with the convex surfaces of the balls or spheres, of a spiral spring which by its retractile force holds the parts together and permits a flexing movement in any direction, substantially as set forth.

4. In a flexible metallic coupler for pipes, the combination, with heads adapted to connect with the ends of steam conduit-pipes, the heads having convex or spherical faces, of a sleeve or short cylinder having concave ends, and a spiral spring which holds the parts together by its contractile force, substantially as set forth.

5. In a pipe-coupling, the combination, with pipe-elbows, semi-spherical heads mounted thereon, and a sleeve with concave ends adapted to receive said heads, of a spring, and means for longitudinally adjusting and securing this spring to the heads and elbows, thereby regulating the tension of the spring, substantially as set forth.

6. In a flexible metallic pipe-coupler, the combination, with spheres formed of sheet metal that may be struck, spun, or otherwise made to afford true convex surfaces, of sleeves interposed between these oblate or true spheres to joint with them, and a spiral spring that is secured within the abutting spheres, and sleeves to hold them together by its contractile force and permit a flexible movement of the joined parts in any direction, substantially as set forth.

395,672. DOUBLE SAFETY-SWITCH CROSSING. DWIGHT TRACY, Suffern, N. Y. Filed Sept. 20, 1883. Renewed May 17, 1888. Serial No. 274,196. (No model.)



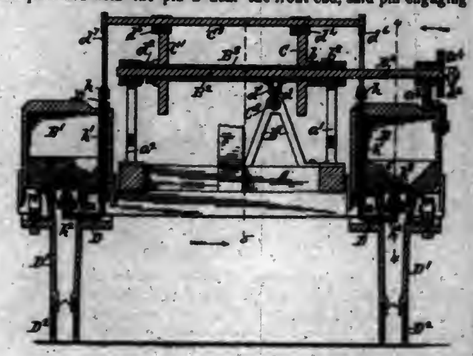
Claim.—1. The combination, in a double-switch crossing, with the bent fixed rails A A', each forming parts of two tracks, of the pairs of movable switch-rails C C', placed opposite each other and having their points beveled on both their inner and outer sides, and connections between the two pairs of movable rails whereby they are caused to move simultaneously in reverse directions, substantially as herein described.

2. The combination, with a switch-rail and its tie-bar, of a connection between the two, consisting of a sleeve loosely fitting on and secured to the bar and provided with a projecting flange or ear, which is secured to the rail, substantially as described.

395,673. AUXILIARY HOSE-COUPLING FOR STEAM AND AIR HOSE. GEORGE W. VERNON, Greensborough, N. C., assignor of one-half to Robert L. Vernon, same place. Filed June 7, 1888. Serial No. 276,316. (No model.)

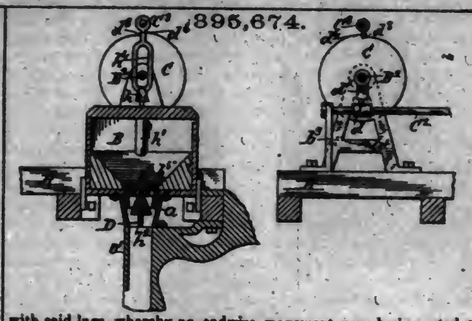
Claim.—1. The combination, with a steam or air brake supply-pipe of a railway-car, of a branch pipe connected with said pipe at each end of the car, a hose connected with said supply-pipe for coupling it with the pipe of an adjoining car, a supplemental hose normally uncoupled and attached to the branch pipe with the free end suspended

395,673.



beneath the car, and adapted to be coupled with the pipe of the adjoining car in event of the primary coupling-hose becoming disabled, a hook for suspending the free end of the supplemental hose, and valves in the pipes to cut off the air or steam from one hose-coupling and direct it into the other, substantially as described.

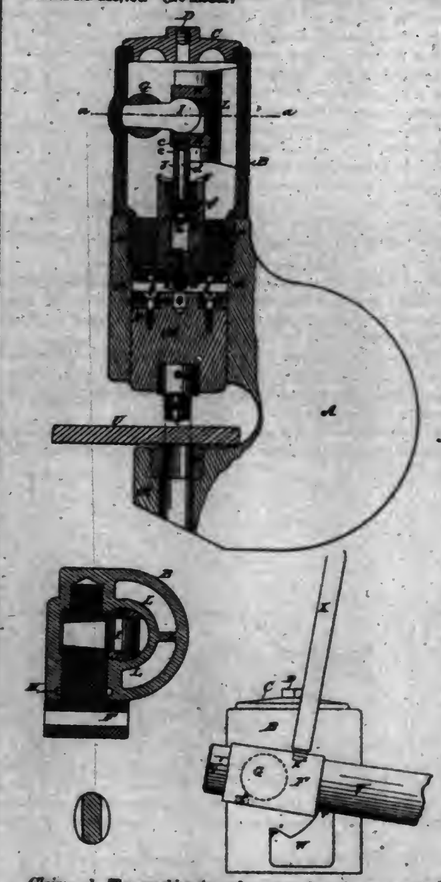
2. The combination, with a steam or air brake supply-pipe of a railway-car, of a forked pipe connected to said supply-pipe at each end of the car, a primary coupling-hose for connecting one branch of said forked pipe with the pipe of an adjoining car, and a valve to said hose, a supplemental hose normally uncoupled and having its free end supported beneath the car and its other end connected with the second branch of said pipe, while the free end is in readiness to be coupled with the pipe of the adjoining car in the event of the primary coupling-hose becoming disabled, and a valve for controlling the passage of air or steam through such supplemental hose, substantially as and for the purposes set forth.



395,674. AUTOMATIC CORN-PLANTER. WILLIAM J. WALLIS, Chicago, Ill., assignor of one-half to Henry Wulff, same place. Filed Sept. 13, 1888. Serial No. 285,749. (No model.)

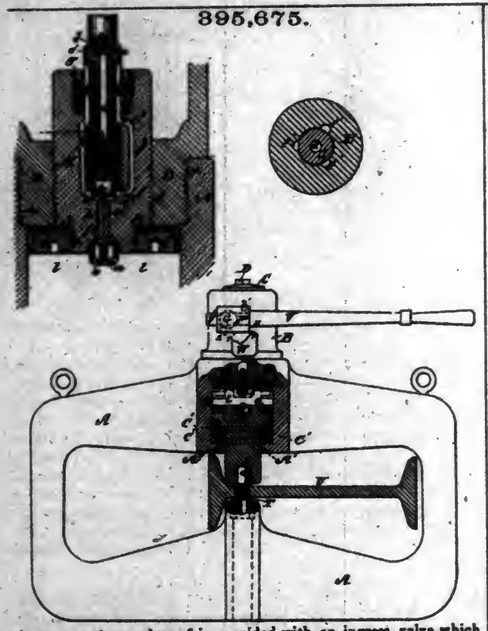
Claim.—1. In a planting-machine, the combination, with one of the sulky-wheels, of a crank-wheel rigidly secured to the hub thereof, the shaft B^2, a companion crank-wheel mounted on one end of said shaft, a rod connecting said crank-wheels, a sleeve loosely mounted on the shaft B^2, the disk-wheels C C', rigidly mounted on said sleeve, the ratchet-toothed hub b, the corresponding ratchet-collar, b^2, rigidly mounted on the shaft B^2, and the means described for engaging and disengaging said clutch mechanism, substantially as and for the purpose set forth.

2. In a planting-machine, the combination, with a sleeve or hollow shaft provided with legs and mounted on a rotating shaft, of the rocking rod C^2, having the lever b^2 mounted on the rear end thereof and provided with the pin d near the front end, said pin engaging



395,674.

with said legs, whereby an endwise movement may be imparted to said sleeve, substantially as and for the purpose set forth.

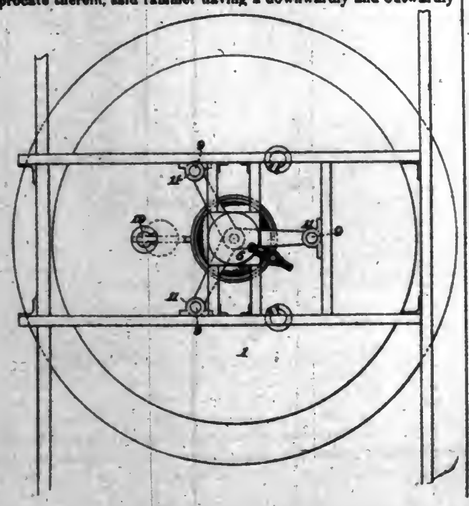


3. In a planting-machine, the combination, with the driving-shaft, of the sleeve B^2, mounted thereon, the disk-wheels C C', provided on their respective peripheries with a recess, d^2, the shaft C^2, located above and resting on top of said disk-wheels, the arms d^6 and d^7, having their upper ends mounted on the respective ends of the shaft C^2 and their lower ends provided with an interiorly-threaded boss, the angular dropping-levers D, the upper ends whereof have a threaded engagement with said boss, the lower ends being bent at right angles and terminating in the conical head A^3, and the seed-boxes provided in the seed-passage with the offset a, and the central aperture, A^3, surrounded by a number of lesser apertures for the passage of the seed, substantially as and for the purpose set forth.

395,675. HYDRAULIC PUNCH, &c. JOHN WEEKS, New York, N. Y., assignor to Richard Dudgeon, same place. Filed Jan. 26, 1887. Serial No. 225,758. (No model.)

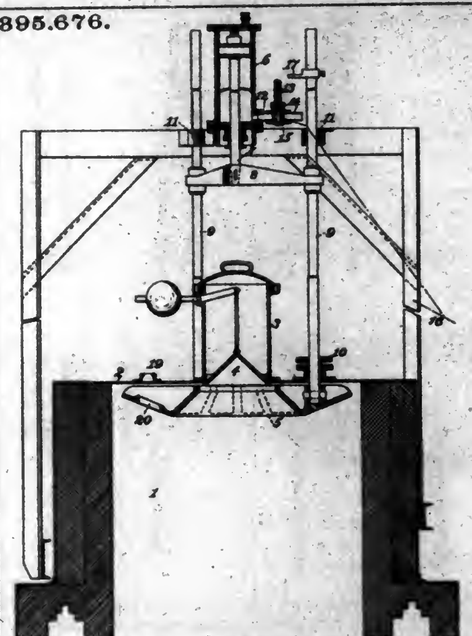
Claim.—1. The combination of a reservoir and a pump, the suction whereof is located at or near the center of the reservoir, and the

395,675.



plunger or piston whereof is provided with an ingress-valve which opens on the upstroke but closes on the downstroke of the piston or plunger, a force-chamber, the liquid capacity of which is such relative to that of the reservoir that when the ram is projected to its utmost limit there will still be sufficient liquid in the reservoir to cover the suction of the pump irrespective of the position of the apparatus and mechanism to operate the pump, substantially as set forth.

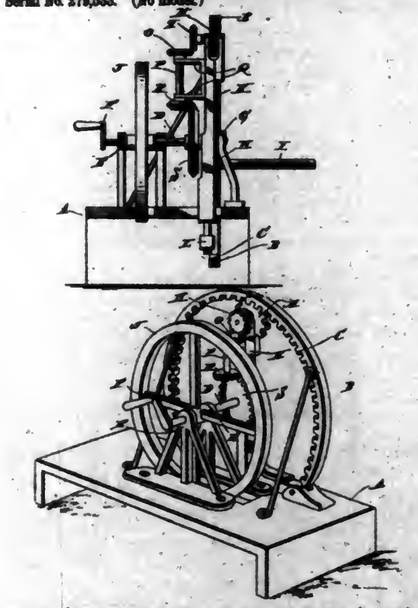
2. The combination of a recessed socket, double stops cast on the exterior of the reservoir, one below the other, against the upper one of which the pumping-lever strikes on the downstroke of the plunger, and against the other the socket strikes on the downstroke of the plunger upon the removal of the pumping-lever, and a pumping-lever, both sides whereof, either of which may engage with the stop, are substantially equidistant from the medial line of the lever, substantially as set forth.



395,676. APPARATUS FOR COMPACTING FUEL IN GAS-FURNACES. SAMUEL T. WELLMAN, Cleveland, Ohio, assignor to the Fuel Gas and Electric Engineering Company, (Limited,) Pittsburg, Pa. Filed May 22, 1888. Serial No. 274,806. (No model.)

Claim.—1. The combination of a gas-producer and a reciprocating rammer for compacting the fuel within the producer, said rammer being provided with an opening therethrough for the passage of the fuel, substantially as set forth.

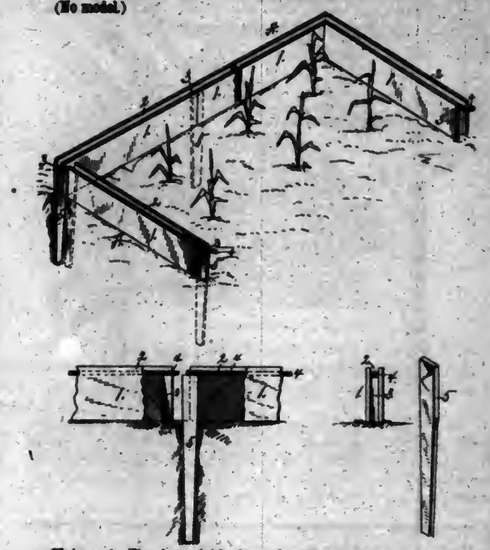
2. The combination of a gas-producer and a rammer fitted to reciprocate therein, said rammer having a downwardly and outwardly



395,676.

tapered open-ended body and an upwardly-inclined circumferential flange of slightly less diameter than the producer connected to the lower end of the body, substantially as set forth.

3. The combination of a gas-producer, a rammer fitted to reciprocate therein, a fluid-pressure cylinder fixed above the top of the producer, a piston fitting said cylinder, and bars or rods passing freely through stuffing-boxes in the top of the producer and connecting the rammer with said piston, substantially as set forth.

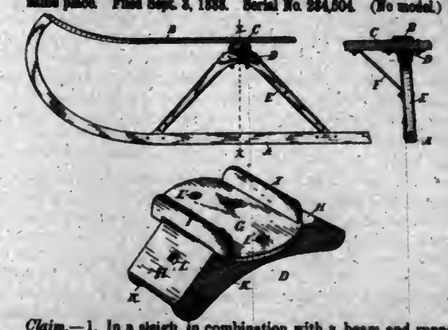


395,677. MECHANICAL MOVEMENT. CHARLES W. WHITE, Sleepy Eye, Minn., assignor of three-fourths to Thomas R. Bowen, John A. White, and Myron G. Burnside, same place. Filed July 10, 1888. Serial No. 279,533. (No model.)

Claim.—1. The combination of the main frame, the stationary ring having internal gear-teeth, the main shaft mounted on the frame, the lever mounted on the main shaft, a pinion on the end of the lever meshing with the gear-teeth of the stationary ring, and gearing between said pinion and the main shaft, as set forth.

2. The combination of the main frame, the stationary ring having internal gear-teeth, the main shaft, the lever mounted on the shaft, the pinion on the end of the lever meshing with the teeth of the stationary ring, the shaft mounted on the side of the lever and having pinions on its ends, and a bevel gear-wheel on the main shaft meshing with one of said pinions, the other one of said pinions being connected by gearing to the pinion meshing with the stationary ring, as set forth.

395,678. FENCE FOR INTERCEPTING INSECTS. FREDERICK A. WIENECK, Humboldt, Kans. Filed July 30, 1888. Serial No. 280,456. (No model.)

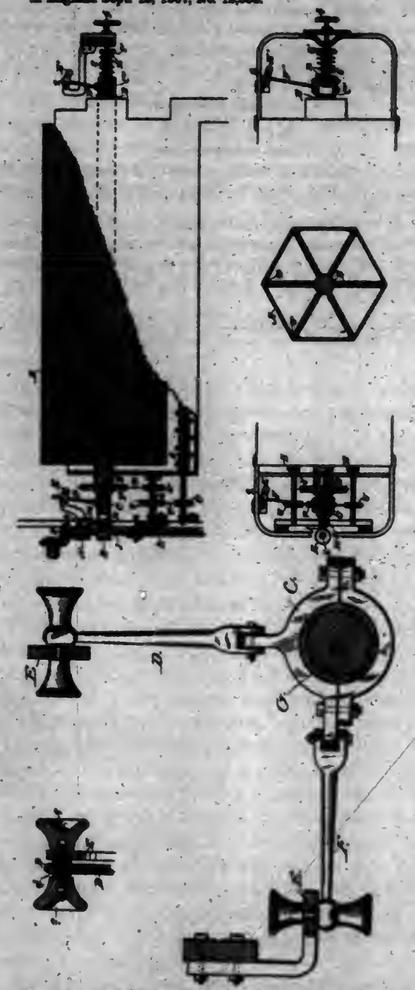


Claim.—1. The insecticide-fence herein described, composed of sections consisting of single narrow boards formed with a groove in their upper edges to receive and retain a substance noxious to insects, and grooves across their ends, and posts arranged in the end grooves of meeting ends of the sections, said posts having their tops arranged on a line with the bottom of the groove in the upper edge of the sections, substantially as described, and for the purpose stated.

2. The insecticide-fence herein described, composed of sections consisting of single narrow boards formed with a groove in their upper edges and grooves across their ends, posts arranged in the end grooves of meeting ends of the sections, said posts having their tops arranged on a line with the bottom of the grooves in the upper edges of the fence, and a saturable material arranged in the top groove of the fence, substantially as described, and for the purpose specified.

3. The insecticide-fence herein described, consisting of single narrow boards having grooves in their upper edges to receive a substance noxious to insects, said sections being laid to form a continual groove between their meeting ends, and posts at the meeting ends of the sections to hold them in line, substantially as described, and for the purpose specified.

395,679. COUPLING FOR BENT SLEIGH-KNEES. JOHN J. COSS, Grand Rapids, Mich., assignor to Sherwood Hall and Martin L. Sweet, same place. Filed Sept. 3, 1888. Serial No. 284,504. (No model.)



Claim.—1. In a sleigh, in combination with a beam and runner, a bent or arched sleigh-knee having its forward end secured to the runner and set bracing obliquely upward and backward, and its rear end secured to the runner and set bracing obliquely upward and forward and having a curved or arched apex, and a knee-cap of malleable iron or other suitable material cast integral and having opposite transverse upper and lower surfaces, the upper surface being flat and having flanges to engage the beam, and the under surface concave fore and aft to receive the apex of the arched knee, and having flanges to engage the sides of said knee, and provided with suitable means to secure said knee-cap, beam, and arched knee together, arranged between said beam and knee, substantially as described.

2. In a sleigh, in combination with a beam and runner, the knee-cap D, with arched knee E, arranged between the beam and runner, substantially as described.

3. In a sleigh, the combination of a knee-cap having flanges to embrace the beam and knee, the beam C, and the arched knee E, arranged between the rave and runner, substantially as described.

4. In a sleigh, in combination with rave B and runner A, the beam C, knee-cap D, and arched knee E, arranged substantially as described, and for the purposes set forth.

395,680. ROTARY BOLT. GEORGE STURGEON, San Francisco, Cal. Filed Mar. 15, 1888. Serial No. 267,370. (No model.) Patented in England Sept. 15, 1887, No. 12,532.

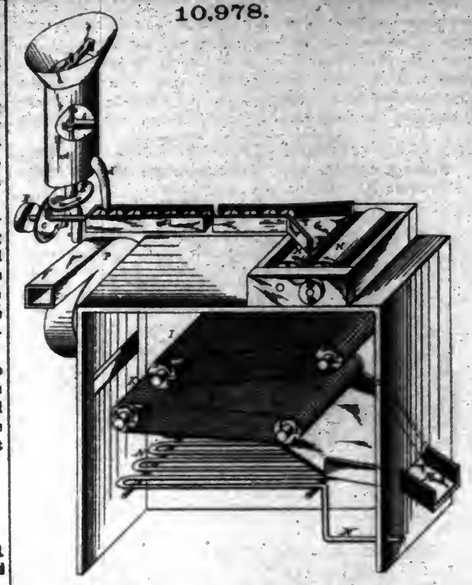
Claim.—1. A bolting-machine comprising a bolt having a shaft, mechanism for rotating said bolt, journal-boxes in which the journals of the shaft turn at opposite ends of the bolt, horizontal and vertical links loosely connected with the journal-boxes, and slotted hangers, in which the outer ends of said links are adjustably secured, substantially as herein described.

2. A bolting-machine comprising a bolt, a shaft, suspended journal-boxes at opposite ends of said shaft, vertical and horizontal links loosely connected with said boxes, slotted hangers, to which the outer ends of the links are adjustably connected, whereby the angle of con-

pension of said bolt may be varied, and means for imparting a reciprocation to the shaft and a rotary movement to the bolt, substantially as herein described.

3. The suspended journal-boxes at opposite ends of the rotary bolt, the shaft having hollow trunnions extending into said boxes, in combination with the bracket having a stem or spindle extending into the hollow trunnion, and having the roller J journaled vertically in its outer end, and the cam or eccentric K, mounted upon the vertical driving-shaft and turning in contact with the roller J, so as to produce an end oscillation or shake of the bolt, substantially as herein described.

4. The horizontal rotary bolt having the ends of its shaft journaled in boxes suspended by links from above, the bracket carrying the anti-friction roller J, and the eccentric or cam from which an end shaking motion is transmitted through the bracket and journal-boxes to the bolt, in combination with the depending plate, against which the upper end of the shaft of the roller J travels, and by which the bracket is retained in its upright position, substantially as herein described.



5. A bolting-machine comprising the horizontal rotary bolt, the suspended swinging boxes at the ends thereof, a shaft journaled in said boxes, horizontal links connected with the boxes and with a fixed support, a cam or eccentric at one end of said bolt, and a spring at the opposite end, whereby an end shaking or oscillating motion of the bolt is produced, substantially as described.

REISSUES.

10,978. PREPARING GRAIN. GEORGE H. CORMACK, Rockford, Ill. Filed Sept. 27, 1888. Serial No. 286,614. Original No. 353,924, dated Dec. 7, 1886.

Claim.—1. In the preparation of grain products, the process substantially as herein described, consisting in steaming the grain, partially drying the steamed grain, reducing the partially-dried grains, and subjecting the product to a drying process, as and for the purpose set forth.

10,978.

2. The herein-described process in the preparation of grain products, consisting in steaming the grain, partially drying and cooling the steamed grain, crushing the partially dried and cooled grains, and subjecting the crushed grains to a drying and separating process, substantially as and for the purpose set forth.

PHOTO LITH NORRIS PETERS WASHINGTON D.C.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

EX PARTE KING.

Decided December 17, 1888.

STATEMENT.

Applicant has presented for registration as a Trade-Mark an exact representation of the well-known badge of the Grand Army of the Republic, which he proposes to use as a water-mark on writing-paper.

1. EXCLUSIVE PROPERTY IN EMBLEMS USED BY SOCIETIES.

The fact that the Grand Army of the Republic have adopted a certain design for their badge, or for the letter-head of writing-paper used by them, does not secure to such organization such exclusive property in the particular representation as would deprive an applicant who has complied with all the requirements of the statute of his right to register the same as a Trade-Mark. It is well settled that emblems which have been used by societies possess no sanctity or sacredness which precludes their being used and applied as Trade-Marks.

2. TRADE-MARKS WHICH EMBELLISH.

The objection of the examiner that the Trade-Mark embellishes the paper is not approved. It may be said that scarcely any Trade-Mark can be applied to paper without incidentally embellishing it. If the design is a legitimate subject of a Trade-Mark and is not prohibited by law, the fact that it incidentally embellishes the page on which it appears cannot deprive it of its lawful quality as a Trade-Mark.

3. REPRESENTATIONS PATENTED AS DESIGNS NOT BARRED FROM REGISTRATION AS TRADE-MARKS.

The fact that the Grand Army of the Republic have previously obtained a Design patent for this representation, the term of which has expired, does not constitute a legitimate bar to the employment of this design as a Trade-Mark in commerce with foreign nations. The mere fact that the organization originated the design would make no difference whatever if the design has been donated to the world to be used in all the ways of which it is capable. The Grand Army of the Republic retained no proprietary right after the term of their design patent expired. There is no property in the design itself vested in any one. Any person may apply the design as a Trade-Mark to a certain class of merchandise, and when thus applied it acquires the quality of property and becomes vested in him who first makes such new and distinct application of the design, and registration will be granted, provided the applicant has complied with all the requirements of the statute and the mark is used in commerce with foreign nations.

4. OFFICE BOUND BY THE OATH OF APPLICANT.

The Patent Office has not the means to investigate the question whether the applicant in the present case is simply seeking to obtain the guise of security round his Trade-Mark, when he really means to use it as an attractive embellishment for a particular class of persons in this country. The Office is bound by the oath of the applicant, and such a question as the above must be settled by the courts.

APPEAL from Primary Examiner.

TRADE-MARK FOR WRITING-PAPER.

Application of David King filed May 14, 1888.

Mr. H. A. Toulmin for the applicant.

HALL, *Commissioner:*

Applicant has presented as his Trade-Mark for writing-paper a design, which he uses as a water-mark, consisting, essentially, of the letters "G. A. R." and the representation of an eagle, a flag, and a star. It is proper to add that this design, which the applicant claims to have applied to his goods as a Trade-Mark, is an exact representation of the well-known badge of the Grand Army of the Republic. Although the applicant in his argument has attempted to draw some distinctions between the Trade-Mark exhibited by him and the badge of the Grand Army of the Republic, there can be no doubt that the similarity is such that the distinctions alluded to make no difference whatever.

This application for registration has been refused by the examiner, for the reason that the design has been heretofore adopted and employed by the Grand Army of the Republic upon badges worn by its members, and has been printed as a letter-head upon the writing-paper used by that organization in its correspondence. The examiner has also insisted that this design, when applied by way of a water-mark upon the paper, embellishes and consequently enhances the value of it, and this, having another use than that of a Trade-Mark, is not the proper subject of a Trade-Mark registration. It is also proper to add that heretofore this design was patented as a Design, but the term for which this security was obtained has expired, so that it is no longer protected. No objection is made to its registration on account of the fact that it is incorporated in the paper as a water-mark in the process of manufacture, for it is conceded that the water-mark is one of the ancient and well-known means of applying a Trade-Mark to writing-paper, and no reason is conceived for objecting to it on that ground. The question then arises whether the facts stated above constitute a proper and legitimate bar to the employment of this design in its application to interstate commerce as a Trade-Mark.

The fact that this proposed Trade-Mark may be said to be a design I think can make no possible difference. The records of the Office contain a multitude of Trade-Marks which are designs in the sense that they are fanciful pictures and illustrations, and it matters not how incongruous or meaningless a design may be it still, within some limits and restrictions, can be the subject of a Trade-Mark.

It is conceded that this design has never been used as a Trade-Mark by the Grand Army of the Republic

or by any other persons either in local trade, interstate commerce, or commerce with foreign nations. As is said by the examiner in a supplement to his statement, this design has become a matter of public knowledge and use, so that it is no longer capable of being exclusively appropriated in the ordinary sense as property. It has fallen into the mass of fanciful designs which may be employed by every person in any appropriate and lawful manner. The applicant in this case claims to have thus found it the subject of lawful use, and has so far appropriated and applied it as a Trade-Mark to a certain class of merchandise in a proper and legal manner. His doing this in no manner interferes with its proper and lawful use by all other citizens and persons. The Grand Army can still use it in precisely the same manner in which it has heretofore been used, upon the badges of the members and upon the paper which they use in their correspondence, whether such paper is manufactured by this applicant with the Trade-Mark incorporated as a water-mark, or whether the paper is entirely different in the respect of containing no water-mark whatever. So any other persons than the members of the Grand Army of the Republic can employ this design upon other materials than paper, and I see no reason why it may not be employed as a Trade-Mark when applied to any other class of merchandise to which it may be properly appropriated. The examiner concedes that this could be done. If a manufacturer of carpets saw proper to have this design woven in his carpet, certainly no objection could be raised against it. The design could also be printed upon wall-paper as an ornament simply, for the reason that, not being the subject of copyright and not being secured by any law applicable thereto, it is capable of general and universal use. The Trade-Mark law provides that when an individual has obtained or selected, either by his own ingenuity or by appropriating that which he finds existing in public knowledge, a device or design, and has applied it as a Trade-Mark to a class of merchandise which he is using in commerce with other nations, he shall be entitled to have such Trade-Mark registered and to receive the protection which the law gives to a Trade-Mark. This, of course, depends upon whether he is the first to have thus applied that device or design upon that class of goods which is the subject of foreign commerce.

In the present case the applicant has complied with the statute and filed the necessary affidavit asserting himself to be the first person who has adopted this design as a Trade-Mark in foreign commerce. There is nothing of record in the statement of the examiner intimating that the Grand Army of the Republic, or any other organization or person, has ever thus applied this design. I have already stated how the Grand Army of the Republic has used this badge or design. That use has been of such a character that no property in it remains with such organization, for its members have published it to the world. It seems that at one time they retained a property in one of the methods recognized by law—viz., by a Design patent. The period of that security has expired. Had that organization been engaged in the manufacture or sale of paper, or any other merchandise or commodity, and seen proper to apply this design to that class of merchandise as a Trade-Mark, they could have been secured in its use and enjoyment in the manner provided by the Trade-Mark law; but, as already stated, they have never engaged in such manufacture or sale, nor have they attempted to secure a property in the design in the manner set forth. They have, however, published the design to the world both in their use of it and by their Design patent, just as manuscripts and the results of thought are donated and given to the public by the ordinary and usual publication and use, when such public use and publication are not guarded and protected by conforming to the copyright law. There is, however, no property in the design itself vested in any one.

The applicant in this case, in selecting the design under consideration from what the examiner may term the worthless rubbish abandoned by its owner—the materials of dust heaps and accumulations—has acquired no property in the thing, and it is only by this new application of the design as a Trade-Mark to a certain class of merchandise that it newly acquires the quality of property and becomes invested in him who first makes such an application of it. I can conceive that there is no more reason why the applicant should be denied his right to a Trade-Mark under these circumstances than if he had selected some fanciful design which might have belonged to the order of St. John, or that had existed two or three centuries ago, the only condition being that, having selected it, he has applied it as a Trade-Mark to merchandise in foreign commerce, as required by the statute.

It is said that the seal of the Government belongs to all persons in the sense that no one can acquire an individual property in it or apply it as a Trade-Mark. I see no occasion to discuss that question now; but as to mere emblems which have been used by societies it seems to be settled by the decisions of the Office that there is no sanctity or sacredness about them which precludes their being used and applied as Trade-Marks.

Attention has been called to the case of *ex parte Tolle*, (2 O. G., 415;) but the later case of *ex parte Thomas* (14 O. G., 821; C. D., 1878, 113) seems especially to overrule the former one. The Commissioner in this later decision says:

> I cannot agree with the doctrine of that case, (*ex parte Tolle.*) There is no law giving to the Masonic fraternity a monopoly of the symbols used by them, and I see no reason why this Office should not hold in the same respect the symbols and emblems of the Odd Fellows and of other secret societies, and the particular emblems used by certain religious organizations.
>
> In regard to the character of the deception that might be caused by the use of such symbols on manufactured goods the decision is silent. It is inferred, however, from a careful perusal of the opinion that the public might be led to think that the manufacturer using the mark was a Mason, when he was not; or that, being a Mason, his goods were of first-rate quality, when in truth they were very poor.
>
> On consulting the statute, however, I find nothing at all indicating that the function of a Trade-Mark is to point out the character or social standing of its owner or the quality of his goods. Nor is there anything in the Office rules requiring us to apply any tests of this kind. The sole and independent office of a Trade-Mark is to distinguish the goods of one person from the same kind of goods made or sold by another. The relations to society the manufacturer bears or the particular quality of his goods are determined by the public in other ways.

It is proper to say in this case that I do not find, nor does the examiner suggest, that the design as used would be calculated to deceive, and the case is not brought within the principles announced in *ex parte M. Bloch & Co.*, (40 O. G., 443.)

It is suggested that if this Trade-Mark is allowed to be registered the members of the Grand Army of the Republic would be precluded from using the design or symbol in the manner in which they have heretofore used it. Evidently this is a misapprehension. As stated above, that organization will have precisely the same right to employ this design upon its badges even if the badges could be regarded as articles of merchandise, and also to imprint it in the manner heretofore done upon paper used in correspondence, whether that paper contains the water-mark or Trade-Mark of this applicant or is common and ordinary paper. But, it is said, suppose hereafter the Grand Army desire to manufacture paper or to use paper in which its members have caused this water-mark, their own symbol, to be impressed, would they not be regarded as infringers of the Trade-Mark thus registered by the applicant? It will be seen at once that whenever the Grand Army of the Republic enter upon the manufacture and sale of paper and attempt to employ this symbol as a feature of that paper they embark in a new business and attempt to apply this design to a new use. So, also, if they, instead of engaging in such manufacture or sale for the purpose of supplying themselves with this kind of paper, were to employ or induce others to manufacture and engage in the sale, then such other persons would themselves begin the manufacture and use of a quality of paper and the employment of this design in a use to which it had not heretofore been applied. Whether such a use of the design would constitute infringement of this Trade-Mark depends upon a number of important questions: First, would they employ it as a Trade-Mark? Second, would such Trade-Mark be applied in foreign commerce or interstate commerce or in local trade only? Finally, would such use be simply a matter of embellishment? In either event it would be an entirely distinct and new application of the use of this design by the Grand Army of the Republic, or by such persons as the organization should employ or induce to enter into the manufacture and sale of such paper, and when the Grand Army or such other persons began this new use of the design they must take it subject to the rights of other parties accrued prior to this new use and application. This is the condition in which every person finds himself placed when he applies for the registration of a Trade-Mark. If some other party has previously used the Trade-Mark and has registered it, an interference follows and the Office decides which one first properly applied the design to the same class of goods; or, if the question arises in the courts, the courts settle the rights of the parties, depending upon which one first thus applied the design as a Trade-Mark. I am not able to see that the Grand Army of the Republic would occupy any other or different position. The mere fact that they were the originators of the design or the authors of it, in my opinion, would make no difference whatever, for the reason that they have donated this design to the world to be used in all the ways in which the design is capable of use, and retained no proprietary right in themselves, and in that condition the Trade-Mark quality which follows the application of the design to merchandise belongs to him who first applies it to that particular purpose.

Then as to the question whether the Grand Army would have the right to embellish their paper with this design by means of the water-mark. Whether they would have the right to do that depends entirely upon whether it would be an infringement of a previously-registered Trade-Mark in which the same design was employed by means of the water-mark. If it were used solely for embellishment, and was never used in commerce, and was employed by the members of the Grand Army exclusively, it probably would not present a case of infringement, unless the courts should find that its use operated to deceive the public and induced it to purchase a particular kind of paper used and thus embellished by this organization upon the supposition or belief that it was the paper of the character and quality manufactured by the applicant under his Trade-Mark. In such a case the courts would probably hold that there was an infringement.

The examiner has made the objection that this Trade-Mark embellishes the paper and thus adds something to its intrinsic value, and that whatever possesses this quality cannot properly be made the subject of a Trade-Mark, and several cases are cited; but I do not think such cases support the proposition in its application to the present case. The proposition which lies at the foundation of this case is that a Trade-Mark may be impressed upon each sheet of paper as a water-mark, and I think it may be safely said that scarcely any Trade-Mark can be or would be thus applied without incidentally embellishing the page or the paper to a greater or less extent; but if the design itself is the proper and legitimate subject of a Trade-Mark, is not prohibited by law or contrary to public morals or public policy, the fact that it incidentally embellishes the page on which it appears cannot deprive it of its lawful quality as a Trade-Mark, and I do not think that objection is well taken under the circumstances.

There are several affidavits filed in the record in which this particular feature of the water-mark is set out, and it is undoubtedly true that paper of a suitable quality containing this water-mark might be particularly acceptable to members of the Grand Army; but the Trade-Mark is sought to be registered for its use in foreign commerce, and the affidavit of the applicant asserts that it has been thus used, although evidently not to any great extent as yet, and it is in the direction of such employment that the registration is allowed. The Patent Office is not constituted, nor has it the means, to investigate the question whether the applicant in the present application is simply seeking to obtain the guise of security around his Trade-Mark when he really means to use it as an attractive embellishment for a particular class of persons in this country. I feel that the Office is bound by the affidavit, and that in that respect the affidavit of the applicant cannot be controverted. Such a question as that must be settled by the courts.

In conclusion, the case is one that has given me no little difficulty. It has been thoroughly and elaborately presented by the examiner, and it is with the greatest hesitation that I find myself compelled to differ with his opinion; but in view of the fact that there is this difference between his opinion and mine I feel that it is due to the applicant to give him the benefit of the doubt.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

GOODYEAR'S INDIA RUBBER GLOVE MANUFACTURING COMPANY *et al. v.* THE GOODYEAR RUBBER COMPANY.

Decided December 10, 1888.

1. TRADE-MARK—WORDS DESCRIPTIVE OF A CLASS OF GOODS CANNOT BE APPROPRIATED AS A TRADE-MARK.
The name "Goodyear Rubber Company" is not one capable of exclusive appropriation as a Trade-Mark. "Goodyear Rubber" are terms descriptive of well-known classes of goods produced by the process known as Goodyear's invention. Names which are thus descriptive of a class of goods cannot be adopted as Trade-Marks and be thereby appropriated to the exclusive right of any one.
2. SAME—SAME—ADOPTED AS A CORPORATE NAME.
Nor will the incorporation of a company in the name of an article of commerce, without other specification, create any exclusive right to the use of the name.

APPEAL from the Circuit Court of the United States for the Southern District of New York.

Mr. F. H. Betts, *Mr. J. E. Hindon Hyde*, and *Mr. Samuel R. Betts* for the appellants.

Mr. W. W. MacFarland for the appellee.

Mr. Justice FIELD delivered the opinion of the Court.

This was a suit in equity, brought by the Goodyear Rubber Company, a corporation created under the laws of New York, to restrain Goodyear's India Rubber Glove Manufacturing Company, a corporation created under the laws of Connecticut, and others, defendants below, from using the name of "Goodyear's Rubber Manufacturing Company," or any equivalent name in their business. The bill alleges that the plaintiff was organized as a corporation on the 20th of November, 1872, for the purpose of manufacturing and dealing in india-rubber and gutta-percha goods, under its corporate name, in the city of New York; that it engaged in business in that city, where it has three large warehouses, with branch houses in other cities; that since its organization it has continually used its corporate name on signs at its various places of business and factories; on its bill and letter heads; on its various articles of manufacture; and on its corporate seal in contracts and other business transactions, that by reason thereof it has become possessed of an exclusive right and title to its corporate name, which, from its inseparable connection with the business and good-will of the company, has become of great value; and that its exclusive use is essential to the prosperity of the plaintiff. The bill then sets forth that at the time of its organization there existed a corporation carrying on business in the city of New York under the name of "Goodyear's India Rubber Glove Manufacturing Company," and dealing in various articles of which india-rubber formed a component part, its business being similar to that of the plaintiff; that prior to the organization of the plaintiff in November, 1872, that company conducted its business under its corporate name, using it on its business signs, on its letter and bill heads, on its seal, and in all contracts and business transactions; that after the creation and organization of the plaintiff that company began to call itself "Goodyear's Rubber Manufacturing Company," and, for the purpose of diverting to itself the business and good-will of the plaintiff, resorted to various devices and contrivances having for their object the imitation and appropriation to its use of the plaintiff's name; that among these devices was the representation of the words "India" and "Glove," sometimes in small letters and sometimes by initials, thereby constituting a name for practical purposes almost identical with the name of the plaintiff, producing much loss and inconvenience to plaintiff's business by causing a diversion of letters and telegrams addressed to it; that for the like purpose of taking from the plaintiff its customers and trade, and appropriating its good-will, that company, on or about the 1st of January, 1882, adopted for its principal sign the name "Goodyear's Rubber Mfg. Co." over the entrance to and in front of its warehouses, and that these devices deceive the public and divert business and customers from the plaintiff, by which it sustains, and, without the interference of this Court, will in the future sustain, great loss and damage.

The bill also alleges that the defendants Allerton and Vermule, with other persons unknown to the plaintiff, pretend to be a corporation under the name of "Goodyear's Rubber Manufacturing Company," and that they are the principal owners and managers of the business carried on under the name of "Goodyear's India Rubber Glove Manufacturing Company," and of "Goodyear's Rubber Manufacturing Company," and as such direct and control whatever is done under the names of both.

The several defendants appeared and filed answers to the bill. These allege in similar terms that the defendant, Goodyear's India Rubber Glove Manufacturing Company, was organized as a corporation under that name in Connecticut in 1847 for the purpose of manufacturing india-rubber goods, and in 1849 obtained license for their manufacture under patents of Charles Goodyear, and continued in that business during the existence of those patents; that after their expiration and in 1865, and continuously since, it has manufactured and sold very largely all kinds and classes of india-rubber goods, treated according to the patents of Goodyear; that it has been for upward of twenty years the most prominent corporation or association in the city of New York engaged in the manufacture of those goods, and has become known to the trade by abbreviated and generally-used titles of "Goodyear's Rubber Manufacturing Company," or "Goodyear Rubber Company," or "The Goodyear's Company," and other similar titles abbreviated from its full corporate name; that the name of "Goodyear" in connection with the word "Company," or "Co.," or with similar brief letters or words indicating a company engaged in rubber-manufacturing, has been its distinguishing characteristic; that by adoption of the name of "Goodyear" in connection with its business and acquiescence of the public therein, and general usage, that company acquired a valuable right and interest in it, and has exercised the same for upward of twenty years; that its use has been recognized by the plaintiff and its predecessors in repeated business transactions; that a large part of its correspondence during this period has been under the abbreviated names of "Goodyear Rubber Company," "Goodyear's Rubber Manufacturing Company," or "Goodyear's Company," or other similar abbreviated title; that it registered a trade-mark in the name of "Goodyear's Rubber Manufacturing Company," and for the purpose of protecting it filed a certificate of incorporation under that name in New York in March, 1873; and that its trustees and managers subsequently organized as a corporation under that name in Connecticut. The answers also allege that the organizers of the plaintiff company, prior to 1873, had done business only under the name of "Rubber Clothing Company," or as "F. M. & W. A. Sheppard," or as "Sheppard & Dudley;" that about January 1, 1873, for the purpose of injuring the defendant and appropriating its well-known name and good-will, and securing its business, they organized the plaintiff under the name of the "Goodyear Rubber Company," against which the defendant protested; and that such action on the part of the plaintiff has caused a diversion of the business of the defendant and general interference with it.

As a separate defense the answers also set forth various transactions of the plaintiff, which tended to show unfair and inequitable measures to divert to itself business from the defendant, "Goodyear's India Rubber Glove Manufacturing Company," but it is not deemed important to state them. That company also filed a cross-bill to restrain the conduct of the plaintiff in that respect, and praying that damages might be decreed against it for its wrongful and inequitable acts. Replications having been filed to the several answers, proofs were taken, upon which the court below rendered a decree in favor of the plaintiff, perpetually enjoining the defendants from using or in any way employing the name "Goodyear's Rubber Manufacturing Company," or the name "Goodyear Rubber Company," or any abreviation thereof representing such integral name in their business, upon their signs, bills of merchandise, receipts, letters, products of their manufacture, or otherwise; and directing that the cross-bill be dismissed. From the whole of that decree an appeal was taken to this Court.

The proofs in the case show very clearly that "Goodyear's India Rubber Glove Manufacturing Company" had, as alleged in its answer, been for many years in the use of abbreviations in the designation of its company, using sometimes a name similar to the corporate name of the plaintiff; and if any exclusive right to the abbreviated name were to follow from its protracted use, that right would seem to belong to that company rather than to the plaintiff. But the name of "Goodyear Rubber Company" is not one capable of exclusive appropriation. "Goodyear Rubber" are terms descriptive of well-known classes of goods produced by the process known as Goodyear's invention. Names which are thus descriptive of a class of goods cannot be exclusively appropriated by any one. The addition of the word "Company" only indicates that parties have formed an association or partnership to deal in such goods, either to produce or to sell them. Thus parties united to produce or sell wine, or to raise cotton or grain, might style themselves "Wine Company," "Cotton Company," or "Grain Company," but by such description they would in no respect impair the equal right of others engaged in similar business to use similar designations, for the obvious reason that all persons have a right to deal in such articles, and to publish the fact to the world. Names of such articles cannot be adopted as trade-marks, and be thereby appropriated to the exclusive right of any one; nor will the incorporation of a company in the name of an article of commerce, without other specification, create any exclusive right to the use of the name.

In *Canal Company* v. *Clark*, (13 Wall., 311,) an attempt was made to appropriate the term "Lackawanna" to coal brought by the canal company from Lackawanna Valley in Pennsylvania. The coal sold by the defendant Clark was a different kind, but was brought from the same valley, and he designated it also as "Lackawanna" coal. To enjoin this use of the name the suit was brought. The Court held that geographical names designating districts of country could not be thus appropriated exclusively, as they pointed only to the place of production, and not to the producer.

Could such phrases—

said the Court—

as "Pennsylvania wheat," "Kentucky hemp," "Virginia tobacco," or "Sea Island cotton" be protected as trade-marks; could any one prevent all others from using them, or from selling articles produced in the districts they describe under those appellations, it would greatly embarass trade and secure exclusive rights to individuals in that which is the common right of many.

In reaching this conclusion the Court considered the principles upon which the owner of a trade-mark is protected in its use, and held that—

the trade-mark must, either by itself or by association, point distinctively to the origin or ownership of the article to which it is applied. The reason of this is, that unless it does, neither can he who first adopted it be injured by any appropriation or imitation of it by others, nor can the public be deceived.

And again:

No one can claim protection for the exclusive use of a trade-mark or trade-name which would practically give him a monopoly in the sale of any goods other than those produced or made by himself. If he could, the public would be injured rather than protected, for competition would be destroyed. Nor can a generic name, or a name merely descriptive of an article of trade, of its qualities, ingredients, or characteristics, be employed as a trade-mark and the exclusive use of it be entitled to legal protection.

To the same purport is the decision in *Manufacturing Company* v. *Trainer*, (101 U. S., 51.) There the Court said:

The object of the trade-mark is to indicate, either by its own meaning or by association, the origin or ownership of the article to which it is applied. If it did not, it would serve no useful purpose, either to the manufacturer or to the public; it would afford no protection to either against the sale of a spurious in place of the genuine article. (See, also, *Amoskeag Manufacturing Co.* v. *Spear*, 2 Sandf., 599; *Falkenburg* v. *Lucy*, 35 Cal., 52; *Choynski* v. *Copia*, 39 Cal., 501; *Faggett* v. *Findlater*, Law Rep. 17 Eq., 29.)

The designation "Goodyear Rubber Company" not being subject to exclusive appropriation, any use of terms of similar import, or any abbreviation of them, must be alike free to all persons.

The case at bar cannot be sustained as one to restrain unfair trade. Relief in such cases is granted only where the defendant, by his marks, signs, labels, or in other ways, represents to the public that the goods sold by him are those manufactured or produced by the plaintiff, thus palming off his goods for those of a different manufacture, to the injury of the plaintiff. (*McLean* v. *Fleming*, 96 U. S., 245; *Sawyer* v. *Horn*, 4 Hughes, 239; *Perry* v. *Truefitt*, 6 Beavan, 66; *Croft* v. *Day*, 7 *Id.*, 84.) There is no proof of any attempt of the defendant to represent the goods manufactured and sold by him as those manufactured and sold by the plaintiff; but on the contrary, the record

shows a persistent effort on its part to call the attention of the public to its own manufactured goods, and the places where they are to be had, and that it had no connection with the plaintiff.

It follows that the decree of the circuit court as to the original bill must be reversed and the cause remanded, with instructions to dismiss that bill, with costs. No case was made out for relief to the plaintiff in the cross-bill. The costs of the appeal are awarded to the appellants.

U. S. Circuit Court—Northern District of Illinois.

PRESTON *v.* THE FIRE EXTINGUISHER MANUFACTURING COMPANY *et al.* LA FRANCE FIRE ENGINE COMPANY *v.* THE FIRE EXTINGUISHER MANUFACTURING COMPANY *et al.*

Decided November 5, 1888.

1. JURISDICTION—SUIT AGAINST NON-RESIDENT CORPORATION—SERVICE OF PROCESS.
   A corporation not a resident of this district cannot be sued in this court. Service of process upon the agent or officer of a non-resident corporation insufficient.
2. SAME—SAME.
   A corporation created and existing solely under the laws of another State, and having its principal office and place of business in another State and district, cannot be said to be an inhabitant of this district and be sued here, even though such corporation may do business in this district through agents.

Messrs. Munday, Evarts & Adcock for the complainants.

Messrs. Banning & Banning & Payson for the defendants.

BLODGETT, *J.*:

These cases are now before me upon a plea filed in the cause to the jurisdiction of the court. The plea sets up by way of challenge to the jurisdiction of the court the fact that this defendant, The Fire Extinguisher Manufacturing Company, at the time of the filing of the bill of complaint was a corporation duly organized and existing under and by virtue of the laws of the State of New York; that it has its principal office and keeps its books of account in that city, and that no stockholder, officer, or director resides in this city; that said company was not prior to nor at the date of the filing of the bill of complaint an inhabitant of the northern district of Illinois or of the State of Illinois.

In the case of the *Gormully & Jeffrey Manufacturing Company* v. *The Pope Manufacturing Company*, (34 Fed. Rep., 818,) before me in March last, I had occasion to examine this question and there came to the conclusion that under the act of March 3, 1887, and the same holds good in regard to the act as explained and modified by the act of August 13, 1888, a non-resident corporation cannot be sued in this district—that is, a corporation not a resident of this district cannot be sued here merely by service upon an agent or officer. The opinion in that case has been published, and counsel are familiar with it, so it is hardly necessary to quote from it. It is enough to say that the act of 1887 requires suit to be brought in the district whereof the defendant is an inhabitant, but drops from the latter the provision that he may also be sued in any district where he may be found at the time of the serving of the process. I have re-examined that question in the light of suggestions made by counsel for complainant, and still adhere to the conclusion there announced, that a corporation created and existing solely under the laws of another State, and having its principal office and place of business in another State and district, cannot be said to be an inhabitant of this district and be sued here, even although such corporation may do business in this district through agents. The agents can undoubtedly be sued here if the case is such as to make them personally liable, or when an injunction is sought against them.

The statute of the State of Illinois, (sec. 26, chap. 32, Rev. Stats. of Ill.,) which provides that foreign corporations shall be subject to all the liabilities, restrictions, and duties that are or may be imposed upon domestic corporations, I do not think helps the complainants in this case, as it has nothing to do with the question of jurisdiction or of the tribunal to which you can go for the purpose of bringing suit. It simply makes foreign corporations subject to the same liabilities as home corporations. It does not reach the question as to what tribunal you are to go into.

The bill charges defendants with the infringement of a patent owned by complainant, and it was stated on argument as to the sufficiency of this plea that defendants have a factory in this district and manufacture the infringing machines here as a reason why defendants may be sued here. It is very plain that if an individual, an inhabitant of another State, owned and carried on this factory, conducting its business through his agents and employés, he could not be sued in this district, and I see no reason why the same rule is not applicable to corporations of other States. In other words, it seems to me a corporation can by State comity carry on business in a State outside of that by which it was created without becoming an inhabitant of such outside State.

The plea in each case is held sufficient.

OFFICIAL GAZETTE

OF THE

UNITED STATES PATENT OFFICE.

SUPPLEMENT

CONTAINING THE

REVISED CLASSIFICATION OF SUBJECTS OF INVENTION,

ALPHABETICALLY ARRANGED.

JANUARY 1, 1889.

WASHINGTON:
GOVERNMENT PRINTING OFFICE.
1889.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., January 1, 1889.

The following is the official classification of patents and inventions in the Patent Office. No changes will be made therein except by order of the Commissioner.

Should occasion arise for any modification of this classification, either by the discontinuance of any title or by the addition of a new one, the matter will be presented to the Commissioner for his action.

Examiners will not transfer patented drawings from one class or sub-class to another except on the Commissioner's approval.

Changes in classes and sub-classes will be published in the OFFICIAL GAZETTE.

BENTON J. HALL,
Commissioner of Patents.

CLASSIFICATION OF INVENTIONS.

REVISED AND APPROVED BY THE UNITED STATES PATENT OFFICE JANUARY 1, 1889.

All inventions are classified in the United States Patent Office.

The present classification, revised January 1, 1889, contains one hundred and eighty-eight classes, subdivided into over four thousand sub-classes.

Persons desiring to inform themselves in regard to the state of the art in any line of invention can best do so by purchasing printed copies of the specifications and drawings of patents in the sub-class containing the invention, the number and cost of which will be given upon application.

Those wishing to subscribe for the printed copies of specifications and drawings of future patents in any sub-class may do so by depositing any amount from five dollars upward, the sum depending upon the size of the sub-class. The copies will then be mailed to them weekly, at the rate of ten cents each, until the deposit shall have become exhausted, when notice will be duly sent for renewal of deposit, if desired.

Orders for specifications and drawings by classes should give the numbers as well as the titles of the class and sub-class.

Orders for single patents should give the number and date of the patent and the name of the inventor.

SPECIFICATIONS of patents issued since June 10, 1862, commencing with No. 35,520, have been printed up to this date; also, all patents previously issued for processes, and in the classes of Arms and Projectiles, Brakes and Gins, Distillation, Electricity, Fire-Arms, Fishing and Trapping, Harrows and Diggers, Harvesters, Injectors and Ejectors, Marine Propulsion, Metal-Founding, Ordnance, Packing and Storing Vessels, Plows, Projectiles, Seeders and Planters, Sewing-Machines, Sheet-Metal-Ware Making, Steam and Vacuum Pumps, Steam Water-Elevators, Sugar and Salt, Tobacco, Trees, Plants and Flowers, and Wire-Working, and the sub-classes of Bale-Band Tighteners, Bale-Ties, Cane-Mills, Cane-Strippers, Car-Seats, Cotton and Hay Presses, Tobacco-Driers, Tobacco-Elevators, Time-Locks, and Type-Writing.

DRAWINGS of all patents, from earliest to present date, have been photolithographed, with a few exceptions.

The cost of copies of drawings with the specifications, if printed, when ordered in quantites of twenty or more, is ten cents per copy. If the specification has not been printed, an additional cost of ten cents per hundred words for a manuscript copy of it will be charged.

For the convenience of those who do not desire to order as many as twenty copies at one time, coupon orders, good for one drawing and printed specification, are sold in quantities of twenty or more, at ten cents each. These may be used singly and are good till used.

CLASSES ALPHABETICALLY ARRANGED.

Number.	Class.	Division.	Number.	Class.	Division.
180	Accouterments and baggage	22	67	Lamps and gas-fittings	30
181	Acoustics	23	68	Laundry	27
40	Advertising	22	69	Leather	11
1	Aeration and bottling	9	70	Locks and latches	20
123	Air and gas engines	18	184	Lubricators	12
2	Apparel	24	74	Machine elements	12
86	Arms and projectiles. Making	13	115	Marine propulsion	22
166	Artesian and oil wells	15	72	Masonry	4
3	Artificial limbs	20	73	Measuring-instruments	23
106	Artificial stone, lime, and cement	15	185	Mechanical motors	19
4	Baths and closets	9	167	Medicines	6
5	Beds	8	153	Metal-bending	14
6	Bee-culture	2	10	Metal bolts, nuts, rivets, and screws	13
8	Bleaching and dyeing	6	77	Metal boring and drilling	13
9	Boats	22	78	Metal-forging	13
11	Book-binding	5	22	Metal-founding	14
12	Boots and shoes	11	75	Metallurgy	3
13	Brakes and gins	21	79	Metal personal wear. Making	13
107	Bread, cracker, and lozenge making	6	80	Metal-rolling	13
7	Brewing and fermenting	3	148	Metal tempering, annealing, and cementation	3
14	Bridges	4	76	Metal tools and implements. Making	13
15	Brushing and scrubbing	27	134	Metal tubing and wire	13
16	Builders' hardware	20	82	Metal turning, planing, and milling	13
17	Butchering	2	81	Metal-working tools	28
18	Caoutchouc and minor plastics	15	83	Mills	25
19	Carding	21	84	Music	5
119	Care of live stock	2	85	Nails and spikes	13
20	Carpentry	29	163	Needles and pins	13
21	Carriages and wagons	10	151	Nut and bolt locks	28
59	Chains, staples, and horseshoes	13	87	Oils, fats, and glue	6
155	Chairs	8	88	Optics	23
23	Chemicals	6	89	Ordnance	22
24	Clasps and buckles	11	150	Packing and storing vessels	14
25	Clay and pottery	15	91	Painting	6
26	Cloth-finishing	21	92	Paper-making	15
96	Coating with metal	3	93	Paper-manufactures	17
154	Composite roofing	15	94	Paving	15

65	Kitchen and table articles	8	144	Wood-working machines	29
66	Knitting and netting	21	145	Wood-working tools	29

CLASSES NUMERICALLY ARRANGED.

Number.	Class.	Division.
1	Aeration and bottling	9
2	Apparel	24
3	Artificial limbs	20
4	Baths and closets	9
5	Beds	8
6	Bee-culture	2
7	Brewing and fermenting	3
8	Bleaching and dyeing	6
9	Boats	22
10	Metal bolts, nuts, rivets, and screws	13
11	Book-binding	5
12	Boots and shoes	11
13	Brakes and gins	21
14	Bridges	4
15	Brushing and scrubbing	27
16	Builders' hardware	20
17	Butchering	2
18	Caoutchouc and minor plastics	15
19	Carding	21
20	Carpentry	29
21	Carriages and wagons	10
22	Metal-founding	14
23	Chemicals	6
24	Clasps and buckles	11
25	Clay and pottery	15
26	Cloth-finishing	21
27	Undertaking	30
28	Cordage	21
29	Crinoline and corsets	24
30	Cutlery	20
31	Dairy	2
32	Dentistry	20
33	Drafting	23
34	Driers	28
35	Educational appliances	23
37	Excavating	4
38	Felting and hat-making	15
39	Fences	1
40	Advertising	22
41	Fine arts	5
42	Fire-arms	22
43	Fishing and trapping	22
44	Fuel	6
45	Furniture	8
46	Games and toys	8
47	Trees, plants, and flowers	2
48	Gas	3
49	Glass	15
50	Fluid-pressure regulators	18
51	Grinding and polishing	27
52	Explosives	6
53	Hardware-making	13
54	Harness	11
55	Harrows and diggers	1
56	Harvesters	7
57	Hoisting	12
58	Horology	23
59	Chains, staples, and horseshoes	13
60	Hose and belting	11
61	Hydraulic engineering	4
62	Refrigeration	23
63	Jewelry	5
64	Journal-boxes, pulleys, and shafting	12
65	Kitchen and table articles	8
66	Knitting and netting	21
67	Lamps and gas-fittings	30
68	Laundry	27
69	Leather	11
70	Locks and latches	20
71	Fertilizers	6
72	Masonry	4
73	Measuring-instruments	23
74	Machine elements	12
75	Metallurgy	3
76	Metal tools and implements. Making	13
77	Metal boring and drilling	13
78	Metal-forging	13
79	Metal personal wear. Making	13
80	Metal-rolling	13
81	Metal-working tools	28
82	Metal turning, planing, and milling	13
83	Mills	25
84	Music	5
85	Nails and spikes	13
86	Arms and projectiles. Making	13
87	Oils, fats, and glue	6
88	Optics	23
89	Ordnance	22
91	Painting	6
92	Paper-making	15
93	Paper-manufactures	17
94	Paving	15
95	Photography	5
96	Coating with metal	3
97	Plows	1
98	Pneumatics	28
99	Preserving	6
100	Presses	2
101	Printing	17
102	Projectiles	22
103	Pumps	9
104	Railways	4
105	Railway-cars	10
106	Artificial stone, lime, and cement	15
107	Bread, cracker, and lozenge making	8
108	Roofing	4
109	Safes	20
110	Steam-boiler furnaces	18
111	Seeders and planters	1
112	Sewing-machines	24
113	Sheet-metal ware. Making	14
114	Ships	22
115	Marine propulsion	22
116	Signals	22
117	Silk	21
118	Spinning	21
119	Care of live stock	2
120	Stationery	5
121	Steam-engines	18
122	Steam-boilers	18
123	Air and gas engines	18
124	Distillation	3
125	Stone-working	15
126	Stoves and furnaces	19
127	Sugar and salt	2
128	Surgery	20
129	Tanning	11
130	Thrashing	25
131	Tobacco	2
132	Toilet	5
134	Metal tubing and wire	13
135	Umbrellas and canes	5
136	Steam-engine valves	18
137	Water-distribution	9
138	Hydraulic motors	9
139	Weaving	21
140	Wire-working	14
141	Washing apparatus	27
142	Wood-turning	29
143	Wood-sawing	29
144	Wood-working machines	29
145	Wood-working tools	29
146	Vegetable cutters and crushers	2
147	Coopering	29
148	Metal tempering, annealing, and cementation	3
149	Hides, skins, and leather. Chemical treatment of	6
150	Packing and storing vessels	14
151	Nut and bolt locks	28
152	Wagon, car, and track irons	13
153	Metal bending	14
154	Composite roofing	15
155	Chairs	8
156	Curtains, shades, and screens	8
157	Wheelwright-machines	29
159	Fire escapes and ladders	4
160	Steam and vacuum pumps	18
161	Steam water-elevators	18
162	Injectors and ejectors	18
163	Needles and pins	13
164	Punching and shearing	13
165	Designs	24
166	Artesian and oil wells	15
167	Medicines	6
168	Farriery	28
169	Fire-extinguishers	9
170	Wind-wheels	28
171	Electricity. Generation	26
172	Electricity. Motive-power	26
173	Electricity. Conductors	26
174	Electricity. Medical and surgical	26
175	Electricity. Special applications	26
176	Electric lighting	16
177	Electric signaling	16
178	Telegraphy	16
179	Telephony	16
180	Accouterments and baggage	22
181	Acoustics	23
182	Sewerage	4
183	Fire-proof buildings	4
184	Lubricators	12
185	Mechanical motors	12
186	Store service	12
187	Elevators	12
188	Fluid-pressure railway-brakes	18

SUB-CLASSES.

CLASS 180.—ACCOUTERMENTS AND BAGGAGE. (XXII.)

Sub-classes.

1. Accouterments.
2. Awnings.
11. Bayonets, scabbards, and sword-belts.
12. Camp and lunch kits.
13. Canteens and flasks.
3. Cartridge boxes and belts.
14. Hat and fur cases.
15. Knapsacks and haversacks.
4. Mail-bags.
16. Musicians' cases.
5. Package-holders.
6. Portfolios and pocket-books.
8. Tents.
9. Traveling-bags.
10. Trunks—
17. Convertible.

CLASS 181.—ACOUSTICS. (XXIII.)

Sub-classes.

1. Audiphones.
2. Ear-trumpets.
3. Mechanical telephones.
5. Miscellaneous.
4. Phonographs.

CLASS 40.—ADVERTISING. (XXII.)

Sub-classes.

1. Articles.
2. Automatic devices.
3. Card-racks.
19. Counters and shelves.
4. Desks and frames.
5. Door and drawer plates.
6. Dummies and hangers.
8. Indicators—
18. Time.
9. Labels.
10. Label-holders.
17. Map-holders.
11. Picture-exhibitors.
12. Show boxes and cards.
13. Show-cases.
16. Show stands and racks.
14. Signs.

CLASS 1.—AERATION AND BOTTLING. (IX.)

Sub-classes.

12. Beer apparatus.
3. Capping-machines.
5. Corking and filling.
14. Dispensing-fountains.
7. Gas-generators.
11. Sirup-fountains.
9. Soda-fountains.
10. Soda-water apparatus.

CLASS 123.—AIR AND GAS ENGINES. (XVIII.)

Sub-classes.

5. Attachments.
Engines—
1. Air,
2. Caloric,
Engines—
3. Explosive,
4. Gas.

CLASS 2.—APPAREL. (XXIV.)

Sub-classes.

34. Armpit-shields.
30. Bonnets.
1. Capes and shawls.
2. Coats and vests.
3. Collars and cuffs.
35. Combination garments.
4. Cutting.
36. Darning-lasts.
5. Diapers.
6. Embroidery-patterns.
37. Garment-protectors.
8. Garters and belts.
9. Gloves.
10. Handkerchiefs.
31. Hats and caps.
32. Hat-sweats.
33. Hat-ventilators.
38. Muffs and mufflers.
11. Neckties.
28. Needles.
39. Needle-threaders.
40. Nether garments.
13. Pin and needle cases.
14. Pinking.
16. Plaiting.
15. Pockets.
18. Sewing.
41. Shirts.
20. Skirt-elevators.
42. Skirts.
23. Stockings.
22. Stretchers and formers.
43. Supplemental bosoms.
25. Tailoring.
29. Thimbles.
44. Thread holders and cutters.
26. Trimmings.
27. Work-boxes.
45. Work-holders.

CLASS 86.—ARMS AND PROJECTILES. MAKING (XIII.)

Sub-classes.

1. Arms.
2. Bullets and shot.
3. Cannon and ball.
4. Cartridges and caps.
5. Gun-barrels.
7. Rifling.

CLASS 166.—ARTESIAN AND OIL WELLS. (XV.)

Sub-classes.

1. Casing-heads.
2. Cleaning.
3. Drilling and boring.
4. Drill-jars.
5. Drill-rod grabs.
6. Reamers.
10. Sucker-rods.
7. Tube-clamps.
8. Tubing and packing.
9. Walking-beams.

CLASS 3.—ARTIFICIAL LIMBS. (XX.)

Sub-classes.

1. Arms and hands.
4. Crutches.
2. Fracture apparatus.
3. Legs.

CLASS 106.—ARTIFICIAL STONE, LIME, AND CEMENT. (XV.)

Sub-classes.

1. Composition.
3. Limekilns.
4. Molds.
5. Plastering.
6. Processes.

CLASS 4.—BATHS AND CLOSETS. (IX.)

Sub-classes.

1. Basins and stands.
2. Bathing apparatus.
19. Bed-pans.
5. Closet-cisterns.
20. Dry closets.
11. Sinks and traps.
12. Urinals.
13. Vapor-baths.
Water-closets—
16. Plunger,
22. Siphon,
17. Valved.
18. Water-closet attachments.
15. Water-closet valves.
21. Water-closet and sewer ventilation.

CLASS 5.—BEDS. (VIII.)

Sub-classes.

Beds—
1. Air,
5. Camp.
Bed-bottoms—
23. Folding,
24. of cords,
25. of slats,
26. of slats and springs,
29. of springs,
19. of wire and other fabrics.
3. Bed-clothing.
4. Bedsteads—
8. Extension,
9. Folding,
12. Invalid,
Bedsteads—
16. Sofa,
17. Table,
18. Wardrobe.
22. Clothes-clamps.
6. Cording and fastenings.
7. Crib attachments.
20. Cribs and cradles.
10. Hammocks.
11. Head-sections.
13. Mattresses.
14. Mosquito-nets and canopies.
15. Pillows.
21. Springs.

CLASS 6.—BEE-CULTURE. (II.)

Sub-classes.

1. Bee-hives.
2. Hive appliances.

CLASS 8.—BLEACHING AND DYEING. (VI.)

Sub-classes.

16. Apron vats and stretchers.
2. Bleaching.
1. Carbon dyes.
5. Dyeing processes.
6. Dyes.
13. Mordants.
17. Perforated rolls and spray-jets.
7. Press-dyeing.
8. Renovating dress.
18. Vats. Close
19. Vats. Open
15. Steam and bleach chests.
12. Wool-cleaning.

CLASS 9.—BOATS. (XXII.)

Sub-classes.

1. Boat hooks and fenders.
2. Building.
3. Buoys and safes.
4. Detaching, hoisting, and lowering.
5. Life boats and rafts.
6. Life-preservers.
7. Oars and oar-locks.
8. Rafting and booming.
9. Sectional and folding.
10. Swimming appliances.

CLASS 11.—BOOK-BINDING. (V.)

Sub-classes.

1. Albums.
2. Binding-machines.
3. Books and covers.
4. Book-cover protectors.
5. Book-cutting.
6. Book-stapling.
7. Indexing.
9. Newspaper-files.
8. Ruling-machines.
10. Temporary binders.
11. Writing-tablets.

CLASS 12.—BOOTS AND SHOES. (XI.)

Sub-classes.

2. Boot-jacks.
30. Boot-treeing machines.
3. Boot-trees.
4. Burnishing.
24. Channeling-machines.
5. Crimping.
6. Edge-planes and shaves.
28. Glove and corset fastenings.
32. Hand nailing implements.
34. Heel-machines.
33. Heel-nailing machines.
29. Heel-stiffener machines.
7. Heels.
8. Ice-creepers.
9. Lasts.
10. Lasting-machines.
25. Lasting and lasting tools.
31. Peg-floats.
11. Pegs.
12. Pegging-jacks.
13. Pegging-machines. Nails and pegs—
35. Wire.
14. Rubber.
15. Shanks and machines.
16. Shoe-fastenings.
17. Soles.
18. Sole and heel trimming machines.
19. Sole-machines.
26. Sole and heel plates.
20. Tips and stiffeners.
21. Tools.
22. Uppers.
23. Upper-machines.

CLASS 13.—BRAKES AND GINS. (XXI.)

Sub-classes.

10. Delinting cotton-seed.
1. Gin attachments.
2. Hackling-machines.
3. Hair-pickers.
4. Oakum-machines.
5. Processes.
6. Reciprocating brakes.
7. Roller-gins.
8. Rotary brakes.
9. Saw-gins.

CLASS 107.—BREAD, CRACKER, AND LOZENGE MAKING. (VIII.)

Sub-classes.

1. Breadandcracker machines.
3. Cake-cutters.
6. Lozenge-machines.
4. Mixers and kneaders.
2. Pastry-boards.
7. Pie crimpers and trimmers.
8. Rolling-pins.

CLASS 7.—BREWING AND FERMENTING. (III.)

Sub-classes.

9. Fermented beverages.
1. Fermenting-vats.
8. Hop-backs.
3. Malting.
4. Mashing.
5. Mash-heaters.
6. Preserving beer and wine.
7. Purifying beer and wine.
10. Wine.

Sub-Classes in Brewing and Fermenting, with Explanatory Notes.

9. FERMENTED BEVERAGES. Includes all fermented beverages except beer or wine.

1. FERMENTING-VATS. Processes of and apparatus for fermenting; also, for the preparation of yeast.

8. HOP-BACKS. Devices for straining hops from beer.

3. MALTING. Processes of and apparatus for the germination of grain for the production of malt.

4. MASHING. Processes of and apparatus for the production of wort.

5. MASH-HEATERS. Apparatus for boiling the wort.

6. PRESERVING BEER AND WINE. Processes of and apparatus for imparting "keeping" properties to beer and wine.

7. PURIFYING BEER AND WINE. Clarifying beer and wine and analogous processes.

10. WINE. Processes of and apparatus for preparing wine.

CLASS 14.—BRIDGES. (IV.)

Sub-classes.

Bridges—
7. Arch,
1. Draw,
9. Gates,
6. Floating,
5. Suspension,
Bridges—
6. Truss.
2. Ferry-guards.
3. Girders and columns.
4. Piers.
10. Towers.

CLASS 15.—BRUSHING AND SCRUBBING. (XXVII.)

Sub-classes.

1. Blacking box and brush cases.
18. Blacking-box holders.
61. Boot-blacking machines.
2. Boot-cleaners.
4. Broom-machines.
Brooms—
19. Broom-heads,
20. Household,
21. Stable and yard,
22. Whisk.
23. Brush and broom bridles—
24. Handles,
6. Supports.
25. Brush-cleaners.
Brush heads and faces—
26. Bath and flesh brushes,
27. Brush and broom fiber,
28. Dusting-brushes,
29. Hair-brushes,
30. Hat and clothes brushes,
31. Horse-brushes,
32. Metal-cleaning brushes,
33. Metallic tuft-fasteners,
34. Molds and molded backs,
35. Nail-brushes,
36. Paint and whitewash brushes,
37. Rotary brushes,
13. Scrubbers,
38. Shaving-brushes,
39. Tooth-brushes.
7. Brush-machines.
40. Brush-trimming machines.
8. Carpet-cleaners.
60. Carpet-sweepers.
Chimney-cleaners—
41. Flue and stove-pipe,
42. Lamp.
43. Combined mop heads and wringers.
44. Combined scrubbers and mops.
45. Dressing and assorting machines.
Fountain-brushes—
46. Blacking,
47. Broom,
48. Hair,
49. Paint,
51. Scrubbers,
50. Shaving,
52. Tooth,
53. Window-cleaners.
Holders—
54. Brush-head,
55. Convertible mop and brush.
56. Mop-heads.
57. Mops.
12. Mop-wringers.
14. Scrubbing-machines.
15. Pails.
58. Shoe-blacking stands.
16. Shoe-brushes.
17. Street-sweepers.
59. Window-cleaners.

CLASS 16.—BUILDERS' HARDWARE. (XX.)

Sub-classes.

1. Blind-stops.
2. Bolts.
3. Carpet-fasteners.
4. Casters—
45. Ball,
21. Sewing-machine.
6. Door-checks—
46. Door checks and closers, Pneumatic.
47. Door-closers, Gravitating—
7. Hangers,
8. Securers,
9. Springs.
10. Handles.
11. Hinges—
48. Awning-blind,
5. Coach,
49. Gate,
12. Lock,
Hinges—
14. Safe,
25. Spring,
27. Table.
50. Nail-heads. Ornamental
15. Sash balances—
18. Fasteners,
19. Holders,
20. Weights.
16. Sash-cord fasteners—
17. Guides.
22. Shutter bowers—
23. Fasteners,
24. Workers.
26. Stair-rods and securers.
37. Till-alarms.
28. Transom-lifters.
29. Window-bead fasteners.
30. Window and door buttons.

CLASS 17.—BUTCHERING. (II.)

Sub-classes.

8. Butchers' stalls.
9. Chopping-blocks.
Dressing—
10. Fish-dressing machines,
11. Hog-scraping machines,
12. Intestine-cleaners,
13. Skinning.
14. Meat-clamps.
15. Hooks.
Meat-cutters—
16. Cracklings,
17. Crank mechanism,
18. Cube,
19. Cylinder and block,
20. Cylinder and concave,
Meat-cutters—
21. Double-cylinder,
22. Hand,
23. Rocking-knife,
24. Slicers,
25. Trip mechanism.
26. Meat-mixers.
Meat-tenderers—
27. Hand,
28. Pivoted-head,
29. Rotary.
6. Sausage-machines.
7. Scalding and singeing.
30. Slaughtering, elevating, and suspending.

CLASS 18.—CAOUTCHOUC AND MINOR PLASTICS. (XV.)

Sub-classes.

2. Articles.
1. Artificial ivory.
3. Celluloid.
4. Fabrics.
5. Hard rubber.
11. Insulating materials.
6. Machines for coating.
7. Miscellaneous compositions.
8. Soft rubber.
9. Vulcanizing apparatus.
10. Vulcanized fiber.

CLASS 19.—CARDING. (XXI.)

Sub-classes.

1. Burring.
2. Card-clothing.
3. Carding.
5. Coilers.
6. Combing.
12. Covering yarn.
7. Feeding-cards.
13. Fleece dividers and condensers.
14. Fleece-removers.
8. Lapping.
9. Pickers.
15. Stripping mechanism.
10. Wadding.
11. Wool oiling.

CLASS 110.—CARE OF LIVE STOCK. (II.)

Sub-classes.

Animal-stocks—
14. Hog-traps,
15. Horse and cattle,
16. Sheep.
46. Bird cages and houses.
17. Catching and holding tools.
48. Curry-combs.
47. Gags and muzzles.
18. Gangways.
3. Grooming.
49. Hitching-posts and ties.
51. Hopples.
4. Incubators.
52. Manure-pouches.
13. Nose-rings and ringing-tools.
12. Pokes.
5. Poultry-culture.
19. Sheep-protectors.
9. Stanchions.
Steading and feeding—
20. Calf-feeders,
21. Combined troughs and racks,
22. Feed-racks,
23. Feed-troughs,
52. Nose-bags,
24. Releasing devices,
25. Stall-floors,
Steading and feeding—
26. Stalls, sheds, and pens.
53. Stock-cars.
27. Stock-sorters.
Straw-cutters—
Cutter and bed—
28. Reciprocating-knife,
29. Rotary-cylinder.
30. Cylinder and concave.
31. Double-cylinder.
Pivoted-knife—
32. Rake-feed,
33. Roller-feed,
34. Without feed.
Rotary wheel—
35. Follower-feed,
36. Rake-feed,
37. Roller-feed,
38. Without feed.
Single-cylinder—
39. Rake-feed,
40. Roller-feed,
41. Without feed.
Sliding-knife—
42. Rake-feed,
43. Roller-feed,
44. Without feed.
50. Tethers.

CLASS 20.—CARPENTRY. (XXIX.)

Sub-classes.

34. Compound lumber.
2. Doors—
23. Car,
24. Sliding.
3. Door-operating device.
32. Drip-troughs.
4. Floors.
5. Frame houses.
7. Interiors.
9. Lathing—
42. Metallic.
10. Marquetry.
39. Mats—
43. Wire.
26. Moldings.
11. Portable houses.
12. Scaffolds—
28. Bracket.
13. Shingling-brackets.
14. Shutters—
29. Flexible,
30. Fire-proof,
Shutters—
44. Sliding,
45. Swinging.
15. Skylights.
16. Slatted floor-coverings.
33. Splices and joints.
17. Stairs.
18. Stair-covers.
31. Thresholds.
19. Weather-strips—
35. Hinged,
37. Sills,
38. Packing,
36. Sliding.
Window—
46. Chairs,
40. Guards,
47. Sashes—
48. Sliding,
50. Sliding and swinging,
49. Swinging.
20. Windows.

CLASS 21.—CARRIAGES AND WAGONS. (X.)

Sub-classes.

1. Ambulances.
2. Axle-boxes.
3. Axle-lubricators.
4. Axle-skeins.
5. Axles.
7. Bodies.
8. Brakes.
9. Brakes, Automatic
10. Brake-levers.
11. Carriage-irons.
12. Children's carriages.
13. Clips.
14. Close carriages.
15. Dash-boards.
16. Detaching horses.
17. Decrs.
18. Draft-equalizers.
19. Drays.
20. Dumping-wagons.
21. End-gates.
22. Felloes.
23. Fenders.
24. Fifth-wheels.
26. Hearses.
27. Holdbacks.
28. Hose-carriages.
29. Hounds.
30. Hub-attaching devices.
31. Hubs.
32. King-bolts.
33. Lumber-wagons.
36. Poles and shafts.
38. Road-engines.
39. Running-gear.
40. Sand-bands.
41. Seat-locks.
42. Seats—
43. Shifting,
44. Spring.
45. Shifting-rails.
75. Skates—
76. Roller,
77. Wheel.
74. Skaters' appliances.
46. Sled-brakes.
47. Sled-propellers.
48. Sleds.
49. Spoke-sockets.
50. Springs—
51. Platform,
52. Side,
53. Torsion.
54. Standards.
55. Steps.
56. Sulkies.
57. Thill-couplings.
58. Tires.
59. Tire-tighteners.
63. Tongue-supports.
60. Top-joints.
61. Top-props.
62. Tops.
64. Traction-wheels.
65. Trucks.
67. Velocipedes.
68. Wheelbarrows.
69. Wheels.
70. Whiffletree-hooks.
71. Whiffletrees.
73. Windows.

CLASS 59.—CHAINS, STAPLES, AND HORSESHOES. (XIII.

Sub-classes.

1. Chains.
2. Chain and link making.
4. Horseshoe-bars. Making
5. Horseshoe-calks. Making
6. Horseshoe-machines.
7. Staples.
8. Staples. Making

CLASS 155.—CHAIRS. (VIII.)

Sub-classes.

3. Chairs—
26. Attachments,
27. Adjustable backs,
28. Adjustable backs and seats,
29. Backs and seats independently adjustable,
4. Bottoms,
6. Convertible,
7. Dentists',
8. Folding,
30. Folding adjustable,
11. Invalid,
12. Nursery,
13. Opera,
16. Reclining,
18. Rocking—
31. Platform,
Chairs—
21. Step-ladder,
23. Surgical,
24. Tilting.
Rests—
9. Foot,
10. Head.
Seats—
2. Car,
5. Circus,
25. Spring.
19. Settees.
20. Sofas.
22. Stools and seats.
32. Stools. Folding

CLASS 23.—CHEMICALS. (VI.)

Sub-classes.

1. Acids. Mineral
21. Ammonia.
3. Apparatus.
24. Carbon compounds, not dyes, containing chiefly vinegar, salicylic acid, and other organic acids.
23. Distilling wood.
27. Electrolysis, containing only those cases in which the subject-matter is, producing chemical compounds by electricity.
5. Fire-extinguishing compounds.
10. Metalloids, embracing non-illuminating gases, sulphur, and phosphorus.
11. Packing chemicals.
26. Purifying water.
13. Salines.
22. Soda and potash.

CLASS 24.—CLASPS AND BUCKLES. (XI.)

Sub-classes.

26. Baggage-checks.
28. Buckles and snap-hooks combined.
1. Buckles—
27. Personal wear.
2. Buttons—
23. Hinged shoe,
21. Separable.
3. Buttoners.
4. Button-fasteners.
5. Button-machines.
29. Button-setting tools.
6. Clasps.
24. Cuff-holders.
7. Eyelets.
8. Eyeleting-machines.
25. Garment-supporters.
9. Hooks.
10. Hooks and eyes.
11. Necktie-fasteners.
13. Paper-fasteners.
14. Punches.
15. Rings.
16. Safety attachments.
17. Snap-hooks.
20. Suspenders.
18. Tags and tag-fasteners.
19. Ticket-clasps.

CLASS 25.—CLAY AND POTTERY. (XV.)

Sub-classes.

1. Bricks.
2. Brick-kilns.
Brick-machines—
4. Reciprocating,
3. Rotary,
5. Screw.
6. Brick-molds.
8. Drain-tiles.
9. Paving-tiles.
10. Pottery articles.
11. Pottery-kilns.
12. Pottery-machines.
13. Pug-mills, clay-mills, and mortar-mixers.
14. Pulverizers.
16. Sarcophagi.
17. Tile-machines.

CLASS 26.—CLOTH-FINISHING. (XXI.)

Sub-classes.

1. Drying.
2. Finishing.
3. Folding.
4. Napping.
5. Pressing.
6. Shearing.
7. Sponging.
8. Stretching.

CLASS 96.—COATING WITH METAL. (III.)

Sub-classes.

1. Electro-deposition.
2. Galvanizing.
9. Iron oxides.
5. Nickel-plating.
8. Precipitating.
7. Tinning.

Sub-Classes in Coating with Metal, with Explanatory Notes.

1. ELECTRO-DEPOSITION. Processes of and apparatus for coating with metals (other than nickel) by electro-deposition.

2. GALVANIZING. Processes of and apparatus for coating metals with molten zinc, copper, &c.

9. IRON OXIDES. Processes of and apparatus for oxidizing iron surfaces.

5. NICKEL-PLATING. Processes of and apparatus for electroplating with nickel.

8. PRECIPITATING. Processes of and apparatus for coating with metal by chemical processes, (not included in other subclasses,) including production of coating of sulphides, &c.

7. TINNING. Processes of and apparatus for coating metals with molten tin, terne, lead, &c.

CLASS 154.—COMPOSITE ROOFING. (XV.)

Sub-classes.

1. Apparatus.
2. Composite.
3. Felt.

CLASS 147.—COOPERING. (XXIX.)

Sub-classes.

1. Barrel-head making.
2. Barrel-hoop machines.
3. Barrel-making machines.
4. Basket-making machines.
5. Box-machines.
11. Coiling.
12. Crozing barrels.
6. Crozing staves.
13. Hoop-drivers.
8. Jointing staves.
10. Wooden articles.

Sub-Classes in Coopering, with Explanatory Notes.

1. BARREL-HEAD MAKING. The wood is held in a clamp and cut to disk form, usually with beveled edges, by a saw or cutter. The clamp revolves or cutter moves around it.

2. BARREL-HOOP MACHINES. For dressing or cutting wooden hoops by saws, or by rotary or reciprocating cutters, including mechanism for forming the taper or bevel of hoops.

3. BARREL-MAKING MACHINES. For assembling the barrel.
4. BASKET-MAKING MACHINES. For building up splints about a former.
5. BOX-MACHINES. For making pill-boxes, &c., by forming the box upon the stock by means of cutters, and then severing the box from the block.
11. COILING. Coiling hoops or veneers, usually about a collapsible former.
12. CROZING BARRELS. Machines for cutting the croze after the barrel is set up.
6. CROZING STAVES. Machines for cutting the croze in staves or blanks.
13. HOOP-DRIVERS. Machines for trussing and evening barrels.
8. JOINTING STAVES. Machines for producing the bevel on bulged staves.
10. WOODEN ARTICLES. Miscellaneous small articles of wood.

CLASS 28.—CORDAGE. (XXI.)

Sub-classes.

1. Balling.
2. Banding.
3. Bobbin-supporters.
4. Braiding.
5. Cords and ropes.
21. Cord and rope machines.
6. Covering cord.
7. Finishing yarn and thread.
8. Fuse.
9. Packaging braid and yarn.
10. Reels.
11. Separating rope.
12. Spools.
13. Tassels.
14. Warping.
Winding bobbins—
15. Warp-wind,
16. Weft-wind,
17. Sewing-machine shuttle.
22. Winding-heddle and seine-needles.
18. Winding-spools.
19. Winding tatting-shuttles.
20. Yarn guides and clearers.

CLASS 29.—CRINOLINE AND CORSETS. (XXIV.)

Sub-classes.

1. Bustles.
3. Corsets.
4. Hoops and clasps.
5. Hoop-skirts.
6. Pads.
7. Skirt-machines.
9. Stays.
8. Underwaists.

CLASS 156.—CURTAINS, SHADES, AND SCREENS. (VIII.)

Sub-classes.

1. Carriage-curtain fastenings.
2. Curtain-cord holders.
11. Curtain-cord tighteners.
3. Curtain-fixtures.
4. Curtain rollers and brackets.
5. Curtain-tassels.
6. Friction-rollers.
7. Inside blinds.
8. Ratchet and pawl.
9. Spring-rollers.
13. Window-cornices.
14. Window-screens.
10. Window-shades.

CLASS 30.—CUTLERY. (XX.)

Sub-classes.

1. Animal-shears.
2. Button-hole cutters.
3. Can-openers.
16. Envelope-openers.
21. Fork-guards,
5. Forks,
22. Forks and spoons. Solid
9. Knives—
20. Gage,
Knives—
8. Hay,
10. Pocket.
11. Pruning implements.
12. Razors.
13. Scissors and shears.
14. Twine-cutters.
15. Wick-trimmers.
17. Wire-shears.

CLASS 31.—DAIRY. (II.)

Sub-classes.

Butter and cheese—
24. Cutters,
23. Manufacture of
25. Butter workers and molds.
30. Centrifugal creamers.
21. Cheese-hoops.
26. Cheese-turners.
22. Cheese-vats and curd-breakers.
7. Churns—
9. Double-acting,
Reciprocating.
Crank mechanism—
29. Multiple-dasher,
30. Single-dasher,
31. Combined lever and crank mechanism,
32. Foot mechanism,
33. Hand and foot mechanism.
Lever mechanism—
34. Multiple-dasher,
35. Single-dasher,
36. Rocking-seat mechanism,
37. Without operating mechanism.
Rotary—
38. Diagonal-dasher,
39. Horizontal single-dasher,
Horizontal double-dasher—
40. Concentric shafts,
41. Parallel shafts.
Churns—
Rotary—
42. Vertical single-dasher.
Vertical double-dasher—
43. Concentric shafts,
44. Parallel shafts.
17. Vibrating,
18. Working body.
8. Cow-milkers.
27. Cream-pumps.
63. Drink-mixers.
57. Egg-beaters—
61. Reciprocating,
59. Rotary multiple-dasher,
58. Single-dasher.
60. Vibrating.
Milk-coolers—
45. Aerating.
46. Creaming-cans—
47. Agitators,
48. Depending-tube,
49. Floats,
50. Vacuum creamers,
51. Vertical-tube.
52. Milk-circulation.
53. Vats—
54. Air-circulation,
55. Horizontal-tube,
56. Removable-pipe.
13. Milk-stools.
14. Pails and strainers.
28. Tables and racks.

CLASS 32.—DENTISTRY. (XX.)

Sub-classes.

1. Articulators.
2. Drills.
3. Foil-condensers.
4. Mechanical.
5. Miscellaneous.
6. Molds.
7. Operative.
8. Pluggers.
9. Teeth.
10. Tools.

CLASS 165.—DESIGNS. (XXIV.)

The sub-classes conform as nearly as possible to those of the mechanical classes.

CLASS 124.—DISTILLATION. (III.)

Sub-classes.

1. Aging liquors.
2. Alcohol.
3. Burning-fluid.
4. Condensers.
7. Fresh water.
8. Oil.
9. Paraffine.
10. Preparing grain.
11. Refining oils.
13. Revenue-guards.
12. Turpentine.

Sub-Classes in Distillation, with Explanatory Notes.

1. AGING LIQUORS.—Processes of and apparatus for purifying and aging liquors by chemical agents, electricity, &c.
2. ALCOHOL. Processes of and apparatus for obtaining alcohols by distillation.
3. BURNING-FLUID. Liquids to be employed for burning in lamps, and processes of preparing the same, not involving distillation or the refining processes.
4. CONDENSERS. Processes of and apparatus for condensing vapors arising from liquids undergoing distillation.
7. FRESH WATER. Processes of and apparatus for distilling water for domestic purposes. (See Class 121, Condensers, Division XVIII.)
8. OIL. Processes of and apparatus for the distillation of mineral oils.
9. PARAFFINE. Processes of and apparatus for the preparation and purification of paraffine, ozokerite, &c.
10. PREPARING GRAIN. Processes of and apparatus for reducing grain to a moist disintegrated mass for immediate use in the mash-tub. Does not include articles primarily suitable for food, nor preparing the same, Class 99, Preserving, Division VI; nor cleaning and degerminating grain, Class 83, Mills, Division XXV.
11. REFINING OILS. Refining mineral oils.
13. REVENUE-GUARDS. Devices for testing liquor, especially adapted for use during the distillation process.
12. TURPENTINE. Preparation and refining of turpentine and rosin.

CLASS 33.—DRAFTING. (XXIII.)

Sub-classes.

13. Beam-compasses.
1. Calipers and dividers.
2. Curve-scribers.
5. Ellipsographs.
6. Pantographs.
7. Parallel-rulers.
8. Plotters.
12. Protractors—
9. Scribers,
10. Stair-curvers.

CLASS 34.—DRIERS. (XXVIII.)

Sub-classes.

13. Coffee-roasters.
1. Driers—
3. Fruit,
12. Glue,
4. Grain,
5. Lumber,
6 Malt,
7. Meal,
Driers—
8. Paper,
10. Tobacco,
11. Wool.
2. Feather-renovators,
14. Gravel-heaters.
9. Smoke-houses.

CLASS 35.—EDUCATIONAL APPLIANCES. (XXIII.)

Sub classes.

1. Alphabet-blocks.
2 Arithmetic.
3. Astronomy.
15. Blackboards.
4. Geography.
5. Globes.
13. Kryptography.
6. Maps.
12. Miscellaneous.
8. Penmanship.
9. Reading.
10. Slates.
14. Slate-mufflers.

CLASS 171.—ELECTRICITY. GENERATION. (XXVI.)

Sub-classes.

Batteries—
6. Galvanic,
72. Secondary,
74. Applications,
73. Thermal.
23. Friction-generators.
95. Galvanometers.
27. Induction-coils.
33. Magneto-electric—
118. Couplings.
76. Hand-machines.
34. Meters.
40. Regulators—
119. Alternating.
97. Systems of distribution.

Sub-Classes in Electricity—Generation—with Explanatory Notes.

6. BATTERIES. GALVANIC. Chemical generators of electricity.
72. BATTERIES. SECONDARY. Appliances for translating electricity into chemical energy and retranslating the same into electricity.
74. BATTERIES. SECONDARY. APPLICATIONS. Devices and systems which involve the use of secondary batteries.
73. BATTERIES. THERMAL. Appliances for translating heat directly into electricity.
23. FRICTION-GENERATORS. Generators of static electricity.
95. GALVANOMETERS. Devices for indicating the strength, tension, or direction of electric currents.
27. INDUCTION-COILS. Coiled conductors for producing and applying the higher order of currents from varying or intermittent primary currents.
33. MAGNETO-ELECTRIC. Including dynamic generators of electricity for producing currents by magneto-electric induction.
118. MAGNETO-ELECTRIC. COUPLINGS. Including combinations of generators with other generators and driving devices.
76. MAGNETO-ELECTRIC. HAND-MACHINES. Including machines for signaling, blasting, and medical purposes.
34. METERS. Devices for measuring and registering the flow of electric currents.
40. REGULATORS. Devices for controlling and governing electric generators and motors.
119. REGULATORS. ALTERNATING. Including devices for regulating alternating generators and motors.
97. SYSTEMS OF DISTRIBUTION. Organized systems for distributing electricity, including apparatus at a central station and circuits controlled therefrom.

CLASS 172.—ELECTRICITY. MOTIVE-POWER. (XXVI.)

Sub-classes.

9. Car-brakes.
15. Dental instruments.
75. Locomotion.
36. Motors—
120. Alternating.
8. Steering and propulsion.
83. Transmission of power.

Sub-Classes in Electricity—Motive-Power—with Explanatory Notes.

9. CAR-BRAKES. Devices for retarding the movement of vehicles.
15. DENTAL INSTRUMENTS. Includes teeth-extractors, drillers, and pluggers.
75. LOCOMOTION. Machines and devices adapted to the propulsion of vehicles by electricity.
36. MOTORS. Including machines for translating electricity into mechanical power.
120. MOTORS. ALTERNATING. Including electric motors operated by alternating currents.
8. STEERING AND PROPULSION. Devices for controlling and directing torpedo and other boats from a distant point.
83. TRANSMISSION OF POWER. Systems and apparatus for transmitting power to distant points by electricity.

CLASS 173.—ELECTRICITY. CONDUCTORS. (XXV.)

Sub-classes.

13. Conductors—
94. Lead-covered,
70. Underground,
14. Connectors.
28. Insulators.
31. Lightning-rods.
43. Rheostats.

Sub-Classes in Electricity—Conductors—with Explanatory Notes.

13. CONDUCTORS. Including cables, wires, and means for making and insulating the same.
94. CONDUCTORS. LEAD-COVERED. Lead-incased conductors, including machines for their manufacture.
70. CONDUCTORS. UNDERGROUND. Conduits and conductors for subterranean lines.
14. CONNECTORS. Including binding-posts, line-connectors, &c.
28. INSULATORS. Insulating bearing-points for line-wires.
31. LIGHTNING-RODS. Devices for protecting structures from lightning.
43. RHEOSTATS. Devices for producing artificial resistance.

CLASS 174.—ELECTRICITY. MEDICAL AND SURGICAL. (XXVI.)

Sub-classes.

87. Baths.
88. Body-wear.
89. Electrodes.

Sub-Classes in Electricity—Medical and Surgical—with Explanatory Notes.

87. BATHS. Applications of electricity to baths and bath-furniture for curative purposes.
88. BODY-WEAR. Galvanic devices to be applied to the body for curative purposes.
89. ELECTRODES. Circuit terminals for applying electricity to the body.

CLASS 175.—ELECTRICITY. SPECIAL APPLICATIONS. (XXVI.)

Sub-classes.

Applications—
4. General,
5. Tools and machines.
21. Electro-magnets—
96. Machines for winding.
16. Heaters.
Igniting devices—
115. Automatic,
Igniting devices—
117. Inductional,
116. Manual,
91. Portable.
25. Incrustation.
93. Magnetic locks and bolts.
90. Separators.
84. Valve-controllers.

Sub-Classes in Electricity—Special Applications—with Explanatory Notes.

4. APPLICATIONS. GENERAL. Includes applications of electricity not otherwise classified.
5. APPLICATIONS. TOOLS AND MACHINES. Includes application of electricity to machinery and mechanical implements.
21. ELECTRO-MAGNETS. Special constructions and arrangements of electro-magnets and their armatures.
96. ELECTRO MAGNETS. MACHINES FOR WINDING. Machines for winding insulated wire for electro-magnets and armatures.
16. HEATERS. Devices for heating or warming by the use of the electric current.
115. IGNITING DEVICES. AUTOMATIC. Including devices for opening the cock and producing the spark by automatic means.
117. IGNITING DEVICES. INDUCTIONAL. Including inductional devices for producing the spark.
116. IGNITING DEVICES. MANUAL. Including devices for opening the cock and producing the spark by hand.
91. IGNITING DEVICES. PORTABLE. Embracing detached devices for lighting gas and lamps adapted to be carried from place to place.
25. INCRUSTATION. Means for preventing injurious deposition in steam-boilers.
93. MAGNETIC LOCKS AND BOLTS. Application of electricity and magnetism to locks and bolts.
90. SEPARATORS. Electric and magnetic separators of heterogeneous matter.
84. VALVE-CONTROLLERS. Electrical devices for regulating and controlling valve movements.

CLASS 176.—ELECTRIC LIGHTING. (XVI.)

Sub-classes.

Cut-outs—
80. Electro-magnetic,
79. Mechanical,
78. Thermal.
Lights—
Arc—
104. Gravity-feed,
105. Clutch,
106. Gear-clutch,
107. Positive-feed,
108. Clutch,
Lights—
Arc—
109. Gear-clutch,
110. Arc and incandescent—
111. Non-feeding,
112. Special features,
102. Filaments and carbon,
18. Incandescent,
113. Special features,
98. Sockets and keys,
19. Systems.

CLASS 177.—ELECTRIC SIGNALING. (XVI.)

Sub-classes.

1. Alarms—
2. Burglar.
3. Annunciators.
7. Bells.
26. Indicators.
38. Railway-signals.
39. Recorders.

CLASS 187.—ELEVATORS. (XII.)

Sub-classes.

2. Controllers.
3. Dumb-waiters.
1. Elevators.
4. Hatchways.
5. Hod.
6. Indicators.
7. Lazy-tongs.
8. Safety devices.
9. Screw.

CLASS 37.—EXCAVATING. (IV.)

Sub-classes.

11. Diggers.
1. Dredgers—
18. Anchoring,
14. Clam-shell,
13. Scouring.
2. Earth-augers.
Excavators—
15. Carrier,
16. Dipper,
Excavators—
9. Hydraulic,
10. Rammers,
17. Wheel.
5. Scrapers—
7. Wheeled.
6. Self-loading carts.
8. Warping lands.

CLASS 52.—EXPLOSIVES. (VI.)

Sub-classes.

1. Blasting compounds.
2. Fulminates.
4. Gunpowder.
5. Matches.
3. Nitro compounds.

CLASS 168.—FARRIERY. (XXVIII.)

Sub-classes.

1. Calk-sharpeners.
2. Hoof and shoe spreaders.
3. Hoof cleaners and trimmers.
5. Hoof-pads.
6. Shoes.
7. Shoe-nail clinchers.
8. Shoeing-stands.
9. Toe-weights.

CLASS 38.—FELTING AND HAT-MAKING. (XV.)

Sub-classes.

1. Blocks.
2. Blocking and stretching.
4. Brushing and finishing.
6. Curling brims.
7. Fabrics.
8. Felting-machines.
9. Flock-cutting.
10. Forming-bats.
11. Fulling.
12. Furs and pelts.
14. Ironing.
15. Pouncing.
16. Pressing.

CLASS 39.—FENCES. (I.)

Sub-classes.

2. Fence-posts.
3. Fences—
1. Barbed,
4. Flood,
6. Iron,
9. Wire.
5. Gates—
15. Compound,
21. Expanding,
24. Dropping,
22. Jump,
23. Oscillating,
11. Railway—
42. Cattle-guard,
38. Electric,
36. Mast—
35. Automatic,
41. Platform-guard,
37. Pneumatic,
39. Rocking,
44. Sliding,
43. Swinging,
40. Vertically-moving,
7. Sliding—
29. Lever-openers,
28. Pulley or rack openers,
30. Suspended,
31. Vibrating tracks,
32. Sliding and swinging—
33. Hinged-roller,
34. Suspending frames,
8. Swinging—
18. Folding-panel,
Gates—
Swinging—
14. Hand-openers,
20. Load-openers,
17. Rotary,
16. Self-closers,
25. Tilting,
19. Vertically-adjustable,
13. Tilting—
26. Folding-panel.
12. Wire fasteners.
45. Wire-stretchers. Permanent—
46. Compensators,
47. Mid-wire take-up,
48. Path-closers,
49. Post-winders,
50. Vertical.
51. Wire-stretchers. Removable—
52. Clutch-bars,
53. Grips,
54. Levers—
55. Attached,
56. Loopers,
57. Rack-bars,
58. Ratchet-bars,
59. Reel-carriers,
60. Tongs,
61. Twin-hooks,
62. Windlasses.

CLASS 71.—FERTILIZERS. (VI.)

Sub-classes.

1. Apparatus.
9. Compositions.
6. Organic.
7. Phosphates.
8. Sewage and night-soil.

CLASS 41.—FINE ARTS. (V.)

Sub-classes.

1. Artists' appliances.
2. Artificial flowers.
19. Badges.
3. Banners and flags.
4. Canvas-stretchers.
5. Decorative painting.
6. Drawing-boards.
7. Easels.
8. Engraving-machines,
9. Engraving and tools.
10. Gilding. Leaf-
12. Medals.
21. Metal ornamentation.
13. Ornamenting cloth.
14. Picture-frames.
20. Picture-supports.
15. Pictures.
16. Sculpture.
17. Theater appliances.
18. Transfers.

CLASS 42.—FIRE-ARMS. (XXII.)

Sub-classes.

25. Ball-traps.
3. Bayonets.
5. Bows and cross-bows.
6. Breech-loaders.
8. Catapults.
26. Electrical appliances.
Guns—
1. Air and spring,
4. Blow,
7. Cane,
13. Magazine.
9. Gun-barrels.
10. Gun-trimmings.
11. Implements.
12. Locks—
28. Recoil-operated.
27. Muzzle-loaders.
15. Nipples and guards.
16. Pistol-swords.
18. Revolvers.
19. Rifling.
20. Sights.
21. Stocks.
22. Targets—
24. Flying.
23. Toy pistols.

CLASS 169.—FIRE-EXTINGUISHERS. (IX.)

Sub-classes.

4. Car-heater.
1. Chemical.
2. Portable.
3. Stationary.

CLASS 159.—FIRE ESCAPES AND LADDERS. (IV.)

Sub-classes.

10. Bed-bottom.
11. Blanket.
1. Chutes.
4. Friction.
5. Hoists—
9. Trolley.
8. Ladders—
Escape-ladders—
15. Fixed,
16. Mounting,
17. Sectional hand,
19. Shooting and truck,
Ladders—
Escape-ladders—
18. Trolley,
3. Flexible,
7. Step.
20. Ladder-trucks.
6. Lazy-tongs.
14. Sliding poles.
Towers—
13. Fixed,
12. Shooting.

CLASS 183.—FIRE-PROOF BUILDINGS. (IV.)

Sub-classes.

1. Ceilings, floors, and partitions. Non-metallic.
2. Columns and timber.
3. Cornices.
4. Fire-proof roofs.
5. Flooding.
6. Floor-arches.
7. Metallic sidings and partitions.

CLASS 43.—FISHING AND TRAPPING. (XXII.)

Sub-classes.

2. Decoys.
Fishing—
3. Fishways,
4. Floats,
6. Harpoons and spears,
7. Hooks,
9. Nets and seines,
10. Oyster-culture,
11. Oyster-dredges,
12. Oyster rakes and tongs,
13. Pisciculture,
15. Reels,
16. Rods,
17. Sinkers.
Insect-destroyers—
1. Catchers,
Insect-destroyers—
5. Fumigators,
8. Moth-exterminators,
14. Powder-dusters.
Traps—
18. Bed-bug,
19. Cage,
20. Fish,
21. Impalement,
22. Insect,
23. Jaw,
24. Self-set and over-set,
25. Sporting,
26. Victim-set,
27. Wire-choker.

CLASS 188.—FLUID-PRESSURE RAILWAY-BRAKES. (XVIII.)

Sub-classes.

1. Automatic.
2. Derailment.
3. Direct.
4. Electric.
5. Momentum-pump.
6. Vacuum.

CLASS 50.—FLUID-PRESSURE REGULATORS. (XVIII.)

Sub-classes.

1. Gas.
2. Steam.
3. Water.

CLASS 44.—FUEL. (VI.)

Sub-classes.

1. Artificial.
2. Fire-kindlers.
3. Peat-machines.
4. Purifying coal.

CLASS 45.—FURNITURE. (VIII.)

Sub-classes.

1. Book-cases.
2. Book-shelves.
3. Book-supports.
4. Brackets.
5. Bureaus.
43. Carpet stretchers and tackers.
45. Closets.
6. Desks.
7. Drawers.
10. Fire-screens.
44. Furniture-covers.
13. Hat and coat racks.
14. Hat-holders.
15. Insect-guards.
16. Kitchen-cabinets.
18. Mirrors—
39. Window.
19. Music stands and portfolios.
20. Nursery-gates.
21. Oil-can holders.
22. Packing furniture.
12. Pads and feet.
23. Picture-hangers.
24. Quilting-frames.
25. School seats and desks.
28. Soap-holders.
41. Spittoons.
42. Spittoon-lifters.
30. Table-leaf supports.
31. Tables—
8. Drawing,
9. Extension,
11. Folding,
17. Kitchen,
26. Self-waiting,
27. Sewing-machine.
32. Towel racks and stands.
33. Umbrella-stands.
34. Upholstering.
35. Wall-pockets.
36. Wall-protectors.
37. Wardrobes.
38. Wash-stands.

CLASS 46.—GAMES AND TOYS. (VIII.)

Sub-classes.

4. Balls and bats.
43. Base-balls.
6. Billiard appliances—
7. Balls,
8. Chalk-cups,
9. Cues,
10. Cue-tip fasteners,
11. Cushions,
12. Tables,
13. Table-levelers.
14. Buzzes and whirligigs.
15. Croquet.
16. Dice-boxes.
20. Game apparatus—
44. Projectile.
22. Hobby-horses.
23. Kites.
42. Lawn-tennis.
24. Masks.
25. Playing-cards.
41. Puzzles and magic.
27. Roundabouts.
30. Skipping-ropes.
31. Soap-bubble pipes.
32. Spinning-tops.
33. Stilts.
34. Swings.
35. Toy building-blocks.
36. Toy money-boxes.
37. Toys—
40. Figure—
45. Wheeled,
46. Sounding—
47. Wheeled,
48. Wheeled.
38. Trundles and hoops.

CLASS 48.—GAS. (III.)

Sub-classes.

1. Anti-combustion.
2. Carburetors—
24. Carbureting-lamps,
29. Float-vaporizers,
25. Gas and air mixers,
3. Jet-mixers,
26. Oil-feed, Float-valves,
27. Oil-feed, Rotary,
28. Revolving.
4. Center-seals and by-pass valves.
9. Dip-pipes.
22. Distribution.
10. Exhausters.
Gas—
5. Coal,
6. Coal and oil,
8. Coal and water,
7. Coal, oil, and water,
12. Hydrogen,
13. Oil,
14. Oil and water,
19. Water,
20. Wood.
11. Holders.
15. Purifiers.
18. Retort-chargers.
23. Retort gas-furnaces.
16. Retort-lids.
17. Retorts and settings.

Sub-Classes in Gas, with Explanatory Notes.

1. ANTI-COMBUSTION. Processes of and apparatus for deoxygenating air and generating gases to be used in extinguishing fires. Does not include Class 169, Fire-Engines, Division IX, Class 23, Fire-Extinguishing Compounds, Division VI.

2. CARBURETORS. Methods of and apparatus for carbureting air and gas for illuminating and heating purposes, including means for regulating the flow of air or gas before entering and upon leaving the carburetor, and of mixing the carbureted air or gas with air, and of regulating the flow of oil to the carburetor, and for heating the latter, and for heating the air or gas to be carbureted.

24. CARBURETORS, CARBURETING-LAMPS. Devices for carbureting air or gas, attached to individual lamps, burners, and chandeliers. Does not include Class 67, Lamps and Gas Fittings, Division XXX.

29. CARBURETORS, FLOAT-VAPORIZERS. Carburetors in which the air or gas to be carbureted is made to pass through or under a float resting on the carbureting-liquid.

25. CARBURETORS, GAS AND AIR MIXERS. Carburetors provided with means for mixing carbureted air or gas with pure air.

3. CARBURETORS, JET-MIXERS. Carburetors provided with means for introducing air or hydrocarbon vapor on the injector principle. Does not include injector-burners, Class 75, Division III; injectors and ejectors, Class 102, Division XVIII.

26. CARBURETORS, OIL-FEED, FLOAT-VALVES. Carburetors in which the supply of hydrocarbon oil is regulated by a float attached to the valve.

27. CARBURETORS, OIL-FEED, ROTARY. Carburetors with means whereby hydrocarbon oil is elevated by buckets moving on an endless chain.

28. CARBURETORS, REVOLVING. The evaporating-surfaces revolve in the carbureting-fluid.

4. CENTER-SEALS AND BY-PASS VALVES. Construction and operation of same in connection with gas works and mains.

9. DIP-PIPES. Modes of connecting the dip-pipes with the hydraulic main, means for sealing the dip and for carrying off the tar deposited in the main.

22. DISTRIBUTION. Systems of conveying and distributing gas, gas-conduits, automatic cut-offs, mains for conveying gas under pressure, means for detecting and collecting leakage from gas-mains, pipe-joints for gas-mains. (See Pipe Couplings and Mains and Pipes, Class 137, Division IX; and Gas-Pressure Regulators, Class 50, Division XVIII.)

10. EXHAUSTERS. Apparatus for exhausting in connection with gas-retorts. (See Steam-Engines, Exhaust Mechanism, Class 121, Division XVIII.)

5. GAS, COAL. Processes of and apparatus for manufacturing gas for heating and illuminating purposes by the destructive distillation of coal in retorts, horizontal or vertical, singly or in series, and the necessary appliances for operating the same; and in connection the purifiers, condensers, &c.

6. GAS, COAL AND OIL. Processes of and apparatus for manufacturing gas for heating and illuminating purposes by mixing the gas produced from distillation of coal with vapors of hydrocarbon oil; and devices for introducing the latter.

8. GAS, COAL AND WATER. Processes of and apparatus for manufacturing gas by mixing the gas produced by distillation of coal with water or water vapor; and special means for introducing the latter.

7. GAS, COAL, OIL, AND WATER. Processes of and apparatus for manufacturing heating and illuminating gas by mixing gas produced from distillation of coal, vapors of hydrocarbon oils, and gases from decomposition of steam; with devices for introducing the various elements in connection with superheaters, fixing-chambers, purifiers, &c.

12. GAS, HYDROGEN. Processes of and apparatus for manufacturing hydrogen gas by decomposing steam by passing it through incandescent fuel, by bringing water in contact with acids and zinc or other decomposing substances, by action of dilute acid on zinc or iron filings, &c.; with necessary means for carbureting and fixing the gas.

13. GAS, OIL. Processes of and apparatus for manufacturing gas from hydrocarbon oils by vaporizing the same in a heated retort, or in contact with a bath of molten metal, or in a tubular generator to contain oil which is vaporized by means of superheated steam in the tubes, &c.; and means for regulating the temperature in the retorts and the feed of the hydrocarbon.

14. GAS, OIL AND WATER. Processes of and apparatus for manufacture of heating and illuminating gas by decomposing steam, vaporizing hydrocarbon oil, and mixing the two to form a fixed gas; with the necessary appliances for operating the apparatus.

19. GAS, WATER. Processes of and apparatus for production of gas from decomposition of steam by passing same through highly-heated carbonaceous fuel; in connection with means for carbureting and fixing the gas.

20. GAS, WOOD. Processes of and apparatus for production of gas from distillation of wood or other substances, in connection with suitable devices for introducing hydrocarbon oil or vapors, and of fixing the gas.

11. HOLDERS. Receptacles for holding gas under pressure, means for sealing the holder; and, in connection with the necessary operation of the holder, brackets, rollers, guides, pulleys, and weights.

15. PURIFIERS. Methods of and apparatus for the washing or scrubbing of gas by passing through water, lime, and various other substances for removal of deleterious matter.

18. RETORT-CHARGERS. Apparatus for charging and drawing gas-retorts by means of scoops, wheeled carriages, &c., or brackets hung transversely on lateral bars; and means for leveling the charge in the retort.

23. RETORT GAS-FURNACES. Special construction of furnaces for manufacturing heating and illuminating gas, and necessary appliances for operating the same, with special construction of flues for introduction of air, and means for burning the gases within the furnace. (See Iron and Steel Direct, Retort-Furnaces, Class 75, Metallurgy, Division III.)

16. RETORT-LIDS. Caps or lids, as especially applied to the closing of gas-retorts.

17. RETORTS AND SETTINGS. Apparatus for generating various forms of gas, means for operating the same without special provision for flues, or for burning generated gases. (See Gas, Retort Gas-Furnaces.)

CLASS 49.—GLASS. (XV.)

Sub-classes.

1. Articles.
2. Cutters.
4. Enameling.
7. Molds.
8. Ornamentation.
10. Plate and window.
9. Presses.
11. Tools.

CLASS 51.—GRINDING AND POLISHING. (XXVII.)

Sub-classes.

1. Abrading materials and tools.
Glass and stone—
3. Curved surfaces,
11. Plane surfaces.
Metal—
2. Card-grinding,
4. Curved surfaces,
6. Cutlery-scourers,
7. Edge-tools,
8. Mower and reaper knives,
Metal—
9. Needle-eyes,
10. Needles, rods, and points,
12. Plane surfaces,
14. Rumbles,
15. Sheet metal and wire,
16. Strops, hones, and rifles.
Wood—
5. Curved surfaces,
13. Plane surfaces.

CLASS 53.—HARDWARE-MAKING. (XIII.)

Sub-classes.

1. Bridge-irons.
2. Builders' hardware.
3. Cutlery.
4. Eyebolts and hooks.
5. Fence-barbs of sheet metal.
6. Ferrules, rings, and thimbles.
8. Gas and water fittings.
10. Hinges.
23. Lamp-work.
11. Leather-workers' hardware.
9. Miscellaneous.
20. Musical-instrument work.
12. Pens, pencils, and holders.
21. Printing appliances.
13. Spinners and weavers.
15. Spoons. Manufacture of
16. Springs.
22. Stamping.
17. Sucker-rod joints.
19. Tie-bands.
18. Umbrella-irons.

CLASS 54.—HARNESS. (XI.)

Sub-classes.

1. Bonnets and covers.
2. Bridle-bits.
3. Bridles and halters.
4. Collar-fasteners.
5. Collar-machines.
6. Fly-nets.
8. Hame-fasteners.
28. Hame-tugs.
9. Hames.
10. Harness—
29. Attachments,
11. Machines,
30. Pads,
12. Saddles,
Harness—
13. Tools.
16. Horse-boots.
17. Horse-collars.
34. Neck-yokes.
31. Ox-yokes.
32. Rein-holders.
21. Riding-saddles.
22. Spurs and stirrups.
24. Trace-carriers.
25. Trimmings.
26. Tugs.
27. Whips.
33. Whip-sockets.

CLASS 55.—HARROWS AND DIGGERS. (I.)

Sub-classes.

1. Clod-crushers.
2. Forks.
3. Harrows—
11. Revolving,
13. Rotary,
19. Wheel—
20. Rotary.
4. Harrow-teeth.
5. Hoes.
6. Land-rollers.
7. Pivoted teeth.
8. Pivoted tooth-bars.
9. Potato-diggers.
10. Rakes.
12. Rollers and harrows.
14. Shovels.
15. Stalk-choppers.
16. Stalk-pullers.
17. Stone-gatherers.
18. Transplanters.

CLASS 56.—HARVESTERS. (VII.)

Sub-classes.

1. Bean-harvesters.
Binders—
35. Compressors,
36. Grain-adjusters,
37. Sheaf-carriers.
2. Clover-harvesters.
3. Combined rakes and tedders.
Corn-harvesters—
38. Binders and droppers,
39. Cutters,
40. Implements,
41. Strippers and huskers.
5. Corn-shockers.
6. Cotton-harvesters.
Cutting apparatus—
42. Endless,
43. Guard-fingers and finger-bars,
44. Reciprocating,
45. Rotary,
46. Vibrating.
Droppers—
47. Direct-tilting,
49. Miscellaneous,
48. Opening and closing,
50. Side-delivery,
51. Swinging and tilting.
99. Fruit-gatherers.
9. Gearing.
10. Grain-bands.
31. Grain wheels and casters.
Hand-binders—
52. Attachments,
53. Elevated delivery, Rear,
54. Elevated delivery, Side,
55. Flat delivery,
56. Manual traction.
12. Hand-rakers.
13. Hay-caps.
Hay-loaders—
61. Endless-belts,
62. Intermittent,
63. Lifting-reels,
64. Walking-rakes.
101. Hay-racks.
100. Headers.
16. Hedge-trimmers.
17. Hemp and flax harvesters.
Horse-rakes—
65. Draft-dumpers,
66. Drags,
Horse-rakes—
67. Hand-dumpers,
68. Hay-cockers,
69. Rake-teeth.
19. Lawn-mowers.
20. Manure-forks.
33. Miscellaneous.
Mowers—
70. Anomalies,
72. Center-cut,
73. Front-cut, One-wheel,
74. Front-cut, Two-wheels,
76. Rear-cut, One-wheel,
77. Rear-cut, Two-wheels,
75. Reciprocating-gear,
78. Thrust-cut.
32. Platform adjustments.
22. Reels.
Revolving rakes—
80. Flop-over,
81. Wheel.
27. Scythes and cradles.
24. Seats.
Self-binders—
82. Clips and prepared bands,
83. Cord-knotters,
84. General structure,
85. Gleaners and binders,
86. Tension and take-up devices,
87. Twisters and tuckers,
88. Wire-twisters.
Self-rakers—
89. Endless-carriers,
90. Gavelling-tongs,
91. Platform-movement,
92. Reciprocating horizontal curvilinear,
93. Reciprocating horizontal rectilinear,
96. Rotary horizontal axis,
94. Rotary vertical axis, switch,
95. Rotary vertical axis, no switch,
98. Traveling horizontal irregular path,
97. Traveling vertical irregular path.
28. Tedders.
29. Thrashers.
30. Track clearers and dividers.

CLASS 149.—HIDES, SKINS, AND LEATHER. CHEMICAL TREATMENT OF. (VI.)

Sub-classes.

2. Bating.
4. Coloring and polishing.
5. Currying.
6. Depilating.
8. Preserving hides.
9. Tanning materials.
10. Tanning processes.
11. Tawing.

CLASS 57.—HOISTING. (XII.)

Sub-classes.

2. Barrel rollers.
34. Block and tackle—
5. Differential pulleys,
22. Capstans and windlasses.
3. Car-movers.
37. Chutes.
4. Cranes and derricks—
36. Jibless,
57. Lever-jib,
58. Non-pivoted jib—
59. Rotating—
60. Portable,
61. Pivoted jib—
62. Rotating—
63. Portable,
64. Sliding-jib,
65. Traveling, double track,
66. Trolley.
67. Elevated-carrier—
68. Draft-sustaining,
69. Lever-lock,
70. Non-lowering support,
71. Ratchet-lock,
72. Rope-catch,
73. Sheave-frame catch.
29. Endless belts.
8. Grain-conveyers—
48. Pneumatic,
49. Screw.
9. Grapples.
38. Hay-forks—
39. Corkscrew,
40. Grapples,
41. Harpoon,
42. Tilting.
11. Hay-slings.

CLASS 57—Continued.

13. Hoisting-buckets—
74. Belt.
15. Lifting-jacks—
43. Lever,
44. Screw.
16. Loading and unloading—
52. Hay,
81. Load-binders,
80. Mail-bag catchers,
46. Pilers,
Loading and unloading—
47. Shoveling devices.
75. Tilting—
76. Hoist,
77. Platform.
18. Skids.
19. Stump-extractors.
53. Stackers—
54. Endless aprons.
79. Wagon-raisers.

CLASS 58.—HOROLOGY. (XXIII.)

Sub-classes.

8. Balance-escapements.
3. Clocks—
2. Calendar,
28. Electric,
9. Geographical,
29. Pneumatic.
4. Clock-cases.
5. Clock-striking.
6. Clock-winding.
34. Dials and hands.
10. Metronomes.
11. Pendulums.
35. Pendulum-escapements.
30. Repeaters.
12. Safety-wheels.
13. Stem-winders.
14. Sun dials.
15. Time-alarms.
16. Time-checks.
31. Time lamp-lighters.
33. Time-signals.
17. Watches
18. Watch-balances.
19. Watch-barrels.
20. Watch-cases.
21. Watch-case springs.
22. Watch dust-caps.
23. Watch-keys.
32. Watch-maker's tools.
24. Watch-plates.
25. Watch-regulators.
26. Watch-stops.
27. Watch-winding.

CLASS 60.—HOSE AND BELTING. (XI.)

Sub-classes.

1. Belt-fasteners.
2. Belt-machines.
7. Belt-stretchers.
3. Belting.
6. Drive-chains.
4. Hose and tubing.
5. Hose-machines.

CLASS 61.—HYDRAULIC ENGINEERING. (IV.)

Sub-classes.

1. Aqueducts.
19. Breakwaters.
2. Cable-laying.
3. Caissons—
20. Ship.
4. Canals—
28. Gate-valves.
27. Gates, Bear-trap—
21. Lock.
5. Chutes.
23. Cribbing.
24. Dams and levees.
22. Dams, Coffer—
25. Sectional.
7. Diving-armor.
8. Docks.
9. Drains.
26. Forming and preserving channels.
29. Jetties. Sectional
11. Marine ways.
12. Mining.
13. Pile-drivers.
18. Piles.
30. Protecting shores.
15. Tide-powers.
16. Tunnels.
17. Water-gates.
31. Wharves.

CLASS 138.—HYDRAULIC MOTORS. (IX.)

Sub-classes.

11. Chain—
8. Elevators,
9. Jacks,
10. Presses.
1. Oscillating.
2. Reciprocating.
3. Rotary—
12. Feathering.
Turbines—
4. Bottom supply,
5. Side ring supply,
6. Top and side direct supply
7. Top ring supply.

CLASS 162.—INJECTORS AND EJECTORS. (XVIII.)

No sub-classes.

CLASS 63.—JEWELRY. (V.)

Sub-classes.

1. Bracelets.
2. Brooches.
4. Ear-rings.
5. Finger-rings.
8. Gem-setting.
6. Lockets.
11. Metal stock and ornamental wire fabric.
7. Ornamental chains.
10. Processes.
9. Watch-chain attachments.

CLASS 64.—JOURNAL-BOXES, PULLEYS, AND SHAFTING. (XII.)

Sub-classes.

4. Belt-shifters.
5. Belt-tighteners.
6. Clutches.
7. Compensating journals.
9. Flexible shafting.
10. Journal-boxes—
16. Roller-bearings.
17. Pulleys—
8. Expansible,
18. Split.
12. Shaft-casings.
13. Shaft-couplings.
14. Shaft-hangers.

CLASS 65.—KITCHEN AND TABLE ARTICLES. (VIII.)

Sub-classes.

1. Butter-dishes.
2. Butter, egg, and table tongs.
3. Cake-turners.
6. Caster-bottles.
5. Casters.
9. Cheese-covers.
10. Compound tools.
45. Condiment-holders.
11. Corkscrews.
12. Culinary.
13. Cups.
15. Dishes and plates.
16. Dish-covers.
17. Dish-holders.
18. Dish-mats.
19. Dish stands and trays.
20. Dust-pans.
21. Egg-beaters.
22. Egg-cups.
23. Fish-scalers.
24. Fruit and cake dishes.
25. Fruit-lifters.
26. Jar-lifters.
27. Knife racks and rests.
28. Ladles.
29. Napkin-holders.
30. Oyster-openers.
31. Pitchers.
32. Plate-lifters.
33. Provision-safes.
35. Salt-cellars.
36. Scoops.
38. Spice-boxes.
41. Tea-service.
42. Tumbler-holders.
43. Twine-holders.

CLASS 66.—KNITTING AND NETTING. (XXI.)

Sub-classes.

1. Burrs and sinkers.
Circular—
2. Circular machines,
11. Looper pin and hook machines.
17. Crocheting.
3. Darning.
4. Fabrics.
12. Feeding.
5. Needles.
6. Netting.
7. Stopping.
Straight—
8. Straight machines,
13. Fashioning-machines,
14. Looper pin and hook machines,
15. Cams and stops,
16. Warp-machines.
9. Take-ups and tensions.
10. Tatting.

CLASS 67.—LAMPS AND GAS-FITTINGS. (XXX.)

Sub-classes.

43. Calcium and magnesium lights.
1. Candlesticks.
3. Chandeliers.
4. Chimney-holders.
50. Decorative lights.
5. Drop-lights and hangers.
6. Extinguishers.
7. Gas-burners—
51. Incandescent,
52. Regenerative.
40. Gas-extinguishers—
8. Fittings.
41. Lighting devices,
9. Regulating-burners.
33. Lamp-burners—
10. Argand,
11. Multiple-wick,
12. No-chimney.
13. Lamp chimneys—
14. Collars,
21. Posts,
22. Shades,
23. Wicks.
32. Lamps—
39. Bracket,
2. Car,
42. Cigar-lighting,
16. Forced-draft,
17. Independent-reservoir,
19. Miners',
20. Safety-tube and central-draft,
29. Street.
24. Lanterns—
35. Signal,
46. Submarine,
44. Tubular.
45. Lantern-holders.
25. Lighting devices.
26. Locomotive head-lights.
27. Match-safes.
28. Reflectors.
37. Refracting attachments.
34. Signal-lights.
38. Torches.
30. Vapor-burners.
31. Wick-raisers.

CLASS 68.—LAUNDRY. (XXVII.)

Sub-classes.

1. Bosom-boards.
2. Clamps.
34. Clothes-driers.
12. Clothes-line fasteners.
3. Clothes-lines.
4. Clothes-pins.
5. Clothes-pounders.
4. Clothes-line reels.
6. Clothes sticks and tongs.
7. Fluting-irons.
8. Hand-rubbers.
19. Ironing-machines.
10. Ironing-tables.
11. Laundries.
13. Mangles.
26. Sad-irons.
27. Sad-iron holders.
28. Starching-machines.
35. Wash-benches.
29. Wash-boards.
30. Wash-boilers.
31. Wash-tubs.
Washing-machines—
15. Agitator,
16. Boiler,
17. Combined washing and wringing,
18. Cylinder,
37. Miscellaneous,
19. Pounder,
20. Reciprocating rubber,
21. Rocking and swinging,
22. Roller,
23. Roller and bed,
24. Rotary rubber.
32. Wringers.
33. Wringer-rolls.

CLASS 69.—LEATHER. (XI.)

Sub-classes.

1. Cutting.
3. Machines.
4. Splitting.

CLASS 70.—LOCKS AND LATCHES. (XX.)

Sub-classes.

40. Baggage-seals.
3. Box-fasteners.
7. Key-fasteners.
8. Key-hole guards.
9. Keys.
10. Knobs.
11. Knob attachments.
12. Knob-roses.
13. Latches—
28. Gate,
21. Reversible.
14. Locks—
1. Alarm,
2. Bag,
4. Car-seat,
5. Hasp,

CLASS 70—Continued.

Locks—
6. Indicator,
18. Permutation,
20. Piano,
23. Seal,
31. Sliding-door,
25. Till,
26. Time,
Locks—
27. Trunk.
15. Lock-strikes.
16. Lock-trimmings.
29. Locks and latches combined.
17. Padlocks—
19. Permutation.
24. Shackles.

CLASS 184.—LUBRICATORS. (XII.)

Sub-classes.

1. Capillary attraction.
2. Condensation displacement.
3. Force-feed.
4. Gravity-feed—
5. Automatic cut-off.
6. Liquefiers.
7. Loose-pulley.
8. Miscellaneous.

CLASS 74.—MACHINE ELEMENTS. (XII.)

Sub-classes.

1. Cams and eccentrics.
5. Cranks and levers.
6. Fly-wheels.
7. Gearing—
21. Belt,
26. Frictional.
8. Gibs and keys.
28. Intermittent grip—
29. Strap and dog or ball,
30. Ratchet.
13. Machine-brakes.
14. Mechanical movements.
20. Overcoming dead-centers.
16. Pawls and ratchets.
17. Pitmen.
27. Racks and pinions.
18. Treadles.
19. Universal joints.

CLASS 115.—MARINE PROPULSION. (XXII.)

Sub-classes.

Propelling—
1. Buoyant propellers,
2. Chain-propellers,
3. Crank-paddles.
6. Hydraulic propellers,
20. Interior power,
21. Motion of vessel,
24. Oscillating propellers,
8. Pneumatic propellers,
12. Reciprocating propellers,
10. Steering-propellers, (except screw,)
13. Wheels in channel.
Paddle-wheels—
4. Feathering blades,
22. Fitting and driving,
23. Form and construction.
Screw-propellers—
14. Feathering blades,
15. Fitting and driving,
16. Form and construction,
17. Steering.
Towing—
18. External power,
19. Internal power.

CLASS 72.—MASONRY. (IV.)

Sub-classes.

9. Apartment-houses.
10. Bonding and tying.
13. Cellars.
12. Centering.
2. Cisterns.
14. Composite walls.
3. Construction.
11. Coping.
16. Facing walls.
5. Fire-shields.
17. Foundations.
18. Hollow tile walls.
7. Iron structures.
19. Smoke and air flues.
20. Stone and brick setting.
21. Subways.
23. Tile and metal floors.
22. Timber-seats.
24. Waste chutes and sinks.

CLASS 73.—MEASURING-INSTRUMENTS. (XXIII.)

Sub-classes.

1. Air and gas meters.
2. Anemometers.
3. Balances.
74. Ballot-boxes.
4. Barometers.
5. Bathometers.
6. Bevels.
7. Calculators.
84. Calculators. Tabular
8. Cart-scales.
86. Cash-indicators.
9. Cloth-measuring machines.
10. Coin-counters.
83. Coin-packages.
11. Coin-testers.
73. Conformators.
12. Diaphragm-meters.
13. Dividing-engines.
15. Dynamometers.
75. Fare-boxes.
59. Fare-registers.
16. Gages.
77. Gages. Micrometer
17. Game-counters.
19. Grain-meters.
78. Grain-meters. Rotating
20. Grain-tallies.
22. Hydrometers.
23. Hydrostatic scales.
24. Hygroscopes.
79. Lactometers.
63. Leather-measuring.
76. Letter-boxes.
60. Measuring-faucets.
61. Measuring-pumps.
62. Measuring-vessels.
27. Odometers.
28. Oscillating meters.
58. Passenger-registers.
29. Pendulum-scales.
30. Piston-meters.
80. Pitch-boards.
81. Planimeters.
72. Plumb-bobs—
71. Levels.
31. Pressure-gages.
68. Proportional meters.
32. Pyrometers.
33. Rain-gages.
34. Recorders.
35. Registers.
36. Rotary measures.
37. Rotary meters.
38. Sack-scales.
39. Scale-beams.
40. Scale-measures.
41. Scale-pans.
60. Ships' logs.
64. Shoe-makers' measures.
42. Specific-gravity apparatus.
43. Speed-measures.
44. Sphygmoscopes.
70. Spirit-levels.
45. Spirit-meters.
46. Spring-scales.
47. Squares.
66. Surface-gages.
48. Tailors' measures.
49. Tape-measures.
85. Telethermometers.
50. Testing illuminating fluids.
51. Testing-machines.
52. Thermometers.
65. Thermostats.
21. Tollers.
67. Track-gages.
53. Voting-machines.
54. Water-gages.
82. Water-gages. Float
55. Weather-vanes.
56. Weights.

CLASS 185.—MECHANICAL MOTORS. (XII.)

Sub-classes.

1. Horse-powers—
2. Equalizers,
3. Treads.
4. Manual.
5. Miscellaneous.
6. Spring.
7. Weight.

CLASS 167.—MEDICINES. (VI.)

Sub-classes.

1. Aerated beverages.
2. Capsules.
3. Disinfectants.
4. Extracts.
5. Hair dyes and tonics.
6. Insecticides.
7. Internal remedies.
8. Plasters.
9. Topical remedies.
10. Veterinary medicines.

CLASS 153.—METAL-BENDING. (XIV.)

Sub-classes.

1. Bending—
11. By press.
12. By rolls.
2. Coiling.
3. Corrugating.
4. Curving plates.
5. Dishing.
6. Flanging—
7. Straight.
8. Straightening—
9. Plates and sheets.
10. Twisting.

CLASS 10.—METAL BOLTS, NUTS, RIVETS, AND SCREWS. (XIII.)

Sub-classes.

1. Bolts and nuts. Dressing and assembling.
2. Bolts and rivets.
3. Bolts and rivets. Making
4. Capping screws and nails.
5. Metal-screw machines.
6. Nuts and washers.
7. Nuts and washers. Making
8. Screws.
9. Screw-blank feeders.
10. Screw-cutting machines.
11. Screw-swaging machines.
12. Screw-tapping machines.
13. Screw-threading machines.
14. Taps and dies.
15. Wood-screw machines.

CLASS 77.—METAL BORING AND DRILLING. (XIII.)

Sub-classes.

1. Bits.
2. Boring and drilling appliances.
3. Boring-machines.
4. Drill-chucks.
5. Drills, Hand—
9. Ratchet.
6. Drilling-machines.
7. Reamers and drifts.
8. Tapping mains.

CLASS 78.—METAL-FORGING. (XIII.)

Sub-classes.

1. Anvils.
17. Compositions.
16. Compressing.
3. Drop-hammers.
4. Forges.
20. Forge-tuyeres.
5. Forging and welding.
8. Oilers.
9. Power-hammers.
11. Riveting.
18. Shafts and pulleys.
19. Structural work.
15. Upsetting metal.

CLASS 22.—METAL-FOUNDING. (XIV.)

Sub-classes.

Metal molds—
1. Apparatus and plants.
2. Chains, hinges, and joints.
4. Hardware.
5. Hollow ware.
7. Ingots—
9. Compound.
6. Hollow and tube.
10. Plants.
11. Materials.
12. Ordnance and projectiles.
13. Pigs.
14. Plows.
15. Rolls.
18. Screw-threads.
16. Soft-metal machines—
21. Molds.
19. Shot.
20. Spoons.
22. Traps.
51. Type.
50. Tools.
23. Vehicle-wheels.
24. Wheels.

Molded molds—
25. Chains, hinges, and joints.
26. Hardware.
27. Hollow ware.

Molded molds—
28. Molded molds.
8. Molders' flasks—
29. Materials.
17. Tools and arts.
30. Ordnance and projectiles.
31. Pipes—
32. Horizontal.
3. Pipe-elbows.
33. Plants.
34. Plows.
35. Rolls.
36. Screw-threads.
37. Tools.
38. Vehicle-wheels.
39. Wheels.

Molding apparatus—
40. Blacking molds.
41. Hollow ware.
42. Machines.
43. Ordnance and projectiles.
44. Pipes—
45. Horizontal.
46. Pipe-cores.
47. Screw-threads.
48. Vehicle-wheels.
49. Wheels.

CLASS 75.—METALLURGY. (III.)

Sub-classes.

1. Alloys.
Amalgamators—
34. Electric,
35. Lead,
36. Mercury,
37. Plate,
33. Vacuum,
38. Vapor.
2. Assaying.
90. Blow-pipes.
7. Calcining-kilns.
8. Coke and charcoal.
3. Converters.
54. Drying air.
30. Fume-arresters.
10. Furnace-protecting—
82. Fire-brick.
Furnaces—
83. Annealing,
5. Blast—
4. Accessories,
96. Bells,
97. Tuyeres,
29. Crucible,
9. Cupola,
11. Gas—
81. Burners,
88. Heating air and gas,
78. Mixing air and gas,
80. Producers,
40. For heating blanks,
41. Hydrocarbon—
42. Injector-burners,
43. Retort-vaporizers,
84. Melting—
89. Glass-pots,
92. Pot-furnaces,
93. Tank-furnaces,
19. Pigment,
20. Puddling,
26. Shaft and shelf,
91. Slag.
Hot-blast ovens—
52. Single surface,
53. Double surface.
14. Iron and steel direct—
73. Bricks,
74. Flux,
71. Furnaces,
Iron and steel direct—
75. Gases,
72. Retort-furnaces,
76. Slag,
77. Sponge.
15. Lead.
16. Mechanical puddlers and tools.
22. Quicksilver.
17. Reducing and separating—
57. Apparatus,
58. Aluminium,
62. Copper,
59. Desilverizing lead,
60. Desulphurizing ores,
61. Disintegrating ores,
63. Flux,
64. Gold and silver,
85. Manganese,
66. Nickel and cobalt,
65. Ore bricks.
23. Regenerators—
95. Continuous or double surface,
94. Discontinuous or single surface.
24. Revolving roasters.
25. Roasting and smelting hearths.
18. Solution and precipitation—
86. Apparatus,
67. Chlorination,
68. Electrolysis,
69. Ferric salts,
70. Parting bullion.
28. Spelter.
27. Treating molten iron—
44. Air, steam, and gases,
45. Alloys,
46. Basic,
87. Basic linings,
47. Granulating,
48. Oxides,
49. Physic,
50. Scrap,
51. Vacuum.
55. Utilizing tin-scrap—
56. Wet processes.

Sub-Classes in Metallurgy, with Explanatory Notes.

1. ALLOYS. Includes amalgams and dental alloys, alloys for coating metals, anti-incrustation alloys, alloys for journal-bearings, anti-friction metals, coin metal, bronze, and bell metal, non-magnetic alloys for watch-works, fusible alloys, type-metal, and white metal. Does not include mixtures of metals with non-metallic substances. (See Caoutchouc and Minor Plastics, Class 18, Division XV; and Lubricants, Class 87, Oils, Fats, and Glue, Division VI.) (See Treating Molten Iron, Alloys, for special steels, and alloys of iron, such as ferro-manganese, ferro-silicon, tungsten steel, &c.)

34. AMALGAMATORS, ELECTRIC. Includes riffle, plate, and pan amalgamators in which continuous and intermittent currents of electricity are passed through the ore pulp or mercury, or both, for the purpose of assisting the amalgamation.

35. AMALGAMATORS, LEAD. Furnaces and processes for separating precious metals wherein the ore containing the metal is passed through molten lead or alloys of lead, zinc, mercury, &c.

36. AMALGAMATORS, MERCURY. Construction and arrangement of pans, mullers, barrels, riffles, &c., for the ordinary amalgamation of the precious metals; also, processes in which chemicals are used to remove "rust," grease, &c., and "enliven" the action of the mercury.

37. AMALGAMATORS, PLATE. Silver, copper, brass, and other metal plates coated with mercury, and arranged either in the sluiceways, riffles, or in connection with the pan, for the purpose of collecting the precious metals.

33. AMALGAMATORS, VACUUM. Apparatus and processes in which an exhaust is used to carry the ore through the mercury or lead contained in a closed vessel.

38. AMALGAMATORS, VAPOR. Apparatus and processes in which the ore is subjected to the vapor of mercury for the purpose of amalgamating the precious metals.

2. ASSAYING. Includes muffle and cupel furnaces; apparatus and burners used in assaying, &c.; also, methods of fire analysis.

7. CALCINING-KILNS. Stack-furnaces for roasting and desulphurizing metallic ores. (See Roasting and Smelting Hearths; and Shaft and Shelf Furnaces; and Lime-Kilns, Class 106, Division XV.)

8. COKE AND CHARCOAL. Processes of making coke; coke-ovens, and appliances for operating the same. Processes and kilns for charring wood. (See Distilling Wood, Class 23, Division VI.)

3. CONVERTERS. Includes apparatus for the pneumatic refining of iron; also, methods of operating converters, and tuyeres, tuyere-stoppers, bottoms, and blast appliances for same, and processes for lining. (For pneumatic processes see Treating Molten Iron, Air, Steam and Gases; and for Bessemer Plants see Metal-Founding, Division XIV.)

54. DRYING AIR. Apparatus for and methods of desiccating air by means of chloride of calcium, sulphuric acid, &c., for metallurgic purposes.

30. FUME-ARRESTERS. Devices for collecting dust from ore-furnaces and purifying waste gases. Does not include condensers for volatile metals. (See Quicksilver and Spelter; also, Gas-Purifiers, Class 48.)

10. FURNACE-PROTECTING. Devices for protecting furnace walls, hearths, doors, valves, tuyeres, &c., by air and water cooling. (See Furnaces, Blast, Tuyeres.)

82. FURNACE-PROTECTING, FIRE-BRICK. Compositions to be used in furnace-linings. Does not include lime or basic linings. (For which see Treating Molten Iron, Basic Linings.)

83. FURNACES, ANNEALING. Gas and coal burning furnaces for annealing glass.

5. FURNACES, BLAST. Form and general construction of furnaces for smelting iron ores, using either an air, steam, or gas blast. (See Cupola-Furnaces for blast-furnaces used in smelting lead and similar ores.)

4. FURNACES, BLAST, ACCESSORIES. Methods of and apparatus for feeding stock, except hoppers and bells. Includes devices for utilizing waste gases and gas-seals. (See Gas-Furnaces; for heating blast, see Hot-Blast Ovens.) (See, also, Furnace-Protecting; Furnaces, Blast, Bells; and Furnaces, Blast, Tuyeres.)

95. FURNACES, BLAST, BELLS. Bell and hopper mechanism for charging stack-furnaces. (See Furnaces, Gas-Producers; Water-Gas, Class 48; and Hoisting, Class 57, Division XII.)

39. FURNACES, BLAST, TUYERES. Water and air cooled tuyeres and tuyere-pipes for blast-furnaces. (See, also, Furnaces, Blast, Accessories; Furnaces, Hydrocarbon, Injector Burners; and Blow-Pipes.)

29. FURNACES, CRUCIBLE. Coal, oil, or gas burning furnaces for heating crucibles, muffles, and retorts, for assayers, jewelers, &c. (See Furnaces, Melting, Pot-Furnaces.)

9. FURNACES, CUPOLA. Furnaces for remelting iron and smelting lead, silver, and other similar ores. Does not include Blast-Furnaces for smelting iron ores.

11. FURNACES, GAS. Apparatus for generating and burning gases in metallurgical and other furnaces.

81. FURNACES, GAS, BURNERS. Devices for burning gas in metallurgical furnaces. (See Furnaces, Hydrocarbon, Injector-Burners.) (For Illuminating-Gas Burners, see Class 67, Division XXX.)

88. FURNACES, GAS, HEATING AIR AND GAS. Furnaces with devices connected therewith for heating the air or gas, or both, including arrangements of flues, blast-pipes, &c., to insure the complete combustion of the gaseous fuel. Such furnaces include reverberatory, smelting, blast, reheating, open-hearth, and all other furnaces used for metallurgic purposes. (See Hot-Blast Ovens and Regenerators.)

78. FURNACES, GAS, MIXING AIR AND GAS. Furnaces provided with appliances for mixing gas and air, either exterior to or within the combustion-chamber. (See Carburetors, Gas and Air Mixers; and Furnaces, Hydrocarbon.)

80. FURNACES, GAS-PRODUCERS. Gas-generators for metallurgic heating-furnaces which are either separated from or directly connected with the furnace in which the gas is consumed, but not including apparatus for generating gas for illuminating purposes. (See Class 48, Coal-Gas, Water-Gas, &c.)

40. FURNACES FOR HEATING BLANKS. Furnaces for heating ingots, pipe-skelps, gun-barrels, and blanks for bolts, car-wheels, and reheating-furnaces generally. Does not include Soaking-Pits. (See Class 22, Metal-Founding, Ingots. Plants, Division XIV; also, Class 75, Furnaces, Annealing, and Class 148, Metal Tempering, Annealing, and Cementation.)

41. FURNACES, HYDROCARBON. General apparatus for burning hydrocarbon oils in metallurgical furnaces, &c., where the oil is fed and burned upon trays, refractory material, water, &c.

42. FURNACES, HYDROCARBON, INJECTOR-BURNERS. Apparatus for injecting hydrocarbon oils, vapors, or gases, together with steam or air, or steam and air; also, apparatus in which the gases, &c., are mixed before injecting them into the furnace. (See Class 162, Injectors and Ejectors, Division XVIII; also, Class 67, Lamps and Gas-Fittings, Vapor-Burners, Division XXX.)

43. FURNACES, HYDROCARBON, RETORT-VAPORIZERS. Apparatus in which the oil is vaporized and the vapors heated, water converted into steam, and the steam superheated or decomposed; means for heating air and burners for consuming the commingled gases and vapors thus produced. (See Class 48, Oil Gas and Water-Gas; Class 67, Lamp and Gas Fittings, Vapor-Burners, Division XXX; and Class 126, Stoves and Furnaces, Vapor-Stoves, Division XIX.)

84. FURNACES, MELTING. Gas and coal burning furnaces for melting metals, glass, &c. (See Regenerators, &c.)

92. FURNACES, MELTING, GLASS-POTS. Structure of pots for melting glass for composition. (See Furnace-Protecting, Fire-Brick; also, Class 25, Clay and Pottery, Division XV.)

91. FURNACES, MELTING, POT-FURNACES. Furnaces adapted to melting and working out glass in pots. (See Furnaces, Crucible.)

90. FURNACES, MELTING, TANK-FURNACES. Hearths adapted to melting glass.

19. FURNACES, PIGMENT. Processes of and apparatus for obtaining pigment. (See Fume-Arresters, Spelter, and Quicksilver, for similar apparatus.)

20. FURNACES, PUDDLING. Reverberatory furnaces in which pig-iron is melted and rabbled by hand, including special construction of fire-boxes, flues for heating air, &c.

26. FURNACES, SHAFT AND SHELF. Furnaces for roasting ores, consisting of upright stacks, either clear or provided with shelves or partitions for delaying the progress of the ore, fully exposing it to the action of the heat.

97. FURNACES, SLAG. Processes of and apparatus for utilizing slag.

52. HOT-BLAST OVENS, SINGLE-SURFACE. Recuperators or discontinuous stoves for heating air; also, water-cooled valves used in hot-blast-oven flues. (See Furnace-Protecting. For special construction of bricks see Furnace-Protecting, Fire-Brick.)

53. HOT-BLAST OVENS, DOUBLE-SURFACE. Pipe or continuous stoves for heating air for blast-furnaces, converters, &c. Air is passed through externally-heated pipes, tubes, or chambers. (See Furnaces, Gas, Heating Air and Gas; and Regenerators, Continuous.)

14. IRON AND STEEL DIRECT. Processes of manufacturing wrought-iron and steel directly from ore or sponge. (See Treating Molten Iron.)

71. IRON AND STEEL DIRECT, FURNACES. Apparatus employed in the direct production of wrought-iron or steel. (See Iron and Steel Direct, Retort-Furnaces; also, Furnaces, Blast.)

72. IRON AND STEEL DIRECT, RETORT-FURNACES. Apparatus for reducing ores and making sponge-iron direct from the ores, in which the charge is placed in retorts which are heated internally or externally by furnace-gases, the product being subsequently reduced in a hearth usually connected with the retorts.

73. IRON AND STEEL DIRECT, BRICKS. Cylinders, blocks, and bricks of iron ore made up with or without fuel or flux; also, construction and arrangement of furnaces for reducing the same.

1. IRON AND STEEL DIRECT, FLUX. Compositions used in the reduction of iron ore, either in the direct or indirect processes.

74. IRON AND STEEL DIRECT, GASES. Processes for obtaining wrought-iron and steel from iron ores and for deoxidizing ores preparatory to smelting in blast-furnaces by means of gases or gaseous fuel.

76. IRON AND STEEL DIRECT, SLAG. Methods of utilizing furnace-slag and cinder in the manufacture of iron by the ordinary smelting processes.

77. IRON AND STEEL DIRECT, SPONGE. Processes of producing iron and steel sponge by heating iron ore in retorts with carbon.

15. LEAD. Hearth and blast furnaces for smelting lead ores and processes for same; also, apparatus for refining lead. Includes "Scotch hearths," but not water-jacketed lead-smelters. (See Furnaces, Cupola.)

16. MECHANICAL PUDDLERS AND TOOLS. Revolving or removable hearths or cylinders, horizontal and inclined. Devices for puddling and balling iron mechanically, including rabbles, mixers, cutters, &c. (See Revolving Roasters.)

22. QUICKSILVER. Processes of and apparatus for separating mercury from its ores and amalgams, including furnaces, retorts, collectors, condensers, and strainers; also, apparatus for retorting, purifying, and separating amalgams. (See Alloys.)

17. REDUCING AND SEPARATING. Processes of reducing and separating metals from their ores by application of heat, including processes in which the ore is melted by heat electrically generated, and reducing processes not otherwise classified, exclusive, however, of amalgamation.

57. REDUCING AND SEPARATING, APPARATUS. Special apparatus for treating ores and metals, not otherwise classified. (See Revolving Roasters, Roasting and Smelting Hearths, and Furnaces, Cupola.)

58. REDUCING AND SEPARATING, ALUMINIUM. Processes and apparatus for obtaining aluminium and other metals of the alkaline earths.

62. REDUCING AND SEPARATING, COPPER. Furnace processes for purifying and refining copper and extracting the same from ores and matte.

59. REDUCING AND SEPARATING, DESILVERIZING LEAD. Processes of and apparatus for separating silver and gold from bullion by Parke's, Pattison's, and other furnace methods. (See Reducing and Separating Gold and Silver.)

60. REDUCING AND SEPARATING, DESULPHURIZING ORES. Processes, apparatus, and compounds for freeing metallic ores (principally those of copper, gold, and silver) from sulphur. (See Calcining-Kilns; Roasting and Smelting Hearths; Furnaces, Shaft and Shelf.)

61. REDUCING AND SEPARATING, DISINTEGRATING ORES. Processes in which hot ore is dumped into water or chemical solutions preparatory to amalgamating or desulphurizing, and also processes for comminuting copper and other metals in a similar manner.

63. REDUCING AND SEPARATING, FLUX. Compositions of fluxes used in the reduction of metals.

64. REDUCING AND SEPARATING, GOLD AND SILVER. Processes of and apparatus for separating the precious metals from ores, speiss, amalgams, &c. (See Amalgamators; Solution and Precipitation, Chlorination; and Reducing and Separating, Disintegrating Ores and Desulphurizing Ores.)

85. REDUCING AND SEPARATING, MANGANESE. Processes of and apparatus for obtaining manganese from its ores and for the manufacture of ferro-manganese and spiegeleisen.

66. REDUCING AND SEPARATING, NICKEL AND COBALT. Processes of separating nickel and cobalt from their ores by furnace operations.

65. REDUCING AND SEPARATING, ORE BRICKS. Processes of forming bricks, blocks, lumps, and cakes of crushed or pulverized ore, especially ores of precious metals, preparatory to roasting. (See Iron and Steel Direct, Ore Bricks.)

23. REGENERATORS. Includes devices for reversing the direction of the gaseous currents, valves, and special constructions of brick. (See Furnace-Protecting, Fire-Brick; Furnaces, Gas; and Hot-Blast Ovens.)

94. REGENERATORS, CONTINUOUS OR DOUBLE SURFACE. Structures of the Ponsard type, with separate flues for the air and for the waste gases; for utilizing waste heat, as applied to metallurgical furnaces, especially open-hearth furnaces. (See Hot-Blast Ovens, Double-Surface.)

93. REGENERATORS, DISCONTINUOUS OR SINGLE SURFACE. Structures of the Siemens type, containing only a single system of passages; for utilizing waste heat, as applied to metallurgical furnaces, especially open-hearth furnaces. Waste gases and air are alternately passed through the flues, heating them and heated by them, respectively. (See Hot-Blast Ovens, Single Surface; and Furnaces, Gas, Heating Air and Gas.)

24. REVOLVING ROASTERS. Furnaces with one or more revolving chambers or cylinders for roasting, oxidizing, chloridizing, and desulphurizing ores. (See Mechanical Puddlers and Tools.)

25. ROASTING AND SMELTING HEARTHS. Hearth-furnaces for roasting and smelting metallic ores. (See, also, Revolving Roasters; Reducing and Separating; and Furnaces, Puddling.)

18. SOLUTION AND PRECIPITATION. Processes of and compounds for obtaining metals from solutions of ores, waste jewelers' solutions, leaching solutions, &c. (See Solution and Precipitation, Electrolysis; and Coating with Metal, Electro-Deposition.)

57. SOLUTION AND PRECIPITATION, APPARATUS. Special apparatus employed in solving processes not classified elsewhere in sub-classes of Solution and Precipitation.

67. SOLUTION AND PRECIPITATION, CHLORINATION. Processes of and compounds for chloridizing ores by subjecting the ore to the action of chlorine gas or chlorine solutions, and leaching them after chlorination. (See Revolving Roasters, and Roasting and Smelting Hearths.)

68. SOLUTION AND PRECIPITATION, ELECTROLYSIS. Processes of and apparatus for the electrolytic separation and purification of metals from their ores and alloys by solving operations; also, for chloridizing ores by electricity. (See Coating with Metal, Electro-Deposition.)

69. SOLUTION AND PRECIPITATION, FERRIC SALTS. Processes of and apparatus for treating ores of copper, silver, and gold by means of solutions of ferric salts.

70. SOLUTION AND PRECIPITATION, PARTING BULLION. Processes for refining bullion by dissolving silver in acid, and subsequent precipitation.

28. SPELTER. Processes and apparatus for obtaining metallic zinc from its ores, including furnaces, retorts, condensers, and appliances for operating them. (See Pigment-Furnaces and Fume-Arresters.)

27. TREATING MOLTEN IRON. Miscellaneous processes and apparatus for treating molten iron for the production of wrought iron and steel. (See Converters, and Iron and Steel Direct.)

44. TREATING MOLTEN IRON; AIR, STEAM, AND GASES. Processes and apparatus for treating molten iron with currents of air, steam, or gas, for the purpose of purifying the same or converting it into steel. (See Converters.)

45. TREATING MOLTEN IRON, ALLOYS. Processes and compounds of metals which are added to molten iron to produce an alloy of iron or steel; such as chrome, manganese, and tungsten steels.

46. TREATING MOLTEN IRON, BASIC. Processes of removing phosphorus by treating molten iron with lime, magnesia, and similar materials, either as additions or as the lining of the vessel in which the metal is placed, by uniting with which, to form a slag, the phosphorus is eliminated.

87. TREATING MOLTEN IRON, BASIC LININGS. Bricks or linings of lime, magnesia, &c. (See Furnace-Protecting, Fire-Brick.)

47. TREATING MOLTEN IRON, GRANULATING. Processes of granulating molten iron, and for treating iron prepared in this way or mechanically subdivided.

48. TREATING MOLTEN IRON, OXIDES. Decarbonizing crude molten iron by the use of iron oxides, nitrates, &c., either as additions or furnace-linings.

49. TREATING MOLTEN IRON, PHYSIC. Miscellaneous compounds which, when added to molten iron or steel, serve to purify, decarbonize, or, by uniting with the same, to improve the quality of the steel.

50. TREATING MOLTEN IRON, SCRAP. Processes of melting and utilizing iron and steel scraps, turnings, &c. (See Utilizing Tin-Scrap.)

51. TREATING MOLTEN IRON, VACUUM. Processes of treating molten iron in vessels from which air can be exhausted for the purpose of inducing a current of air through the molten mass, or removing gases therefrom. (See Furnaces, Cupola.)

55. UTILIZING TIN-SCRAP. Dry or furnace processes for separating tin and iron from tin-scrap by means of heat.

6. UTILIZING TIN-SCRAP, WET PROCESSES. Apparatus for and processes of separating tin, zinc, &c., from iron by chemical solutions, with or without the aid of electricity.

CLASS 79.—METAL PERSONAL WEAR, MAKING (XIII.)

Sub-classes.

1. Buttons and clasps.
2. Eyelets.
3. Ornamental chains.
4. Personal wear.
5. Thimbles. Manufacture of
6. Watches and clocks.

CLASS 80.—METAL-ROLLING. (XIII.)

Sub-classes.

11. Angle irons.
12. Compound plates and bars.
1. Cylindrical.
2. Foil. Manufacture of
3. Mill appliances.
4. Piles and fagots.
8. Plates and bars.
5. Puddlers' balls.
6. Railroad-rails.
13. Reworking.
7. Rolling. Miscellaneous
9. Sheet and hoop iron manufacture.
10. Taper.

CLASS 148.—METAL TEMPERING, ANNEALING, AND CEMENTATION. (III.)

Sub-classes.

7. Cementation and case-hardening.
8. Decarbonizing.
9. Tempering and annealing—
10. Applications of electricity,
11. Compositions,
Tempering and annealing—
3. Metals generally,
12. Metals other than iron,
4. Sheet and plate metal,
5. Wheels and tires,
6. Wire and springs.

Sub-Classes in Metal Tempering, Annealing, and Cementation, with Explanatory Notes.

7. CEMENTATION AND CASE-HARDENING. Processes of and apparatus for cementation and case-hardening; also, compositions for the entire or superficial conversion of wrought-iron into steel.

8. DECARBONIZING. Processes of and apparatus for decarbonizing cast-iron; also, compositions for the conversion of cast-iron into steel.

9. TEMPERING AND ANNEALING.

10. TEMPERING AND ANNEALING, APPLICATIONS OF ELECTRICITY. Processes of and apparatus for the application of electricity to heating and annealing.

11. TEMPERING AND ANNEALING, COMPOSITIONS. Chiefly compositions used in connection with the hardening process.

3. TEMPERING AND ANNEALING, METALS GENERALLY. Processes of and apparatus for tempering and annealing not specifically included in the other classes.

12. TEMPERING AND ANNEALING, METALS OTHER THAN IRON. Processes of and apparatus for tempering and annealing copper and metals other than iron or steel.

4. TEMPERING AND ANNEALING, SHEET AND PLATE METAL. Processes of and apparatus for tempering and annealing sheet and plate metal, such as saws.

5. TEMPERING AND ANNEALING, WHEELS AND TIRES. Processes of and apparatus for tempering and annealing wheels and tires.

6. TEMPERING AND ANNEALING, WIRE AND SPRINGS. Processes of and apparatus for tempering and annealing wire and springs.

CLASS 76.—METAL TOOLS AND IMPLEMENTS, MAKING (XIII.)

Sub-classes.

1. Augers.
2. Axes and hatchets.
27. Compound metal-working machines.
3. Cultivator-irons.
4. Dies.
5. Drills.
6. Farm implements.
7. File-blanks.
8. File-cutting.
9. Files and rasps.
10. Hammers.
11. Harvester-irons.
12. Hoes and shovels.
13. Picks and mattocks.
14. Pitchforks.
15. Plow-irons.
16. Rake and harrow irons.
26. Saw clamps and jointers.
19. Saw-setting.
22. Saw-swaging.
17. Saws.
18. Saws, Gumming
20. Saws, Sharpening reciprocating tool-
21. Saws, Sharpening rotary tool-
23. Scythes.
24. Tools and implements.
25. Wrenches

CLASS 134.—METAL TUBING AND WIRE. (XIII.)

Sub-classes.

1. Coiling and bending pipe.
10. Drawing.
2. Lead pipe, Making
3. Lightning-rods, Making
4. Lining cylinders with metal.
5. Plumbers' traps, Making
14. Reeling.
15. Rods for wire.
6. Tubes.
11. Tubing, Lapped—
12. Rolled,
13. Seamless.
16. Wire.
8. Wire, Pointing

CLASS 82.—METAL TURNING, PLANING, AND MILLING. (XIII.)

Sub-classes.

1. Centerers.
2. Cutters and cutter-holders.
4. Gear-cutting.
5. Key-seat cutters.
6. Lathe-chucks.
7. Mandrels and work-holders.
8. Milling.
9. Milling-cutters.
10. Planer-chucks.
Planers—
11. Reciprocating bed or cutter,
Planers—
12. Rotary bed or cutter.
13. Rests.
14. Shaping and slotting.
Turning—
15. Irregular forms,
16. Miscellaneous,
17. Tapers,
18. Wheels and axles.
19. Watch-makers' lathes.
20. Wrist-pin turners.

CLASS 81.—METAL-WORKING TOOLS. (XXVIII.)

Sub-classes.

26. Bolt-holders.
23. Cutting sharpeners.
24. Nippers.
Nut-wrenches—
5. Pivoted and spring-jaw,
6. Ratchet-wheel,
7. Rigid-jaw,
8. Rigid-socket and axle-nut,
9. Sliding-jaw,
27. Wheel.
Pipe-cutters—
10. Inside,
11. Outside.
12. Pipe-expanders.
Pipe-wrenches—
28. Chain.
13. Pivoted-jaw,
14. Pivoted-jaw, with cutter,
15. Rigid-jaw and spanner,
16. Sliding-jaw,
17. Sliding-jaw, with cutter.
25. Pliers.
18. Rod and bolt cutters.
19. Smiths' tongs.
Vises—
20. Pipe and rod,
21. Smiths',
22. Wood-workers'.

CLASS 83.—MILLS. (XXV.)

Sub-classes.

Bagging grain—
26. Bag-holders.
Chop-graders—
50. Bran-dusters, Beaters,
51. Bran-dusters, Brushes,
49. Electric purifiers,
42. Flour processes,
40. Gravity,
39. Rotary bolts,
38. Shaking bolts.
Dust-collectors—
47. Reciprocating,
48. Rotating.
Grain-scourers—
32. Centrifugal,
36. Concave face,
31. Conical,
30. Cylinder, Horizontal,
29. Cylinder, Vertical,
37. Disk-face,
33. Pestle-action,
35. Reciprocating and endless,
34. Screw-action.
Grinding-mills—
17. Balancing millstones,
9. Ball and drum,
21. Bark,
19. Cane,
45. Chasing,
18. Coffee,
10. Compound movement,
Grinding-mills—
13. Cone and shell,
12. Crushing-rolls,
14. Cylinder and concave,
7. Disk-action, Horizontal,
8. Disk-action, Vertical,
44. Feed-regulators,
15. Grain-samplers,
16. Grist-alarms,
23. Hominy,
46. Impact pulverizers,
6. Knife-action,
1. Mill-spindles,
3. Millstone-dress,
4. Millstone-exhaust,
2. Millstone-frame,
22. Paint,
11. Rotary beaters.
Ore and coal—
52. Coal-breakers,
53. Crushers.
Separators—
54. Dry,
58. Jiggers,
59. Washers,
56. Sifters and screens—
60. Household,
57. Stamps.
Preparing grain—
28. Processes,
27. Steaming and dampening.

CLASS 84.—MUSIC. (V.)

Sub-classes.

1. Accordions.
53. Auxiliary strings.
2. Banjos and guitars.
6. Castanets.
7. Clarionets and flutes.
55. Combined organ and piano.
54. Combination organ stop-actions.
8. Cornets and trumpets.
9. Couplers.
10. Drums.
81. Electric actions.
11. Exercising devices.
13. Harmonicas.
12. Harmonic attachments—
56. Dampers.
14. Harps.
48. Indicators.
15. Insulators.
57. Key-board self-playing attachments.
58. Key-holding devices.
16. Keys and key-boards.
49. Knee-swells.
17. Leaf-turners.
79. Mouth-pieces.
18. Notation.
19. Organ-actions—
50. Pneumatic,
20. Bellows,
21. Cases,
22. Pipes,
59. Stop-actions,
23. Swells,
47. Wind-chests.
24. Pedals.
61. Pianissimo devices.
25. Pianos—
63. Horizontal,
Pianos—
70. Sostenuto,
62. Upright,
31. Without strings.
26. Piano-actions—
65. Horizontal,
60. Pedal,
64. Upright.
66. Piano agraffes and bridges—
27. Attachments,
52. Cases,
28. Frames,
29. Legs,
30. Sounding-boards,
40. Stringing,
67. Tuning-pins.
32. Pipe-organs.
68. Recording attachments.
33. Reeds.
34. Reed-boards—
35. Organs,
36. Organ attachments.
37. Self-playing instruments—
71. Cylinder,
51. Pneumatic.
69. Solo attachments.
38. Steam-organs.
41. Transposers.
42. Tremolos.
43. Tuning-instruments.
44. Violins—
76. Practice.
72. Violin-bows—
73. Bridges,
74. Chin-rests,
75. Dampers and mutes,
77. Tail-pieces,
78. Tuning-pegs.
80. Zithers.

CLASS 85.—NAILS AND SPIKES. (XIII.)

Sub-classes.

1. Cut-nail making.
3. Horseshoe-nail-blank finishing.
2. Horseshoe-nail cutting.
4. Horseshoe-nail forging.
6. Nail-distributers.
8. Nail-plate feeders.
9. Nails and spikes.
15. Shoe nails and tacks.
16. Spike-making.
17. Wrought-nail making.

CLASS 163.—NEEDLES AND PINS. (XIII.)

Sub-classes.

1. Machine-needles, Making
4. Pins, Making
5. Pins, Papering
6. Sewing-needles, Making

CLASS 151.—NUT AND BOLT LOCKS. (XXVIII.)

Sub-classes.

9. Base.
1. Base, key and ratchet.
2. Base, washer.
3. Side.
4. Side, key and ratchet.
5. Thread.
6. Thread, key and ratchet.
7. Top.
8. Top, key and ratchet.

CLASS 87.—OILS, FATS, AND GLUE. (VI.)

Sub-classes.

17. Adhesives.
18. Artificial butter.
1. Barrel-linings.
2. Bleaching.
3. Candles and apparatus.
4. Decomposing fats.
5. Detergents.
6. Extracting oils.
7. Glue.
8. Lard-coolers.
9. Lubricants.
10. Lubricating. Treating oils for
12. Refining fat oils.
13. Rendering.
14. Soap.
15. Soap-cutting.
16. Soap-manufacture.
19. Wax.
20. Wool-oils.

CLASS 88.—OPTICS. (XXIII.)

Sub-classes.

1. Altitude-instruments.
19. Compasses.
2. Distance-instruments.
3. Heliostats.
4. Kaleidoscopes.
5. Lenses.
6. Leveling-instruments.
7. Magic lanterns.
8. Microscopes.
20. Optometers.
9. Photometers.
10. Prisms.
11. Sextants.
12. Spectacles.
22. Spectacle-cases.
13. Stakes and targets.
14. Stereoscopes.
17. Surveying-instruments.
15. Telescopes.
21. Testing-instruments.
16. Tripods.

CLASS 89.—ORDNANCE. (XXII.)

Sub-classes.

1. Breech-loading.
2. Carriages.
19. Cartridge-feed cases.
3. Counterpoise-carriages.
4. Disabling.
21. Electrical appliances.
7. Loading.
20. Locks—
23. Recoil-operated.
9. Machine-guns.
10. Mortars.
11. Muzzle-loaders.
12. Operating ordnance.
22. Pneumatic.
13. Shields.
15. Submarine guns.
16. Tompions and valves.
17. Trunnions.
18. Vents and stoppers.

CLASS 150.—PACKING AND STORING VESSELS. (XIV.)

Sub-classes.

Cloth, leather, and rubber—
134. Bag-fasteners.
128. Bags.
129. Baskets and buckets.
130. Boxes.
131. Unclassified.

Glass and pottery—
11. Bottles and jugs—
126. Neck-collars,
135. Brush and spreader.
42. Bottle-tops.
43. Boxes and tanks.
18. Ejectors.
12. Jackets—
81. Stands,
74. Wrapper.
44. Jars—
73. Clamp,
96. Expanding-stopper,
75. Screw-cap,
97. Screw-stopper,
79. Swing-cover,
80. Swing-fastener.
15. Stopper-fasteners—
77. Cap and tie,
99. Screw-cap,
86. Swing,
87. Swing-stopper—
164. Aside,
165. Yoke,
166. Yoke and lever,
167. Yoke and top levers.
16. Stopper-locks.
107. Stopper-pullers.
17. Stoppers—
105. Cap,
145. Dose,
88. Expanding,
46. Internal,
147. Rotary.
53. Screw—
106. Cap,
146. Tube.
49. Valve—
124. Screw,
125. Siphon.

Metallic vessels—
47. Baskets and crates.
29. Boxes—
65. Blacking,
137. Compartment,
83. Knockdown,
84. Pocket.
51. Canisters.
30. Cans and unclassed vessels—
100. Single-blank.
54. Casks.
55. Closures—
56. Clamp,
57. Screw-cap,
98. Screw-stopper,
58. Seam or solder,
108. Swing-cover.
52. Coal-scuttles.
110. Ears and bails.
111. Handles.
33. Hermetic sealing.
34. Jackets—
62. Cask,
63. Package,
123. Stand.
61. Jacked and stands. Swing
64. Linings.
36. Milk-cans.
37. Nozzles and vents—
65. Screw-cap,
114. Screw.
66. Valve—
115. Screw.
72. Pistons and stirrers.
50. Slop-buckets.
Metallic vessels—
116. Spouted—
117. Feeders—
118. Piston.
119. Stands—
120. Pump.
121. Storage.
122. Transport.

Paper vessels: bags—
142. Bags—
143. Closures,
144. Square-bottom.

Paper vessels: barrels and pails—
82. Barrels.
148. Pails.

Paper vessels: Boxes. Angular—
149. Boxes, Angular—
150. Blanks, Plural,
151. Compartment—
152. Folded,
153. End folds,
154. Side and end folds,
155. Side folds,
156. Side folds and end laps,
157. End laps,
158. Side and end laps,
159. Side laps,
160. Slide,
161. Stays.

Paper vessels: Boxes. Curved—
162. Boxes, Curved—
163. Compartment.

Wooden vessels: barrels, buckets, and pails—
132. Barrels—
1. Bent,
168. Stand.
101. Bungs—
102. Expanding,
103. Plug.
4. Bungs and vents.
5. Bung-wrenches.
133. Closures—
127. Screw and bayonet.
6. Covers.
7. Hoops.
8. Linings and coverings.
10. Stands.

Wooden vessels: baskets—
41. Baskets—
91. Covered,
67. Folding.

Wooden vessels: boxes—
19. Boxes—
94. Closures,
140. Compartment,
169. Bent—
92. Closures,
136. Linings and coverings,
93. Single blank,
95. Block.
20. Can and bottle cases.
21. Cell-cases—
68. Cloth or cord cells,
141. Paper box,
69. Paper cells,
70. Wood cells,
71. Wood-veneer cells.
22. Crates.
23. Crates and boxes, Folding—
109. Knockdown.
104. Linings and coverings.
27. Powders. Cases for
113. Stays. Corner-
112. Straps.

CLASS 91.—PAINTING. (VI.)

Sub-classes.

2. Enameling wood.
3. Fireproofing compounds.
4. Graining.
Ink—
21. Indelible,
5. Printing,
6. Writing.
7. Japanning.
8. Lamp-black.
9. Mixed paints.
20. Painting.
11. Painting-machines.
12. Paint-mixers.
22. Pigments.
13. Stencils.
14. Stove-polishes.
15. Striping.
16. Varnishes.
17. Varnishing-machines.
19. White lead.

CLASS 92.—PAPER-MAKING. (XV.)

Sub-classes.

1. Bleaching.
2. Bronzing-machines.
3. Calendering.
24. Carpet-lining.
4. Coating.
5. Digesters.
6. Disintegrating fibrous substances.
7. Fabrics.
8. Fibers.
9. Flocking.
10. Materials.
11. Molding machines and articles.
12. Ornamenting.
13. Paper-board.
14. Paper-hanging machines.
15. Paper-making machines.
16. Parchment.
17. Processes.
18. Pulp-engines and bed-plates.
19. Pulp washing and straining.
20. Rag dusters and engines.
21. Stock-grinders.
22. Waterproofing and sizing.
23. Wood-grinders.

CLASS 93.—PAPER-MANUFACTURES. (XVII.)

Sub-classes.

2. Articles.
3. Attaching labels.
5. Bag-machines.
6. Bank notes, checks, and bonds.
10. Box-machines.
11. Collar, cuff, and bosom machines.
13. Cutters. Reciprocating
14. Cutters. Rotary
15. Envelopes.
16. Envelope-machines.
17. Feeding.
18. Folding.
19. Label and tag machines.
21. Perforating and lace paper.
22. Postage and revenue stamps.
23. Tickets.
24. Tube-machines.
25. Wrapping-machines.

CLASS 94.—PAVING. (XV.)

Sub-classes.

2. Gutters.
Pavements—
1. Concrete,
3. Iron,
5. Stone,
Pavements—
8. Wood.
4. Road-rammers.
6. Tools.
7. Vault-covers.

CLASS 95.—PHOTOGRAPHY. (V.)

Sub-classes.

34. Actinometers.
1. Backgrounds and reflectors.
2. Baths. Chemical
3. Baths. Mechanical
4. Burnishers. (Presses.)
5. Cameras.
6. Camera attachments—
37. Shutters,
7. Stands.
8. Coloring.
30. Combined apparatus.
9. Daguerreotypy.
10. Dark-chambers.
11. Dippers.
12. Embossing.
13. Enameling.
14. Eye-rests.
31. Galleries.
15. Head-rests.
16. Heaters and driers.
17. Mechanical printing.
18. Mounts and mounting.
19. Negatives.
32. Photosculpture.
22. Pictures.
36. Plate-holders.
25. Printing and vignetting.
29. Processes.
26. Retouching.
38. Roller-holders.
35. Surfaces.
28. Washing apparatus.

CLASS 97.—PLOWS. (I.)

Sub-classes.

1. Attachments.
2. Beams.
3. Cleaners.
4. Clevises.
5. Corn-coverers.
6. Colters.
7. Couplings.
8. Cotton-choppers.
9. Cotton-scrapers.
10. Cultivators—
20. Parallel,
25. Rotary,
31. Straddle-row,
34. Wheel—
35. Straddle-row.
11. Cultivator-teeth.
37. Draft-eveners.
13. Fenders.
14. Gage wheels and runners
15. Handles.
17. Landsides.
18. Mold-boards.
21. Plows—
12. Ditching,
16. Hand,
19. Mole,
26. Shovel,
27. Side-hill,
30. Steam,
36. Wheel.
22. Points.
23. Revolving mold-boards.
24. Ridgers.
28. Sod-cutters.
29. Standards.
32. Subsoilers.
33. Weed-turners.

CLASS 98.—PNEUMATICS. (XXVIII.)

Sub-classes.

1. Aerial navigation.
Air and gas pumps—
31. Hydraulic,
32. Mechanical,
33. Mercury,
34. Rotary.
5. Bellows.
Chimneys and cowls—
22. Rotary,
23. Stationary.
28. Fan attachments.
27. Fans, Automatic—
29. Toilet.
13. Sand-blowers.
Ventilation—
7. Car,
10. Grain,
11. House,
12. Mine.
19. Window-ventilators.

Sub-Classes in Pneumatics, with Explanatory Notes.

1. AERIAL NAVIGATION. Balloons and flying-machines and their fittings for navigating the air, but not advertising-balloons, (Class 40, Division V,) toy balloons, (Class 46, Division XV,) signal-balloons, (Class 116, Division XXII,) or balloons for raising sunken vessels, &c., (Class 114, Division XXII.)

(31, 32, 33, 34. AIR AND GAS PUMPS. For compressing and exhausting aeriform fluids. Includes gas-pumps for ice-machines.)

31. AIR AND GAS PUMPS. HYDRAULIC. Those using water as a piston or in which a piston is operated by direct water-pressure.

32. AIR AND GAS PUMPS. MECHANICAL. Those having reciprocating pistons operated by applied mechanical power.

33. AIR AND GAS PUMPS. MERCURY. Those in which mercury or an analogous liquid acts as a piston, as in the Sprengel and Geissler pumps.

34. AIR AND GAS PUMPS. ROTARY. Those having rotating pistons. Includes rotary blowers and all separate air forcing and exhausting fans, but not fly-fans or devices for fanning the person and the like. (Sub-classes 27, 28, and 29.)

5. BELLOWS. Air-forcing devices and fittings involving flexible diaphragms, cylinders, walls, or bags, but not bellows organized for musical instruments (Class 84, Division II) or water-pumps, (Class 103, Division IX.)

22. CHIMNEYS AND COWLS. ROTARY. Cowls which automatically move in whole or part to prevent a draft down through the smoke-flue.

23. CHIMNEYS AND COWLS. STATIONARY. Chimneys and cowls which are designed to prevent a draft down through the smoke-flue and have no moving part.

* * * * * * *

15. SAND-BLOWERS. Rotary blowers, air-pumps, and bellows specially adapted to throw sand by a blast of air.

7. VENTILATION. CAR. Those constructions whereby fresh air is directly or through filters introduced into the cars, or foul air is forced or drawn out; but does not include cooling air, (Class 62, Division XV,) or dust-guards for car-windows, (Class 98, Division IX,) or devices involving ventilation as an incident to warming, (Class 126, Division XIX.)

10. VENTILATION. GRAIN. Devices and flues for supplying fresh air to grain in bins, bulk, and stacks, but not devices and methods for *drying* grain by heat, (Class 34, Division XIX.)

11. VENTILATION. HOUSE. Those constructions whereby fresh air is directly or through filters introduced into the house, or foul air is forced or drawn out; but does not include cooling air, (Class 62, Division XV,) window-ventilators as defined, (Class 98, Division IX,) or devices involving ventilation as an incident to warming, (Class 126, Division XIX.)

12. VENTILATION. MINE. Those constructions whereby fresh air is directly or through filters introduced into mines and tunnels, or foul air or fire-damp is forced or drawn out; but does not include cooling air (Class 62, Division XV) or devices involving ventilation as an incident to warming, (Class 126, Division XIX.)

19. WINDOW-VENTILATORS. Ventilators depending in whole or part on the raising or lowering of the sash, removable ventilators which are inserted in the open window under or over the sash, devices for preventing moisture on the glass, schemes for ventilating bulk-head windows, and car-window dust-guards, all when mere attachments; but does not include ventilators or dust-guards involving the construction of the window or its frame, nor window-screens. (Class 20, Division IV.)

CLASS 99.—PRESERVING. (VI.)

Sub-classes.

1. Antiseptics.
2. Apparatus.
4. Cold.
5. Desiccation.
6. Egg-testers.
7. Embalming.
8. Exclusion of air.
11. Food compounds.
9. Fumigation.
10. Pasteurization.
12. Wood saturation.

CLASS 100.—PRESSES. (II.)

Sub-classes.

7. Baling—
27. Bale-box attachments,
21. Rack bar and pinion,
22. Ratchet and grapple bar,
29. Rebounding plunger,
23. Revolving bale-boxes,
24. Screw,
25. Toggle-joint,
31. Windlass.
2. Bale-band tighteners.
1. Bale-ties—
19. Wire.
26. Can-filling machines.
4. Cheese.
5. Cider and wine.
6. Cloth.
9. Flour-packers.
10. Fruit-packers.
11. Fruit.
26. Fuel.
12. Hop.
13. Lard and oil.
17. Oil-press mats.
18. Paint-expellers.
30. Silos.
14. Sugar.
15. Tobacco.
16. Wool.

CLASS 101.—PRINTING. (XVII.)

Sub-classes.

1. Addressing.
2. Autographic.
3. Blankets.
4. Block.
5. Branding-stamps.
7. Calico and fabric.
6. Card, tag, and ticket.
8. Chases.
9. Chromatic.
10. Composing-sticks.
11. Copying.
12. Cylinder.
13. Damping.
14. Delivering.
15. Electrotyping
16. Frisketa.
17. Furniture.
18. Galleys.
19. Glass.
20. Hand-stamps.
21. Inking.
22. Lever-presses.
23. Lithographic.
44. Matrix-making.
24. Oscillating.
25. Paging and numbering.
26. Perforating-stamps.
27. Plate.
28. Reciprocating.
29. Registering.
30. Rotary
31. Rules.
32. Setting and distributing.
33. Spool.
34. Stereotyping.
35. Stereotype blocks—
36. Plate holders.
37. Surfaces.
38. Types.
39. Type beds—
40. Cases.
41. Machines.
42. Type-writing.
43. Warp and yarn.

CLASS 102.—PROJECTILES. (XXII.)

Sub-classes.

1. Blasting and fuses.
2. Bomb-lances.
3. Cap-boxes
4. Cap-filling.
19. Cartridge implements.
5. Cartridge-loading.
6. Cartridges—
20. Electric.
7. Flasks and chargers.
8. Lubricating.
9. Marine torpedoes.
11 Primers.
12. Projectiles.
13. Rockets.
14. Sabots and wads.
15. Shells.
16. Shell-fuses.
17. Shot-cartridges.
18. Torpedoes.

CLASS 103.—PUMPS. (IX.)

Sub-classes.

45. Accumulators.
2. Attachments.
46. Brakes.
5. Cattle.
6. Chain.
7. Compound.
8. Compressed-air water-elevators.
10. Diaphragm.
11. Double-acting.
12. Double-cylinder.
13. Double-piston.
14. Drainage.
16. Force.
17. Hollow piston-rod.
22. Lift.
47. Lift and force.
48. Miscellaneous parts.
23. Oil.
25. Oscillating.
37. Pistons.
20. Rams.
44. Rotary double piston.
43. Rotary single piston.
31. Sand.
32. Ship.
35. Windlass water-elevators.

CLASS 104.—PUNCHING AND SHEARING. (XIII.)

Sub-classes.

1. Cutting.
2. Punching.
3. Sawing metal.
5. Shears. Lever and sliding
4. Shears. Rotary

CLASS 105.—RAILWAY-CARS. (X.)

Sub-classes.

1. Axle-boxes.
2. Axle-box lids.
3. Axle-lubricators.
4. Axles.
5. Baskets.
6. Brakes—
7. Automatic,
8. Rail.
9. Brake-shoes.
10. Bumpers.
Cars—
14. Dumping,
15. Freight,
16. Hand,
19. Passenger,
22. Safety,
23. Sleeping,
28. Steam street,
31. Street.
11. Change-able gage-trucks.
12. Couplings.
13. Draw-bars.
17. Locomotives.
20. Platforms.
21. Safety-bridges.
24. Springs.
25. Stake-holders.
26. Starters.
27. Starters and brakes.
35. Straps.
30. Street-car poles.
32. Trucks.
33. Wheel-fenders.
34. Wheels.

CLASS 104.—RAILWAYS. (IV.)

Sub-classes.

49. Buffers.
1. Car-replacers.
2. Chairs.
63. Compensators.
40. Crossings.
3. Deadening noise.
75. Deflection-stands.
76. Detector-bars.
4. Elevated.
50. Foot-guards.
5. Frogs.
35. Grippers—
87. Automatic release,
88. Friction,
89. Friction-belt,
90. Roller,
91. Sprocket-wheel,
92. Whelp-wheel.
7. Hose-bridges.
8. Inclined plane.
39. Interlocking.
9. Pneumatic—
93. Dispatch-tubes.
60. Pot-sleepers.
54. Rail-braces.
11. Rail-joints.
10. Rails.
21. Signals—
42. Automatic alarm,
67. Bar,
71. Danger,
31. Detonating,
68. Light,
27. Pneumatic,
69. Portable,
22. Switch,
70. Train-order.
94. Signals, Automatic—
72. Setting apparatus,
73. Tappets,
74. Trips.
61. Sledways.
95. Switch-chairs.
96. Switch-rods.
25. Switch-stands.
12. Switches—
23. Automatic,
77. Automatic safety,
26. Pneumatic,
78. Safety,
79. Spring,
24. Tramway.
13. Tank-feeders.
Track—
44. Fastenings,
14. Miscellaneous,
45. Portable,
46. Stringers and ties,
55. Metallic.
Track-cleaners—
36. Centrifugal,
37. Dumping,
38. Elevators,
56. Explosive,
52. Melters.
58. Removing weeds,
Snow-plows,
51. Stock-alarms,
57. Wheel-fenders.
16. Track-layers.
17. Track-platforms.
59. Track-raisers.
18. Traction—
80. Cable-shields,
81. Crossing conduits,
82. Crossing streams,
83. Curves,
53. Running and carrying rope,
84. Slot-closers,
85. Slot-switches,
86. Take-ups,
48. Transfer-tables,
64. Truck-changers,
19. Turn-tables,
47. Underground,
62. Yards and plants.

CLASS 62.—REFRIGERATION. (XXVIII.)

Sub-classes.

1. Air-cooling apparatus.
2. Beer-coolers.
3. Corpse-coolers.
4. Ice-cream freezers.
5. Ice-crushers.
6. Ice-machines.
7. Ice picks and shavers.
8. Implements.
10. Refrigerators.
11. Refrigerator-buildings.
12. Refrigerator-cars.
13. Water-coolers.
14. Wine-coolers.

CLASS 106.—ROOFING. (IV.)

Sub-classes.

1. Battening.
2. Eaves-troughs.
3. Fenders.
4. Metallic.
5. Roofs.
6. Slate and shingle.
7. Tile.

CLASS 109.—SAFES. (XX.)

Sub-classes.

1. Burglar-proof.
2. Fire-proof.
3. Safe bolt-work.

CLASS 111.—SEEDERS AND PLANTERS. (I.)

Sub-classes.

1. Broadcast—
2. Hand,
3. Revolving hoppers,
4. Walking.
5. Check-row.
8. Cups on belt.
9. Cups on disk.
Drills—
35. Adjustable rank,
18. Grain,
36. Walking.
10. Drills and broadcast combined.
11. Drill-teeth.
12. Elastic feed-wheels.
34. Fertilizer-distributers—
13. Hand,
14. Revolving hoppers,
15. Walking.
17. Force-feed.
19. Grain-drill cleaners.
24. Land-markers.
25. Pivoted seed-cups.
Planters—
6. Corn,
7. Cotton,
16. Foot,
20. Hand—
21. Oscillating,
22. Reciprocating,
23. Rotating,
27. Potato—
28. Walking,
32. Walking—
33. Vibrating hoppers.
26. Plungers.
29. Preparing seed.
37. Rolling hoppers.
31. Screw-feed.

CLASS 182.—SEWERAGE. (IV.)

Sub-classes.

1. Backwater and animal gates.
2. Cleaning.
3. Construction.
4. Flushing.
5. Man-holes and catch-basins.
6. Mechanical treatment.
7. Systems.

CLASS 112.—SEWING-MACHINES. (XXIV.)

Sub-classes.

35. Attachment-holders.
1. Binders.
2. Bobbin-winders.
41. Book-sewing.
3. Braiders and corders.
43. Broom-sewing.
4. Button-hole.
5. Chain and double chain.
7. Embroidering.
8. Feeding.
36. Glove-sewing machines.
9. Guides.
10. Hemmers.
34. Methods.
29. Miscellaneous parts.
11. Needles.
37. Needle-clamps.
13. Presser-feet and lifters.
14. Quilting.
38. Revolving hooks.
15. Revolving-hook machines.
16. Rufflers and gatherers.
17. Running-stitch.
18. Setters and threaders.
31. Sewing hats.
19. Sewing looped fabrics.
32. Sewing on buttons.
42. Sewing rugs.
20. Sewing shoes.
21. Short-thread.
22. Shuttle-machines.
23. Shuttles and bobbins.
24. Special machines.
25. Straw.
26. Take-ups.
39. Tensions.
33. Thread-cutters.
6. Trimmers.
27. Tuck creasers and markers.
12. Tucking-guides.
40. Turfing fabrics.
28. Wax-thread.

Sub-Classes in Sewing-Machines, with Explanatory Notes.

35. ATTACHMENT-HOLDERS. Devices adapted to secure different kinds of attachments in proper position relative to the sewing mechanism.

1. BINDERS. Attachments for guiding a binding and the fabric, to the edge of which it is to be secured, to the sewing mechanism.

2. BOBBIN-WINDERS. Attachments for winding or filling the bobbins or spools of shuttles and rotary hooks.

41. BOOK-SEWING. Machines and appliances for holding, feeding, and stitching signatures in book-binding.

3. BRAIDERS AND CORDERS. Attachments for guiding braids or cords to the sewing mechanism.

43. BROOM-SEWING MACHINES. For stitching brooms with cord, wire, &c.

4. BUTTON-HOLE. Machines and attachments for sewing over-edge or zigzag stitches for working the edges of button-holes or fabrics, or ornamenting fabrics.

5. CHAIN AND DOUBLE CHAIN. Machines for forming chain or loop stitches with one thread and double chain or double loop stitches with two threads, respectively.

7. EMBROIDERING. Machines and attachments for ornamenting fabrics with thread.

8. FEEDING. Includes improvements which relate to feeding mechanisms only.

36. GLOVE-SEWING MACHINES. Machines for sewing the seams of gloves.

9. GUIDES. Attachments for guiding fabrics to the sewing mechanism.

10. HEMMERS. Attachments for turning hems and guiding the fabrics to be hemmed to the sewing mechanism.

34. METHODS. Particular methods of forming stitches and peculiar methods of sewing.

29. MISCELLANEOUS PARTS. Sundry devices or machines not properly classifiable under other heads.

11. NEEDLES. Sewing-machine needles only.

37. NEEDLE-CLAMPS. Devices for securing the needle to the needle-bar.

13. PRESSER-FEET AND LIFTERS. Presser-feet and devices for raising the same when the work is to be removed or inserted; also, mechanisms for automatically lifting the presser-foot at each stitch.

14. QUILTING. Machines for sewing several seams simultaneously by means of multiplex stitch-forming mechanisms; also, attachments to ordinary machines for holding fabrics to be quilted.

38. REVOLVING HOOKS. Includes improvements in hooks and loopers, oscillating or revolving, and means for attaching the same to the shaft.

15. REVOLVING-HOOK MACHINES. Machines for forming lock-stitches by means of a needle and a co-operating rotary hook which carries the needle-thread around a locking-thread from a bobbin or spool which is in most instances stationary.

16. RUFFLERS AND GATHERERS. Attachments for forming ruffling, plaiting, and shirring, either by means of a tension-plate which checks the movement of one of two strips of fabric, thus permitting the other to be moved faster by the feeding device, or by means of reciprocating blades or other moving devices.

17. RUNNING-STITCH. Machines which crimp the fabric and feed the same on to a stationary threaded needle, thus forming the ordinary hand running-stitch.

18. SETTERS AND THREADERS. Attachments for properly setting the needle in the needle-bar and for threading the same.

31. SEWING HATS. Machines and attachments for sewing linings, bindings, &c., to hats.

19. SEWING LOOPED FABRICS. Special machines for uniting the edges of knitted goods by sewing.

32. SEWING ON BUTTONS. Machines and attachments for sewing buttons to fabrics.

42. SEWING RUGS. Includes frames, &c., upon which rugs, yarns, &c., are wound to be presented to the stitch-forming mechanism of sewing-machines.

20. SEWING SHOES. Machines for sewing the soles of boots and shoes to their uppers.

21. SHORT-THREAD. Machines other than running-stitch machines using measured lengths of thread, in contradistinction to those machines which sew with continuous threads.

22. SHUTTLE-MACHINES. Machines which form the lock-stitch by means of a needle and a co-operating shuttle.

23. SHUTTLES AND BOBBINS. Includes improvements in shuttles and bobbins, or spools for the same.

24. SPECIAL MACHINES. Machines for doing special kinds of work not otherwise properly classifiable.

25. STRAW. Machines for sewing straw braid into hats and bonnets.

26. TAKE-UPS. Includes improvements which relate to take-up devices only.

39. TENSIONS. Includes improvements which relate to tension devices only.

33. THREAD-CUTTERS. Devices for cutting the threads when the work is to be removed from the machine.

6. TRIMMERS. Attachments for trimming off the edges of the work simultaneously with the sewing.

27. TUCK CREASERS AND MARKERS. Attachments for creasing or marking the work simultaneously with the formation of a seam, to indicate where the fabric is to be folded to form the succeeding tuck.

12. TUCKING-GUIDES. Guiding attachments for forming plaits.

40. TURFING FABRICS. Apparatus for inserting a loop or a series of loops of pile, yarn, rags, &c., through perforations made in a foundation fabric.

28. WAX-THREAD. Machines for sewing leather, &c., with waxed threads; also, thread-waxing devices for such machines.

CLASS 113.—SHEET-METAL WARE, MAKING (XIV.)

Sub-classes.

23. Burnishing.
1. Cutting printers' leads.
2. Edging sheets.
3. Roller-tools.
4. Screw-thread bending.
5. Seaming sheets.
24. Spinning.
11. Tools.
12. Troughs and moldings.
Soldering—
6. Clamps.
7. Irons—
25. Heaters.
8. Machines—
26. Dip.
27. Soldering.
Soldering—
10. Solders.
Tubing—
13. Curved and spouts.
14. Grooving and seaming.
15. Pipe-elbows, Making
16. Straight, Making
Vessels—
17. Bending, Angular—
18. Curved.
19. Seaming, Die—
21. Roller.
20. Shaping, Die—
28. Fillers and forcers.
22. Wiring and flanging.

CLASS 114.—SHIPS. (XXII.)

Sub-classes.

1. Anchors.
2. Anchor-trippers.
3. Armor-clad.
4. Ballasting.
5. Berths, cabins, and furniture.
6. Bilge-water. Discharging
9. Building.
10. Cables and cable-stoppers.
12. Camels.
14. Center-boards and keels.
15. Cleats and belaying-pins.
16. Couplings and tow-lines.
17. Dead-lights.
18. Decks and hatches.
19. Fire-extinguishers.
21. Floating-docks.
22. Form.
23. Gangways and bridges.
24. Hanks, cringles, and hoops.
25. Hawser-clamps.
26. Ice boats and breakers.
27. Implements.
28. Iron.
29. Leak-stoppers.
30. Light and air ports.
32. Masts and spars.
46. Oil-distributers.
33. Raising sunken vessels.
34. Reefing and furling sails.
35. Sails and rigging.
36. Scows.
37. Scuppers and hawse-holes.
38. Steamboat-chimneys.
39. Steering mechanism—
47. Hydraulic,
48. Pneumatic,
50. Rudders,
49. Wheels and channels.
40. Submarine and torpedo.
41. Surge-relievers.
42. Travelers.
43. Turrets.
44. Valve and port stoppers.
45. Ventilating.

CLASS 116.—SIGNALS. (XXII.)

Sub-classes.

1. Alarms—
Burglar—
41. Combined,
42. Detonating,
43. Miscellaneous,
44. Ringing,
11. Fire,
15. Leak,
22. Shoal.
32. Annunciators.
33. Bells—
34. Call,
35. Door,
36. Letter-box,
37. Sleigh.
38. Bell-hanging—
39. Pulls,
40. Ringing.
12. Flag-staff holders.
31. Indicators.
22. Semaphores.
Signals—
9. Car,
13. Fog,
18. Nautical,
19. Pneumatic,
30. Pyrotechnic.
26. Speaking-tubes.
27. Station-indicators.

CLASS 117.—SILK. (XXI.)

Sub-classes.

1. Assorting.
2. Cleaning.
3. Cocooneries.
4. Doubling.
5. Silk.
6. Stretching.
7. Throwing.
8. Winding.

CLASS 118.—SPINNING. (XXI.)

Sub-classes.

1. Bobbin and cop builders.
2. Bobbins.
26. Clearers.
4. Cop-tubes.
5. Domestic.
6. Doubling.
7. Drawing and evening.
23. Drawing rollers.
17. Drawing stop mechanism.
28. Drawing trumpets.
29. Fliers.
8. Hemp, flax, and hair.
9. Mules and jacks.
10. Ring-frames.
11. Rings and travelers.
27. Spindles and appurtenances.
Spindles and bearings—
18. Bolsters,
19. Combined bearings,
20. Sleeve whirls and standards,
25. Spindles and bearings,
21. Steps.
24. Spindle-driving devices.
12. Stopping.
22. Top-roll saddles.
13. Throstles and caps.
14. Twisting-heads.
16. Yarn-controllers.

CLASS 120.—STATIONERY. (V.)

Sub-classes.

4. Bill-files.
5. Blotters.
6. Calendars.
7. Copy-holders.
39. Desk-rulers.
9. Erasers.
11. Fountain-pens.
12. Hand-rests.
13. Inkstands.
37. Knife erasers.
38. Lead and crayon holders.
36. Paper-clips.
17. Paper-weights.
18. Pens.
19. Pen-holders.
20. Pen and pencil cases.
21. Pen racks and cleaners.
22. Pencils.
23. Pencil-clasps.
24. Pencil-holders
25. Pencil-sharpeners.
26. Post-office boxes.
28. Scholars' companions.
29. Slate and blackboard rubbers.
30. Sponge-cups.
35. Stylographic pens.
32. Ticket-cases.
33. Ticket-reels.

CLASS 160.—STEAM AND VACUUM PUMPS. (XVIII.)

No sub-classes.

CLASS 122.—STEAM-BOILERS. (XVIII.)

Sub-classes.

1. Attachments.
2. Cleaners—
31. Scrapers,
20. Steam or air jet.
3. Coverings.
5. Circulation.
22. Feeders.
6. Fire-tube.
7. Flashers.
8. Flue and tubular.
Heating feed-water—
29. Furnace-gases,
30. Steam,
21. Steam-injected.
10. Incrustation.
11. Indicators.
12. Introducing smoke and gases
13. Rotary.
32. Safety devices.
14. Sectional.
15. Separators.
16. Superheaters.
17. Tubes and flues.
4. Vapor-generators.
23. Vertical.
27. Water-tube—
28. Coil.
18. Water fire-boxes.

CLASS 119.—STEAM-BOILER FURNACES. (XVIII.)

Sub-classes.

14. Attachments.
1. Bagasse.
2. Draft-regulators.
Furnace-feeding—
3. Air,
4. Fuel.
5. Furnaces.
6. Grates and grate-bars—
10. Hollow.
9. Pulverized-fuel.
12. Smoke and gas returning.
7. Spark-arresters—
13. Conductors.

CLASS 121.—STEAM-ENGINES. (XVIII.)

Sub-classes.

1. Attachments.
Condensers—
25. Injector,
26. Surface.
46. Cylinder relief-valves.
Engines—
2. Beam,
47. Bell-ringer,
3. Compound,
5. Direct-acting,
7. Fire,
16. Hammer,
9. Locomotive,
35. Multiple-cylinder,
48. Multiple-piston,
11. Oscillating,
13. Portable, traction, and dummy,
17. Pumping—
40. Duplex,
18. Rock-drilling,
14. Rotary—
30. Concentric-piston,
31. Eccentric-piston,
36. Impact,
34. Oscillating-piston,
41. Reciprocating-piston,
50. Wabbling-piston,
Engines—
51. Single acting—
52. Compound,
19. Steam-steering.
6. Exhaust mechanism.
27. Exhaust regenerated.
22. Mufflers.
Packing—
28. Compound and textile,
12. Metallic piston,
29. Rod,
32. Steam-joint.
53. Pistons.
23. Speed-governors—
37. Centrifugal,
38. Marine,
42. Pressure.
54. Steam sanding device.
20. Trips—
43. Expansion.
21. Valve-gear—
44. Link,
45. Rod,
33. Shifting-eccentric—
55. Automatic.
56. Tripping cut-off.

CLASS 136.—STEAM-ENGINE VALVES. (XVIII.)

Sub-classes.

1. Balanced-slide—
13. Double,
14. Roller.
2. Cut-off.
3. Gage-cocks.
4. Governor.
5. Piston.
6. Puppet.
12. Reversing.
7. Rotary.
9. Safety.
8. Slide.
10. Steam-actuated.
11. Throttle.

CLASS 161.—STEAM WATER-ELEVATORS. (XVIII.)

No sub-classes.

CLASS 125.—STONE-WORKING. (XV.)

Sub-classes.

2. Channeling-machines.
3. Chucks for rock-drills.
4. Diamond-tools.
5. Dressing slate.
6. Dressing stone.
10. Drills.
11. Millstone-dressing machines.
12. Millstone paint-stuffs.
13. Millstone-picks.
14. Mining-machines.
15. Monuments.
18. Sawing stone.
19. Tools.

CLASS 186.—STORE SERVICE. (XII.)

Sub-classes.

3. Buffers.
4. Carriers.
5. Carriers. Wheeled
6. Elevators and drops.
1. Gravity.
2. Propulsion.
10. Store service.
7. Switches.
9. Vending apparatus.
8. Ways.

CLASS 126.—STOVES AND FURNACES. (XIX.)

Sub-classes.

Boilers—
1. Agricultural,
16. Domestic—
17. Steamers,
84. Stand.
Burners—
79. Hay and straw,
49. Refuse.
9. Coffee and tea pots.
12. Corn-poppers.
13. Dampers—
14. Automatic.
95. Dough-raisers.
20. Fenders.
21. Fire-dogs.
22. Fire-places—
89. Blowers,
68. Fire-backs,
23. Fronts,
24. Grates,
70. Hot-air.
25. Fire-pots and linings.
27. Foot-warmers.
90. Fuel-boxes.
Furnaces—
76. Cremation,
37. Hot-air—
86. Steam,
43. Magazine,
46. Portable.
28. Glue-pots.
29. Grates—
96. Adjustable,
98. Compound-movement,
97. Cut-offs,
102. Raking-attachment,
99. Reciprocating,
100. Rocking-bar,
78. Rotary,
101. Vertical-movement.
31. Gridirons.
Heaters—
5. Barrel,
73. Car—
75. Pendent,
74. Steam,
15. Dish,
26. Flat-iron,
40. Lunch,
82. Solar,
32. Soldering-iron,
53. Heaters—Steam.
32. Heating-drums.
38. Hot-air registers.
Ovens—
4. Bakers',
19. Domestic.
87. Paint-breamers.
Pans—
2. Ash,
3. Bake,
80. Frying.
94. Pipe-hangers.
45. Platforms.
47. Pot and lid lifters.
81. Pots and kettles.
48. Ranges.
51. Shovel, tongs, and pokers.
83. Snow and ice melters.
72. Steam-radiator attachments.
85. Steam-radiators.
54. Steaming-tables.
55. Stove doors and windows.
56. Stove-hoods.
57. Stove-legs.
58. Stove lids and tops.
59. Stove-pipes.
60. Stove-pipe shelves.
61. Stove-pipe thimbles
62. Stove-shelves.
Stoves—
10. Cooking—
11. Hearths,
41. Magazine,
50. Reservoir,
71. Steam,
66. Gas,
69. Heating—
92. Central air-tube,
34. Horizontal-body,
33. Hot-air,
35. Open-front,
36. Panel,
91. Parlor,
39. Lamp,
44. Magazine—
42. Fire-place,
64. Vapor.
63. Tea-kettles.
88. Waffle-irons.

CLASS 127.—SUGAR AND SALT. (II.)

Sub-classes.

1. Bleaching cane-juice.
2. Bone-black.
3. Centrifugal machines.
4. Confectionery.
6. Cube sugar.
5. Cutters and crushers.
7. Defecating.
8. Diffusion apparatus.
9. Evaporating-pans.
10. Glucose.
19. Graining and draining.
11. Mixers.
12. Molds and carriages.
13. Pill-machines.
14. Refining salt.
15. Refining sugar.
16. Salt-making.
17. Sugar-making.
18. Vacuum-pans.

CLASS 128.—SURGERY. (XX.)

Sub-classes.

2. Atomizers.
33. Baby-jumpers—
34. Walkers.
3. Bandages.
4. Breast-pumps.
32. Capsule-machine.
5. Catamenial sacks.
9. Depuratora.
35. Dumb-bells and clubs.
10. Ear.
36. Exercising-machines.
11. Eye.
12. Inhalers and respirators.
15. Medical spoons.
23. Miscellaneous.
16. Movement cure.
17. Nasal douches.
18. Nipples.
19. Nursing-bottles.
20. Obstetrics.
21. Pessaries.
22. Pharmaceutical.
23. Scarificators and lancets.
24. Speculums.
25. Syringes.
26. Trusses.
27. Veterinary.

CLASS 129.—TANNING. (XI.)

Sub-classes.

7. Dressing.
2. Preparing hides.
3. Stretching.
4. Tanning.
5. Tanners' tools
6. Tan-vats.

CLASS 178.—TELEGRAPHY. (XVI.)

Sub-classes.

Telegraphs—
46. Automatic,
45. Circuits and systems,
47. Dial,
48. Duplex,
49. Dynamo,
50. Fire,
103. Fire alarms and extinguishers,
51. Multiplex,
52. Perforating,
54. Printing,
Telegraphs—
55. Quadruplex,
56. Railway-car,
63. Reed.
10. Circuit-closers.
12. Condensers.
29. Keys.
30. Lightning-arresters.
35. Morse registers.
41. Relays and sounders
42. Repeaters.
69. Transmitters.

CLASS 179.—TELEPHONY. (XVI.)

Sub-classes.

82. Anti-induction devices.
81. Conductors. Anti-inductive
Telephones—
57. Calls,
58. Details,
59. Electric,
60. Magnetic,
Telephones—
62. Radiophones,
77. Relays and repeaters,
100. Supports.
85. Switch-boards,
71. Switches,
64. Systems—
101. Automatic.

CLASS 130.—THRASHING. (XXV.)

Sub-classes.

1. Band-cutters and feeders.
31. Cane-strippers.
2. Clover-hullers.
3. Corn-cribs.
4. Corn-husking implements.
5. Corn-husking machines.
Corn-shellers—
6. Breast and cylinder,
7. Disk-action,
9. Ear-grasping,
10. Implements,
8. Peripheral action.
12. Fans and regulators.
13. Flax-thrashers.
32. Fruit and vegetable separators.
14. Granaries and bins.
Grain separators—
17. Gravity,
Grain-separators—
18. Oat, seed, and garlic,
16. Rotary screens,
19. Screens and riddles,
15. Shaking screens.
Straw-carriers—
21. Endless aprons,
22. Overhung rakes,
23. Reels,
24. Shaking tables,
20. Stackers,
25. Vibrators,
26. Walking-rakes.
Thrashing-machines—
27. Cylinder-machines,
29. Dust-conveyers,
28. Flail-machines,
30. Vine and seed strippers.

CLASS 131.—TOBACCO. (II.)

Sub-classes.

1. Boxes, cases, and pouches.
2. Cigars, cigarettes, and cartridges.
18. Cigar-bundling machines.
3. Cigar-cutters.
4. Cigar holders and stands.
5. Cigar-machines—
23. Continuous filler,
24. Roller,
25. Stationary-belt,
26. Traveling-belt.
19. Cigar-makers' implements.
20. Cigar-perforators.
27. Coloring and flavoring.
28. Coloring and flavoring machines.
6. Curing.
29. Dressing-machines.
7. Granulating.
8. Leaf-treating machine.
30. Moistening apparatus.
9. Molding cigars.
10. Mouth-pieces.
11. Packing-machines.
12. Pipes and stems.
13. Pipe-cleaners.
14. Plug-making.
15. Plugs.
31. Smoking-tobacco.
22. Smoking-tubes.
16. Snuff-manufacture.
32. Substitutes.
Tobacco-cutters—
33. Pivoted-knife,
34. Reciprocating,
35. Rotary.
21. Tobacco-hangers.
36. Wrappers.

CLASS 132.—TOILET. (V.)

Sub-classes.

1. Barbers' appliances.
2. Bathers' appliances.
3. Combs.
4. Crimping and curling.
5. Hair-pins.
6. Hair and wigs.
7. Jewel-boxes.
8. Mustache-guards.
9. Nail and ear cleaners.
14. Pins.
11. Toilet-cases.
12. Tooth-picks.
13. Tweezers.

CLASS 47.—TREES, PLANTS, AND FLOWERS. (II.)

Sub-classes.

2. Bouquet-holders.
4. Flower pots and stands.
6. Grafting.
13. Hedge-training.
7. Hop-culture.
14. Plant and tree culture.
8. Plant and tree protectors.
10. Propagation.
11. Sap-spouts.
12. Trellises.

CLASS 135.—UMBRELLAS AND CANES. (V.)

Sub-classes.

2. Canes.
3. Combined cane and umbrella.
4. Covers.
5. Drip-cups.
7. Handles and sticks.
8. Ribs and stretchers.
9. Runners and notches.
10. Tip-cups.
13. Umbrellas, Folding—
14. Self opening and closing,
12. Supporters.

CLASS 27.—UNDERTAKING. (XX.)

Sub-classes.

1. Biers.
2. Burial apparatus.
3. Coffins.

CLASS 146.—VEGETABLE CUTTERS AND CRUSHERS. (II.)

Sub classes.

8. Apple-parers.
16. Bunching-machines.
Crushers and graters—
15. Reciprocating,
9. Rotary.
Cutters—
12. Bread,
7. Reciprocating,
Cutters—
11. Rotary.
2. Fruit-squeezers.
3. Nut-crackers.
14. Peelers and washers.
6. Pitters, corers, and eye-cutters.
5. Seeders.

CLASS 152.—WAGON, CAR, AND TRACK IRONS. (XIII.)

Sub-classes.

1. Car axles and boxes. Making
2. Car and locomotive irons.
3. Carriage clips and shackles.
4. Carriage-irons. Miscellaneous
5. Car-wheels and tires.
6. Fifth-wheels. Making
7. Railway-chairs.
8. Repairing and capping rails.
9. Tire-heating furnaces.
10. Tire-upsetting.
11. Track-irons. Miscellaneous
12. Wagon axles and boxes. Making
13. Wagon tires and fellies. Making

CLASS 141.—WASHING APPARATUS. (XXVII.)

Sub-classes.

6. Barrel-washers.
7. Bottle and can washers.
9. Dish-cleaners.
8. Dish cleaners and drainers. Combined
10. Dish-cloth holders.
11. Dish-drainers.
12. Pitching casks.
3. Tumbler-washers.
5. Wool-washing machines.

CLASS 137.—WATER-DISTRIBUTION. (IX.)

Sub-classes.

1. Aquariums.
32. Check-valves.
Cocks and faucets—
26. Compound,
4. Reciprocating valves,
5. Sliding gates,
27. Tank,
6. Tube-compressors,
7. Turning plugs.
9. Cut-offs and spouts.
10. Filters.
11. Fountains.
12. Funnels.
33. Hose-patches.
13. Hydrants and plugs.
14. Irrigating and sprinkling.
16. Mains and pipes.
17. Nozzles.
Pipe-couplings—
28. Detachable,
34. Detachable and flexible,
29. Permanent,
30. Valved.
18. Sampling-tubes.
20. Siphons.
21. Tanks.
31. Water-supply hose-holders.

CLASS 139.—WEAVING. (XXI.)

Sub-classes.

47. Bag-turning-machines.
5. Carpet-rag looper.
6. Chenille—
40. Machines.
8. Cross-weaving.
9. Fabrics.
41. Fringe-machines.
10. Fringes.
13. Heddle-machines.
14. Heddles.
16. Jacquard mechanisms.
18. Looms—
1. Bag,
2. Basket,
3. Button-hole,
7. Circular,
11. Hair-cloth,
12. Hand,
15. Irregular,
17. Lappet,
19. Narrow-ware,
20. Needle,
23. Pile-fabric,
32. Slat, cane, and straw,
Looms—
39. Wire.
42. Pattern-chains.
21. Pickers.
22. Picker-checks.
24. Reeds and reed-making.
25. Shedding.
27. Shuttles—
44. Cop-cell and cover,
45. Float-detecting,
46. Guides and tensions.
28. Shuttle-boxes.
29. Shuttle-checks.
30. Shuttle-guards.
31. Shuttle-motions—
48. Fly,
49. Positive.
43. Shuttle-threaders.
33. Special machines.
34. Stopping.
35. Take-ups and let-offs.
36. Temples.
37. Tying-in warps.
38. Weft-forks.

CLASS 157.—WHEELWRIGHT-MACHINES. (XXIX.)

Sub-classes.

1. Axle-gages.
2. Boring hubs.
3. Carriage-bow setters.
8. Tire-setters.
9. Wheelwright-machines.

CLASS 170.—WIND-WHEELS. (XXVIII.)

Sub-classes.

4. Automatic regulators.
5. Gearing.
6. Power-transmitters.
Wind-wheels—
1. Horizontal,
Wind-wheels—
2. Vertical feathering-blades,
3. Vertical solid-wheel.

CLASS 140.—WIRE-WORKING. (XIV.)

Sub-classes.

1. Barbing—
12. Sheet-metal,
22. Tools.
3. Bending.
4. Bending and coiling.
5. Bending and twisting.
6. Coiling.
7. Covering.
8. Cutting and straightening.
9. Fabrics—
10. Making,
90. Working.
21. Feeding and tension
13. Heddles. Making
14. Joining.
15. Reels and spools.
16. Tools.
17. Wiring bottles and corks—
18. Brushes and cards,
19. Wood—
11. Fences,
23. Fencing.

CLASS 143.—WOOD-SAWING. (XXIX.)

Sub-classes.

11. Log-turners.
15. Saw-bucks.
25. Saw-guards.
26. Saw-guides.
16. Saw-hanging.
Sawing-machines—
1. Band-saw.
4. Circular-saw—
22. Angular,
6. Fire-wood,
23. Radial,
24. Traveling,
29. Drag, Crank—
30. Lever,
5. Edgers,
3. Mills, Circular-saw—
31. Auxiliary-saw,
12. Reciprocating-saw,
Sawing-machines—
32. Reciprocating-saw—
21. Scroll,
13. Resawing,
20. Shingle—
33. Horizontal-saw,
28. Tubular-saw.
17. Saw-mill appliances.
34. Saw-mill carriages. Feed
35. Saw-mill carriages. Offsetting
18. Saw-mill dogs.
9. Saw-mill set-works.
14. Saws.
19. Saw-teeth.
27. Saw-table gages.

Sub-Classes in Wood-Sawing, with Explanatory Notes.

11. LOG-TURNERS. Machines for turning logs by power.

15. SAW-BUCKS.

25. SAW-GUARDS. Shields to prevent accidents.

26. SAW-GUIDES. Devices to prevent vibration of the saw.

16. SAW-HANGING. Devices for holding saws on arbors or in gates.

1. SAWING-MACHINES. BAND-SAW. Machines using an endless flexible saw.

4. SAWING-MACHINES. CIRCULAR-SAW. For sawing on a table with a circular saw without a power-driven carriage.

22. SAWING-MACHINES. CIRCULAR-SAW. ANGULAR. Circular saws arranged to cut in planes inclined to each other.

6. SAWING-MACHINES. CIRCULAR-SAW. FIRE-WOOD. Circular sawing machines adapted to cross-cut rough sticks.

23. SAWING-MACHINES. CIRCULAR-SAW. RADIAL. Circular saws arranged to make cuts radial to the log

24. SAWING-MACHINES. CIRCULAR-SAW. TRAVELING. Revolving saw is carried to the work.

29. SAWING-MACHINE. DRAG. CRANK. Drag-saws in which there are crank-connections for reciprocating the saw.

30. SAWING-MACHINES. DRAG. LEVER. Drag-saws in which the saw is reciprocated by a lever and connecting devices.

5. SAWING-MACHINES. EDGERS. Machines having two or more circular saws on a shaft, usually adjustable relatively to each other.

3. SAWING-MACHINES. MILLS. CIRCULAR-SAW. For sawing logs. A power-driven carriage is usually present. The saw cuts through the log from side to side.

31. SAWING-MACHINES. MILLS. CIRCULAR-SAW. AUXILIARY-SAW. Circular saws enter the log above and below in the same plane.

12. SAWING-MACHINES. MILLS. RECIPROCATING-SAW. Machines with carriages for feeding logs or timber to a reciprocating saw, which is generally hung in a gate.

32. SAWING-MACHINES. RECIPROCATING-SAW. Includes machines in which a reciprocating saw is present except saw-mills, scroll-sawing machines, and drag-saws.

21. SAWING-MACHINES. RECIPROCATING-SAW. SCROLL. Jig-sawing machines where the feed is by hand or under the immediate control of the operator.

13. SAWING-MACHINES. RESAWING. For dividing sawed stuff from edge to edge, usually at an angle and generally with gages at each side of the work.

20. SAWING-MACHINES. SHINGLE. For sawing beveled pieces, and having devices for shifting the bolt so as to produce the bevel.
33. SAWING-MACHINES. SHINGLE. HORIZONTAL-SAW.
28. SAWING-MACHINES. TUBULAR-SAW. The saw is a hollow cylinder.
17. SAW-MILL APPLIANCES. Attachments—as brakes, wheels, log-decks, saw-dust conveyers, and carriages.
34. SAW-MILL CARRIAGES. FEED.
35. SAW-MILL CARRIAGES. OFFSETTING. Setting the carriage away from the saw before returning.
18. SAW-MILL DOGS. Devices to clamp the log to the saw-carriage.
9. SAW-MILL SET-WORKS. Mechanism for moving a log on its carriage. Includes head-blocks and knees.
14. SAWS. Wood-saws with solid teeth.
19. SAW-TEETH. Insertible teeth and fastenings.
27. SAW-TABLE GAGES. For guiding the work on the table.

CLASS 142.—WOOD-TURNING. (XXIX.)

Sub-classes.

9. Irregular forms.
Lathes—
12. Automatic-spindle,
2. Gage,
13. Many-spindle,
14. Single-chuck,
15. Tubular-cutter.
3. Lathe appliances.
8. Oval forms.
16. Polygonal forms.
Regular forms—
17. Lateral-movement,
18. Longitudinal-movement.

Sub-Classes in Wood-Turning, with Explanatory Notes.

9. IRREGULAR FORMS. Lathes having as essential elements revolving work-spindle, revolving pattern, and a bearing-surface, which rests on the pattern and controls the movement of the work-spindle or the rotary cutter.
12. LATHES. AUTOMATIC-SPINDLE. Lathes in which the spindles close on the work, usually for turning spools, buttons, &c.
2. LATHES. GAGE. Lathes having a revolving work-spindle, a traveling cutter, and fixed pattern for guiding the cutter.
13. LATHES. MANY-SPINDLE. Lathes with a series of spindles, which usually move past a series of cutters.
14. LATHES. SINGLE-CHUCK. Lathes in which the work is chucked to a single spindle.
15. LATHES. TUBULAR-CUTTER. A hollow revolving cutting-mandrel, through which the work is fed.
3. LATHE APPLIANCES. Attachments for wood-lathes.
8. OVAL FORMS. TURNING. Spindle of lathe has double or eccentric motion.
16. POLYGONAL FORMS. TURNING. Lathes in which a rotating stick is given of substantially a polygonal form in cross-section, because of the intermittent character of the rotation or because of the large circle of rotation.
17. REGULAR FORMS. TURNING. LATERAL-MOVEMENT. Simple lathes in which the cutter moves laterally toward the work.
18. REGULAR FORMS. TURNING. LONGITUDINAL-MOVEMENT. Same as above, with cutters made to move lengthwise of the stick, or nearly so.

CLASS 144.—WOOD-WORKING MACHINES. (XXIX.)

Sub-classes.

1. Bending wood.
2. Boring—
77. Portable.
48. Boring and reaming.
78. Box-nailing machines.
79. Bundling firewood.
20. Bundling shingles.
6. Clothes-pin machines.
8. Comb-teeth. Cutting
60. Cutters, Bits and non-rotary stocks—
49. Chain,
9. Rotary-stock.
10. Cutting dye-wood.
11. Cutting gears.
14. Dovetailing.
81. Feed mechanism—
82. Rolls.
50. Gaining.
51. Machine-tables.
16. Match-splints. Making
75. Match-trays.
83. Mitering-knife—
84. Saw.
Molding—
85. Axles,
52. Clamped-work,
53. Hand-feed,
54. Lateral-feed,
55. Pattern-feed,
56. Special-feed,
57. Straight-feed.
Mortising—
58. Auger-cutters,
59. Chisel and auger cutters,
60. Chisel-cutters,
Mortising—
61. Rotary cutters.
19. Osier-peelers.
20. Packing shingles.
22. Pencil-wood. Making
23. Planer attachments.
Planers—
64. Beveling,
65. Rotary-cylinder,
66. Rotary-disk,
25. Sliding,
27. Planing and matching.
28. Planing and sawing.
63. Presser bars and rolls.
67. Punching-cutters.
29. Rossing bark.
68. Routing—
4. Pattern.
Sashes and blinds—
31. Making,
74. Tenoning.
69. Shaving. Fixed-knife
Slicers—
70. Beveling,
71. Reciprocating,
72. Rotary and oscillating.
36. Slivering.
37. Special work.
38. Splitting and bundling.
73. Tenoning and boring.
40. Universal joiners.
45. Working rattan.
46. Wiring blinds.
42. Wooden pins. Making
43. Wooden trays. Making
44. Wood ornamentation.

Sub-Classes in Wood-Working Machines, with Explanatory Notes.

1. BENDING WOOD. Includes machines for bending sticks, devices holding them bent, and machines for rendering sticks pliant for bending by steaming or otherwise.
2. BORING. Machines which operate with a simple rotary bit or bits.
77. BORING. PORTABLE. Small boring-machines, operated usually by hand, adapted to be moved along the work.
48. BORING AND REAMING. Machines which have reamers for enlarging, as well as augers for boring, holes.
78. BOX-NAILING MACHINE. Machines for nailing the parts of a box together.
79. BUNDLING FIRE-WOOD.
20. BUNDLING SHINGLES.
6. CLOTHES-PIN MACHINES. For removing the wood between the legs of clothes-pins.
8. COMB-TEETH. CUTTING. Machines for slitting the spaces between the comb-teeth, usually circular saws with intermitting feed devices for the comb-blanks.
80. CUTTERS. BITS AND NON-ROTARY STOCKS. Includes bits or irons for cutter-heads for use in machines; also, non-rotary cutter-heads.
49. CUTTERS. CHAIN. Endless chains carrying cutting-blades.
9. CUTTERS. ROTARY-STOCK. Rotary heads with cutting-blades, (other than saws and augers.)
10. CUTTING DYE-WOOD. Chip-making machines.
11. CUTTING GEARS. Machines with cutters for forming gear-teeth, and generally a step-by-step feed.
14. DOVETAILING. Machines with rotary cutters or saws arranged at angles to the wood, which is fed in straight lines.
81. FEED MECHANISM. Means for feeding the work to the cutters in wood-working machines.
82. FEED MECHANISM. ROLLS. The work is fed by means of driven rolls.
50. GAINING. Machines with rotary cutting-tools having their axes parallel (or nearly so) to the surface in which a transverse groove is cut.
51. MACHINE-TABLES.
16. MATCH-SPLINTS. MAKING
75. MATCH-TRAYS. A device for receiving, clamping, adjusting, or preparing the splints for dipping, &c., and which may be connected to or disconnected from the match-splint machine proper.
83. MITERING-KNIFE. Includes miter-boxes and like devices for cutting bevels on wood by means of knives.
84. MITERING-SAW. The cutter is a saw.
85. MOLDING AXLES. Shaping wooden axles.
52. MOLDING. CLAMPED-WORK. The blank is clamped and the cutter advanced to operate on it.
53. MOLDING. HAND-FEED. The material is shaped by rotary cutters on axes parallel to the surface cut, the feed being under immediate control of the operator.
54. MOLDING. LATERAL-FEED. Machines with rotary cutters on axes parallel to the surface operated on, the blank being fed to the cutter and then withdrawn.
55. MOLDING. PATTERN-FEED. The material is shaped by cutters, the feed being in a direction fundamentally regular but modified by transverse movements produced by patterns, cranks, or cams.
56. MOLDING. SPECIAL-FEED. The work is shaped by rotary cutters, the feed being in curved, tortuous, or irregular lines.
57. MOLDING. STRAIGHT-FEED. The work is passed by shaping-cutters in a straight line.
58. MORTISING. AUGER-CUTTERS. Slots are formed by augers, which first bore a hole to the required depth and then move sidewise, cutting at the side.
59. MORTISING. CHISEL AND AUGER CUTTERS. Augers followed or accompanied by chisels which enlarge and square the hole bored.
60. MORTISING. CHISEL-CUTTERS. Machines with reciprocating chisel.
61. MORTISING. ROTARY CUTTERS. For cutting mortises by means of rotary, oscillating, or chain cutters, the axis of the cutter being parallel to the surface of the wood.
19. OSIER-PEELERS.
20. PACKING SHINGLES.
22. PENCIL-WOOD. MAKING
23. PLANER ATTACHMENTS. Miscellaneous attachments for planing-machines.
64. PLANERS. BEVELING. For planing tapered articles—as shingles, &c.—by rotary cutters.
65. PLANERS. ROTARY-CYLINDER. Planer with rotary cutter-head on axis parallel with face of bed; knives on cylindrical surface of cutter.
66. PLANERS. ROTARY-DISK. Planers with rotary disk having knives on the flat surface, which is parallel with the bed of machine. Traversing planers.
25. PLANERS. SLIDING. Planers with fixed or reciprocating knives, the work being fed to the knife or the knife reciprocated over the work.

27. PLANING AND MATCHING. Planers with matcher-heads attached.
28. PLANING AND SAWING. Planers with circular saws or edges attached.
63. PRESSER BARS AND ROLLS.
67. PUNCHING-CUTTERS. Machines for forming cylinders, cones, &c., by cutters which surround the article, cutting its outside, and machines for cutting patterns out of veneers.
29. ROSSING BARK.
68. ROUTING. Rotary cutters with their axes at right angles to the surface operated on, and capable of lateral movement over such surface, for panel-raising, &c.
4. ROUTING. PATTERN. Routing-machines for following the contour, usually with a tracer attached to the cutter.
31. SASHES AND BLINDS. MAKING. Machines for.
74. SASHES AND BLINDS. TENONING. Cutting round tenons on blind-slats by rotary cutters, against which the slats rotate.
69. SHAVING. FIXED-KNIFE. The work fed continuously to the stationary knife.
70. SLICERS. BEVELING. Machines with reciprocating or rotary splitting-knives, to which the work is fed by mechanism.
71. SLICERS. RECIPROCATING. Machines with reciprocating splitting-knives.
72. SLICERS. ROTARY AND OSCILLATING.
36. SLIVERING. Machines with sets of fine knives for making tooth-picks, excelsior, &c.
37. SPECIAL WORK. Machines for special purposes, (as gluing, driving parts together, fastening cane-seats, felling trees, &c.)
38. SPLITTING AND BUNDLING. Includes splitting devices for making fire-wood with or without bundling attachments.
73. TENONING AND BORING. Cutting round tenons by hollow augers which may be replaced or accompanied by boring-augers.
40. UNIVERSAL JOINERS. Machines for performing several operations simultaneouly or successively.
45. WORKING RATTAN.
46. WIRING BLINDS.
42. WOODEN PINS. MAKING
43. WOODEN TRAYS. MAKING
44. WOOD ORNAMENTATION. By cutting or embossing.

CLASS 145.—WOOD-WORKING TOOLS. (XXIX.)

Sub-classes.

1. Augers—
25. Countersink.
2. Auger-handles—
26. Ratchet.
3. Bench-dogs.
4. Bench-planes—
29. Gage attachments.
5. Bit-stocks—
27. Ratchet.
6. Box-openers.
7. Box-scrapers.
22. Cant-dogs.
8. Chisels.
9. Clamps.
10. Chalk-line holders.
30. Floor sets.
11. Gages—
31. Weather-board.
23. Handsaws.
12. Hammers and hatchets.
13. Hollow augers.
15. Nail-extractors.
16. Saw-handles.
17. Screw-drivers—
28. Ratchet.
18. Spokeshaves.
19. Tools.
20. Tool-handles—
32. Fastenings.
21. Work-benches.

SUBJECTS OF INVENTION.

Subjects of invention are divided into one hundred and eighty-eight classes, and assigned for examination to the thirty Examining Divisions of this Office, as follows:

DIVISION I.—EXAMINER FOX.

Classes.

39. Fences.
55. Harrows and Diggers.
97. Plows.
111. Seeders and Planters.

DIVISION II.—EXAMINER BLODGETT.

Classes.

6. Bee-Culture.
17. Butchering.
119. Care of Live Stock.
31. Dairy.
100. Presses.
127. Sugar and Salt.
131. Tobacco.
47. Trees, Plants, and Flowers.
146. Vegetable Cutters and Crushers.

DIVISION III.—EXAMINER MACLEAN.

Classes.

7. Brewing and Fermenting.
96. Coating with Metal.
124. Distillation.
48. Gas.
75. Metallurgy.
148. Metal Tempering, Annealing, and Cementation.

DIVISION IV.—EXAMINER POND.

Classes.

14. Bridges.
37. Excavating.
159. Fire Escapes and Ladders.
183. Fire-Proof Buildings.
61. Hydraulic Engineering.
72. Masonry.
104. Railways.
108. Roofing.
182. Sewerage.

DIVISION V.—EXAMINER BURKE.

Classes.

11. Book-Binding.
41. Fine Arts.
63. Jewelry.
84. Music.
95. Photography.
120. Stationery.
132. Toilet.
135. Umbrellas and Canes.

DIVISION VI.—EXAMINER ANTISELL.

Classes.

8. Bleaching and Dyeing.
23. Chemicals.
52. Explosives.
71. Fertilizers.
44. Fuel.
149. Hides, Skins, and Leather. Chemical Treatment of
167. Medicines.
87. Oils, Fats, and Glue.
91. Painting.
99. Preserving.

DIVISION VII.—EXAM'R GOLDSBOROUGH.

Classes.

56. Harvesters.

DIVISION VIII.—EXAMINER SKINNER.

Classes.

5. Beds.
107. Bread, Cracker, and Lozenge Making.
155. Chairs.
156. Curtains, Shades, and Screens.
45. Furniture.
46. Games and Toys.
65. Kitchen and Table Articles.

DIVISION IX.—EXAMINER TRYON.

Classes.

1. Aeration and Bottling.
4. Baths and Closets.
169. Fire-Extinguishers.
138. Hydraulic Motors.
103. Pumps.
137. Water-Distribution.

DIVISION X.—EXAMINER SANDERS.

Classes.

21. Carriages and Wagons.
105. Railway-Cars.

DIVISION XI.—EXAMINER CHAPMAN.

Classes.

12. Boots and Shoes.
24. Clasps and Buckles.
54. Harness.
60. Hose and Belting.
69. Leather.
129. Tanning.

DIVISION XII.—EXAM'R AUGHINBAUGH.

Classes.

187. Elevators.
57. Hoisting.
64. Journal-Boxes, Pulleys, and Shafting.
184. Lubricators.
74. Machine Elements.
185. Mechanical Motors.
186. Store Service.

DIVISION XIII.—EXAMINER JAYNE.

Classes.

86. Arms and Projectiles. Making
59. Chains, Staples, and Horseshoes.
53. Hardware-Making.
10. Metal Bolts, Nuts, Rivets, and Screws.
77. Metal Boring and Drilling.
78. Metal-Forging.
79. Metal Personal Wear. Making
80. Metal-Rolling.
76. Metal Tools and Implements. Making
134. Metal Tubing and Wire.
82. Metal Turning, Planing, and Milling.
85. Nails and Spikes.
163. Needles and Pins.
164. Punching and Shearing.
152. Wagon, Car, and Track Irons.

DIVISION XIV.—EXAMINER STOCKING.

Classes.

153. Metal-Bending.
22. Metal-Founding.
150. Packing and Storing Vessels.
113. Sheet-Metal Ware. Making
140. Wire-Working.

DIVISION XV.—EXAMINER HUDSON.

Classes.

166. Artesian and Oil Wells.
106. Artificial Stone, Lime, and Cement.
18. Caoutchouc and Minor Plastics.
25. Clay and Pottery.
154. Composite Roofing.
38. Felting and Hat-Making
49. Glass.
92. Paper-Making.
94. Paving.
125. Stone-Working.

DIVISION XVI.—EXAMINER BROWN.

Classes.

176. Electric Lighting.
177. Electric Signaling.
178. Telegraphy.
179. Telephony.

DIVISION XVII.—EXAMINER COOKE.

Classes.

93. Paper-Manufactures.
101. Printing.

DIVISION XVIII.—EXAMINER FOWLER.

Classes.

123. Air and Gas Engines.
188. Fluid-Pressure Railway-Brakes.
50. Fluid-Pressure Regulators.
162. Injectors and Ejectors.
160. Steam and Vacuum Pumps.
122. Steam-Boilers.
110. Steam-Boiler Furnaces.
121. Steam-Engines.
136. Steam-Engine Valves.
161. Steam Water-Elevators.

DIVISION XIX.—EXAMINER STEWARD.

Classes.

126. Stoves and Furnaces.

DIVISION XX.—EXAMINER WILKINSON.

Classes.

3. Artificial Limbs.
16. Builders' Hardware.
30. Cutlery.
32. Dentistry.
70. Locks and Latches.
109. Safes.
128. Surgery.
27. Undertaking.

DIVISION XXI.—EXAMINER RANDALL.

Classes.

13. Brakes and Gins.
19. Carding.
26. Cloth-Finishing.
28. Cordage.
66. Knitting and Netting.
117. Silk.
118. Spinning.
139. Weaving.

DIVISION XXII.—EXAMINER SEATON.

Classes.

180. Accouterments and Baggage.
40. Advertising.
9. Boats.
42. Fire-Arms.
43. Fishing and Trapping.
115. Marine Propulsion.
89. Ordnance.
102. Projectiles.
114. Ships.
116. Signals.

DIVISION XXIII.—EXAM'R F. A. SEELY.

Classes.

TRADE-MARKS.
LABELS.
181. Acoustics.
33. Drafting.
35. Educational Appliances.
58. Horology.
73. Measuring-Instruments.
88. Optics.

DIVISION XXIV.—EXAMINER PIERCE.

Classes.

165. DESIGNS.
2. Apparel.
29. Crinoline and Corsets.
112. Sewing-Machines.

DIVISION XXV.—EXAMINER WYNNE.

Classes.

83. Mills.
130. Thrashing.

DIVISION XXVI.—EXAM'R GEO. D. SEELY.

Classes.

171. Electricity. Generation.
172. Electricity. Motive Power.
173. Electricity. Conductors.
174. Electricity. Medical and Surgical.
175. Electricity. Special Applications.

DIVISION XXVII.—EXAMINER GOULD.

Classes.

15. Brushing and Scrubbing.
51. Grinding and Polishing.
68. Laundry.
141. Washing Apparatus.

DIVISION XXVIII.—EXAM'R TOWNSEND.

Classes.

34. Driers.
168. Farriery.
81. Metal-Working Tools.
151. Nut and Bolt Locks.
98. Pneumatics.
62. Refrigeration.
170. Wind-Wheels.

DIVISION XXIX.—EXAMINER TYLER.

Classes.

20. Carpentry.
147. Coopering.
157. Wheelwright-Machines.
143. Wood-Sawing.
142. Wood-Turning.
144. Wood-Working Machines.
145. Wood-Working Tools.

DIVISION XXX.—EXAMINER WOODWARD.

Classes.

67. Lamps and Gas-Fittings.

PRICE LIST

OF THE

PUBLICATIONS OF THE UNITED STATES PATENT OFFICE.

OFFICIAL GAZETTE: Published every Tuesday; in two volumes a year prior to July, 1883, subsequent to that date in quarterly volumes, commencing January 1, April 1, July 1, and October 1.

SUBSCRIPTIONS: To all subscribers within the United States and Canada, one year..... $5 00
To foreign subscribers, except Canada..... 7 00
Single numbers..... 10

No Club rates. No discount to newsdealers. No sample copies.

All subscriptions must commence with the beginning of a volume. None taken for less than three months.

The publication of the GAZETTE commenced January 1, 1872, and the twenty-third volume (the last semi-annual) closed June 30, 1883, since when the GAZETTE has been published in quarterly volumes. Unbound numbers of all back volumes except Volume 17, (January to June, 1880,) Volumes 19, 20, and 21, (January, 1881, to June, 1882,) and Volumes 26 and 27 (January to June, 1884,) can be obtained at the above rates.

BOUND VOLUMES:

Semi-annual volumes, each six months, from January 1, 1872, to June 30, 1883, full sheep binding, per volume..... 4 00
Quarterly volumes, subsequent to July 1, 1883, full sheep binding, per volume..... 2 75
Complete sets of back volumes, except Volumes 19 and 21, can be furnished bound in full sheep, but only Volumes 9, 10, 11, 12, 13, 14, and 15 in half sheep.

ANNUAL INDEX, Lists of Patentees and Inventions, alphabetically arranged, with date of patent, number, &c., for the years 1872,-'73-'74-'75-'76-'77-'78-'79-'80-'81-'82-'83-'84-'85-'86-'87, *one volume each year*, full law binding, per volume..... 2 00
In paper covers, per volume..... 1 00

Prior to 1872 this information, with plates similar to the illustrations contained in the OFFICIAL GAZETTE, was embodied in the Annual Report of the Patent Office and gratuitously distributed. Back volumes of these reports for the years 1869, 1870, and 1871 only can be furnished—all others are exhausted. As a substitute therefor the Office has compiled a General Index, mentioned next below.

GENERAL INDEX, Lists of Inventions patented from 1790 to 1873, with the name of inventor, residence, date of patent, number, &c., three volumes, full law binding, per set..... 10 00

INDEX 1790 TO 1836, Lists of Inventions patented from 1790 to 1836, photolithographed from Patent Office Reports, one volume, full law binding..... 5 00

INDEX TO PATENTS RELATING TO ELECTRICITY, granted by the United States prior to June 30, 1882, one volume, 250 pp., bound..... 5 00
In paper covers..... 3 00
Appendix, from June 30, 1882, to June 30, 1883, paper covers..... 1 50
Appendix, from June 30, 1883, to June 30, 1884, paper covers..... 1 50
Appendix, from June 30, 1884, to June 30, 1885..... 1 50
Appendix, from June 30, 1885, to June 30, 1886..... 1 50
Appendix, from June 30, 1886, to June 30, 1887..... 1 50

INDEX TO FRENCH PATENTS, 1791 to 1876, inclusive, (subject-matter.) Translated, compiled, and published under the authority of the Commissioner of Patents; one volume, 935 pp., bound in cloth..... 10 00

INDEX TO ITALIAN PATENTS, 1848 to May 1, 1882, (subject-matter.) Translated, compiled, and published under the authority of the Commissioner of Patents; one volume, 120 pp.:
Bound half turkey..... 2 50
Bound in cloth..... 1 25
Paper covers..... 1 00

COMMISSIONER'S DECISIONS:
For 1869-'70-'71, bound in one volume, full law binding..... 2 00
For 1873-'74, bound in one volume, full law binding..... 2 00
For 1875-'76, in one volume, with decisions of United States courts in patent cases, full law binding..... 2 00
For 1877-'78-'79-'80-'81-'82-'83-'84-'85-'86-'87, one volume *each year*, with decisions of United States courts, full law binding, per volume..... 2 00
For 1877-'78-'79-'80-'81-'82-'83-'84-'85-'86-'87, one volume *each year*, with decisions of United States courts, paper covers, per volume..... 1 00

SPECIFICATIONS AND DRAWINGS:

Single copies, if printed*	$ 25
Twenty or more copies, if printed,* per copy	10
MONTHLY VOLUMES containing the specifications and photolithographic copies of the drawings of all patents issued during the month, certified, bound full sheep, per volume	12 00
Do do Bound half sheep, per volume	10 00
SPECIFICATIONS, manuscript copies of, per 100 words	10
DRAWINGS, not photolithographed	Cost of tracing.
CERTIFIED COPIES, whether written or printed, per 100 words	10
MISCELLANEOUS MANUSCRIPT COPIES, per 100 words	10
CATALOGUE OF SCIENTIFIC LIBRARY, U. S. PATENT OFFICE, edition 1878, one volume, 700 pp., paper cover	5 00
CATALOGUE OF ADDITIONS TO SCIENTIFIC LIBRARY, U. S. PATENT OFFICE, 1878 to 1883, one volume, 450 pp., paper cover	4 00
RULES OF PRACTICE	Free.
PAMPHLET PATENT LAWS	Free.

☞ No Annual Reports Published since 1871 for Gratuitous Distribution.

*ALL INVENTIONS are classified in the United States Patent Office. The latest classification, published as a supplement to the OFFICIAL GAZETTE of January 1, 1889, contains one hundred and eighty-six classes, subdivided into over four thousand sub-classes.

Persons desiring to inform themselves in regard to the state of the art in any line of invention can best do so by purchasing printed copies of the specifications and drawings of patents in the sub-class containing the invention, the number and cost of which will be given upon application.

Those wishing to subscribe for the printed copies of specifications and drawings of future patents in any sub-class may do so by depositing any amount from five dollars upward, the sum depending upon the size of the sub-class. The copies will then be mailed to them weekly, at the rate of ten cents each, until the deposit shall have become exhausted, when notice will be duly sent for renewal of deposit, if desired.

Orders for specifications and drawings by classes should give the numbers as well as the titles of the class and sub-class.

Orders for single patents should give the number and date of the patent and the name of the inventor.

SPECIFICATIONS of patents issued since June 10, 1862, commencing with No. 35,520, have been printed up to this date; also, all patents previously issued for processes, and in classes of making Arms and Projectiles, Brakes and Gins, Distillation, Electricity, Fire-Arms, Fishing and Trapping, Harrows and Diggers, Harvesters, Injectors and Ejectors, Marine Propulsion, Metal Founding, Ordnance, Packing and Storing Vessels, Plows, Projectiles, Seeders and Planters, Sewing-Machines, Sheet-Metal-Wire Making, Steam and Vacuum Pumps, Steam Water-Elevators, Sugar and Salt, Tobacco, Trees, Plants, and Flowers, and Wire-Working, and the sub-classes of Bale-Band Tighteners, Bale-Ties, Cane-Mills, Cane-Strippers, Car-Seats, Cotton and Hay Presses, Tobacco-Driers, Tobacco-Elevators, Time-Locks, and Type-Writing.

DRAWINGS of all patents, from earliest to present date, have been photolithographed, with a few exceptions.

The cost of copies of drawings with the specifications, if printed, when ordered in quantities of twenty or more, is ten cents per copy. If the specification has not been printed, an additional cost of ten cents per hundred words for a manuscript copy of it will be charged.

FOR THE CONVENIENCE OF THOSE WHO DO NOT DESIRE TO ORDER AS MANY AS TWENTY COPIES AT ONE TIME, COUPON ORDERS, GOOD FOR ONE DRAWING AND PRINTED SPECIFICATION, ARE SOLD IN QUANTITIES OF TWENTY OR MORE, AT TEN CENTS EACH. THESE MAY BE USED SINGLY AND ARE GOOD UNTIL USED.

THE OFFICIAL GAZETTE OF THE United States Patent Office.

The Official Gazette.

THE OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of its publication,) to June 30, 1883, it was published and bound in semi-annual volumes; since July 1, 1883, in quarterly volumes. All subscriptions must commence with the beginning of a volume; none taken for less than three months. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound semi-annual volumes, (prior to June 30, 1883,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1883,) full sheep, $2.75 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Fraudulent Practices by Attorneys.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., April 18, 1888.

The attention of this Office having frequently been called to circulars and communications of persons pretending to have access to the records of this Bureau, and claiming to possess information of the pendency of applications for patents, notice is hereby given the public that all such persons in so advertising themselves are acting under false representations and are guilty of unprofessional conduct, and should not be entitled to credit.

The Office has also received information that certain attorneys disbarred from practice under section 487 of the Revised Statutes are continuing to prosecute applications for patents under the names of other persons.

Hereafter a list will be published in the OFFICIAL GAZETTE containing the names and addresses of all such persons, and the public warned against employing them or intrusting applications or interests to their charge.

BENTON J. HALL, *Commissioner.*

The Office has information that *Isaac S. McGehan, No.* 155 *Broadway, New York*, a disbarred attorney, has been practicing under the name of *Alexander Melhado.*

Publishers' Catalogues.

This Office would be pleased to receive from manufacturers and publishers such catalogues, circulars, price-lists, or other advertisements relating to the sciences and mechanical arts as are published by them for gratuitous distribution; but notice is hereby given such manufacturers or dealers who feel disposed to send their publications that not less than three copies should be forwarded in order that the subjects may be properly indexed, classified, and subclassified in the Scientific Library for convenient and ready reference.

Issue of January 8, 1889.

Patents	378—No. 395,681 to No. 396,058,	inclusive.
Designs	16—No. 18,838 to No. 18,853,	inclusive.
Trade-Marks	18—No. 16,151 to No. 16,168,	inclusive.

DESIGNS.

18,838.—PLATE FOR CAR-SPRINGS.—*Thomas M. Bell*, Philadelphia, Pa., assignor to *The Charles Scott Spring Company*, same place. Application filed December 3, 1888. Serial No. 292,542. Term of patent 14 years.

18,839.—BOX.—*Frank K. Bowers*, Baltimore, Md. Application filed December 4, 1888. Serial No. 292,667. Term of patent 3½ years.

18,840.—ORNAMENTATION OF CORSETS.—*Morris P. Bray*, Ansonia, assignor to *Warner Bros.*, Bridgeport, Conn. Application filed October 29, 1888. Serial No. 289,471. Term of patent 14 years.

18,841.—ORNAMENTATION OF CLOCK-CASES.—*Walter Camp*, New Haven, Conn., assignor to *The New Haven Clock Company*, same place. Application filed August 13, 1888. Serial No. 282,659. Term of patent 7 years.

18,842.—CARPET.—*Edwin Fisher*, New York, N. Y., assignor to *The Lowell Manufacturing Company*, Lowell, Mass. Application filed December 10, 1888. Serial No. 293,190. Term of patent 3½ years.

18,843 to 18,848, inclusive.—RUG.—*George B. Fox*, Philadelphia, Pa., assignor to *John Bromley & Sons*, same place. Applications filed December 17, 1888. Serial Nos. 293,915 to 293,920, inclusive. Term of patents 3½ years.

18,849.—SURFACE ORNAMENTATION OF CANES, &c.—*Gottlob Hauber*, New York, N. Y. Application filed September 18, 1888. Serial No. 285,744. Term of patent 7 years.

18,850 to 18,852, inclusive.—RUG.—*Julius Pegel*, Philadelphia, Pa., assignor to *John Bromley & Sons*, same place. Applications filed December 17, 1888. Serial Nos. 293,912 to 293,914, inclusive. Term of patents 3½ years.

18,853.—PHOTOGRAPH-EXHIBITOR CASE.—*George M. Porteous* and *Frederick S. Miller*, Chicago, Ill. Application filed November 5, 1888. Serial No. 290,063. Term of patent 7 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

16,151.—TONIC MEDICINE.—*Mary Colman Barrett*, Fredonia, N. Y. Application filed November 12, 1888. Used since June 1, 1888.
"The words 'THE HEBE TONIC,' with the figures of Jupiter and Hebe."

16,152.—SHOT-GUN CARTRIDGES.—*The Peters Cartridge Company*, Cincinnati and King's Station, Ohio. Application filed October 2, 1888. Used since August 1, 1888.
"The word 'SHOTLESS.'"

16,153.—SHOT-GUN CARTRIDGES.—*The Peters Cartridge Company*, Cincinnati and King's Station, Ohio. Application filed October 2, 1888. Used since August 1, 1888.
"The representation of a shot-gun shell and the words 'SHOT-GUN BLANKS' printed thereon."

16,154.—BUTCHERS' KNIVES AND STEELS.—*Friedrich Dick*, Esslingen, Wurtemberg, Germany. Application filed November 17, 1888. Used since January 1, 1877.
"The representation of an arrow and the name of 'F. DICK.'"

16,155.—WATCHES.—*M. C. Eppenstein & Co.*, Chicago, Ill. Application filed November 5, 1888. Used since October 15, 1888.
"The word 'GIANT.'"

16,156.—LEATHER.—*Horton & Co.*, New York, N. Y. Application filed December 7, 1888. Used since January 1, 1884.
"The representation of a leaf."

16,157.—PILLS.—*Rogers & Irvin*, New York, N. Y., and Doncaster, England. Application filed June 9, 1888. Used since April 1, 1888.
"The word 'ATLANTA.'"

16,158.—PHOTOGRAPH-ALBUMS.—*Koch, Sons & Company*, New York, N. Y., and Berlin, Germany. Application filed November 2, 1888. Used since October 11, 1888.
"The words 'NON PAREIL.'"

16,159.—NUTS.—*Francis H. Leggett & Co.*, New York, N. Y. Application filed November 12, 1888. Used since November 1, 1888.
"The picture of a squirrel."

16,160.—COFFEE.—*Walter McEwan*, Albany, N. Y. Application filed November 7, 1888. Used since August 1, 1888.
"The words 'ROYAL DUTCH.'"

16,161.—COMPRESSED COOKED BEEF.—*Armour Packing Co.*, Kansas City, Kans. Application filed October 18, 1888. Used since July 19, 1888.
"The words 'LUNCHEON BEEF' associated with an oval figure in which appears a block of beef on a plate."

16,162.—ICE-CREAM FREEZERS.—*Charles G. Shepard and Walter J. Shepard*, Buffalo, N. Y. Application filed December 8, 1888. Used since January, 1888.
"The word 'LIGHTNING.'"

16,163.—CORSETS AND ATTACHMENTS FOR SUPPORTING UNDERWEAR.—*Emma J. Swarticoul*, New York, N. Y. Application filed August 25, 1888. Used since May 1, 1886.
"The word 'DELSARTE.'"

16,164.—OUTER GARMENTS FOR MEN AND BOYS.—*L. C. Wachsmuth & Co.*, Chicago, Ill. Application filed October 26, 1888. Used since October 1, 1888.
"The words 'HAPPY HOME GUARANTEE.'"

16,165.—BARLEY-FLOUR KNOWN AS FLAKES.—*Farwell & Rhines*, Watertown, N. Y. Application filed November 12, 1888. Used since December, 1887.
"The word 'CRYSTALS.'".

16,166.—UNDERWEAR.—*Jaros Hygienic Underwear Company*, Chicago, Ill. Application filed October 11, 1888. Used since September, 1877.
"The words 'JAROS HYGIENIC UNDERWEAR.'"

16,167.—ANTIPYRETIC DRUG.—*Ivan Levinstein*, Manchester, county of Lancaster, England. Application filed October 23, 1888. Used since August, 1888.
"The word 'PYRODINE.'"

16,168.—WATCHES, WATCH-MOVEMENTS, AND WATCH-CASES.—*Emile Quartier, Fils*, Brenets, Switzerland. Application filed November 17, 1888. Used since July 29, 1887.
"The representation of a bell."

LABELS.

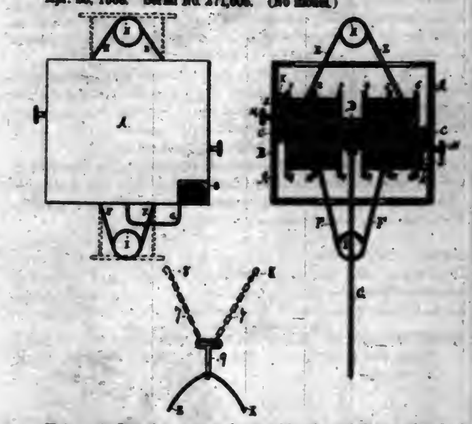
5,785.—Title: "MISS BUELL'S LOTION" (FOR CHAPPED HANDS.)—*Mary Buell*, Chicago, Ill. Application filed December 11, 1888.

5,786.—Title: "MANTECA CHICHARRON PREPARDA ESPRESAMENTE PARA LOS CLIMAS CALIDOS ENDURECIDA."—*Central Lard Company*, New York, N. Y. Application filed November 10, 1888.

5,787.—Title: "MELLIN'S FOOD FOR INFANTS AND INVALIDS."—*Dolliber-Goodale Company*, Portland, Me., and Boston, Mass. Application filed August 13, 1888.

5,788.—Title: "HAWLEY'S SPAVIN CURE."—*Edward T. Hawley & Co.*, Detroit, Mich. Application filed December 17, 1888.

5,789.—Title: "ANTISEPTIC CATARRH CURE."—*August P. Light-Aill*, Boston, Mass. Application filed December 17, 1888.



5,790.—Title: "IRIDIUM ANTI-FRICTION." (FOR METALS.)—*Merchant & Co.*, Philadelphia, Pa. Application filed December 14, 1888.

5,791.—Title: "IRIDIUM" (FOR ANTI-FRICTION METAL.)—*Merchant & Co.*, Philadelphia, Pa. Application filed December 14, 1888.

PATENTS

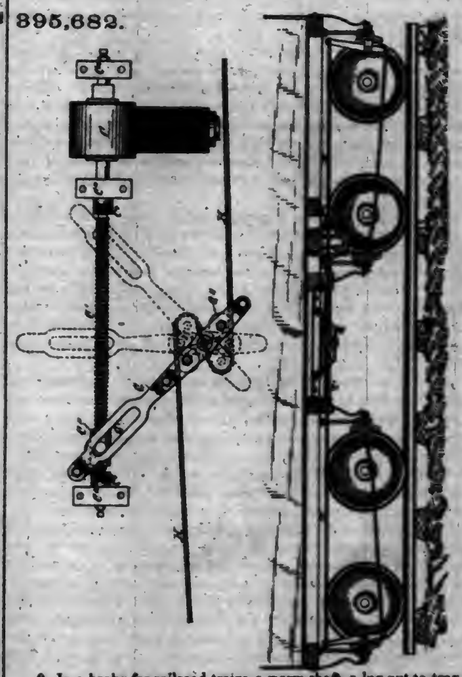
GRANTED JAN. 8, 1889.

395,681. FIRE-ESCAPE. JOHN ATTERS, New York, N. Y. Filed Apr. 23, 1888. Serial No. 271,608. (No model.)

Claim.—1. In a fire-escape, the combination of the case A, shaft B, drum D, mounted on the shaft, disks 1 2 3 4 5 6, attached to the drum, cords E, F, and G, and a suspending device, to which the cord E is connected, substantially as and operating in the manner specified.

2. The combination of the case A, revolving drum D, disks 1 2 3 4 5 6, attached to the drum, the wire cord E, having one end secured to the drum between the disks 1 and 2, and the other end secured to the drum between the disks 5 and 6, the wire cord F, having one end fastened to the drum between the disks 2 and 3, and the other end secured to the drum between the disks 4 and 5, and the cord G, one end of which is fastened to the center of the drum between the disks 3 and 4, after the cords E and F have been coiled upon the drum, and the other end passed out through an opening in the lower part of the case, and a suspending device, to which the cord E is connected, substantially as described.

3. In a fire-escape, the combination of the case A, shaft B, drum D, mounted on the shaft, disks 1 2 3 4 5 6, attached to the drum, cords E, F, and G, brake-levers J, provided with friction brake-shoes L, said levers being pivoted to the arms K, attached to the case, screws M, for regulating the brake-shoes, and a suspending device, to which the cord E is attached, substantially as specified.



4. In a fire-escape, the combination of the case A, shaft B, drum D, disks 1 2 3 4 5 6, the cords E and F, attached to the drum and passed outside the case and there attached to a ring or bar, and the cord G, one end of which is fastened to the drum after the cords E and F have been coiled upon said drum, and a suspending device, substantially as specified.

5. In a fire-escape, the combination of the case A, shaft B, drum D, disks 1 2 3 4 5 6, and cords E, F, and G, attached to the drum, substantially as specified.

395,682. ELECTRIC TRAIN-BRAKE APPARATUS. ARCHIBALD I AMBLER, Washington, D. C., assignor to Rosaline M. Ambler, same place. Filed Apr. 16, 1888. Serial No. 271,027. (No model.)

Claim.—1. In a brake for railroad-trains, an electromotor, a series of independent batteries to energize said motor, a sliding contact-arm, fixed contact-pieces, and switch-board, substantially as described, to close and open the circuit between the motor and one or more of said independent batteries, the screw-shaft, the traverse-nut having lugs or projections thereon, a central lever, and connections between said lever and the truck-levers and brake-shoes of each car in the train, substantially as shown, as and for the purpose specified.

395,682.

2. In a brake for railroad-trains, a worm-shaft, a lug-nut to traverse thereon, an electromotor to actuate said shaft, a series of independent batteries to energize said motor, a sliding contact arm or switch, with follower to close and open the circuit between said motor and one or more of said independent batteries, independent fixed contact-pieces, truck-levers, brake-shoes, and the connections between said worm-shaft and said truck-levers and said brake-shoes, substantially as described.

3. A brake for railroad-trains, comprising a screw or worm shaft, an electromotor to actuate said shaft, a series of independent batteries which may be brought into electrical connection with said motor, a switch-board having independent fixed contact-pieces, a sliding contact arm or switch, with a follower to close and open the circuit between said motor and one or more of said batteries, a lug-nut to move on said screw-shaft, a central lever, and flexible connection with the truck-levers to set and release the brakes, substantially as shown and described.

4. In a train-brake for railroad-cars, a screw or worm shaft, a movable lug-nut thereon, and a lever connected at one end with said nut above and below and embracing the same to prevent lateral binding in its movement on the worm-shaft, and at the other end connected by means of a flexible connection passing partly around sheaves or frictional pulleys with the truck-levers, and by their connections with the brake-shoes of each car in the train, substantially as described.

5. In a brake for railroad-trains, the combination of a worm-shaft, a movable nut thereon having a lug above and below, a central lever connected at one end with said nut and embracing the same and moved thereby and at the other end by means of sheaves or pulleys, and a wire rope or flexible connection connected with the truck-levers and their connections by the brake-shoes of each car to op-

erate the same and equalize the pressure thereon, in combination with an electromotor and independent batteries to energize said motor, substantially as described, and for the purpose set forth.

6. The combination, with the brake-shoes, truck-levers, and wire rope or flexible connection therewith, of a swinging central lever, through the short arm of which passes said flexible connection from the long arm of one truck-lever to the other and partly round the sheaves or pulleys to operate the brake-shoes and equalize the pressure thereon on each car, substantially as described.

7. The combination of a screw-shaft, a movable nut having lugs, a lever connected therewith and embracing the same and to be moved thereby, and the truck-levers and brake-shoes of a railroad-car, an electromotor, a series of independent batteries to energize the motor, and the switch-board having fixed contact-pieces and a sliding contact arm or switch to throw either one or all of said batteries into circuit to set the brakes upon each car throughout the train, substantially as described.

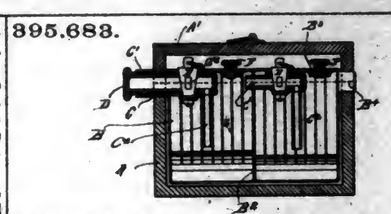
8. The combination of a screw-shaft, an electromotor to actuate said shaft, a traversing lug-nut and the connections between said nut and the the truck-levers and brake-shoes of each car, and a series of independent electric batteries, a switch-board having independent fixed contact-pieces, separate electrical connections between each of said fixed contact-pieces and one of said batteries, and a switch or sliding contact-arm and follower connected therewith to throw one or more of said batteries into and out of circuit with the motor, substantially as described.

9. The combination, with a worm-shaft, an electromotor to actuate the same, and connections between said shaft and the brake-shoes of a railroad-car, of a series of independent batteries, a switch-board having independent fixed contact-pieces, separate electric connections between each of said fixed contact-pieces and each of said batteries, and a switch with a follower to throw one or more of said fixed contact-pieces and their connecting-batteries into and out of circuit with the motor, and transmitting-wires for return-circuit, substantially as described.

10. In a train-brake for releasing the brakes, the combination of an independent battery, transmitting and return current wires and connections to complete the circuit, a reversible electromotor, a fixed contact-piece upon the switch-board, and a sliding contact-arm, with a follower, by means of which upon a backward movement the follower may be connected with the fixed contact-piece, and the circuit closed for releasing the brakes, the magnets energized, the motor reversed, and the brakes released, substantially as shown and described.

11. In a train-brake, the combination of a worm-shaft, an electromotor to actuate the same, a sleeved nut having lugs moving upon said screw or worm shaft, with a lever having a looped end to embrace the opposite sides of said nuts to prevent undue lateral pressure or binding on said screw, and slots above and below to receive the lugs or projections upon said nut, and sheaves or pulleys carried at the opposite end of said lever, and a flexible or movable connection between the long arms of the truck-levers to actuate the brake-shoes and equalize the pressure, substantially as described.

12. The combination of a worm-shaft, a lug-nut moving thereon, a central lever pivoted to swing upon a fulcrum in the hanger or chair bolted to the central and under part of the body of each car, sheaves or pulleys pivoted in the loop of the short arm of said lever, the fulcrum of said lever being located between said sheaves and equidistant therefrom, and the flexible connection between the truck-levers and the brake-shoes of each car, substantially as described.



13. The central lever having the following combination and elements of construction, viz: a fulcrum pivoted to swing in the hanger, sheaves or pulleys to equalize the pressure, a loop for the sheaves and the passage of the rope at one end, and a loop and slots at the other end for the traverse of the lug-nut to actuate the lever, substantially as described.

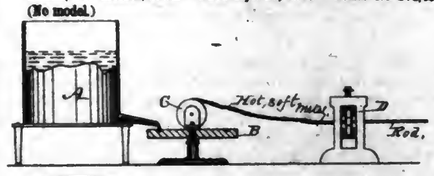
14. In a railroad-train brake, a series of independent batteries, an electromotor and transmitting electric-current and return wires, an independent switch-board having a sliding contact-arm, a single fixed contact-piece, and a spring having a dog or catch by means of which the current in circuit may be thrown upon the magnet of the motor and there retained for the purpose of setting the brakes either automatically or by hand on each car in case of accident or disaster, substantially as described, and for the purpose set forth.

395,683. APPARATUS FOR COMBINING ANÆSTHETICS. JACOB S. ATHON, Reading, Pa. Filed Sept. 12, 1888. Serial No. 285,230. (No model.)

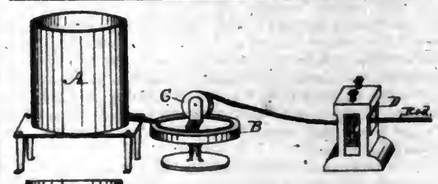
Claim.—1. In an apparatus for vaporizing and aerating anæsthetics, the pivoted chamber provided with inlet and outlet openings and an absorbent material, H, adapted to be wet by the oscillation of said chamber, substantially as set forth.

2. In an apparatus for vaporizing and aerating anæsthetics, the pivoted chamber provided with inlet and outlet openings, an outlet-

tube extending downward to near the fluid-level, and an absorbent material, H, adapted to be wet by the oscillation of said chamber, substantially as set forth.



3. In an apparatus for combining anæsthetics, an oscillating chamber divided into two or more compartments, each of which is provided with inlet and outlet openings, and outlet-tubes with regulating-cocks converging from near the fluid-level of each compartment toward the mixing-compartment and from said mixing-compartment to an inhaler-nozzle, substantially as set forth.

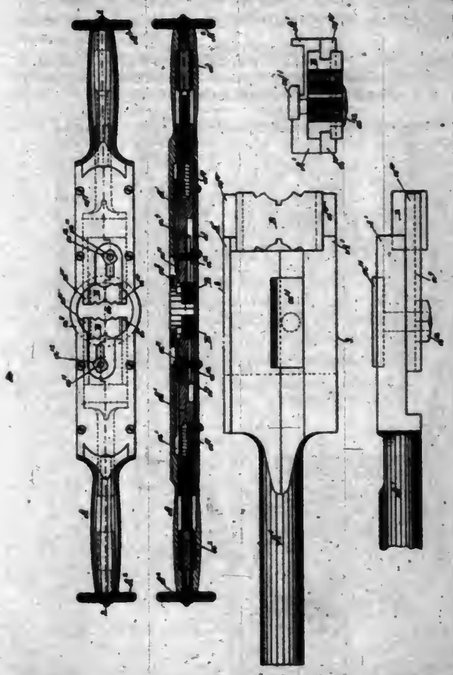


4. In an apparatus for vaporizing or combining anæsthetics, an oscillating semi-cylindrical chamber, B, provided with inlet and outlet openings, and with an absorbent material, H, normally retained above the fluid-level, substantially as described, in combination with an inclosing and supporting case, A, substantially as set forth.

5. In an apparatus for combining anæsthetics, the chamber B, divided into two or more compartments, each of which is provided with inlet and outlet openings, and outlet-tubes converging toward the first or mixing compartment, substantially as set forth.

6. In an apparatus for combining anæsthetics, the oscillating chamber B, divided into two or more compartments, each of which is divided into inlet and outlet openings, and outlet-tubes converging toward the first or mixing compartment, each compartment containing an absorbent material, H, arranged substantially as set forth.

395,684. METHOD OF MAKING RODS, RAILS, &c. GEORGE C. BAKER, Des Moines, Iowa. Filed Apr. 21, 1888. Serial No. 271,457. (No model.)



Claim.—The herein-described method of making metal rods, which mode or method consists in first melting the metal, then discharging it in a continuous stream into a groove or mold to temper and cool it and to produce a continuous flexible bar, and then passing the flexible bar between grooved rollers to reduce and shape it into a continuous rod.

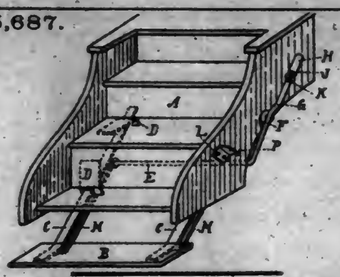
395,685. FASTENER FOR THE MEETING-RAILS OF SASHES. JOHN I. BARINGER, Waterford, N. Y. Filed Oct. 6, 1888. Serial No. 287,355. (No model.)

Claim.—A sash-fastener comprising the casing having a heart-shaped recess in its upper side, a bolt within the casing, a spring to normally project the bolt, and a handle pivotally secured to the end of the shaft of the bolt and engaging the point of the heart-shaped recess to hold the bolt in its withdrawn or projected position, as set forth.

395,686. DIE-STOCK. ALBERT W. BARTHOLOMEW, Boston, Mass., assignor of one-third to Thomas C. Ashley, same place. Filed Mar. 28, 1888. Serial No. 268,264. (No model.)

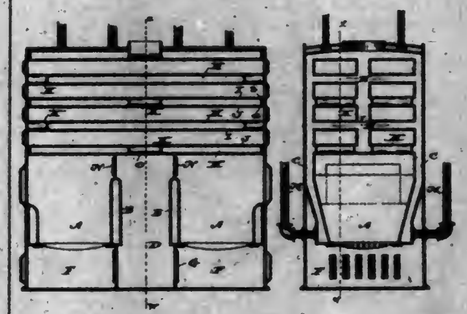
Claim.—1. Stock A, having an opening, *a*, in combination with the tool-carriers A', mounted in stock A on opposite sides of the opening *a*, and screw-rods a^3, mounted in stock A and secured to tool-carriers A' to move the tool-carriers toward and away from the opening *a* in the stock, substantially as and for the purpose set forth.

2. Stock A, having an opening, *a*, intermediate the ends of the stock, tool-carriers A', mounted in the stock A, one on each side of the opening *a*, and means, substantially such as described, for moving the carriers toward and away from the opening *a*, in combination with a chuck, A^2, stock A and chuck A^2 being connected together, so that one can be rotated on the other, the opening *a* in stock A being located in relation to the jaws of the chuck, substantially as shown, and stock A being extended into handles, substantially as and for the purpose set forth.



3. In a device substantially such as described, stock A, having an opening, *a*, and a recess, *a'*, portions of the side walls of which are parallel, in combination with carrier A', having parallel edges 3 and mounted in the recess *a'*, and screw-rods a^3, connected to carriers A' and mounted in the stock A, the carriers being on opposite sides of the opening *a* in stock A, all substantially as and for the purpose set forth.

4. In a device substantially such as described, carrier A', in combination with forked plate a^9, having arms a^{10}, substantially as and for the purpose set forth.



395,687. CAR-STEP. GUY M. BELTON, Knoxville, Tenn. Filed Sept. 26, 1888. Serial No. 286,433. (No model.)

Claim.—In a car-step, the combination, with the permanent steps, of the supplementary step B, the sliding bars C C, carrying that step and engaging into the bearings D, the crank E, laterally extending below the steps, the crank-rods M, connecting said crank with the supplementary step, the lever G, forming an extension of one arm of the crank, the sliding sleeve H upon said lever, and the catch I, provided with the inclined portion P, all arranged to operate substantially as and for the purpose described.

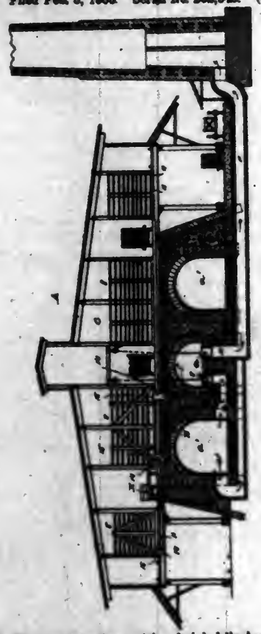
395,687. (image)

395,688. SECTIONAL WATER-HEATER. RICHARD RIDLEY, Toronto, Ontario, Canada. Filed July 7, 1888. Serial No. 279,240. (No model.)

Claim.—1. A hot-water heater composed of a series of sections, preferably rectangular in shape, and having smoke-flues between the plates of the sections, and a water-space between each section, the said water-spaces being connected together by vertical passage-ways arranged substantially as and for the purpose specified.

2. A hot-water heater composed of a series of sections, preferably rectangular in shape, and having longitudinal smoke-flues formed between the plates of the sections, and a water-space formed between each section, the said water-spaces being connected together by suitable passage-ways arranged as herein described and extending from a point near the grate to the crown of the said heater, substantially as and for the purpose specified.

3. A hot-water heater composed of a series of sections, preferably rectangular in shape, and having smoke-flues formed, between the plates of the sections, and a water-space between each section, connected together by suitable vertical passage-ways, in combination with a fire-box located at each end of the heater and connected with the smoke-flues passing through the sections, substantially as and for the purpose specified.



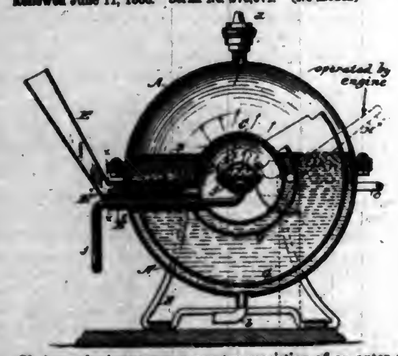
4. A hot-water heater composed of a series of sections, preferably rectangular in shape, and having smoke-flues formed between the plates of the sections, and a water-space formed between each section, the said water-spaces being connected together by suitable vertical passage-ways, in combination with two fire-boxes located at each end of the heater, the said fire-boxes being separated by an air-space through which the smoke and heated gases pass from the fire-boxes on their way to the smoke-flues, arranged, as described, in the sections of the heater.

5. A hot-water heater having two fire-boxes separated by an air-space extending to a point where the smoke and heated gases pass into the flues arranged in the heater, combined with the adjustable dampers arranged above the water-backs of each fire-box, substantially as and for the purpose specified.

6. A hot-water heater composed of a series of sections, preferably rectangular in shape, and having smoke-flues formed between each section, the said water-spaces being connected together by suitable vertical passage-ways extending from a point near the grate to the crown of the fire-box, in combination with two fire-boxes separated by an air-space extending upwards from the bottom of the ash-pit, from which it is separated by adjustable dampers arranged substantially as and for the purpose specified.

7. A hot-water heater composed of a series of sections having smoke-flues formed in each section and connecting with each other, the said sections being jointed together, so as to form the water-space between each section, substantially as and for the purpose specified.

395,689. COMBINED BRICK DRIER AND KILN. MAX A. T. BOESECKE, Omaha, Nebr., assignor to the Continuous Kiln Company, same place. Filed Feb. 3, 1888. Serial No. 262,845. (No model.)

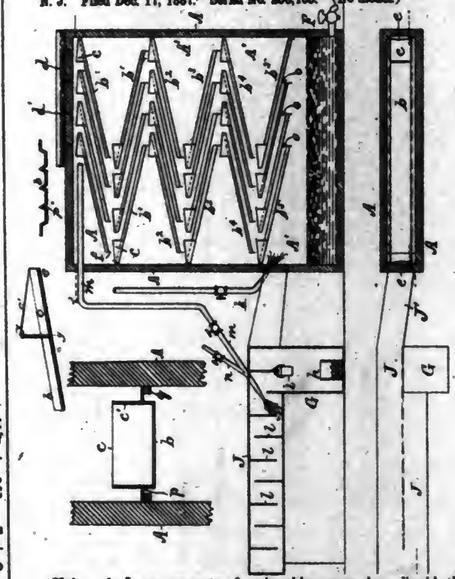


Claim.—1. The combination, with a brick-kiln having a continuous central smoke-chamber and the main ventilator-pipe B opening thereinto, of the drier-chamber disposed on said kiln, the series of ventilator-pipes having short extensions projected through the bottom of said chamber, and the dampers disposed on said extension, substantially as described, the inner ends of said ventilator-pipes E being secured to said main ventilator-pipe B, as stated.

2. The combination, with the brick-kiln having the continuous main ventilator-pipe, of the drier-chamber, and ventilator-pipes disposed between said drier-chamber and kiln and having openings into said drier-chamber and opening into said main ventilator-pipe, substantially as shown and described.

3. The combination, with the brick-kiln having a smoke-chamber provided with a continuous main ventilator-pipe having damper-covered openings or apertures extending into said smoke-chamber, of the drier-chamber, the series of drying-racks, the steam-exhaust pipes, the steam-supply pipe, the water-condensation pipe, and the ventilator-pipes opening into the bottom and arranged substantially as shown and described.

395,690. APPARATUS FOR CREATING A VACUUM FOR MOTIVE POWER. JOHN R. CAMERON, Pittsburg, Pa. Filed June 2, 1887. Renewed June 11, 1888. Serial No. 276,671. (No model.)



Claim.—1. A vacuum apparatus consisting of an outer casing adapted to receive water and provided with valved inlet and outlet pipes, a central heating-chamber, and a rock-shaft provided with a pair of invertible cups adapted to pass from the lower part of the casing to a position above the central heating-chamber, substantially as and for the purpose described.

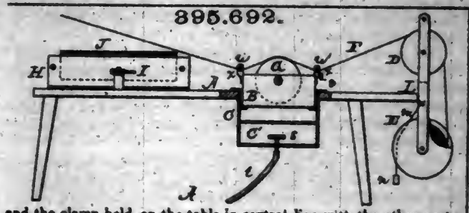
2. The combination, with the outer casing, of a central heating-chamber having flue D, and a pipe-section, E, having a partition-plate, E', for separating the cold fresh air from the escaping products of combustion, substantially as shown and described.

3. The combination of the outer casing, A A', made in globular form in two sections, and having outwardly-opening relief-valve *d'*, the central heating-globe, C, with flue and smoke-pipe, as described, the hollow rock-shaft F F', with gears for reversing it, and an inwardly-opening branch, F^3, and the two hemispherical shells G G', rigidly fixed to the rock-shaft and adapted to be inverted, as described.

395,691. APPARATUS FOR ABSORBING GASES. FREDERICK CARLSER, Franklin, assignor of part to Charles E. Hoffman, Jersey City, N. J. Filed Dec. 17, 1887. Serial No. 258,165. (No model.)

Claim.—1. In an apparatus for absorbing gases by a liquid, the combination, with the narrow chamber A', of a series of longitudinal inclined conductors arranged one above another and provided each with a receptacle upon its upper end, the receptacle being open upon one side toward the higher end of the conductor, and thereby adapted to discharge the fluid over the end of the conductor upon its under side, and the fluid being delivered from the lower end of one conductor into the receptacle at the upper end of the next conductor throughout the series, substantially as herein set forth.

2. In an apparatus for absorbing gases by a liquid, the combination, with the narrow chamber A', of a series of longitudinal inclined conductors arranged one above another and provided each with a receptacle upon its upper end, the receptacle being open upon one side toward the higher end of the conductor, and thereby adapted to discharge the fluid over the end of the conductor upon its under side, and the conductor being grooved or bent adjacent to the casing of the chamber A', to confine the fluid to the under side of the conductor, as and for the purpose set forth.



3. In an apparatus for absorbing gases by a liquid, the combination, with the narrow chamber A', of several series of sloping conductors arranged one above the other, with the narrow spaces *e* between the several conductors, each conductor being provided with a receptacle at its upper end, such receptacle being open upon one side toward the higher end of the conductor to discharge the fluid over the end of the conductor upon its under side, and the lower ends of the conductors being arranged over the receptacles of the conductors beneath the same, as and for the purpose set forth.

395,692. GLUING-MACHINE FOR BINDING-STRIPS. CHARLES H. CRAPPEL, Dayton, Ohio. Filed Sept. 20, 1888. Serial No. 285,676. (No model.)

Claim.—1. In a machine for gluing writing-tablets, the combination of spool E, roller D, vessel B, guide-roller *u'*, glue-roller G, provided with scraper *w*, and the guide-roller *u*, substantially as set forth.

2. In a machine for gluing writing-tablets, the combination of spool E, roller D, vessel B, guide-roller *u'*, glue-roller G, guide-roller *u*,

395,692.

and the clamp held on the table in central line with the other parts, substantially as set forth.

3. The combination of the flanged vessel C, provided with compartment for the gas-burner S, the vessel B, with glue-roller G, and guide-rollers *u u'*, substantially as shown and described.

395,693. DOOR-HANGER. REUBEN CLARKE, Toronto, assignor of one-half to Andrew Forester Barron, Barrie, Ontario, Canada. Filed Aug. 6, 1888. Serial No. 282,041. (No model.)

Claim.—The bracket D, having jaws *d*, combined with the bearing *c*, held in said jaws, and provided with a vertical shank, the pin *g* in said shank, the wedge-shaped block G on said shank and resting on said pin, and the adjusting-screw H, engaging said block, all arranged and operating substantially as shown and described.

395,694. PLANTER. THOMAS L. CROSIER, O'Daniel, Tex. Filed Aug. 22, 1888. Serial No. 283,419. (No model.)

Claim.—1. The combination, with a plow, of the detachable board E, the hopper E', secured thereto, the double-armed lever pivoted or swiveled on said board and vibrated from one of the conveyer-wheels, the spring O, and the seed-slide attached to the end of the inner arm of said lever, substantially as described.

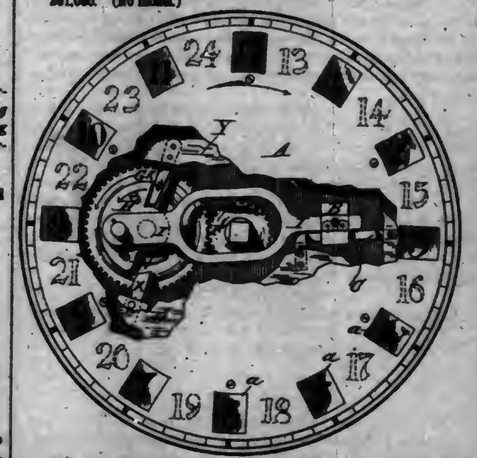
2. The combination, with a plow, of the shaft or axle *h'*, detachably secured to the front portion of the beam thereof, the conveyer-wheels on said shaft, the actuating-rods secured to the inner face of the wheel I, the board E, detachably secured to the beam, the hopper at the rear end of the said board, the double-armed lever swiveled or pivoted upon the board, the spring O, and the seed-slide attached to the end of the rear arm of the said lever, substantially as described.

3. The combination, with a plow, of the board E, the clip G, detachably securing said board to the plow-beam, the hopper E', secured to the rear end of the board E and provided with the openings *e d* and brush d^2, the lever K, pivoted upon the clip G, the spring O, the seed-slide secured to the end of the rear arm of the lever K, and the dropping-tube F, screwed through its wing *f* to the plow-standard.

4. The combination, with a plow and the board E, the hopper, seed-slide, double-armed lever, and dropping-tube detachably secured thereto, of the bearing-arms H, the bolts *h*, the shaft *h'*, the conveyer-wheels I I', and the actuating-rods J, secured to the wheel I, substantially as specified.

5. The combination, with a plow, of the coverer-bar, the integral spring-rods secured thereto and passing on each side of the plow-standard and over the beam, and bolt N, passing through eyes, said rods and the nut *n* engaging said bolt, substantially as specified.

395,695. FOUNTAIN-PEN. JOHN H. CROWELL, Vineyard Haven, Mass. Filed Mar. 15, 1886. Serial No. 195,280. (No model.)



Claim.—1. In a fountain-pen, the combination, with the holder and reservoir, of a rod constructed to be moved longitudinally in said holder and reservoir, and provided with a cavity near its end which receives a given quantity of ink from the reservoir, and which from pressure applied longitudinally to said rod mechanically separates from the reservoir and conveys to or toward the pen said given quantity of ink, substantially as and for the purpose specified.

2. In a fountain-pen, the combination, with the holder A and reservoir F, of the longitudinally-sliding rod D, which has constructed in it near its end an annular groove or cavity, *e*, and which extends through the reservoir into the tip B and to the cap E, substantially as described.

3. In a fountain-pen, the combination and arrangement of the holder A, reservoir F, longitudinally-sliding rod D, provided with the cavity *e*, spiral spring *c*, collar *d*, and tip B, substantially as and for the purpose described.

4. In a fountain-pen, the combination of the holder A, reservoir F, longitudinally-sliding rod D, with its annular groove *e*, spiral spring *c*, collar *d*, tip B, with its sleeve *f*, pen C, and cap E, all arranged and operated substantially as and for the purpose described.

395,696. TIME-PIECE DIAL. MARTIN V. B. BYRNEDGE, Boston, Mass., assignor of two-thirds to John Swann, New York, N. Y., and Henry R. Waite, West Newton, Mass. Filed Jan. 18, 1888. Serial No. 261,060. (No model.)

Claim.—1. In a time-piece, the combination, with a shifting inner dial, of relatively-adjustable weights carried thereby on opposite sides of the central support of said dial and mechanical devices for adjusting the weights, consisting of a cam acting on projecting points on the dial, a connection between the cam and the weight on the opposite side of the dial-center, and actuating-gearing for the cam, substantially as described.

2. In a time-piece, the combination, with a shifting inner dial, of weights carried thereby on opposite sides of the dial-center, one of said weights being normally stationary, while the other is adjustable between points where it will and will not overbalance the other, and mechanical devices for adjusting the movable weight, all arranged to operate substantially as described.

3. In a time-piece, the combination of an apertured outer dial, a shifting inner dial, a sliding weight carried by a rod fixed to the inner dial on one side of its center, a stationary weight and projecting arms affixed to the dial on the opposite side of its center, a rotative cam acting on the projecting arms, a connecting-rod between the cam and the sliding weight, and actuating-gearing for the cam, all arranged to operate as set forth.

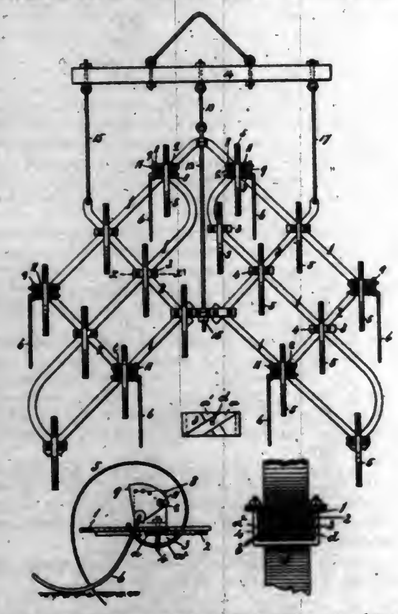
4. The combination of the inner dial, Y, the rod C, secured thereto and carrying weight B, the weight and arms X and W, likewise secured to the dial on the opposite side of the dial-center, the gear G, cam H, attached to said gear, connecting-rod I, and actuating-gear F, substantially as described.

395,697. FIRE-PLACE BACK. DAVID FARMER, Piedmont, Ohio. Filed Mar. 7, 1888. Serial No. 266,405. (No model.)

Claim.—The combination, with the fire-place, of the end walls, O,

resting on the grate, and the cross-pieces D, having end lugs, by which they are bolted to the end walls, and having overlapping flanges *e* and *e'*, which are bolted together and form a projecting ledge over the fire-pot, the upper cross-piece extending part way up the chimney to form a wall for the draft-flue, substantially as described.

395,698. CORN-COB HOLDER. FREDERIC B. PETTERSTONHAUGH, Toronto, Ontario, Canada. Filed Feb. 13, 1888. Serial No. 263,865. (No model.)



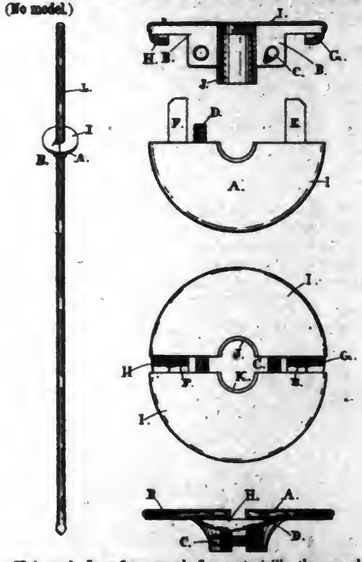
Claim.—1. As a holder for hot corn, two uprights, having pivoted on their outer ends the holding-knobs, to the spindles of which are secured the plates for holding the corn, in combination with two closed tubes, one of which fits into and is adjustable lengthwise within the other, and a spring inclosed in the tubes and connected with the opposite ends thereof, substantially as and for the purpose specified.

2. The uprights A and B, having plates C, provided with spikes or prongs *c*, the said plates being secured on the ends of the spindles of the knobs D, in combination with the inclosed tubes E and F, one sliding within the other, and a spring inclosed in the tubes and connected with the opposite ends thereof, substantially as and for the purpose specified.

3. The uprights A and B, plates C, and knob D, in combination with the closed tube F, provided at one end with a stop, *e*, the closed tube F, sliding within the other tube and provided at one end with a stop, *f*, and a spring inclosed in said tubes and connected with the opposite ends thereof, substantially as and for the purpose specified.

4. The corn-holder composed of two closed tubes, one adjustable within the other, the uprights each having an end within the tubes, the spring within the tubes with an end secured to each of said uprights, and the knobs carrying the prongs and rotatable in said uprights, substantially as and for the purpose specified.

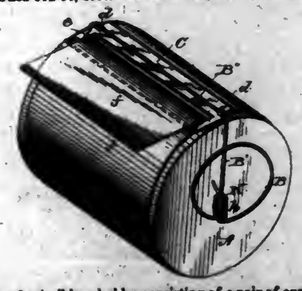
395,699. SPRING-TOOTH HARROW. GEORGE GILLIES, Cananoque, Ontario, Canada. Filed July 18, 1888. Serial No. 280,395. (No model.) Patented in Canada Feb. 1, 1888, No. 28,430.



Claim.—1. A harrow composed of two sections hinged together in line with the draft, each section comprising front and rear parallel straight bars of approximately uniform length and diagonal to the draft, an intervening S-shaped bar having a straight portion parallel to said bars, one end of said bar intersecting the front bar near its forward end, the other end intersecting the rear bar at its rearward end, transverse bars at right angles from the forward end of the rear bar to the front bar, and the rearward end of the front bar to the rear bar, and clips connecting all the bars at their intersections to spring-teeth, substantially as described.

2. The adjustable runners 6, curved at the lower end and having a laterally square bent upper end provided with a quadrant, 9, having holes therein and journaled in a U-shaped bearing, 8, clipped to the harrow-bars and tooth-holder, said bearing provided with a spring-bolt, 11, engaging the holes in the quadrant and locking the runner at an adjusted position, as set forth.

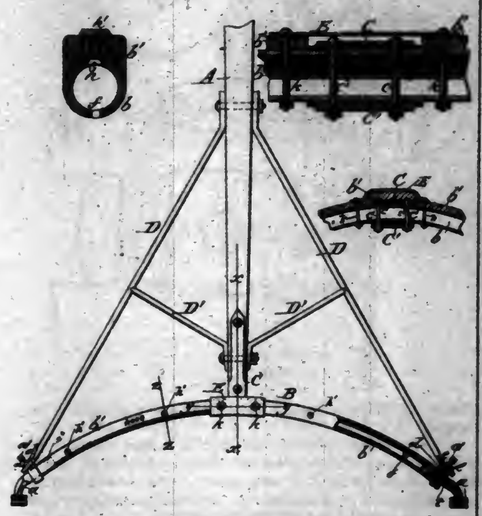
3. The harrow-bars 1 2, having a coinciding indentation and projecting teat, *b*, and the tooth-holder 3, having an indentation, *d*, coinciding with said teat, in combination with a tooth, 5, and clip 4, as set forth.



395,700. HAND-GUARD FOR ROCK-DRILLS. BALSARINI GIOVANNI, San Francisco, Cal. Filed Mar. 27, 1888. Serial No. 268,684. (No model.)

Claim.—1. In safety-guards for rock-drills, the guard composed of the parts A and B, having the guides E, F, G, and H, in combination with the washer J and K and bolts C and D, for the purpose of attaching to rock-drills and guarding the hands, substantially as and for the purposes set forth.

2. In combination with a rock-drill, L, the guard described, composed of the parts A and B, guides E, F, G, and H, bolts C and D, cushion I, and washer J and K, for the purpose of protecting the hands in drilling rock, constructed and operated substantially as and for the purposes set forth.



395,701. RIBBON-HOLDER. JAMES A. GRANT, Mount Pleasant, Iowa. Filed Oct. 30, 1888. Serial No. 289,516. (No model.)

Claim.—1. A ribbon-holder consisting of a pair of curved springs, B, formed on the inner ends of straight radial sections B' and arranged to lie in planes close to and corresponding with the ends of a ribbon-spool when attached, with their yielding ends provided with coils A, loosely surrounding the sections B', and the inward-pointing pivot-points K being coupled together by a straight section, B'', all constructed of one continuous wire, in combination with a ribbon roll or spool, substantially as shown, for the purposes specified.

2. A ribbon-holder consisting of a pair of curved springs, B, formed on the inner ends of straight radial sections B' and arranged to lie in planes close to and corresponding with the ends of a ribbon-spool when attached, with their yielding ends provided with coils A, loosely surrounding the sections B', and the inward-pointing pivot-points K being coupled together by a straight section, B'', all constructed of one continuous wire, with a plate, C, provided with a longitudinal slot, *c*, and fastened to the section B'', in combination with a ribbon roll or spool, substantially as shown, for the purposes specified.

395,702. CARRIAGE-POLE. JAMES IVES, Mount Carmel, Conn. Filed Apr. 27, 1888. Serial No. 272,060. (No model.)

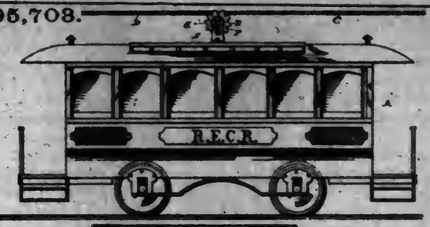
Claim.—1. A carriage-pole comprising a pole proper, a divisible socket-coupling encircling the sweep and receiving the end of the said pole, a tubular sweep having connecting-eyes at its ends, screw-bolts connecting the pole proper, sweep, and parts of coupling together, and braces between the pole proper and the tubular sweep, substantially as and for the purpose described.

2. A carriage-pole comprising a pole proper, a divisible socket-coupling encircling the sweep and receiving the end of the said pole, a tubular sweep having connecting-eyes at its ends, a wood-finishing enlargement portion, screw-bolts connecting the pole proper, sweep, and parts of coupling together, and braces between the pole proper and the tubular sweep, substantially as and for the purpose described.

3. The divisible socket-coupling secured by bolts to the rear end of the pole and one of its parts provided with lugs, in combination with the curved metallic tube-sweep provided with orifices or recesses to receive the said lugs, substantially as and for the purpose described.

4. The combination, with the tubular sweep, of the wood-finishing enlargement portion *b'*, secured to the said tube by screws passed through the lower side of the tube, their heads bearing against the inner upper side of the same, and their body portions embedded and retained by screw-threads in the wood portion, substantially as and for the purpose described.

5. The combination, with the tubular sweep and the wood-finishing enlargement portion thereof, and the socket-coupling, of the cap E and screw-bolts, substantially as described.



6. The curved sweep-tube *b*, provided with the wood-finishing enlargement portion *b'*, in combination with the connecting-eyes *a*, provided with shanks entering the ends of said tube and secured by suitable fastenings, substantially as described.

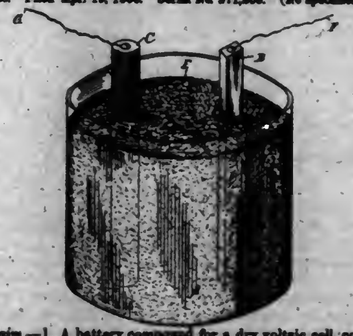
7. A carriage-pole comprising, in combination, the pole proper, the sweep, braces from the pole to the sweep, the wood-finishing enlargement portion, and the bayonet-fastenings connecting the ends of said sweeps with the braces, substantially as and for the purpose described.

395,703. TROLLEY FOR ELECTRIC RAILWAYS. WILTON P. JENKINS, Richmond, Va. Filed Apr. 18, 1888. Serial No. 271,019. (No model.)

Claim.—In combination with the main cable and cross-cables, the trolley having the flanges circumferentially scalloped, providing the projections G, and having said semicircular scallops of a diameter greater than the cable.

395,708.

395,704. COMBINATION-HOOK. LEE KENT, Hot Springs, Ark. Filed Apr. 13, 1888. Serial No. 271,075. (No model.)

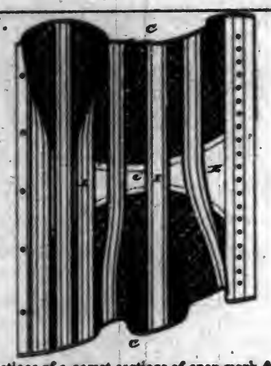


Claim.—The painter's combination pot-hook herein described, provided with the putty-knife A, tack-puller B, tack-hammer K, glass-cutter F, glass-nipper I, can-opener H J, and screw-driver G, substantially as shown and described.

395,705. RECTAL SPECULUM. JOHN M. KING, Stecoah, N. C., assignor of one-half to George F. Brock, same place. Filed Apr. 28, 1888. Serial No. 272,122. (No model.)

Claim.—In a speculum, the tapering conical tube having a slot throughout its entire length, a plug fitted to fill the end and having a shank fitted to a groove in the inner face of the tube, and a slide covering the entire slot and bearing against the rear end of the plug, substantially as described.

395,706. DRY VOLTAIC BATTERY. ISIDOR KITSEE, Cincinnati, Ohio. Filed Apr. 19, 1888. Serial No. 271,209. (No specimens.)



Claim.—1. A battery composed for a dry voltaic cell, consisting of chloride of ammonia or an equivalent chloride compound, bisulphate of mercury, and glycerine.

2. In a dry voltaic cell, in combination, a containing-vessel, positive and negative elements contained therein, and a battery compound consisting of chloride of ammonia or an equivalent chloride compound, bisulphate of mercury, and glycerine, contained within said vessel and in contact with said elements, as specified.

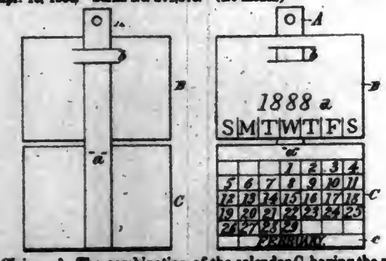
395,707. MANUFACTURE OF ORNAMENTAL CORSETS. LEOPOLD KRAUS, Birmingham, Conn. Filed July 6, 1888. Serial No. 278,178. (No model.)

Claim.—The within-described improvement in the manufacture of ornamental corsets, the same consisting in applying to irregular-

395,707.

shaped body-sections of a corset sections of open-work fabric, slitting said open-work section to permit the same to conform to the shape of the body portions, and then covering the parts by overlying strips I, securing the strips to the body portion upon the intermediate ornamental fabric, substantially as set forth.

395,708. BASKET-COVER. TILGHMAN W. LANKFORD, Pocomoke City, Md. Filed Nov. 16, 1888. Serial No. 291,002. (No model.)

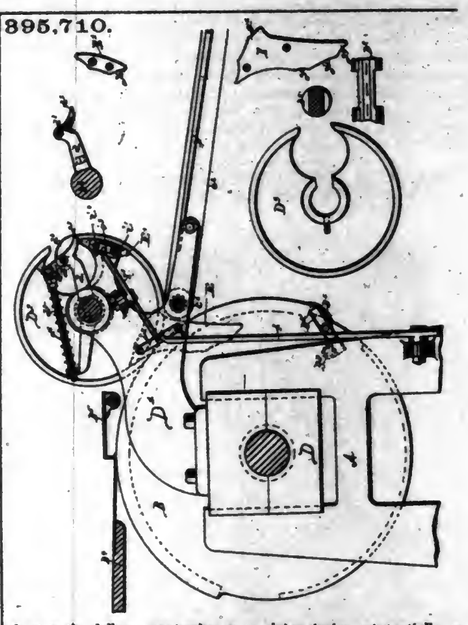


Claim.—1. The combination of the basket having the inner and outer concentric hoops, D E, the eyes formed each of a single piece of wire doubled and having its arms passed between the hoops and clinched on the exposed sides thereof, and the lid or cover having the devices to engage the eyes, substantially as described.

2. The basket having the eye F, in combination with the lid or cover having the catch M, the latter being formed of a single piece of wire and having the spring-coils N, the arm O, with eye S, and the arm T, having the hook U to engage the eyes F and S, substantially as described.

3. The basket-lid having the depending rim, the spring-catch M, having the eye S, and the hook U to engage the same, and provided, further, with the spring-coils N and the eye P, the tack or rivet R in the eye P and in the rim, and the eye L, engaging the spring-coils N, substantially as described.

395,709. CALENDAR. EDWARD S. MAY, Washington, D. C. Filed Apr. 18, 1888. Serial No. 271,073. (No model.)



Claim.—1. The combination of the calendar C, having the mouth a, with the fixed piece A at the point a, and with the adjustable piece, B, having the year and days of the week d, and the strap b, arranged and operating substantially as and for the purpose set forth.

2. The adjustable screen B, having the strap b, and made to slide upon the piece A to a required point, the numerals 1 2 3 4 5, placed vertically upon the piece A and appearing singly through the opening in B, as at c, arranged and operating with a calendar, substantially as and for the purpose set forth.

395,710. SHEET-DELIVERY APPARATUS FOR PRINTING-MACHINES. ROBERT MIEHLE, Chicago, Ill. Filed Mar. 3, 1887. Renewed Aug. 22, 1888. Serial No. 283,514. (No model.)

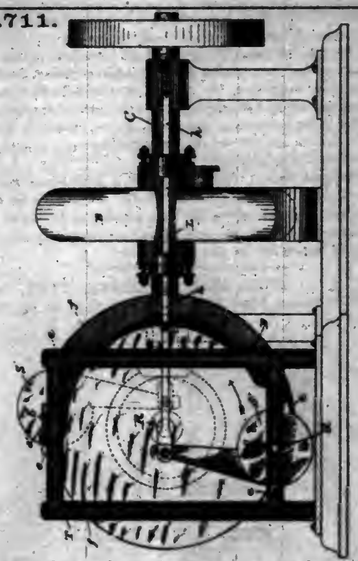
Claim.—1. In a cylinder printing-press, the combination, with the impression-cylinder, of the revolving delivery-grippers and delivery-reels located at the front or top of the cylinder, the said delivery-grippers receiving one revolution and over before discharging the printed sheet to the said delivery mechanism or receiving device, substantially as described.

395,710.

2. In a cylinder printing-press, the combination, with the impression-cylinder, of delivery-grippers, delivery-reels, and the receiving-tapes located at the front or top of the cylinder, the delivery-grippers receiving one revolution and over before discharging the printed sheet to the said tapes, substantially as described.

3. In a cylinder printing-press, the combination, with the impression-cylinder, of the delivery-grippers, reels, tapes, and fly-fingers located at the front or top of the cylinder, the delivery-grippers receiving one revolution and over before discharging the printed sheet to the said tapes, substantially as described.

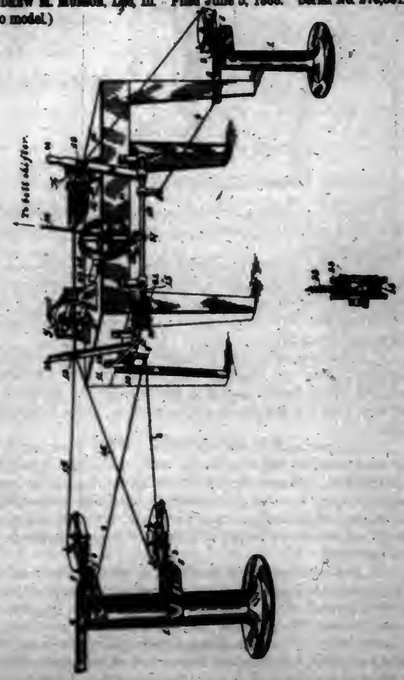
4. In a cylinder printing-press, the combination, with the impression-cylinder and vibrating fly-fingers, of the revolving delivery-grippers located at the front or top of the cylinder for seizing the leading edge of the printed sheet and discharging it upon the fly-fingers with the non-printed or dry side to said fly-fingers, which deposit the same upon the fly-table with the last-printed side down, substantially as described.



395,711. ROTARY ENGINE. HENRY T. MORSE, Boston, Mass. Filed June 18, 1888. Renewed June 18, 1888. Serial No. 277,483. (No model.)

Claim.—1. In a rotary engine, the combination of the annular cylinder having the ports I I', the piston adapted to move in the cylinder, the disk D and shaft C, rotated by the piston, the abutment-casing intersecting the cylinder, the two alternately-acting abutments in said casing, and mechanism for reciprocating said abutments, whereby the acting abutment is withdrawn from the cylinder to permit the passage of the piston across the abutment-casing and is immediately replaced by the other abutment after the passage of the piston, as set forth.

2. In a rotary engine, the combination of the annular cylinder



395,711.

having the ports I I', the piston adapted to move in the cylinder, the disk D and shaft C, rotated by the piston, the abutment-casing intersecting the cylinder between the ports thereof, the two abutments in said casing, the oscillatory levers S S', connected with said abutments, and the cams rotated by a connection with the shaft C, whereby said levers are oscillated and the abutments reciprocated, as set forth.

3. The combination of the casing having the annular cylinder, the piston, the disk to which the piston is attached, and the packing-rings G H, the former attached to the casing and the latter engaged with the disk, so as to be capable of expanding, said rings being beveled, as shown, so that only a knife-edge of the ring H is exposed to steam-pressure, as set forth.

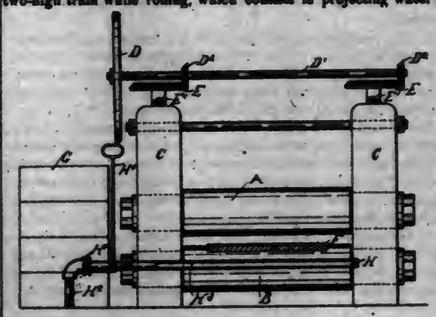
395,712. AUTOMATIC STOP FOR WIRE-BARBING MACHINES. ANDREW M. MUNSON, Lee, Ill. Filed June 5, 1888. Serial No. 276,061. (No model.)

Claim.—1. In a wire-barbing machine provided with suitable feeding devices for drawing the wires from the reel, the combination of the standard I, arms 3 and 6, reel 2, chain 8, arm 9, and rock-shaft 10, having pinion 22, and shaft 19, having pinion 21, and connected with means for disconnecting the driving-power from the machine, whereby the suspension of the uncoiling of the wire causes the arm 3 to swing toward the machine and rock the shafts 10 and 19, whereby the power is disconnected from the machine, substantially as shown, and for the purpose described.

2. In a wire-barbing machine provided with suitable feeding devices for drawing the wires from the reels, the combination of the standard 1, inclined from the perpendicular outwardly and provided with the stops 5 and socket 4, the arm 3, pivoted at its inner end in said standard, the reel 2, pivotally seated on the outer end of arm 3, arm 6, provided with lug 7, adapted to be engaged by arm 3 in its forward swing, arm 9, seated on the shaft, and chain 8, connecting the outer end of arm 6 to the lower end of arm 9, and means connected with the shaft 10 for disconnecting the power, substantially as shown, and for the purpose described.

3. In a wire-barbing machine provided with suitable feeding devices for drawing the wires from the reels, the combination of the standard 1, inclined outward from the perpendicular and provided with the stop 5, the arms 6 and 3, pivoted thereon, the reel 2, pivoted on the outer end of arm 3, the arm 6, provided with flange 7, the chain 8, rock-shaft 10, provided with arm 9, spring 15, lever 12, provided with slot 13 and pinion 22, shaft 19, provided with pinion 21 and lever 20, and means for disconnecting the driving-power of the machine, substantially as shown, and for the purpose described.

4. In a wire-barbing machine provided with suitable feeding devices for drawing the wires from the reels, the combination of the side standard, 1, provided with stop 5, arms 6 and 3, pivotally seated thereon, reel 2, pivoted to said arm 3, chain 8, shaft 19, provided with arm 9, spring 15, lever 20, provided with slot 13, and means for disconnecting the driving-power, all substantially as shown, and for the purpose described.



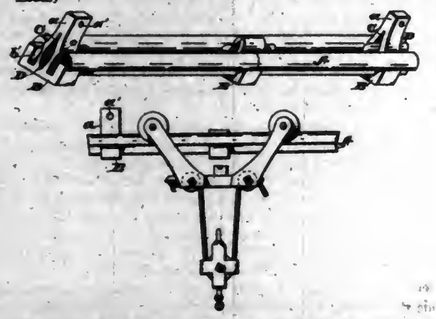
5. In a wire-barbing machine provided with suitable feeding devices for drawing the wires from the reels, the combination of the standard 1, inclined outward from the perpendicular and provided with the arms 6 and 3, pivoted thereon, reel 2, pivotally seated on arm 3, arm 6, provided with flange 7, the chain 8, the rock-shaft 10, provided with arm 9, lever 12, provided with slot 13, pinion 22, shaft 19, provided with pinion 21, lever 20, arm 37, pitman 36, lever 35, collar 28, provided with annular opening 30, and stop 31, the collar 25, shaft 23, slotted at 26, the key 27, adapted to be embedded in said slot, and the rope or chain 32, connecting with belt-shifting devices, substantially as shown, and for the purpose described.

6. In a wire-barbing machine provided with suitable feeding devices for drawing the wires from the reels, the combination of the side standard, 1, inclined outward from the perpendicular and provided with arms 3 and 6, the arm 6 having the flange 7, reel 2, the chain 8, lever 20, provided with slot 13, arm 37, pitman 36, lever 35, collar 28, and rope or chain 32, and means for disconnecting the driving-power from the machine, all arranged and interacting substantially as shown, and for the purpose described.

7. In a wire-barbing machine provided with feeding devices to draw the wire from the reels, the standard 1, the reel thereon, and the intermediate devices connecting it to the chain 8, the chain 8, the shaft 19, provided with arm 37, a pitman, 36, lever 35, sliding collar 28, provided with opening 30 and stop 31, the collar 25, shaft 23, slotted at 26, the key 27, adapted to be embedded in said slot, and rope or chain 32, attached at its lower end to said collar, and suitably fastened at its upper end to the ordinary shifting-lever, substantially as shown, and for the purpose described.

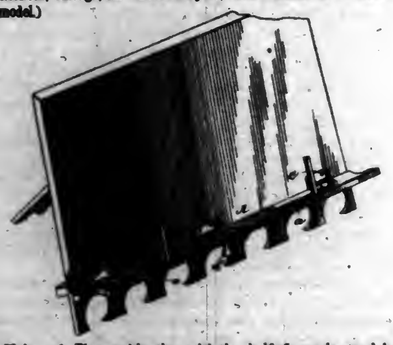
395,713. METAL-ROLL-COOLING DEVICE. FRANKLIN NEWLIN, Pottstown, Pa. Filed July 7, 1888. Serial No. 279,266. (No model.)

Claim.—The method herein described of cooling the rolls of a two-high train while rolling, which consists in projecting water up-



395,713.

wardly against the top roll, so as to strike below its center line and be deflected upon the top of the lower roll, substantially as set forth.



395,714. HAY-ELEVATOR TRACK. VOLENTINE L. NEY and JACOB NEY, Canton, Ohio. Filed May 23, 1888. Serial No. 274,844. (No model.)

Claim.—1. The securing-blocks B, provided with the grooves or notches *b'*, the ribs *c*, and the openings C, the key or wedge D, and the rails A, substantially as and for the purpose specified.

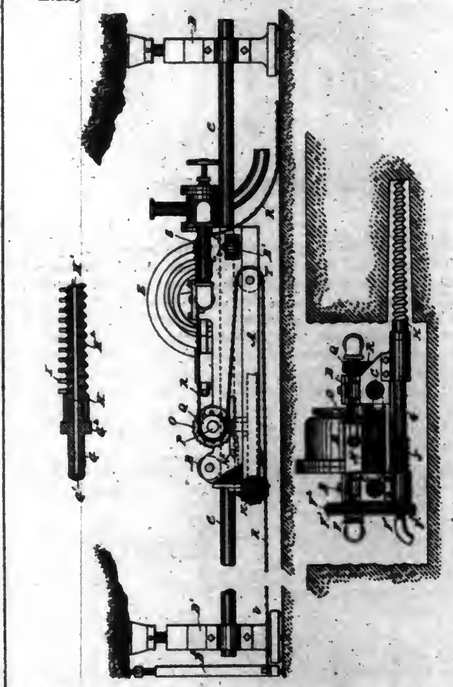
2. The securing-blocks B, provided with the openings C and the grooves or notches *b'*, the key or wedge D, the rails A, and means for suspending the rails, substantially as and for the purpose specified.

395,715. BOOK-SUPPORT OR MUSIC-STAND. RAYARD B. NICHOLS, Chicago, Ill. Filed May 21, 1888. Serial No. 274,530. (No model.)

Claim.—1. The combination, with the shelf of a music-stand, book-support, easel, or the like, of the uprights pivoted to said shelf, and the rod connecting the uprights and provided with a handle depending therefrom and capable of elevating and depressing the uprights, substantially as described.

2. The combination, with the shelf of a music-stand, book-support, easel, or the like, of the uprights pivoted to it, the rod connecting the uprights and capable of elevating and depressing the uprights, and a spring designed to act against the end of the connecting-rod to retain the uprights in a perpendicular position, substantially as described.

3. The combination, with the shelf of a music-stand, book-support, easel, or the like, of the pivoted uprights provided with arms, and rods connecting the uprights above and below the pivotal points, the lower one of said rods being provided with a handle depending therefrom, substantially as and for the purpose described.



4. The combination, with the shelf of a music-stand, book-support, easel, or the like, of the uprights pivoted to it, the rod connecting the uprights and capable of elevating and depressing the uprights, and a handle pivotally secured to the connecting-rod to operate the device and designed to be turned parallel with the connecting-rod, substantially as and for the purpose specified.

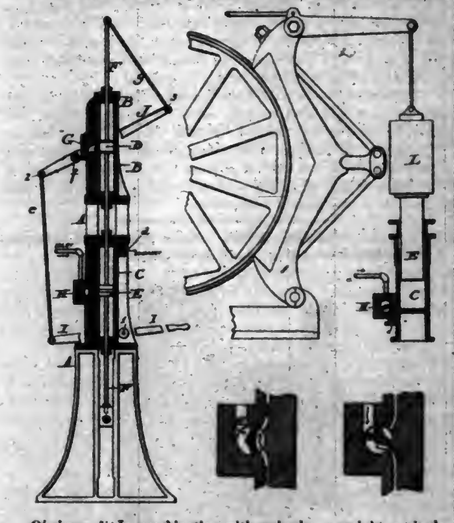
5. The combination, with the shelf of a music-stand, book-support, easel, or the like provided with the kerf-slots and a kerf-recess connecting the kerf-slots, of the uprights pivoted in the kerf-slots, and the connecting-rod secured to the uprights and sliding in the kerf-recess and provided with a depending handle, substantially as and for the purpose described.

6. The combination, with the shelf of a music-stand, book-support, easel, or the like provided with the kerf-slots and a kerf-recess connecting the kerf-slots, of the uprights pivoted in the kerf-slots, the connecting-rod having a depending handle and secured to the uprights and sliding in the kerf-recess, and a stop secured in one of the kerf-slots, whereby the uprights are prevented sinking too deep in the kerf-slots, substantially as described.

7. The combination, with the shelf of a music-stand, book-support, easel, or the like provided with the felt or similarly-lined slots and connecting-recess, of the uprights pivoted in the slots, and a connecting-rod secured to the uprights and sliding in the kerf-recess, substantially as and for the purpose described.

395,716. MINING-DRILL AND CHANNEL-CUTTER. JOHN P. PAYNTER, Pomona, Kans. Filed Jan. 26, 1888. Serial No. 261,823. (No model.)

Claim.—1. A mining drill-tool consisting of a longitudinally and transversely apertured conical screw provided with cutters, substantially as described.



2. A mining drill-tool consisting of a conical screw having a central longitudinal aperture and a series of transverse apertures leading from the longitudinal aperture and provided with a series of removable cutters secured in the threads of the screw, substantially as herein shown and described.

3. In a mining-drill, the combination, with a drill-supporting frame mounted on wheels or rollers, of jack-screws provided with side bearings, and rods or bars supported in said bearings and forming a track for supporting the said frame, substantially as herein shown and described.

4. In a mining-drill, the combination, with a track and a frame mounted on rollers and traveling on said track, of an engine carried by the frame, a transverse cutter-shaft operated from the engine, a sprocket-wheel operated from the cutter-shaft, and a sprocket-chain having one end secured to a support and passing over the said sprocket-wheel and over guide wheels or pulleys, substantially as herein shown and described.

5. In a mining-drill, the combination, with fixed rods, of a frame adapted to slide longitudinally on the said rods, an engine located on the said frame and provided on its main shaft with a sprocket-wheel, a shaft mounted to rotate on the said frame and provided with a sprocket-wheel, an endless sprocket-chain passing over the said two sprocket-wheels, a drilling-tool having cutters and screw-threads and secured on the said shaft, a worm formed on the said shaft, a worm-wheel secured on a vertical shaft mounted in the said frame, said worm-wheel meshing in the said worm and also carrying a bevel gear-wheel, a bevel-pinion meshing in the said bevel gear-wheel, a shaft carrying the said bevel-pinion and mounted to rotate on the said frame, a sprocket-wheel secured to the said pinion-shaft, and a sprocket-chain passing over the said sprocket-wheel and having one end secured on a fixed point, substantially as shown and described.

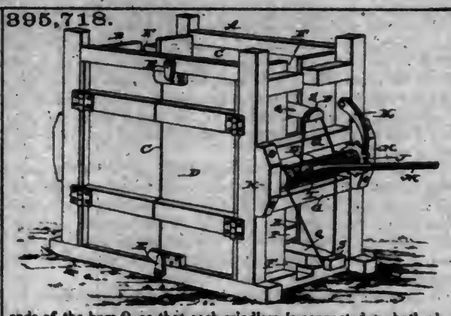
395,717. BRAKE. EDWIN REYNOLDS and REUBO V. HORSBURG, Milwaukee, Wis. Filed Sept. 4, 1888. Serial No. 284,542. (No model.)

Claim.—1. In combination with a brake, a weight, a single-acting cylinder, a piston, a valve, a hand-lever, and intermediate connections, substantially such as shown, for causing the piston to follow the motion of the hand-lever.

2. In combination with a brake, a weight, a fluid-cylinder provided with a piston, a valve to control the admission and emission of fluid, a second cylinder provided with a piston and containing an inelastic fluid, and a piston-rod common to both pistons.

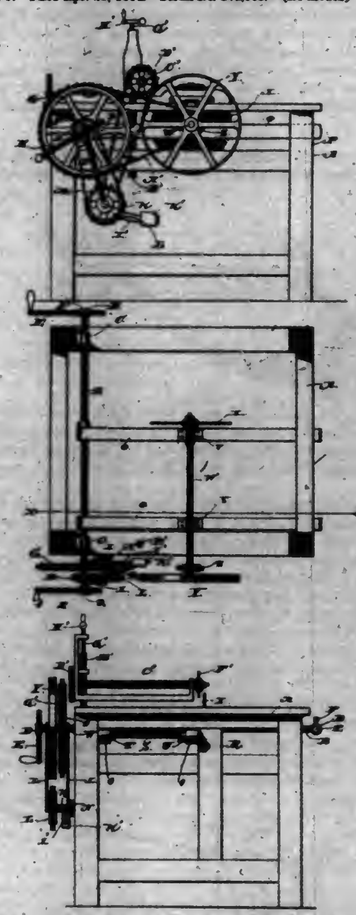
3. In combination with a brake, a weight, a fluid-cylinder and piston, a valve therefor, a second cylinder provided with a piston and containing a fluid, a valve for said cylinder, a piston-rod common to both pistons, and a connection between the two valves.

4. In combination with a brake, a weight, a single-acting cylinder provided with a piston adapted to release the brake, and a cushion, arranged substantially as shown, to counteract the momentum of the piston and weight.



5. In combination with a brake, a weight, a cylinder and piston adapted to release the brake, a valve for controlling the admission to and exhaust from said cylinder, a second cylinder provided with a piston and with a valve adapted to connect opposite ends of the cylinder, a piston-rod common to both pistons, a rod or link connecting the valves, a hand-lever, and intermediate connections between the hand-lever and the valves and pistons, all arranged substantially as shown, whereby the movements of the hand-lever and pistons are caused to correspond.

6. In combination with a brake, a weight, a cylinder and piston to release the brake, a valve to control the admission and discharge from the cylinder, a hand-lever, and connecting-gear between the hand-lever and valve, whereby the movements of the hand-lever and piston are made to correspond, substantially as shown.



395,718. BALING-PRESS. TULLY BUNKLE, Farmersville, assignor of one-half to James F. Yeager, Prairie Creek, Ind. Filed May 25, 1888. Serial No. 275,006. (No model.)

Claim.—The improved baling-press herein described, comprising the box A, having the open sides and closed ends, the latter having slots F, the doors for closing the sides of the box, the windlasses I, one for each end of the box, journaled at the ends of the box, the pawl and ratchet for the windlasses, the latter having the openings L for the insertion of the detachable operating-levers M, the two plungers mounted in the press-box and having bars Q, projecting through slots F, and the two sets of cables at opposite ends of the press-box secured to the windlasses, wound in reverse directions thereon, extended outward on each side thereof, and connected to the extended ends of the bars Q, so that each windlass is connected to both plungers, as set forth.

395,718.

395,719. SAWING-MACHINE. EDGAR W. SUTPHEN, Jamesburg, N. J. Filed Apr. 25, 1888. Serial No. 271,805. (No model.)

Claim.—1. The combination of the frame having the vertical standard B', the driving-shaft journaled in the frame, the saw-frame hinged on said shaft, the saw-arbor journaled in said frame and having the wheel connected to a wheel on the driving-shaft, for the purpose set forth, the swinging frame I, pivoted to the driving-shaft, the shaft K, journaled in said swinging frame, the wheels and endless chain connecting said shaft to the main shaft, the vertically-movable frame guided on standard B', the shaft C', journaled in said frame and having the feed-wheel, and the wheels and endless chain connecting said shaft C' with the shaft K, substantially as described.

2. The combination, in a sawing-machine, of the frame A, hav-

ing the posts or guides P R, the driving-shaft journaled in the said frame, the wheel G on said shaft, the parallel bars O, having one end pivoted to the driving-shaft and having their free ends arranged between the guide-posts P R, clamping device to secure the free ends of the said bars to the said posts at any desired vertical adjustment, the saw-arbor journaled in bearings on the bars O and having the wheel Z, and the endless chain connecting the wheels Z and G, substantially as described.

3. The combination, in a sewing-machine, of the driving-shaft having the wheel H, the swinging frame or arm I, pivoted to the said shaft and having the shaft K, provided with the wheels L N, the sprocket-chain connecting the wheels H L, the vertically-movable shaft C, having the feed-wheel, for the purpose set forth, and the wheel D, and the sprocket-chain connecting the wheel D to the wheel N, substantially as described.

4. In a sewing-machine, the driving-shaft having the wheel H, the swinging frame or arm I, pivotally hung therefrom and having the shaft K, provided with the wheels L N, the sprocket-chain connecting the wheels H L, the adjustable shaft C, having the wheel D, the sprocket-chain connecting the wheel D to the wheel N, and the weighted arm I for the frame I, as set forth.

5. In a sewing-machine, the combination of the shaft W, having the saw X, the driving or main shaft having the wheels G H, the sprocket-wheel Z on shaft W, the chain connecting wheels G Z, the swinging frame I, having the sprocket-wheels L N, the chain connecting the wheels H L, the shaft C, having the sprocket D, and the chain connecting the sprocket-wheel N to the sprocket-wheel D, as set forth.

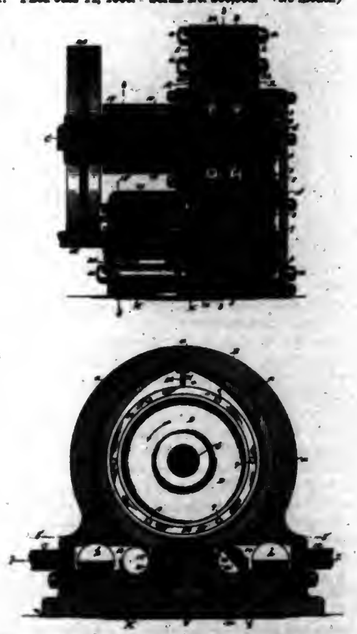
395,720. POLISHING-WHEEL. FERDINAND W. STARR, Springfield, Ohio. Filed July 24, 1886. Serial No. 208,920. (No model.)

Claim.—1. In a machine for polishing and finishing surfaces, the combination, with a main driving-shaft, of a slack polishing-belt passing loosely about a pulley upon said shaft and adapted to be brought into frictional contact with the pulley by the work to be operated upon.

2. In combination with a shaft, mechanism for imparting motion thereto, a polishing-belt passing loosely about said shaft and adapted to be brought into frictional contact with a pulley thereon by the work to be operated upon, and a support for said belt, arranged substantially as shown, whereby when the work is removed from the belt the latter will be prevented by its support from traveling.

3. The herein-described method of mounting and operating polishing belts or cords—that is to say, mounting or hanging an endless polishing belt or cord loosely on its driving-pulley, so that the belt or cord will remain practically stationary when not in use, and then applying to said belt or cord the article to be polished with the force necessary to cause the belt or cord to adhere to its driving-pulley and receive motion therefrom, substantially as shown and described.

395,721. LAWN-RAKE. HENRY W. STEINER, Easton, Pa., assignor of one-half to Edward W. Miller, same place. Filed Sept. 26, 1888. Serial No. 286,362. (No model.)



Claim.—1. A rake having its head, teeth, shank, and braces all formed of wire, the said wire being twisted centrally to form a screw-shank, C, a portion of which is engaged in the rake-handle, while a portion outside of the handle is bent downward to form a strong central brace for the rake-head, the strands of wire separating at the point D and carried outward in opposite directions on each side, bent downward from D a short distance, then bent upward in a curve, E, then inclined upward and outward, then downward in a curve, F, these reflex bends being continued far enough on each side to form one-half of the rake-head, the ends of the wire at each end of the rake-head being extended inward to form inclined braces H, which are secured to the rake-handle, as set forth.

2. A rake-head made of wire and composed of a series of reflex bends, the said bends having their lower ends arranged in a line which is curved upward on each side of the center of the rake-head, whereby the center of the rake-head first touches the ground, as set forth.

3. In a rake, a head composed of wire bent centrally upon itself to form a screw-shank, a portion of which twisted shank is engaged in the handle, while a portion outside therefrom is bent downward to form a strong central brace for the rake-head, and a series of reflex bends in the wire on each side of the central brace, said bends forming the teeth of the rake, substantially as specified.

4. The herein-described rake, composed of the handle A and the heavy spring-wire B, bent centrally to form the screw-shank C, having the downwardly-bent portion *d* outside the handle and bent reflexly outward on each side to form the curves E F and inclined arms or portions *e f*, and with its end portions bent toward the handle to form inclined braces H, having the loops A and secured to the handle by the rivet I, substantially as specified.

395,722. ROTARY ENGINE. JOSEPH THORNE, Port Richmond N. Y. Filed Jan. 11, 1888. Serial No. 260,262. (No model.)

Claim.—1. The combination, with a rotary piston having a projection or lobe, of a rotary abutment formed to maintain contact with the periphery of the piston and rotating in the same direction therewith, substantially as described.

2. The combination, with a rotary piston having a projection or lobe, of a rotary abutment formed and arranged to maintain contact with the periphery of the piston, induction and exhaust ports located upon the opposite sides of the abutment, and a rotary valve for controlling the induction-port, substantially as described.

3. The combination, with a rotary piston having a projection or lobe, of a rotary abutment formed to maintain contact with the periphery of the piston and connections between the piston and abutment for rotating the latter turn for turn with the former and in the same direction, substantially as described.

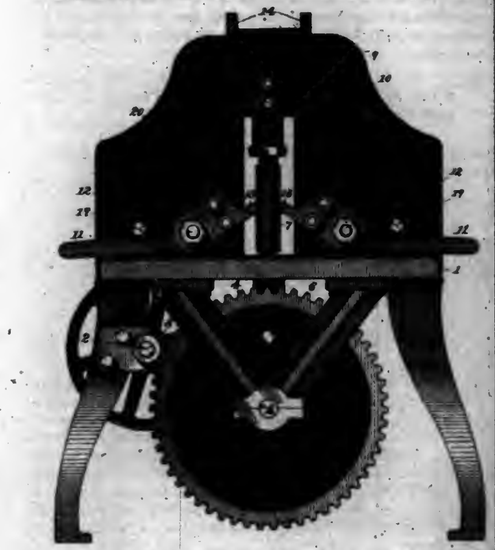
4. The combination, with a rotary piston having a projection or lobe, of a rotary abutment formed to maintain contact with the periphery of the piston, induction and exhaust ports located upon the opposite sides of the abutment, a rotary valve for controlling the induction-port, and connections between the piston, abutment, and valve for causing the abutment and valve to make turn for turn with the piston, substantially as described.

5. The combination, with a rotary piston having a projection or lobe, of a rotary abutment formed to maintain contact with the periphery of the piston and double adjustable gearing connecting the two to cause them to make turn for turn in the same direction without backlash, substantially as described.

6. The combination, with a rotary piston having a projection or lobe, of a rotary abutment formed to maintain contact with the periphery of the piston and rotating in the same direction therewith, induction and exhaust ports located upon the opposite sides of the abutment, and adjustable valves for controlling said ports, whereby the steam can be admitted upon either side of the abutment and exhausted upon the other, substantially as described.

7. The combination, with a rotary piston having a projection or lobe, of a rotary abutment formed to maintain contact with the periphery of the piston, induction and exhaust ports located upon the opposite sides of the abutment, and the rotary valves F G, for controlling said ports, which are geared to the shaft of the abutment and arranged to be inserted and withdrawn to reverse the engine, substantially as described.

8. The combination, with a plurality of rotary pistons having projections or lobes set in different positions with relation to the main shaft, of rotary abutments formed to maintain contact with the peripheries of said pistons and rotating in the same direction therewith, substantially as described.



9. The combination, with a plurality of rotary pistons having projections or lobes sets in different positions with relation to the main shaft, of rotary abutments formed to maintain contact with the peripheries of said pistons, induction and exhaust ports located upon the opposite sides of the abutments, and rotary valves for controlling the induction-ports, said pistons, abutments, and valves being connected so as to make turn for turn, substantially as described.

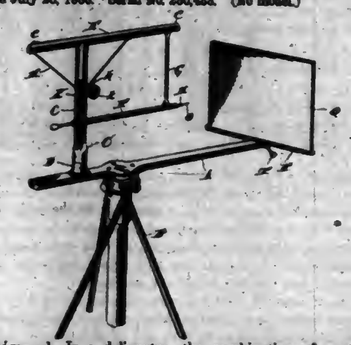
10. The combination, with a rotary piston having a circular body and a lobe, the sides of which form arcs of two circles described about different centers, of a rotary abutment maintaining contact with the periphery of said piston and rotating in the same direction, and having a circular body and a depressed portion formed upon the arcs of two circles described about different centers, substantially as described.

11. The combination, with a rotary piston and the rotary abutment having the gear 19, of the rotary valves F G, arranged to be inserted and withdrawn, and having the gears 20 and the long gears 41, connecting the gears 19 20, substantially as described.

12. The combination, with the rotary piston and the rotary abutment, of the packing-blocks 21, mounted upon the body of the abutment, so as to be permitted to move outward by centrifugal force, substantially as described.

395,728. METAL-BENDING MACHINE. SAMUEL VANSTONE, Providence, R. I. Filed May 10, 1888. Serial No. 273,461. (No model.)

Claim.—1. The combination of the plunger and the lever-arms having the die portions, substantially as described, with the locking-bolts, the parts being so constructed and arranged that the plunger is caused, first, to give a partial bend to the central portion of the metal and the lever-arms having the die portions are caused, second, to give the final bend, as described.



2. In combination with the plunger, the lever-arms having the die portions, the locking-bolts, as described, and the mechanism for withdrawing the same at the proper time.

3. The combination of the plunger, the lever-arms having the die portions, the cam-pieces, and the rods 15 15, with the locking-bolts, as described.

4. The combination of the plunger, the slide-block 9, having the cam-pieces 14 14, the bars 15 15, with the locking-bolts and lever-arms having the die portions, as described.

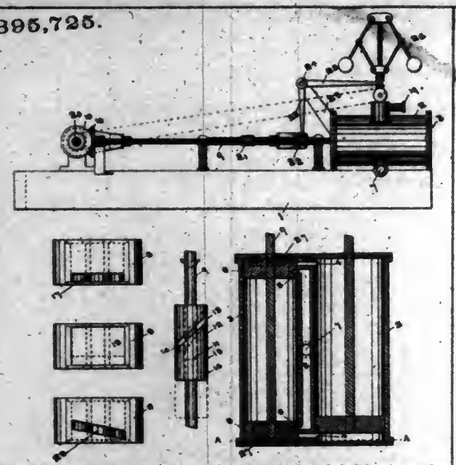
5. The machine described, having the reciprocating plunger adapted to perform the first part of the bending action, the pivoted lever-arms with die portions adapted to exert after the first bending action a further bending action, the locking-bolts for holding the lever-arms against action, and the mechanism for withdrawing the same at the proper time, as and for the purpose set forth.

395,724. DELINEATOR. DAVID K. WADE, McPherson, Kans. Filed July 20, 1888. Serial No. 280,483. (No model.)

Claim.—1. In a delineator, the combination of a standard mounted in a suitable socket, the sight-bar mounted on the upper end of the standard, the tubular arm pivoted at one end to the standard and connected at the other end to the free end of the sight-bar, whereby the tubular arm and the sight-bar are held parallel, and the pointer arranged in the tubular arm and provided at its front end with a suitable pencil or crayon adapted to bear against a vertical surface, substantially as specified.

2. In a delineator, the combination, with a base plate or bar arranged on a suitable stand or tripod and the vertical board longitudinally adjustable on the said plate or bar, of the standard mounted in a suitable socket on the base plate or bar, the sight-bar mounted on the upper end of the standard, the tubular arm pivoted to the standard at one end and connected by a suitable rod to the free end of the sight-bar, and the spring-actuated pointer mounted in the tubular arm and provided with a pencil or crayon adapted to bear against the said board, substantially as specified.

3. In a delineator, the combination, with a base plate or bar having a vertical board arranged thereon, of the standard swiveled at its lower end on the plate or bar, the sight-bar mounted on the upper end of the standard, the tubular arm connected to the sight-bar and carrying a suitable pointer, and the cord affixed at its ends to the sight-bar on opposite sides of the standard and passing at an intermediate point around a suitable drum or pulley, substantially as specified.



4. In a delineator, the combination, with a suitable base plate or bar provided with a suitable vertical board, of the standard swiveled on the said plate or bar and provided with a vertical slot, *c*, the spindle K, mounted in registering bearings in opposite sides of the slot *c* and provided with a thumb-wheel and a drum, the sight-bar provided with suitable sights, the cord attached at its ends to the sight-bar and passing at an intermediate point around the said drum, the tubular arm mounted in the lower end of the slot and connected at its free end to the sight-bar, and the pointer mounted in the tubular arm and provided with a suitable pencil or crayon, substantially as and for the purpose specified.

5. In a delineator, the combination, with the dovetailed base plate or bar A, provided with a socket, D, the standard mounted in the socket, the sight-bar mounted on the standard, the tubular arm mounted on the standard and connected to the sight-bar, and the pointer arranged in the tubular arm, of the vertical board provided with a depending casting having a dovetailed notch fitting snugly on the base plate or bar, and the thumb-screws arranged in the sides of the notch and bearing against the plate or bar to lock the board in the desired position, substantially as specified.

395,725. STEAM-ENGINE VALVE. WILLIAM A. WALKER, Rome, N. Y. Filed June 27, 1887. Serial No. 242,501. (No model.)

Claim.—1. The combination, within a steam-chamber, of a cir-

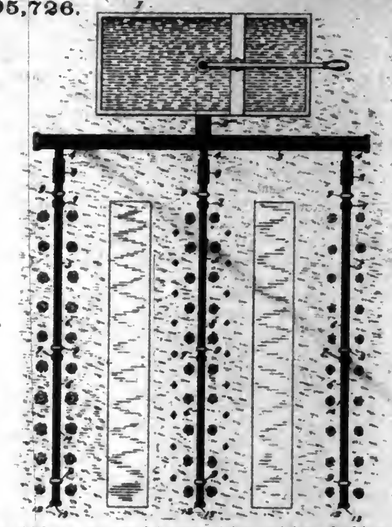
395,725.

cular seat having two ports therein, and a cylindrical shell having a slot or port through the shell adapted to register with one of the ports in the seat and having a pocket or recess upon the external cylindrical surface of the shell adapted to cover both ports in the seat and establish communication between them, one or more shells being mounted on a shaft within the chamber, so as to admit of a lateral movement of the shell upon the seat within the chamber.

2. In a rotary valve for a motor, the combination of a curved valve-seat located in a steam-chamber, the seat being provided with an inlet and exhaust ports for each end of the cylinder, a cylindrical shell mounted upon a shaft within a chamber, rotating in the curved seat, covering the ports, and provided with slotted openings through the shell adapted to register with the inlet-ports in the seat with each revolution of the shell, and recesses or pockets upon the external cylindrical surface of the shell, each pocket being adapted to cover the exhaust and inlet ports at each end of the cylinder and establish communication between them with each revolution of the valve, the shell being longitudinally adjustable in the seat, whereby the slotted openings of the shell are adjusted to a position not to or only partially to register with the inlet-ports.

3. The combination, with a rotary valve of a motor having a cylindrical shell mounted on a shaft covering inlet and exhaust ports for each end of the cylinder in a circular seat and the shell provided with slotted openings for establishing communication between the inlet-ports and the interior of the cylindrical shell and pocket upon the exterior cylindrical surface of the shell for establishing communication between the inlet and exhaust ports, of a governor connected with the shell for adjusting it longitudinally in the seat.

4. A steam-chamber having a circular seat having ports therein, and a rotary valve consisting of a cylindrical shell having a slot or port through the shell adapted to register with one of the ports in the seat and having a pocket or recess upon the external cylindrical surface of the shell adapted to simultaneously cover two of the ports in the seat and establish communication between them, one or more shells being mounted upon a shaft within the chamber, so as to revolve and also admit of a lateral movement of the shell upon the seat, the shaft being in sections and one of the sections provided with a movable sleeve revolving with and longitudinally adjustable upon the section of the shaft, the sleeve having a spiral slot and the other section of the shaft entering the sleeve and provided with a projection engaging the sleeve within the slot.



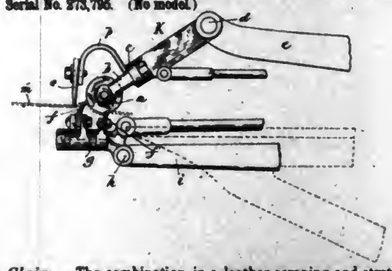
395,726. SPRINKLING OR IRRIGATING APPARATUS. JOHN WALTER, Winter Haven, Fla. Filed Feb. 9, 1888. Serial No. 263,452. (No model.)

Claim.—1. In a sprinkling or irrigating apparatus, the combination, with a main pipe having outlet-pipes arranged at the ends of the beds or rows of plants to be watered, of branch pipes which are formed with perforations in both sides and movably or slidingly connected to said outlet-pipes and supported above said plants, substantially as and for the purpose described.

2. In a sprinkling or irrigating apparatus, the combination, with a main pipe, of a sectional longitudinally-movable branch pipe formed with perforations in both sides and provided with a cap having a drainage-aperture in its lower portion, substantially as described.

3. In a sprinkling or irrigating apparatus, the combination of a water-supply source, a main pipe provided with outlet-pipes at the ends of the beds or rows of plants to be watered, sectional branch

395,726.

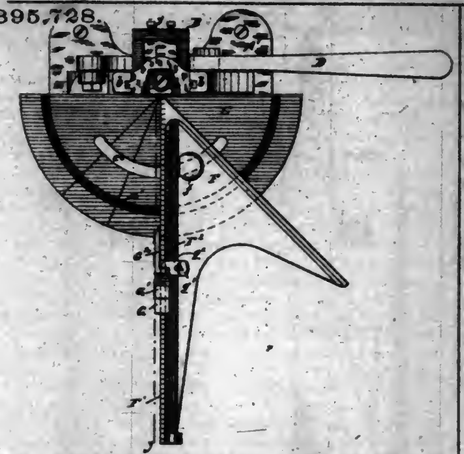


pipes which are connected by screw-joints and formed with rows of perforations registering with said beds or rows of plants and constructed to be longitudinally movable upon said outlet-pipes, and supports or stakes formed with notches or recesses in which said branch pipes may be slid longitudinally, substantially as and for the purpose described.

4. In a sprinkling or irrigating apparatus, the combination of the main pipe 3, having the outlet-pipes 4 opposite the ends of the rows or beds of plants, with the perforated branch pipes 5, having movable or sliding joints 8 at their inner ends, and caps 12, having apertures 13 at their outer or lower ends, substantially as and for the purpose described.

5. The herein-described sprinkling or irrigating apparatus, comprising a supply-tank provided with a discharge-opening, a valve, a spring for holding said valve closed, a rod and hand-lever for opening the same and an outlet-pipe, a main water-supply pipe having outlet-pipes, perforated branch pipes telescoping or slidingly connected to said outlet-pipes and formed in removable sections, and notched or recessed supporting-stakes provided with bails or straps, substantially as described.

395,727. MACHINE FOR STRETCHING, SCRAPING, AND FINISHING HIDES. NICHOLAS WEBER, Lynn, Mass. Filed May 14, 1888. Serial No. 273,795. (No model.)

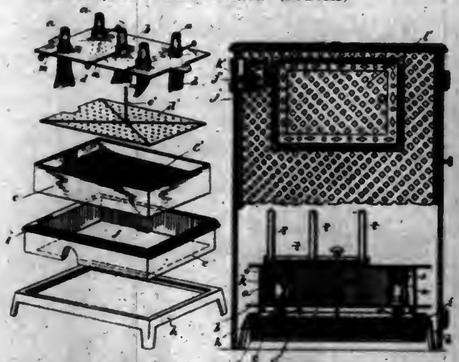


Claim.—The combination, in a leather scraping and stretching machine, of the yielding jaw or roll *a*, arranged to bear on the grain side of a skin, a scraping-jaw arranged to bear on the opposite side of the skin, holders for said jaws, the finishing or polishing blade secured to the holder of the yielding jaw or roll and arranged to bear on the grain side of a skin at one side of the line of contact of the said jaws with the skin, and mechanism for reciprocating and opening and closing said jaws, whereby the finishing-blade is caused to rub and polish the grain side of the skin while said jaws are closed thereon, as set forth.

395,728. MACHINE FOR CUTTING PRINTERS' RULES. FERDINAND WIBEL, New York, N. Y. Filed Aug. 7, 1888. Serial No. 282,149. (No model.)

Claim.—The combination of an upright standard, a vertically-reciprocating knife-holder guided in ways of the same, a cutting-knife in said holder, a lever for reciprocating said holder, a horizontal guide-

395,728.



table, a horizontal adjustable guide-plate provided with a dovetailed edge-bar, a guide-rod fixed on said guide-plate parallel to said edge-bar, an adjustable stop on said guide-rod, and a push-piece guided on said edge-bar, substantially as set forth.

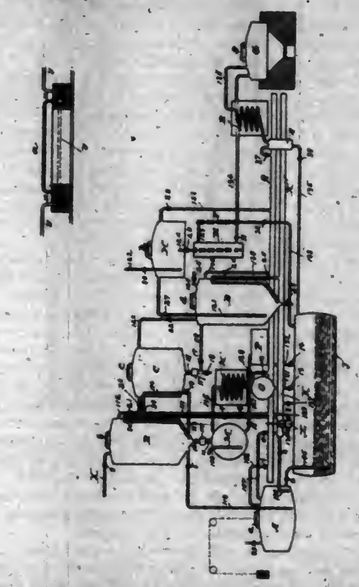
395,729. POCKET FOR GARMENTS. HENRY R. WHALEY, St. Paul, Minn. Filed Sept. 7, 1888. Serial No. 284,775. (No model.)

Claim.—A garment having a pocket-opening therein the edges of which are folded inward, in combination with a pocket attached to said inwardly-folded edges and re-enforcing strip attached by one of its edges between the adjacent edges of the pocket and the inwardly-folded edges of the pocket-opening, whereby the pocket-opening is supported and the strains distributed over the body of the garment contiguous thereto.

395,730. PORTABLE HEATING OR COOKING STOVE. J. BURNHAM ANDERSON, Boston, Mass., assignor to George H. Heath, same place. Filed Feb. 3, 1888. Serial No. 262,961. (No model.)

Claim.—1. The combination of a series of burners, a cage or frame composed of liquid-holding tubes arranged to be heated by said burners and inclosing a horizontal oven-receiving space, and a movable oven formed to be inserted in said space, as set forth.

2. The combination of a series of burners, a horizontal cage or frame composed of liquid-holding tubes arranged to be heated by said burners and inclosing a horizontal space, a movable oven formed to be inserted in said space, a removable cover formed to inclose said cage and oven, and a plate, *p*, provided with openings coinciding with the burners and arranged to support the oven, as set forth.



3. The reservoir *c*, having the fibrous absorbent material, combined with the perforated follower and means for depressing the same, as set forth.

4. The combination of the reservoir, the fibrous material thereon, the perforated follower, and the screw and fixed nut, whereby said follower may be depressed, as set forth.

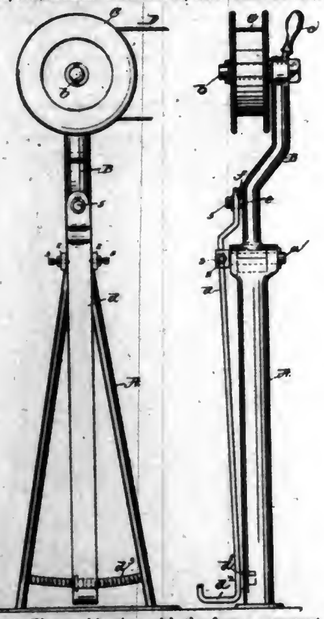
5. The combination of the hollow casing *e*, having the outwardly-projecting flange *i*, the air-space, and the inwardly-projecting legs or supports *f*, the base *h*, formed to support the casing by its flange *i*, and the reservoir *c*, formed to be inserted in the casing and to rest on the legs *f* thereof, as set forth.

6. The combination of the burners *a*, the chamber *k*, having the chimneys *n* opening through its top, the plate *p*, having openings *q* arranged to coincide with the chimneys, and the tubes *l l* on said plate, formed into a hollow cage or oven-receptacle, all arranged and operating substantially as set forth.

395,731. BLEACHING AND REFINING RESINS AND OTHER SUBSTANCES. HENRY A. BERENDS, Bremen, Germany. Filed Oct. 31, 1885. Serial No. 181,543. (No model.) Patented in Germany June 7, 1885, No. 35,090; in England Sept. 19, 1885, No. 11,177, and in Belgium Sept. 21, 1885, No. 70,262.

Claim.—1. The within-described process of bleaching and refining resins and other similar substances, consisting in dissolving the same in a volatile substance having a low boiling-point, mixing the solution with an alkali to separate the impurities, removing the alkali with the impurities from the solution, and finally recovering the solvent and depositing the resin by evaporation, substantially as described.

2. The within-described process of bleaching and refining resins and other similar substances, consisting in first dissolving the same in a volatile substance, then mixing the solution with an alkali to separate the impurities, then removing the alkali and impurities from the solution, and then recovering the solvent and depositing the resin by evaporation, the movement of the substances during the several steps of the process being controlled by the compression and exhaustion of confined air, substantially as described.



3. The within-described process of bleaching and refining resins and other similar substances, consisting in first dissolving the same in a volatile substance, then mixing the solution with an alkali to separate the impurities, then removing the alkali and impurities from the solution, then mixing with the solution a suitable bleaching agent and removing the latter, and finally separating the resin and solvent by evaporation and recovering the latter, substantially as described.

4. In an apparatus for bleaching and refining resins, the combination of the receptacle A, in which the resin is dissolved, a series of purifiers wherein the resin solution is subjected to decolorizing sub-

stances, the pipes leading from the purifiers, through which the decolorizing substances and the impurities are drawn off, the distilling apparatus for removing the solvent from the resin, the connecting-pipes between the said parts of the apparatus, whereby the resin solution passes in succession from one to the other, the pump having both high and low pressure connections with each of the purifiers, and stop-cocks in the said connections, substantially as and for the purpose set forth.

5. In an apparatus for bleaching and purifying, the combination, with the purifying-vessels, of a cap for closing the same, a channel for the reception of a fusible alloy, and a steam-pipe located in said channel, substantially as described.

395,782. BELT-TIGHTENER FOR BUFFING-MACHINES. JOHN G. BLOUNT, Boston, Mass. Filed Mar. 16, 1888. Serial No. 267,393. (No model.)

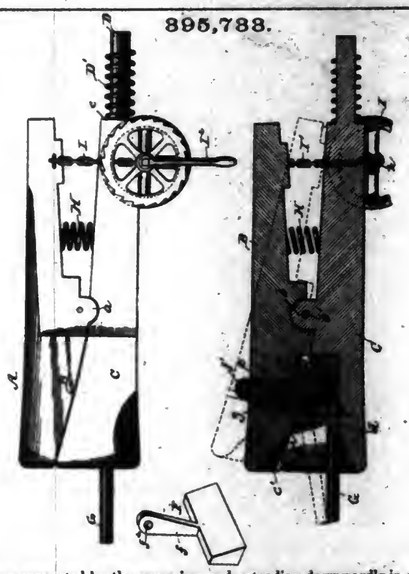
Claim.—1. The combination, with the frame or support, the pin *a*, arm B, pivoted thereon, the stud *c*, and strap-carrying pulley C, of a foot-lever pivotally attached to the said pin and movable toward and from the arm B upon the stud *c*, substantially as described.

2. The combination, with the support or frame A, pivoted arm B, and strap-carrying pulley C, of the handle *c*, rigidly connected with the upper end of the arm *b*, substantially as described.

3. The combination, with the frame or support A, pivoted arm B, and strap-carrying pulley C, of a foot-lever, *d*, having at its lower end the tooth d^1, and the ratchet-toothed bar d^2, with which the tooth of the foot-lever co-operates, substantially as described.

4. The combination, with frame or support A, the arm B, pivoted on the pin *a* and having the yoke 2 2, the strap-carrying pulley C, of the lever having pivots 3 in the said yoke, the stud *c*, the spring *f*, and a locking or engaging device, d^3, substantially as described.

5. The combination, with the main frame or support A, the pivoted arm B, and strap-carrying pulley C, of the foot-lever *d*, having the spring *f*, bearing against it at one end, and a locking or engaging device, substantially as described, at the other end of the foot-lever, as and for the purposes set forth.



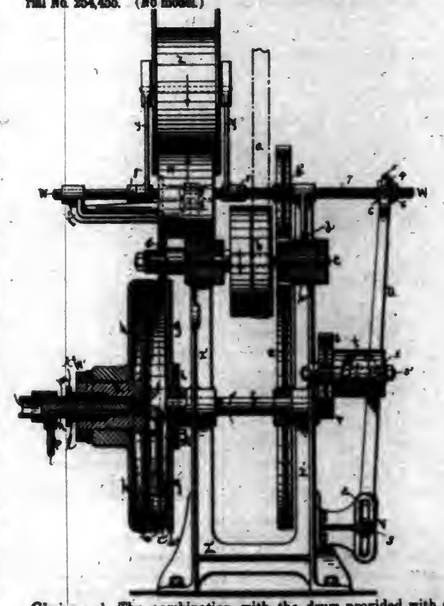
395,783. CAR-COUPLING. HARTWELL BRALEY, Langsville, Ohio. Filed July 6, 1888. Serial No. 279,220. (Model.)

Claim.—1. In a car-coupler, the combination, with a draw-head comprising two jaws pivoted together and provided with recesses at their forward ends, of projections extending from said jaws into said recesses, substantially as set forth.

2. In a car-coupler, the combination, with a draw-head composed of two jaws pivoted together and recessed at their forward ends, of a projection on one of said jaws having a straight rear face and a spring to maintain the forward portions of the jaws together, substantially as set forth.

3. In a car-coupler, the combination, with a draw-head composed of two jaws pivoted together and recessed at their forward ends, of projections extending from said jaws into the recess and a pendulous

395,783.



lever supported by the upper jaw and extending downwardly in rear of the projection on the lower jaw, substantially as set forth.

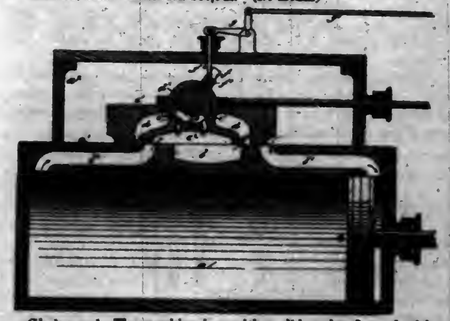
4. In a car-coupler, the combination, with a draw-head composed of two jaws pivoted together and recessed at their forward ends and projections extending from said jaws into the recess, of a pendulous lever supported by the upper jaw and extending downwardly in rear of the projections on the jaws and mechanism for vibrating said jaw, substantially as set forth.

5. In a car-coupler, the combination, with a draw-head made in two sections and recessed at their forward ends and projections extending from said jaws into the recesses, of a pendulous lever supported to oscillate in rear of said projections, hooked bars carried by the upper jaw and extending to the bottom of the recess in the lower jaw and mechanism for vibrating the jaws, substantially as set forth.

395,784. MACHINE FOR GRADING AND REELING STRAW BRAID. DANIEL BROWN, Wrentham, Mass. Filed Nov. 7, 1887. Serial No. 254,455. (No model.)

Claim.—1. The combination, with the drum provided with a raised rim on one side, of a shell adjustable on said drum with relation

to the rim, for the purpose set forth, and devices, substantially as described, for heating the drum.

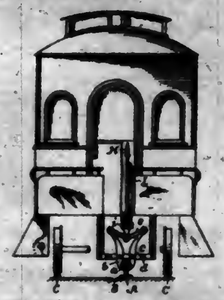


2. The combination, with the drum provided with a raised rim on one side and a screw-threaded projection on the other side, of a shell screwed onto said projection, and thereby adjustable on the drum with relation to the rim, for the purpose stated, and devices, substantially as described, for admitting steam to the interior of the drum for the purpose of heating it.

3. The combination, with the drum having a peripheral groove, as described, of a shaft journaled in eccentrics mounted in the main frame, means for holding the eccentrics in adjusted position, a pressure-roll secured on said shaft and working in the groove in the drum, and mechanism for driving the shaft, for the purposes set forth.

4. The combination, with the drum having a peripheral groove, as described, and a pressure-roll working in said groove, of a reciprocating shaft journaled in the main frame above said roll, a delivery-roll rigidly secured on said shaft, a reel journaled above the delivery-roll in supports loosely mounted on said shaft but reciprocating therewith, and means, substantially as described, for rotating and reciprocating the shaft.

5. The combination, with the drum having a peripheral groove and a pressure-roll working in said groove, of a guide for directing the straw braid under the pressure-roll, and a lifting-finger lying in the groove in the drum in rear of said roll for lifting the braid from the drum, substantially as described.



395,785. SLIDE-VALVE. THOMAS T. BROWN, Chicago, Ill. Filed Mar. 21, 1888. Serial No. 267,942. (No model.)

Claim.—1. The combination, with a slide-valve formed with a cored exhaust-passage in its face and a cored chamber on each side of the same connected by passages with the face of the valve, and also with its exhaust-passage, of a cored rock-valve seated in the main valve across the auxiliary passages and a stem for operating this valve connected to an adjustable point upon the valve-chest, whereby the throw of the auxiliary valve is adjusted to suit the stroke of the main valve, substantially as and for the purpose set forth.

2. The combination, with a slide-valve formed with suitable main and auxiliary exhaust-passages and a rock-valve seated in said auxiliary passages, of an operating-arm on this rock-valve and a guide for the arm swiveled upon a sliding rod past which the auxiliary valve is carried by the stroke of the main valve, and means, substantially as described, for moving said rod to increase or diminish the throw of the auxiliary valve inversely to the adjustment of the main valve, substantially as and for the purpose set forth.

395,786. SAFETY-BRAKE FOR CABLE CARS. CHESTER BULLOCK, Kansas City, Kans. Filed Feb. 24, 1888. Serial No. 265,126. (No model.)

Claim.—1. In a safety-brake for cable railways, a pair of oppositely-located gripping-jaws secured together at their upper ends by a toggle-joint and operated by means of an L-shaped lever, in combination with a notched bar for holding said lever at any desired adjustment, substantially as described.

2. The combination, in a safety-brake for cable cars, of a pair of oppositely-located gripping-jaws connected at their free ends by means of a toggle-joint, an L-shaped lever which is attached to said toggle and by which said joint is operated, and a notched bar secured to the car and adapted to hold said lever at any desired adjustment, substantially as described.

3. In a safety-brake for cable cars, the combination of a pair of gripping-jaws, a stationary rail having a rounded head, a toggle connecting said jaws at their upper free ends, an L-shaped lever by means of which said jaws are operated, a link connecting said lever to the toggle-joint, and a notched bar for holding the lever at any desired adjustment, all arranged and adapted to operate substantially as described.

395,787. RATCHET-AND-PAWL DEVICE. WILLIAM S. BUXTON, Springfield, Mass. Filed Apr. 23, 1888. Serial No. 271,618. (No model.)

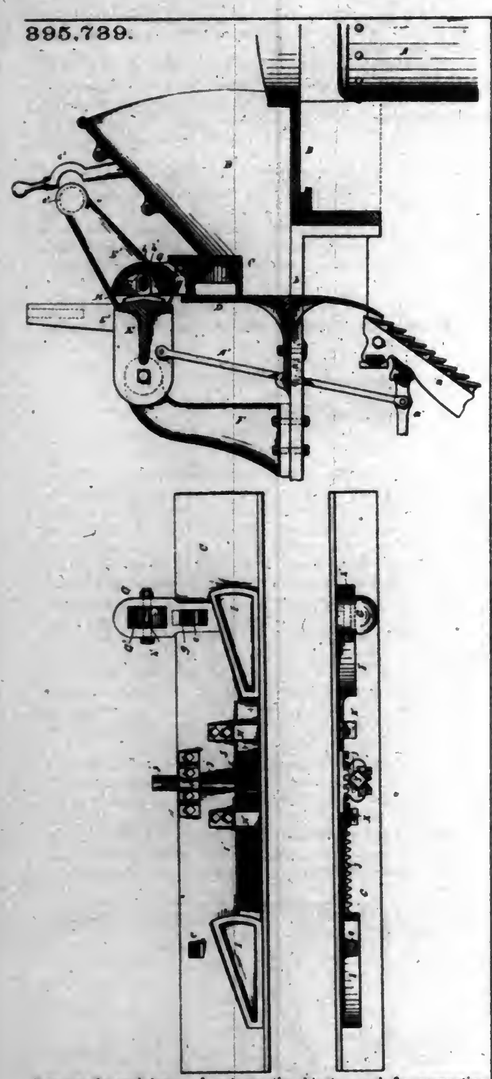
Claim.—1. A pawl-and-ratchet device consisting of a shaft having at one end thereof a longitudinal groove, a hub capable of rotating on said shaft, having ratchet-teeth on its inner wall and an annular groove in said wall, combined with a pawl having a bar thereon extending into the groove in said shaft, and an arm on said bar engaging with said annular groove, and a head on the end of said bar adapted to have a vibratory motion at the end of said shaft and engaging by either end with said ratchet-teeth, substantially as set forth.

2. In combination, the shaft 2, having at one end thereof a longitudinal groove deepest at the end of the shaft, a hub, 3, capable of rotating on said shaft, having one end extending beyond the end of the shaft, and having in the inner wall thereof ratchet-teeth 6, and the annular groove 5 and the pawl 4, having a bar thereon extending into said groove in the shaft, a head on the end of said bar engaging with said ratchet-teeth, and an arm on said bar engaging with the annular groove in said hub, substantially as set forth.

3. In combination, the grooved shaft 2, the pawl 4, having a head, *c*, a bar, *e*, extending into the groove in said shaft, and a laterally-projecting arm, *x*, on said bar, a hub capable of rotating on said shaft extending beyond the end thereof and surrounding said pawl-head, and having ratchet-teeth with which said pawl-head engages, and an annular groove in its inner wall with which said arm *x* engages, and a cap, D, screwing on the end of said hub, substantially as set forth.

395,788. SPOKESHAVE. ISAAC CARMER, Chicago, Ill. Filed Sept. 29, 1887. Serial No. 251,063. (No model.)

Claim.—1. The combination, in a spokeshave, of the stock A, having open-sided recesses *a a* in the lateral walls of the bit-throat, the clamping-plate G, having marginal lugs *g g*, projecting laterally from its sides and adapted to rest in the recesses *a* to prevent a movement of the plate G in a plane with the cutter-bit, the holding-screw F, clamping-screw H, and cutter-bit C, essentially as set forth.



2. The combination, in a spokeshave, of the stock A, having open-sided recesses *a a* in the lateral walls of its bit-throat, the clamping-plate G, having marginal lugs *g g*, projecting laterally from its sides and adapted to rest in the recesses *a* to prevent a movement of the plate G in a plane with the cutter-bit, the holding-screw F, clamping-screw H, adjusting-screw D, and cutter-bit C, essentially as set forth.

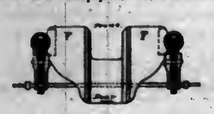
395,789. DEVICE FOR FEEDING FUEL. HENRY H. CAMPBELL, Cleveland, Ohio, assignor of one-half to Nathan W. Taylor, same place. Filed May 25, 1888. Serial No. 275,083. (No model.)

Claim.—1. In a coal-feeding device, the combination, with reciprocating block for feeding the coal, and push-bars for actuating such block, of adjustable wedges interposed between the push-bars and reciprocating block for adjusting the throw of the latter, substantially as set forth.

2. In a coal-feeding device, the combination, with reciprocating block and push-bars, substantially as indicated, of wedges interposed

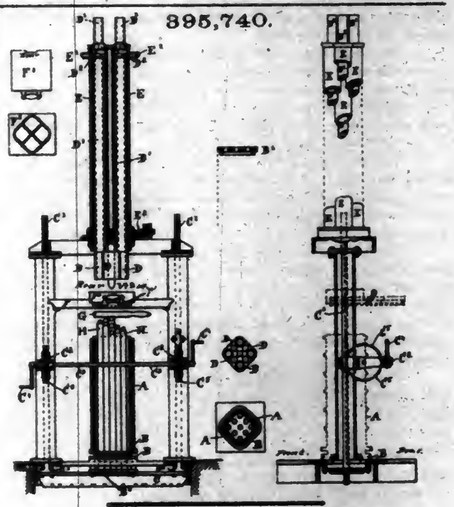
395,739.

between the push-bars and reciprocating block, a rack for connecting the wedges, and a pinion for operating the rack, the parts being arranged substantially as set forth.



395,740. MACHINE FOR MOLDING MULTITUBULAR PIPE. CHARLES CARR, Boston, Mass. Filed July 14, 1887. Serial No. 244,253. (No model.)

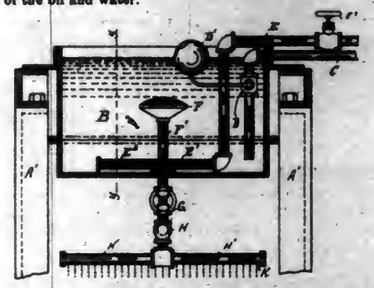
Claim.—1. In a machine for molding multitubular pipe, the combination of a series of separate steam-cylinders, pistons, piston-rod hammers, and a pipe-mold, substantially as described.



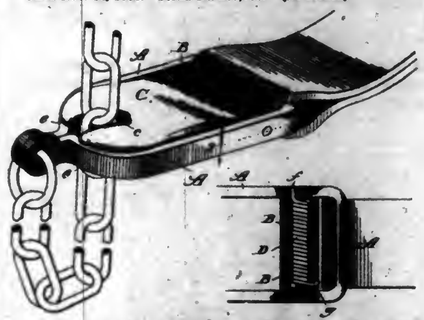
2. The combination of the follower and a series of dowel pins or blocks let into its upper face, substantially as described.

3. The combination of a perforated leather face with the dowel pins or blocks and the follower having a series of sockets in its upper face, substantially as described.

4. In a machine for molding multitubular pipe, a series of cores of gradually-varying length, in combination with the even or level-faced hammer or hammers and the pipe-mold, substantially as described.

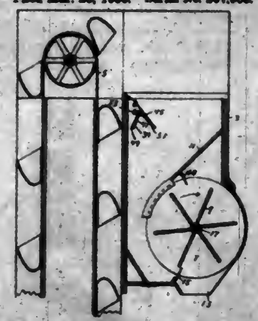


395,740.



395,741. MACHINE FOR SOFTENING JUTE, HEMP, &c. JOHN CHESTER, Paterson, N. J. Filed July 7, 1888. Serial No. 279,335. (No model.)

Brief.—In passing through the machine the fiber is subjected to jets of oil in the usual way, after which it is subjected to jets of steam and boiling water from a separate pipe, the object being a better union of the oil and water.



Claim.—The combination, with mechanism for softening the fiber and for supplying oil thereto, of the box B, the pipe C, provided with valve D and float D', the pipes E and E', the latter having perforations E², the pipe F, having perforated enlargement F and valve G, and the pipes H and H', the latter having the perforations K.

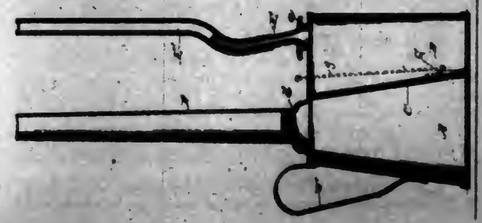
395,742. BUCKLE. LEONARD L. CORBEY, Benton Harbor, Mich. Filed Nov. 14, 1888. Serial No. 290,768. (No model.)

Claim.—A buckle comprising, in combination, a frame or jaws, A, a tongue, C, the outer end of which is provided with a slot, *c*, which tongue C works upon a hinge, B, together with a coiled metallic spring, D, within the hinge B, attached to the frame or jaws A and the tongue C, so that the tension will incline to keep the outer end of the tongue C against the outer end of the jaws or frame A, substantially as described.

395,743. AUTOMATIC GRAIN-MEASURE. HARRY W. COWAN, Gran, Dak. Filed Mar. 20, 1888. Serial No. 267,902. (No model.)

Claim.—1. The combination, in a device of the class described, of a measuring-wheel provided with a series of compartments, a receptacle constructed to hold a sufficient supply of material to fill all of the compartments of said measuring-wheel and adapted to supply material to said wheel, a driving mechanism adapted to revolve said measuring-wheel, and a tripping mechanism arranged in said receptacle and adapted to be moved by the material therein and to connect said driving mechanism with said measuring-wheel, whereby when said receptacle has received a sufficient supply of material to fill all of the compartments of said wheel said tripping mechanism will be operated by the material and will connect said driving mechanism with said measuring-wheel, as and for the purpose specified.

2. The combination, in a device of the class described, of the measuring-wheel provided with a series of compartments, the receptacle 3, constructed to receive a sufficient supply of material to fill all the compartments of said measuring-wheel, a driving mechanism, a clutch adapted to connect said driving mechanism and said measuring-wheel, and tripping mechanism arranged in said receptacle and adapted to be operated by the material therein when said receptacle has received a sufficient supply of material to fill all the compartments of said measuring-wheel.

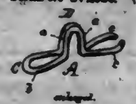


3. The combination, in a device of the class described, with the receptacle 3, of the measuring-wheel 7, the driving-wheel 19, mounted loosely upon the shaft of the said measuring-wheel, the clutch mechanism adapted to connect said driving-wheel with said shaft, the pivoted lever 31, the vibratory plate 45, arranged within said receptacle 3, the pivoted plate 51, the arm 55, the pivoted arm 53 upon the lever 31, the spring 35, and the wheel 37, provided with the lug 41, substantially as described.

4. The combination, in a device of the class described, with the measuring-wheel, the driving mechanism, and the clutch mechanism, of the operating-lever 31, provided with the arm 33 and the spring 35, the wheel 37, provided with the lug 41, and the tripping mechanism consisting of the vibratory plate 45, arranged in the grain-receptacle, the pivoted plate 51, and the arm 55, adapted to engage the arm 33, substantially as described.

5. The combination, in a device of the class described, with the measuring-wheel 7 and its shaft 17, of the wheel 19, mounted loosely upon said shaft and provided with the pins 32, the stationary ring 27, surrounding said shaft 17, the pivoted lever 25, the spring 29, and the operating-lever 31, substantially as described.

6. The combination, in a device of the class described, with the revolving measuring-wheel, of the pivoted stroke-board 60, extending across said measuring-wheel and adapted to be adjusted toward or from said wheel, the index on the outside of the casing, and the pointer secured upon the pivot of said board and adapted to be moved over said scale, and thereby to adjust said stroke-board, substantially as described.



395,744. VETERINARY DRENCHING-HORN. GEORGE A. DORAN, Menominee, Mich. Filed May 16, 1888. Serial No. 274,089. (No model.)

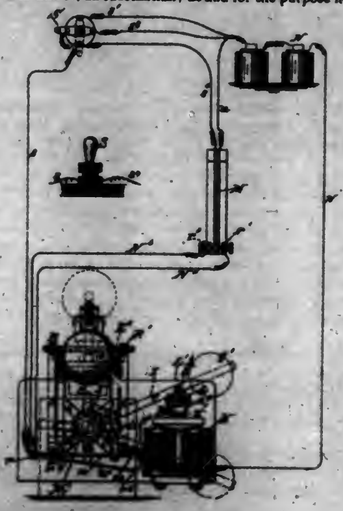
Claim.—1. A drenching-horn composed of two receptacles, each receptacle having a nozzle, substantially as described, for the purpose specified.

2. The horsie shown and described drenching-horn, composed of a vessel, the partition dividing the vessel into two receptacles which have communication with one another, the valve for shutting off the communication between the two receptacles, and the nozzles, one for each receptacle, substantially as and for the purpose described.

395,745. BUTTON-FASTENER. GEORGE H. FOX, Boston, Mass. Filed May 21, 1888. Serial No. 274,080. (No model.)

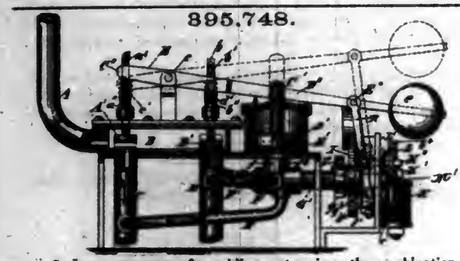
Claim.—A button-fastener consisting of the open eye D, formed by the dual loops *a a* and the loop C, co-operating with the legs *c c*, divergent and lying in the same plane with said loop at right angles to the plane of said dual loops *a a*, substantially as and for purposes specified.

395,746. VEHICLE BRAKE-GEAR. CHARLES FULLER and JOHN H. CUNNINGHAM, Lodell, Kans. Filed Mar. 27, 1888. Serial No. 268,807. (No model.)



Claim.—The combination, with a vehicle having a vertically-moving axle and a brake, substantially as set forth, of the brake-bracket secured to the body of the vehicle, the clip secured to the axle, the right and left hand screw-threaded rods, the pivot-pins connecting the said rods to the brake-bracket and to the axle-clip, respectively, and permitting the said axle to move vertically, and the adjustable coupling-link provided with right and left hand screw-threaded holes for the screwed ends of the said rods, substantially as set forth.

395,747. SELF-RAISING FLOUR. GLENN L. HILLS and CARL G. HILLS, Bloomington, Ill. Filed Feb. 16, 1888. Serial No. 264,206. (No specimens.)



Claim.—A self-raising flour consisting of ground popped popcorn, wheat-flour, potato-flour, rice-flour, baking-powder, and sugar, substantially as described.

395,748. ANTI-FREEZING DEVICE FOR WATER-PIPES. JAMES W. KENT and ROBERT ORR, Brooklyn, N. Y. Filed Sept. 8, 1887. Serial No. 249,089. (No model.)

Claim.—1. In an apparatus for voiding water-pipes, the combination of the double four-way cock with the valve-chest F, pipes or passages *f f'*, cylinder E, piston D', pipes F' H C D A, chamber B, and valves A' and F, all substantially as and for the purpose herein set forth.

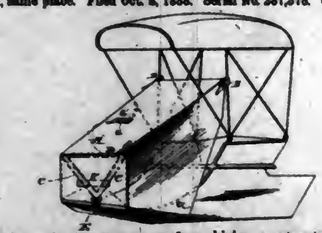
395,748.

2. In an apparatus for voiding water-pipes, the combination of the double four-way cock with the valve-chest F, pipes or passages $f f^3$, cylinder E', piston D', pipes F' H C D A, chamber B, valves A' and B', ratchet-wheel g, lever I, and pawl F, all substantially as and for the purpose herein set forth.

3. In an apparatus for voiding water-pipes, the combination of the double four-way cock with the valve-chest F, pipes or passages $f f^3$, cylinder E', piston D', pipes F' H C D A, chamber B, and valves A' and B', provided with the valve-stems a and b, all substantially as and for the purpose herein set forth.

4. In an apparatus for voiding water-pipes, the combination of the double four-way cock with the valve-chest F, pipes or passages $f f^3$, cylinder E', piston D', pipes F' H C D A, chamber B, valves A' and B', provided with the valve-stems a and b, and springs c' and d', all substantially as and for the purpose herein set forth.

5. In an apparatus for voiding water-pipes, the combination of the double four-way cock with the valve-chest F, pipes or passages $f f^3$, cylinder E', piston D', pipes F' H C D A, chamber B, valves A' and B', ratchet-wheel g, lever I, pawl I', electro-magnet K, and armature K', all substantially as and for the purpose herein set forth.



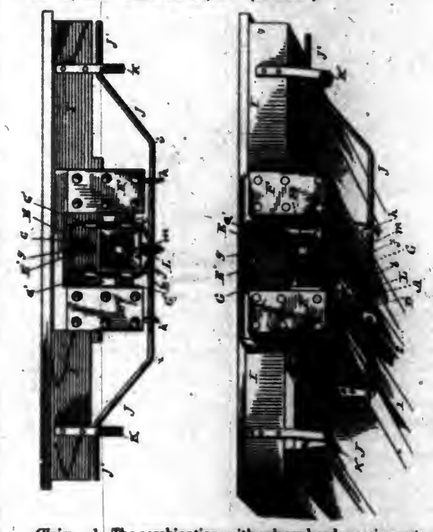
6. In an apparatus for voiding water-pipes, the combination of the double four-way cock with the valve-chest F, pipes or passages $f f^3$, cylinder E', piston D', pipes F' H C D A, chamber B, valves A' and B', ratchet-wheel g, lever I, pawl I', electro-magnet K, armature K', catch K'', spring L, and standard L', all substantially as and for the purpose herein set forth.

7. In an apparatus for voiding water-pipes, the combination of the double four-way cock with the valve-chest F, pipes or passages $f f^3$, cylinder E', piston D', pipes F' H C D A, chamber B, valves A' and B', ratchet-wheel g, lever I, pawl I', electro-magnet K, armature K', thermostat M, battery N, and a system of electric wires for automatically magnetizing and demagnetizing the electro-magnet to give movement to the armature, all substantially as and for the purpose herein set forth.

8. In an apparatus for voiding water-pipes, the combination of the double four-way cock with the valve-chest F, pipes or passages $f f^3$, cylinder E', piston D', pipes F' H C D A, chamber B, valves A' and B', ratchet-wheel g, lever I, pawl I', electro-magnet K, armature K', catch K'', spring L, standard L', thermostat M, battery N, and a system of electric wires for automatically magnetizing and demagnetizing the electro-magnet to give movement to the armature, all substantially as and for the purpose herein set forth.

9. In an apparatus for voiding water-pipes, the combination of the double four-way plug G, having a projecting end, a^2, with the valve-chest F, having a yoke, d^3, a screw or bolt, e^3, pipes or passages $f f^3$, cylinder E', piston D', pipes F' H C D A, chamber B, and valves A' and B', all substantially as and for the purpose herein set forth.

395,749. STORM-APRON FOR VEHICLES. CORYDON C. KING, Pittston, Pa., assignor of two-thirds to Wiseman & Co., and A. Fleischer, agt., same place. Filed Oct. 8, 1888. Serial No. 287,373. (No model.)

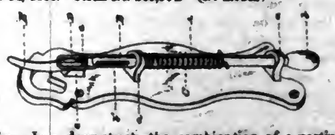


Claim.—1. A storm-apron for vehicles, constructed to extend over the dash, and provided with a hook arranged to depend from the apron and be secured at the lower edge of the dash, substantially as set forth.

2. A storm-apron provided with the converging-straps, and hook attached to their lower ends and adapted to be secured at the lower edge of the dash, substantially as set forth.

3. A storm-apron provided with the straps C C, the hook E, secured to the lower ends of the straps, and the elastic gathering-strap E', substantially as set forth.

395,750. CAR-COUPLING. SIDNEY D. KING, Pittston, Pa. Filed Jan. 10, 1888. Serial No. 260,329. (No model.)

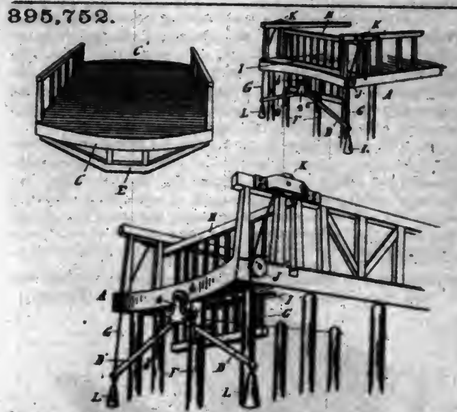


Claim.—1. The combination, with a draw-head, a spring-actuated slide in the draw-head, and a coupling-pin adapted to be held in an elevated position by the slide, of a yoke loosely mounted in the end of the car, said yoke having a sliding connection with the coupling-pin, substantially as set forth.

2. The combination, with a spring-cushioned draw-head, a spring-actuated slide therein, and a coupling-pin adapted to be held in an elevated position by the slide, of a yoke loosely mounted in loops secured to the end of the car, said yoke having a sliding connection with the coupling-pin, and an actuating-shaft having loose engagement with the yoke, substantially as set forth.

3. The combination, with a spring-cushioned draw-head having a spring-actuated slide therein, and a coupling-pin adapted to be held in an elevated position by said slide, said pin having a loop in its end, of a yoke arranged to slide in loops secured to the end of the car, this yoke having a loop in its lower end and an arm in its opposite end having a sliding connection with the loop in the coupling-pin, and an actuating-shaft provided with an arm having sliding connection with the loop in the yoke, substantially as set forth.

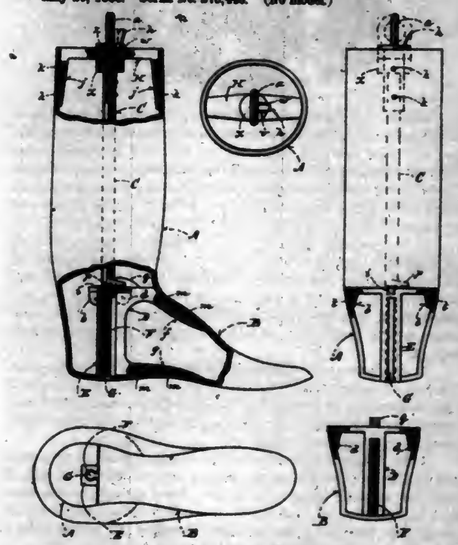
395,751. DOOR-CHECK. JOHN J. KROH, St. Augustine, Fla. Filed Sept. 14, 1888. Serial No. 285,364. (No model.)



Claim.—In a door-check, the combination of a vertically-movable rod, a lever fulcrumed at one end at a point immediately above the rod, a spring for normally pressing the rod in one direction, and a sliding link pivoted to the lever at one side of the fulcrum thereof and having a sliding connection with the vertically-movable rod to be capable of a limited movement longitudinally of the same, substantially as described, for the purpose set forth.

395,752. AUTOMATIC GATE FOR SWING-BRIDGES. HENRY MARCHETTE, Wallaceburg, Ontario, Canada. Filed May 23, 1888. Serial No. 275,356. (No model.)

Claim.—1. The combination, with the swing provided with the bar E, of the vertically-movable gate, the levers fulcrumed on the stationary part of the bridge transverse of the same and connected with said gate, one of said levers being movable on its fulcrum, and the roller b, connected with said levers and adapted to be depressed by the bar E on the swing to elevate the gate, substantially as described.



2. The combination, with a rising and falling gate, of the levers D D', fulcrumed at the stationary end of the bridge transverse with

395,752.

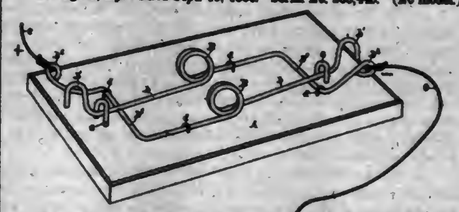
the same and having their inner ends pivotally connected and carrying the contact-roller b, the fulcrums c d, said lever D' being movable on its fulcrum, the weights L, secured to the ends of the levers, and the chains G, secured to the outer ends of the levers and to the outer ends of the gate, and the sheaves J K, substantially as described.

395,753. BOOT-TREE. ALFRED M. MOORE, Malden, Mass. Filed May 30, 1888. Serial No. 275,446. (No model.)

Claim.—1. In a boot-tree, the combination of a hollow leg portion, a centrally-disposed vertical standard secured in the bottom of said leg portion and provided in its outer face with a dovetail groove, a vertically-arranged locking-rod provided with a flange near its lower end, said rod being journaled in the top of said standard and in a brace in said leg portion, a foot-piece provided with a brace having a dovetail adapted to enter said dovetail groove, and a locking-cam on said brace adapted to engage the flange on said rod and thereby secure said leg portion to said foot-piece, substantially as set forth.

2. In a boot-tree, the combination of a hollow leg portion, a centrally-disposed vertical standard secured in the bottom of said leg portion and provided in its outer face with a dovetail groove, a vertically-arranged locking-rod provided with a flange near its lower end, said rod being journaled in the top of said standard and in a brace in said leg portion, a foot-piece provided with a brace having a dovetail adapted to enter said dovetail groove, a locking-cam on said brace adapted to engage the flange on said rod, and thereby secure said leg portion to said foot-piece, and a spring on said rod adapted to enter a slot in the brace in said leg portion and keep the rod from turning, whereby said cam and flange are prevented from becoming accidentally disengaged, substantially as described.

3. In a boot-tree, the combination of the leg A, the standard B, provided with the dovetail groove G, hole i, and arms d, the brace H, provided with the hole z and slot w, the locking-rod C, provided with the flange p and journaled to revolve in the holes i z, the spring A, secured to said rod and adapted to enter the slot w and prevent said rod from revolving, the foot-piece B, the brace D, secured in said foot-piece and provided with the dovetail F, adapted to enter said dovetail groove, and the locking-cam q on said brace, said cam being adapted to engage the flange p and secure said foot-piece to said leg portion, substantially as set forth.



395,754. CANNON-PINION FOR WATCHES. DOLPHAS D. PALMER, Waltham, Mass. Filed June 2, 1888. Serial No. 275,815. (No model.)

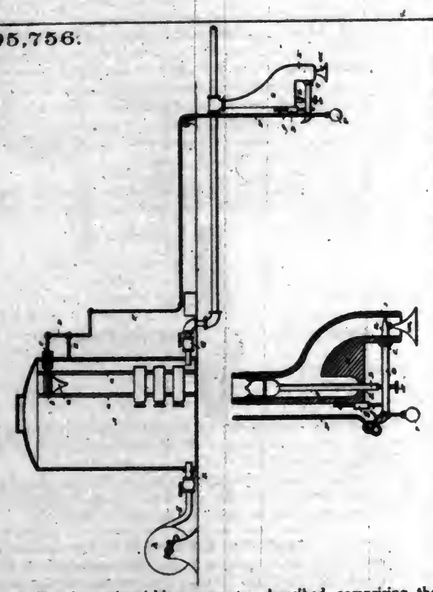
Claim.—1. A cannon-pinion for watches, consisting of the pinion b, having the spring-acting arms b' and the independent tubular staff c, substantially as described.

2. A cannon-pinion for watches, consisting of the non-slitted pinion b, having the screw-threaded hub b^3 and spring-acting arms b', and the independent tubular staff c, substantially as described.

395,755. HOLDER FOR ELECTRIC-ARC LAMPS. JACOB PAWLOWSKI, Cincinnati, Ohio, assignor of one-half to Andrew Winter, West Covington, Ky. Filed Sept. 15, 1888. Serial No. 285,445. (No model.)

Claim.—1. A holder for electric-arc lamps, consisting of two lamp-supporting members of conducting material and forming, when the lamp is in operative position, its opposite poles, the lamp-holding end of each member crossing the plane of the opposite member, the two members being held normally in electrical connection, but arranged to be disconnected by the weight of the lamp when in position and automatically returned to the normal position when the lamp is disconnected, substantially as shown and described.

2. The combination, substantially as specified, of the board A, the two metallic holders, each consisting of a rigid part secured to the board and a spring holding-arm, the metallic holders being so formed that the spring-arm of each member crosses the rigid part of the opposite member, and the tension of the spring being to hold the opposite members in electrical connection, whereby the circuit is closed through the lamp when in operative position and automatically closed through the holder when the lamp is disconnected.

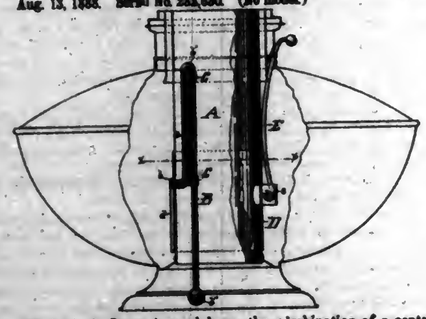


3. The combination, substantially as specified, of the board A, the two spring-wire holders B b b' b^3 b^3, and staples d, for securing them to the board, and the keeper c, to limit the movement of the arms b b.

395,756. FIRE-EXTINGUISHER. OCTAVIUS PIERCE, Chicago, Ill. Filed Aug. 27, 1888. Serial No. 283,941. (No model.)

Claim.—1. In a fire-extinguishing apparatus, the combination, with a reservoir for holding chemicals, of the discharge-pipe leading therefrom, a weight suspended within the reservoir, the nozzle H, secured to the discharge-pipe, the lever K, pivoted at one end to the nozzle, the opposite end of the said lever being secured by a fusible joint, g, to the body of the nozzle, and also having a weight secured thereto, the valve arranged in the nozzle and having its rod secured to the pivoted lever, and the rope F, leading from the weight supporting and tripping device at the reservoir to the free end of the lever K, substantially as specified.

2. In a fire-extinguishing apparatus, the combination of the reservoir having the guides a therein to receive chemical-holders and guide a weight, the weight B, arranged in the said guides, the reciprocating rod C, adapted to engage and normally sustain the weight, the angle-lever D, pivotally connected at one end to the reciprocating rod, and a rope, F, secured to its opposite end, whereby the drawing of the cord will precipitate the weight upon the chemical-holders, substantially as specified.



395,756.

3. The fire-extinguishing apparatus described, comprising the tank or reservoir having a guide-frame therein, a weight arranged in the said frame, a reciprocating rod adapted to engage the weight, an angle-lever for reciprocating the rod, an operating rope or wire connected with the said angle-lever and carrying a weight on its opposite end, a spray-nozzle connected with the tank, a valve in the nozzle, the valve-lever, a screw in said lever bearing against the valve-rod, and the said weighted cord connected with the outer end of the lever, substantially as specified.

4. The fire-extinguishing apparatus described, comprising the tank or reservoir having a guide-frame therein, a weight arranged in the said frame, a reciprocating rod adapted to engage the weight, an angle-lever for reciprocating the rod, an operating rope or wire connected with the said angle-lever and carrying a weight on its opposite end, a spray-nozzle connected with the tank, a lever pivoted to the nozzle, a valve in the nozzle, a screw in said lever bearing against the valve-rod, and the said weighted cord connected with the outer end of the lever, and a discharge-pipe in the tank adapted to receive a hose and provided with a cock, substantially as specified.

395,757. WICK-LIFTING DEVICE. FRANK REED, Meriden, Conn., assignor of one-half to the Edward Miller & Company, same place. Filed Aug. 13, 1888. Serial No. 282,630. (No model.)

Claim.—1. In an Argand lamp, the combination of a central-draft or inner wick-tube, a groove or recess in said tube, a wick-adjusting sleeve surrounding said tube, and a vertically-movable wick-lift stem or draw-bar, one leg of which passes into said groove or recess and engages with said sleeve, the other leg passing downward through said inner wick-tube, substantially as described.

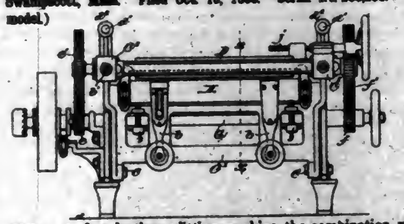
2. In an Argand lamp, the combination of a central-draft or inner wick-tube, a groove or recess in said tube, a removable wick-adjusting sleeve surrounding said tube, and a vertically-moving wick-lift stem or draw-bar, one leg of which passes into said groove or recess and is adapted for detachable engagement with said sleeve, the other leg passing downward through said inner wick-tube, substantially as described.

3. In an Argand lamp, the combination of a central-draft or inner wick-tube, a groove or recess in said tube, a wick-adjusting sleeve surrounding said tube, a hollow exterior rib on said sleeve, and a vertically-movable wick-lift stem or draw-bar, one leg of which passes into said groove or recess and is bent outward at its lower end to enter and engage with said exterior rib, the other leg passing downward through said inner wick-tube, substantially as described.

4. In an Argand lamp, the combination of a central-draft or inner wick-tube, a groove or recess in said tube, a wick-adjusting sleeve surrounding said tube, a vertically-movable wick-lift stem or draw-bar, one leg of which passes into said groove or recess and is adapted to engage with said sleeve, the other leg passing downward through said inner wick-tube, and an auxiliary draw-bar connected with said sleeve and passing out of the top of the lamp, substantially as described.

395,758. CAR-AXLE LUBRICATOR. THEODORE SAUNDERS, Danbury, Conn. Filed June 23, 1888. Serial No. 277,961. (No model.)

Claim.—1. In a car-axle lubricator, a flexible absorbent pad or oil-spreader, in combination with supports which are connected to said pad only at its ends, and wicks pendent from said pad between said supports, substantially as described, whereby said pad may be maintained in free flexible contact with the exposed portion of a journal under slight tensile strain and enable it to freely absorb oil taken up by the wicks and to impart the same to the surface of a journal.



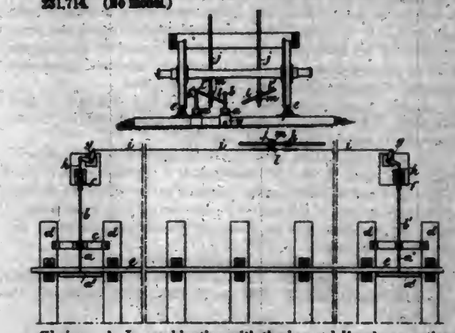
2. In a car-axle lubricator, the combination of an absorbent pad or oil-spreader having pendent wicks, of a pair of spring-supports attached to the ends of said pad and between which it is suspended, said supports being adapted to rest upon the bottom of an axle-box, substantially as described, for maintaining the pad under slight tensile strain in free flexible contact with the exposed surface of an axle-journal.

3. In a car-axle lubricator, the combination, with an oil-spreading pad, of spring-supports which are hinged to the two ends of said pad, substantially as described, whereby said supports may be folded toward each other below the pad for enabling the whole to be readily placed into or removed from an axle-box.

4. In a car-axle lubricator, the combination, with an oil-spreading pad, of two spring-supports attached at their tops to the ends of said pad, and each support having two crossed spring-legs adapted to rest upon the bottom of an axle-box, and by exerting vertical strains to maintain the pad against the exposed portion of a journal under a light tensile strain substantially as described.

5. In a car-axle lubricator, the combination, substantially as hereinbefore described, of an oil-spreading pad, two vertical spring-supports attached to the ends of said pad and adapted to rest upon the bottom of an axle-box, and a detachable keeper operating as a loose brace between the lower ends of said supports for maintaining them in a vertical position when in service.

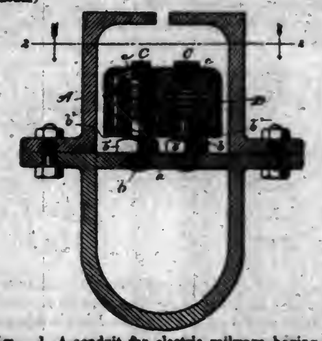
395,759. LEATHER-SPLITTING MACHINE. FRANK F. STANLEY, Swampscott, Mass. Filed Oct. 16, 1888. Serial No. 288,238. (No model.)



Claim.—1. In a leather-splitting machine, the combination, with the positively-rotated feed or pressure roll B, of the movable yoke or frame and the knife, and the gage-roll carried thereby and made movable in unison toward and from the said feed or pressure roll, substantially as described.

2. In a leather-splitting machine, the pivoted yoke or frame C, the knife carried thereby, the gage-roll mounted in movable boxes sustained in the said yoke, and wedge-bar to adjust the said boxes, combined with the feed-roll having rigid bearings, and rods, as d', and springs, as d, to enable the said yoke and the parts carried by it to yield toward and from the said feed-roll, substantially as described.

3. In a leather-splitting machine, the combination, with the feed or pressure roll B, of the movable yoke or frame, and the knife, and the gage-roll carried thereby and made movable in unison toward and from the said feed or pressure roll, and with the stop-screws, substantially as described.

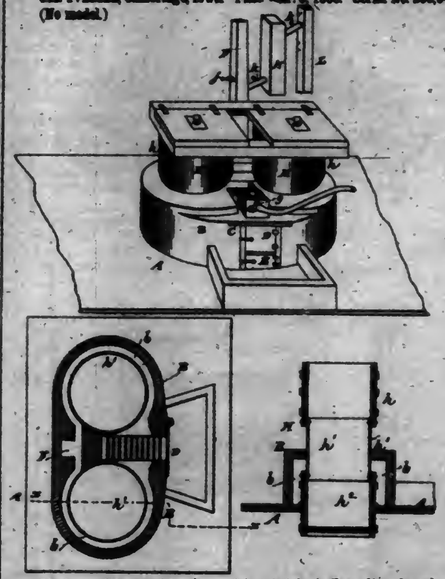


395,760. DEVICE FOR LIGHTING AND EXTINGUISHING LIGHTS IN RAILWAY CARRIAGES, STATIONS, &c. JOHN ST. CLAIR NEWTON STEWART, County of Wigtown, Scotland. Filed Mar. 21, 1887. Serial No. 231,714. (No model.)

Claim.—1. In combination with the levers b b' and connections arranged to be actuated by a passing train, the pipes j j k, levers l l, and devices connected to said levers b b' and serving to turn the gas off, as set forth.

2. In combination with the levers b b' and connections arranged to be actuated by a passing train, the wires i i, having crank-connections, as described, with said levers, pipes j k, lever l, and cock m, the combination being and operating substantially as set forth.

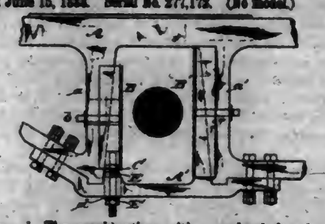
395,761. CONDUIT FOR ELECTRIC RAILWAYS. SAMUEL TROTT, Halifax, Nova Scotia, Canada. Filed Jan. 27, 1888. Serial No. 261,480. (No model.)



Claim.—1. A conduit for electric railways, having a metallic base which supports upright insulators carrying conductors, the insulators being mounted directly on the base of the conduit by means of upright pins, the insulators being also concaved at the bottom and each having a groove in its top to hold a conductor, substantially as described.

2. A conduit for electric railways, having a metallic base, in combination with a pair of conductors mounted upon upright insulators which are supported directly on the base of the conduit by means of upright pins, to which they are screwed, the said insulators being bell-insulators and grooved at the top to hold the conductors.

3. A metallic conduit for electric railways, upright pins screwed into the base thereof, jam-nuts for securing the pins, and bell-insulators screwed to the outer end of the pins, substantially as described.



4. The combination, with an insulator having a wedge-shaped groove, of an L-shaped conductor, each arm of the L being wedge-shaped, and a wedge or key for locking the conductor and insulator together.

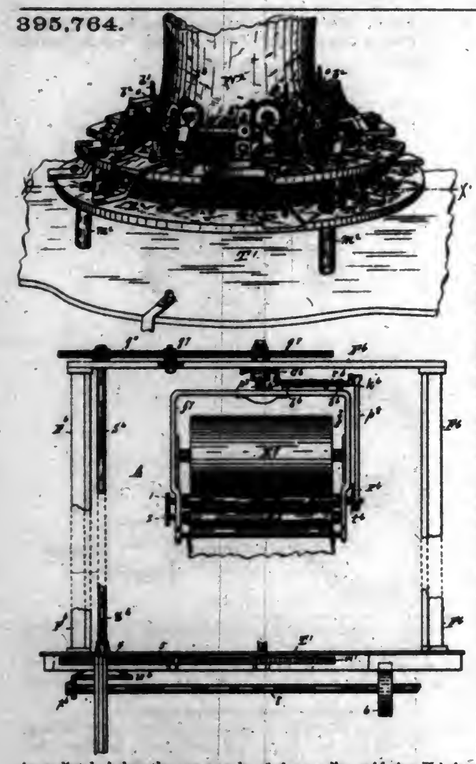
395,762. AGRICULTURAL BOILER OR BARREL-HEATER. TOBIAS TYRRELL, Cambridge, Iowa. Filed Mar. 5, 1888. Serial No. 266,048. (No model.)

Claim.—The combination, with a brick-shell median fire-place and smoke-stack, of two feed-barrels, one on each side of fire-place and extending both above and below it, a space between shell and barrels forming a flue, f, leading to the smoke-stack, as shown and described.

395,763. WEDGE-BOLT FOR LOCOMOTIVES. JOHN P. VAN NESS, Little Falls, N. J., assignor of one-half to John R. Earle, Middletown, N. Y. Filed June 15, 1888. Serial No. 277,172. (No model.)

Claim.—1. The combination, with a wedge-bolt, of a pedestal-brace having a hole large enough to permit the head of the bolt to pass through it, and a removable plug filling the space between the shank of the bolt and the wall of the hole, substantially as described.

2. The combination, with a wedge-bolt having a T-shaped head, of a pedestal-brace having a threaded hole large enough to permit the head of the bolt to pass through it, and a threaded bushing screwed into the hole and filling the space around the shank of the bolt, substantially as described.



3. The combination, with the wedge B, of the wedge-bolt C, having a head, C', cut away at c, the pedestal-brace A', having a threaded hole large enough to let the head C' pass through it, the bushing D, screwed into the hole around the shank of the bolt, and the nuts E E', to adjust and lock the bolt, substantially as described.

395,764. CIRCULAR-KNITTING MACHINE. EUGENE VERMILYEA, Waterford, N. Y., assignor to the Tabor Knitting Mills, same place. Filed Apr. 16, 1888. Serial No. 196,635. (No model.)

Claim.—1. The combination, with the cylinder of a circular-knitting machine containing latch-needles and adapted to be rotated, and an exterior stationary ring provided with cams to operate the needle-jacks, of an interior deflecting-ring arranged inside of and immediately below the upper ends of the needles, and overhanging brackets connecting the deflecting-ring with the said exterior stationary ring, as shown and described.

2. The combination of the cylinder C, adapted to be rotated and provided with latch-needles, the exterior stationary rings E' and E^2, provided with cams to operate the needle-jacks, the deflecting-ring H, secured to overhanging brackets h^2, and arranged inside of and

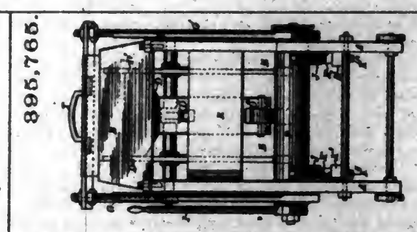
395,764.

immediately below the upper ends of the needles, said ring H being provided with pressing-wheels I and d^3, and a take-up mechanism, A, substantially in the manner as and for the purpose set forth.

3. The combination, with the cylinder C, provided with latch-needles and adapted to be rotated, of the stationary ring R', provided with brackets b^3, and the stationary deflecting-ring H, secured to the overhanging ends of the brackets b^3, and arranged below and inside the upper ends of the needles, substantially as and for the purpose set forth.

4. The combination, with the cylinder C, provided with the latch-needles and adapted to be rotated, of the stationary ring R', provided with brackets b^3, the stationary deflecting-ring H, secured to the brackets b^3, and arranged below and inside of the upper ends of the needles, substantially as shown, and the pressing-wheels I and d^3, arranged on said ring H, substantially as and for the purpose set forth.

5. The combination, with the cylinder, the table, and the cam-ring of a circular-knitting machine, of brackets secured to the cam-ring and overhanging the upper edge of the cylinder, and a deflecting-ring, H, secured to the overhanging ends of said brackets, with its lower edge below the top edge of the cylinder, substantially as described.



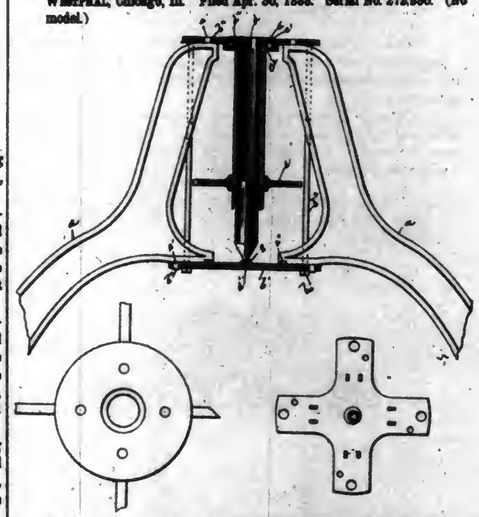
6. The combination, with the cylinder, the needles, and the table of a circular-knitting machine, of the stationary cam-ring R^2, supported on posts on the machine-table, the stationary cam-ring R', supported on posts on the ring R^2, the brackets b^3, having their upper ends projected over the upper edge of the cylinder, and the ring H, secured to the end of the brackets, with its lower edge below the inner top edge of the cylinder, substantially as described.

7. The combination, with the cylinder C, the needles, and cam-rings of a circular-knitting machine, of brackets mounted on the upper cam-ring, a fabric-deflecting ring secured on the upper end of said brackets, arranged as described, and presser-wheels mounted on the fabric-deflecting ring, substantially as described.

395,765. BRICK-MACHINE. WILLIAM WEBBER, Philadelphia, Pa. Filed Apr. 11, 1888. Serial No. 270,368. (No model.)

Claim.—1. The combination, with frame A of a brick-press, of mold-block B, guide R, plunger D, with its stem D', the plunger being adapted to fit snugly in the opening C of the mold-block, cam-shaft F, with its cam F' to raise the plunger-stem, pressure-plate H', secured to side arms, G G', and cams J J, impinging on blocks K K as the cam-shaft F is turned, whereby the plunger is raised by its cam

395,765.



to press the brick, and the arms G G' are then raised by cams J J to throw the plate H' off the mold, substantially as described.

2. The combination, with frame A of a brick-press, of mold-block B, guide R, plunger D, with its stem D', end pieces, D' D', standards E E, supporting said end pieces, cam-shaft F, with its cams F' F'' F''', to operate on the standards and plunger-stem, pressure-plate H', with side arms, G G', and cams J J, to raise the latter and throw the pressure-plate off the mold, rock-shaft L, with its arms M M' M, to engage with the plunger-shaft, and standards to finally raise them and release the brick from the mold, substantially as described.

3. The combination, with the frame A and standards E E, of cam-shaft F, provided with cams F' F''' and elastic cushions U, substantially as and for the purpose described.

4. The combination, with the brick-press, of mold B, plate H, guide R, plunger D, stem D', standards E E, and side arms, G G', of cam-shaft F and its several cams, operating as shown, the latter being detachably secured to the said shaft, whereby as they wear layers or strips may be placed between them and the shaft to raise them, substantially as described.

395,766. HOLDER FOR REVOLVING STANDARDS. HENRY WESTPHAL, Chicago, Ill. Filed Apr. 30, 1888. Serial No. 272,880. (No model.)

Claim.—1. The combination, with the legs *a a* and the plates between which they are clamped, one provided with a conical step and the other with a central opening surrounded with a depressed flange, of a spindle in said support formed on one end with a cone-point and on the other with a peripheral flange, substantially as and for the purpose set forth.

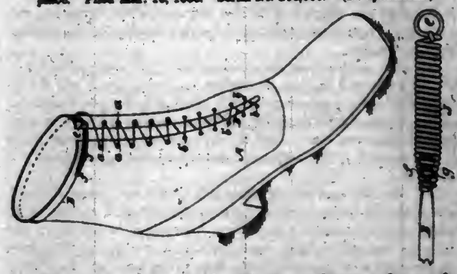
2. The combination, with the legs *a*, plates *b b'*, socketed to receive the pins *a'* and held together by bolts b^3, the step *c*, and depressed flange c^3, of the spindle *d*, its plug *d'*, cone-pointed flange d^3, and the chills or equivalent devices d^4, substantially as and for the purpose set forth.

3. The combination, with the legs secured between a pair of plates, of a revolving spindle provided with a gear-wheel, and a point resting and revolving on the bottom plate and passing through the upper plate and laterally supported by rollers, chills, or similar anti-friction devices, substantially as shown and described, and for the purpose set forth.

395,767. COCKEYE. JOHN B. ALPHAN, Cascade, Iowa. Filed Oct. 18, 1888. Serial No. 288,412. (No model.)

Claim.—1. The combination, with the cockeye composed of a U-shaped frame, the limbs being brought close together at the closed

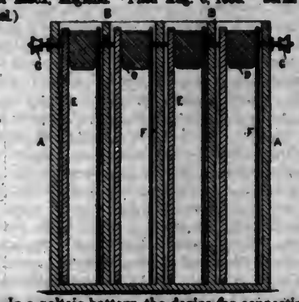
395,767.



end of the said frame and one of the limbs having a vertical channel, of the catch pivoted near its lower end in the said channel, and having its upper end inclining upwardly and extending across the space between the said limbs, substantially as and for the purpose described.

2. The combination, with the U-shaped frame having its limbs brought close together near its closed end, and having the channel *e*, of the catch pivoted in the channel, and having a thumb-rest and the spring, substantially as described.

3. The herein-described cockeye composed of a U-shaped frame, having one of its limbs expanded laterally and provided with a vertical opening and with a channel, the catch pivoted to the said limb and adapted to work in the said channel, and the spring, substantially as set forth.

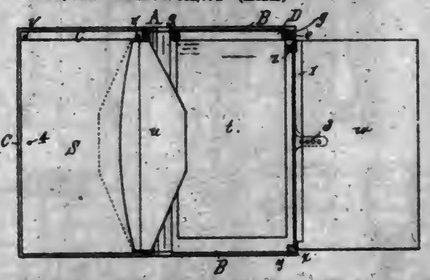


395,768. FASTENER FOR SHOES OR GLOVES. WILLIAM J. BROWN, Jersey City, N. J., assignor of one-half to Robert T. Means, same place. Filed Mar. 10, 1888. Serial No. 266,906. (No specimens.)

Claim.—1. As an improved article of manufacture, a fastener for shoes, gloves, and similar articles, having hook-fastenings through which the cord may reader, comprising a string or cord, and a coiled spring connected at one end to said cord, said coiled spring being provided at its other end with a hook or loop, substantially as specified.

2. As an improved article of manufacture, a fastener for shoes, gloves, and similar articles, comprising a string or cord, a coiled spring contracted near one end and provided with an opening through which the string or cord may be passed to secure it to the spring, said coiled spring being provided at its other end with a hook or loop, substantially as specified.

395,769. VOLTAIC BATTERY. THEOPHILUS CHAD, Forest Gate, County of Essex, England. Filed Aug. 6, 1888. Serial No. 282,044. (No model.)



Claim.—In a voltaic battery, the device for connecting the positive and negative electrodes, consisting of the combination, with a piece of conductive metal held in or to the sides of the containing-cells and passing from one cell to another cell, of the wedge D or equivalent, as and for the purpose set forth.

395,770. FLOOD-FENCE. ALEXANDER COWAN, Urbana, Ohio. Filed Apr. 9, 1887. Serial No. 234,379. (No model.)

Claim.—The combination, with the posts A, having backwardly-projecting hooked arms *d* and inwardly-projecting stop-pins *f*, of the gate composed of a base-bar, *a*, having flat vertical face a^6 and rounded ends *a'*, which rest against the posts, the pickets *b*, secured to the face of bar *a*, and the standards *b'*, secured at the ends of the bar *a* in rear of the line of pickets, the bar *a* being connected to the posts by flexible connections which permit it to turn, the hooked arms *d* preventing backward movement of the gate past a vertical position, and the stop-pins *f* preventing the gate from swinging forward past a horizontal position, substantially as shown and described.

395,771. PAPER-HOLDER. CALVIN D. CRANE, St. Louis, Mo. Filed Nov. 13, 1885. Serial No. 182,774. (Model.)

Claim.—1. In a clamp paper-holder, the combination, with the threaded pin or post A and with the clamping-bar D, of a nut, *g*, having an annular groove therein at its lower end, the combination insuring a positive raising and lowering of the bar and maintaining it in its raised or lowered position, for the purpose set forth.

2. In a clamp paper-holder, the combination, with the threaded pin or post A and the bifurcated clamping-bar D, having one prong, *d*, at one of its ends shorter than the other, of a nut, *g*, having an annular groove therein at its lower end, the combination insuring a positive raising and lowering of the bar and maintaining it in its raised or lowered position, and also serving as a ready means for removing the bar from the nuts, all as set forth.

3. In a clamp paper-holder, the combination, with the clamping-bar D, of a nut, *g*, having an annular groove therein at its lower end, and the screw-hole enlarged or widened near its top, and the threaded post having a rivet or other head, *n*, as and for the purposes described.

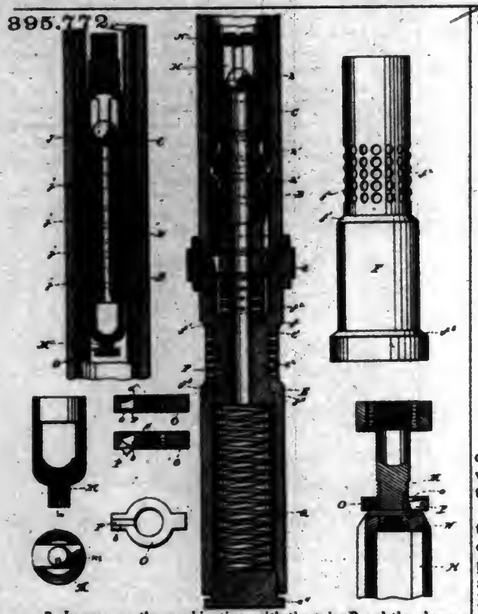
4. In combination with the bottom board and with one of the posts A, the metal slide-piece *q* and spring *r*, such slide-piece and spring being located within a mortise, *p*, in the board, substantially as and for the purposes set forth.

5. In combination with the bottom board, the pivoted bent wire *x*, screwed to the board at one of its ends, and the spring-catch *z* at the upper end of the board, as and for the purposes set forth.

6. In combination with the wire *x*, bent and threaded at one end, as set forth, a threaded socket in which it turns as on a pivot, and the blotting-pad provided with a tube adapted for sliding such pad on and off the wire, as set forth.

7. In combination with the bottom board, the pivoted bent wire *x*, screwed to the board at its bent end, the blotting-pad provided with a tube, 2, whereby the pad may be readily slid on and off the wire, and held thereto as by a hinge, and the spring-catch *z*, all as set forth.

8. The threaded posts *h h* and their grooved nuts *g*, combined with a single bar for supporting both posts and in which the posts are secured, as set forth.



9. In combination with the posts and with the grooved nuts *g*, the bed-piece having the cavity 5 around the post, as and for the purpose set forth.

395,772. PUMP. JOSEPH DARLING, Petrolia, Pa. Filed Nov. 10, 1887. Serial No. 254,821. (No model.)

Claim.—1. In a pump, the combination, with a plunger and removable barrel, of the socket having the lower section, E, provided with a perforated circumferential recess and having its lower end closed, the perforated tubular valve having seats within said section, and the spring holding said valve up against its seat, substantially as specified.

2. In a pump for wells and other cavities, the combination of the plunger provided with an upwardly-opening valve, the removable barrel having an upwardly-opening valve in its lower end, the check-valve screwing into the upper end of the barrel, the section E, provided with a perforated circumferential recess and having its lower end closed, the perforated tubular valve having seats within said section, and the coiled spring holding said valve on its seat, substantially as specified.

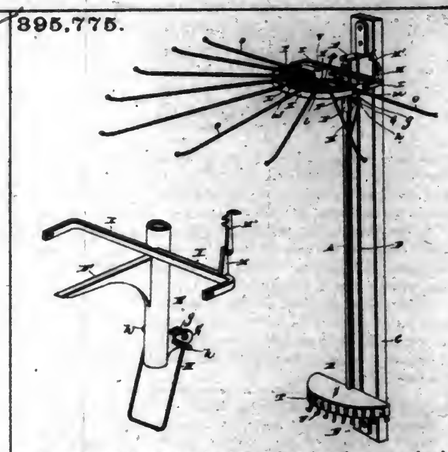
395,772.

3. In a pump, the combination, with the tube B and the plunger D, of the circular nut O, provided with the radial notch *o*, and the detent P, having the toothed end corresponding to the thread of the circular nut O, engaging the lower end of the projection M, substantially as specified.

395,773. CATHODE FOR AN ELECTRO-DEPOSITING APPARATUS. ELISHA EMERSON, Providence, R. I. Filed Mar. 19, 1888. Serial No. 267,868. (No model.)

Claim.—In an electro-depositing apparatus, a cylindrical rotary cathode divided by a spiral line or band of insulation, so as to form one long strip of depositing-surface.

395,774. RATCHET-DRILL. GEORGE FLETCHER, Brooklyn, N. Y. Filed Sept. 22, 1888. Serial No. 286,060. (No model.)



Claim.—1. A ratchet-drill having the drill-holder A, with two shoulders and ratchet-teeth, T, the yoke E, embracing the stem of the holder and on the lower shoulder, the collar G on upper shoulder and between the yoke and stem, the collar L, secured to holder and above the yoke, the pawl P in opening in the yoke, the hollow handle B, secured to the yoke, and with the spring S therein bearing against the pawl P, said parts being combined substantially as described.

2. A ratchet-drill having a holder with ratchet-teeth, a yoke embracing said holder and having a pawl in an opening, a collar intermediate of the yoke and stem of holder, a collar secured to the holder and retaining the yoke in place, a spring bearing against the pawl, said parts being combined substantially as described.

395,775. CLOTHES-DRIER. FRANCIS J. FESSEN, Miles Grove, Pa., assignor to John R. Killian, same place. Filed Oct. 19, 1887. Serial No. 252,831. (No model.)

Claim.—1. In a clothes-drier, the combination of the supporting-bar A, having notches *a a'* therein, the sliding head mounted on the said bar and carrying the drying-arms, and the spring H, mounted

395,775.

on the head and bearing at its free end against the supporting-bar, whereby it engages automatically in the said notches therein, substantially as specified.

2. In a clothes-drier, the combination of the supporting-bar A, the sliding head E thereon, having the horizontal arm F and the lateral arms I I, the supporting-frame K, pivoted to the arms I and comprising the curved bar L, having a series of notches in the upper edge, and the transverse bar L', and the drying-arms pivoted to the frame K and bearing in the notches in the curved bar L, substantially as specified.

3. In a clothes-drier, the combination, with the supporting-bar A, of the head E, sliding thereon, the supporting-frame K, secured to the said head and having the curved bar L, provided in the upper edge with the notches *l*, equally spaced around the curve, and the notches *m'*, arranged close together at the front of the bar L, and the drying-arms O, pivoted to the supporting-frame and adapted to be held in either the notches *l* or *m'*, substantially as specified.

4. In a clothes-drier, the combination, with the supporting-bar A, of the head E, sliding thereon and having the lateral arms I I, the supporting-frame K, pivoted to the said arms I and having the notches *l* and *m'*, the hook M', pivoted to one of the arms I and adapted to engage a stud or pin on the side of the supporting-frame when the latter is in the vertical position, and the drying-arms O O, pivoted to the supporting-frame and adapted to engage in the notches *l* and *m'*, substantially as specified.

5. In a clothes-drier, the combination, with the supporting-bar A, of the sliding head E, having the arm F, and the lateral arms I I, having a hook or catch, M', pivoted thereto, the supporting-frame K, pivoted to the arms I and comprising the semicircular notched bar L, the transverse bar L', having the semicircular loop N and the rearwardly-extending detent or stop V, and the longitudinal bar L^2, adapted to bear on the horizontal arm F when the frame is in the horizontal position, the stud or pin *m* on the frame K, adapted to be engaged by the hook M', the drying-arms O, having the eyes *p p* on the rear ends to engage the loop N, the said bars being adapted to rest in the notches in the bar L, and the spring P, bearing on the upper sides of the drying-arms to hold them in engagement with the notches in the bar L, substantially as and for the purpose specified.

6. In a clothes-drier, the combination of the vertical supporting-bar A, the vertical guide-rod D, adjacent to the supporting-bar, the sliding head E, having the arm G, provided in the end with a notch to receive the guide-bar, and the lateral pins *h*, the supporting-frame secured to the said head and carrying the drying-arms, and the spring H, secured to the pins *h* and adapted to bear against the rear side of the supporting-bar A and engage in notches therein, substantially as specified.

7. In a clothes-drier, the combination of the apertured brackets B B, the supporting-bar A, adapted to engage in apertures in the brackets and having shoulders to bear on the brackets, the rod D, passing at the ends through apertures in the brackets and adapted to have a nut screwed on one end to draw the brackets tightly against the shoulders on the supporting-bar, the head sliding on the bar A and having a guide-arm, G, to engage and slide on the rod D, and the supporting-frame secured to the said tube and carrying the drying-arms, substantially as specified.

8. In a clothes-drier, the supporting-bar A, the tubular head E, embracing the bar A and sliding thereon, the drying-frame carried by the head E, and the spring H, secured to the head and bearing at all times against the bar A, the latter having notches, as described, with

which notches the spring is adapted to engage, substantially as specified.

395,776. CAR-COUPLING. JOHN FREY, Van Wert, Ohio. Filed Oct. 3, 1888. Serial No. 287,043. (No model.)

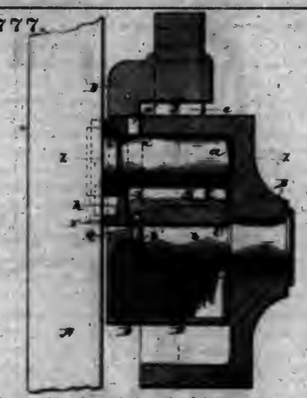
Claim.—1. In a car-coupler, the combination, with the draw-head and coupling-pin, of the pulleys journaled above the draw-head upon the end of the car, the chains extending vertically upward from the pin and over said pulleys, and the levers pivoted to the end of the car near the sides thereof and having the outer ends of the chains secured to them at proper distances from their pivoted points, substantially as specified.

2. In a car-coupler, the combination, with the draw-head and coupling-pin D, having the stop-flange *d*, of the casing *f*, secured to the end of the car above the draw-head and provided with the hinged lid *f'*, the pulleys F, journaled in the front and rear of said casing, the chains E, rising vertically from the pin, passing over said pulleys and through openings in the sides of the casing, and the levers *e*, pivoted to the end of the car and having the outer ends of the chains secured to them, substantially as specified.

3. In a car-coupler, the combination, with the draw-head and coupling-pin, of the link pivoted at about the middle of its length upon the outer ends of swinging bars connected with the draw-bar, and means, substantially as described, whereby the said bars can be swung upward and outward and the end of the link thereby inserted into the recess of the draw-head, substantially as specified.

4. In a car-coupling, the combination, with the draw-head having a flaring mouth and the coupling-pin, of the link having outstanding journals at about the middle of its length, the link-bars having their outer ends mounted on said journals, the sector-wheel journaled in bars, connecting-clips secured, respectively, to the draw-bar and draw-head, and means, substantially as described, whereby the sector-wheel can be swung on its bearings, as specified.

5. The combination, with the draw-head, the draw-bar, the clips attached to the draw-bar, the bars connecting the front and rear clips, the sector-wheel journaled in said bars, and the link pivoted intermediate of its ends to the outer ends of link-bars, of the staples secured to the extended journals of the sector-wheel and the rods L, having their inner ends hooked to said staples, passing thence through elongated bearings attached to the truck of the car, and provided with crank-arms or handles at their outer ends, substantially as specified.



6. The combination, with the draw-head provided with the notches M in its floor, the longitudinally-movable draw-bar, and the coupling-pin, of the link J, the link-rods I, the sector-bars *g*, provided with bearings for the sector-wheel, the staples K, secured to the journals of said wheel, and the rods L, hooked to said staples, passing through elongated bearings, and having crank-arms at their outer ends, substantially as specified.

395,777. CAR-AXLE BOX AND BEARING. GEORGE W. FULMER and DAN T. FRY, Water Valley, Miss. Filed Sept. 3, 1888. Serial No. 284,881. (No model.)

Claim.—1. In a car-axle bearing, the combination, with the wheel having a journal and the flanged roller-bearing supported on the axle-journal and having a shaft or journal projecting from its inner side only, of the box supported on the shaft of the said roller, substantially as described.

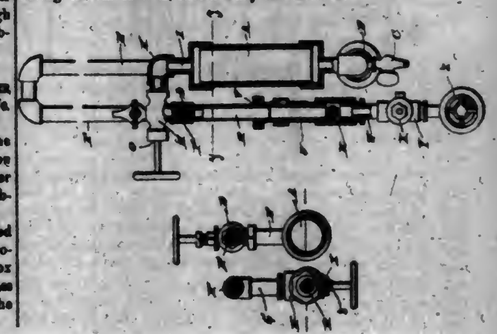
2. The combination of a wheel having a journal, the flanged roller supported on the said journal and having a shaft or journal projecting from its said inner side, said shaft having a flange, the box having a shoulder to rest against one side of the flange, and the brass fitted in the box and adapted to bear against the other side of the flange, substantially as described.

395,777.

3. The combination of the wheel having a journal, the roller supported on the journal and having a shaft projecting from its inner side, said shaft having a flange on its inner end, the box mounted on the shaft and having a shoulder which is adapted to bear against one side of the flange, the brass interposed between the shaft and the box, and having its end adapted to bear against the other side of the flange, and having an extension on its back, which extension is fitted in a corresponding recess in the box, substantially as described.

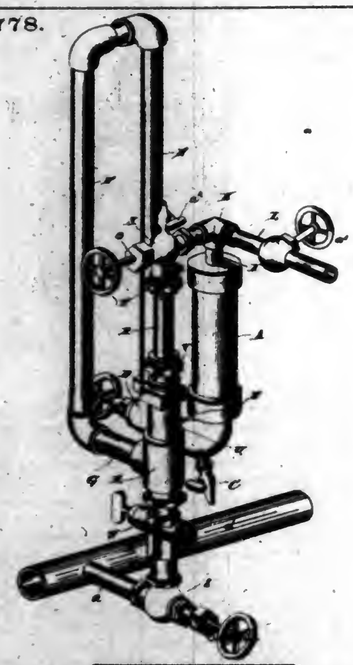
4. The combination, with the wheel having a journal and the flanged roller supported on the journal and having a shaft on its inner side only, of the box mounted on the said shaft and having a recess in its side to give clearance for the flange of the roller, whereby the shaft, the journal, and the flange of the said roller are in approximately the same vertical plane, substantially as described.

5. In a car-axle bearing, the combination, with the box D, having a recess, A, in its side, of the guide-block I, fitted in the said recess and having a limited vertical movement, substantially as described.



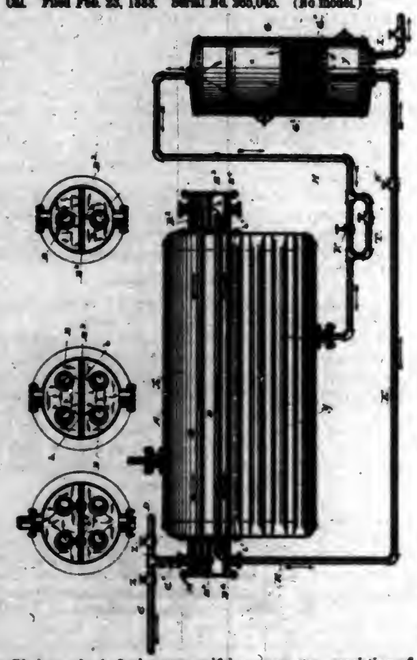
6. In a car-axle bearing, the combination, with the box D, having a recess in its side, of the guide-block fitted in the said recess and having the shoulder *i*, and the wheel having a corresponding shoulder, *a'*, on its journal, substantially as described, for the purpose specified.

7. The combination of the wheel having a shoulder on its journal, the flanged roller supported on the said journal and having a shaft on its inner side, the box mounted on the said shaft, having a recess in its side, and the guide-block fitted in the said recess, and having a corresponding shoulder to fit against the shoulder on the said journal, substantially as described.



8. The herein-described box, having a recess, *c*, in its front side near its upper end, and having its lower portion hollow and provided with an opening leading from the hollow portion, said box having openings for the reception of the journals, substantially as described, for the purpose specified.

395,778. OILING-MACHINE. FRANKLIN P. HAWKINS, Piano, Ala. Filed June 15, 1888. Serial No. 277,191. (No model.)



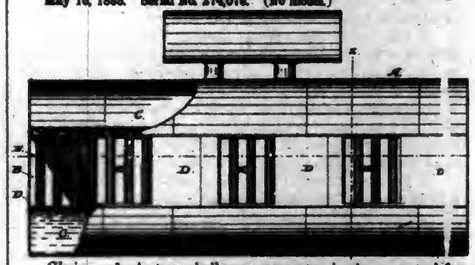
Claim.—The combination of the reservoir A, the pipe E, communicating with the lower end thereof, the valve D and cock C, for the purposes set forth, the supply-pipe communicating with the upper end of the reservoir and having the valve A^3, the pipe F, communicating with the upper end of pipe E, the pipes connecting the upper end of the reservoir and the pipe F, the drip-nozzle in one of said pipes, said nozzle having the valve N and air-cock c^4, and the pipes connecting the lower end of pipe F to the steam-pipe of an engine and having the valves W Z, substantially as described.

395,778.

395,779. FEED-WATER PURIFIER. ADAM HEBERER, Alameda, Cal. Filed Feb. 23, 1888. Serial No. 265,045. (No model.)

Claim.—1. A feed-water-purifying apparatus consisting of a water-heating device located inside the boiler, by which the heat within the steam-generating space is utilized for raising the temperature of the feed-water, said heating device consisting of the horizontal pipes or passages connected by the heads or chambers, arranged and constructed as set forth, a filtering device located outside the boiler, and suitable pipes with valves connecting the heating device with the feed-pump and with the filtering device, and also the filtering device with the steam-generating space of the boiler, whereby the feed-water is caused to pass through the heating device and then outside the boiler into and through the filtering device before being delivered into the boiler-water, substantially as described, for operation as set forth.

2. In a feed-water heating and purifying apparatus for steam-boilers, a heating device located within the boiler and connected with the feed-pump outside, said heating device consisting of the horizontal pipes connected by the heads or chambers, arranged and constructed as described, a conducting-pipe leading from said heater outside the boiler and adapted to deliver the feed-water therefrom into the boiler-water, and a filtering device interposed in the length of said pipe between the heater and the filter, in combination, substantially as described, the connections between feed-pump and heater and between filter and heater having the necessary valves for controlling the feed-water, as set forth.



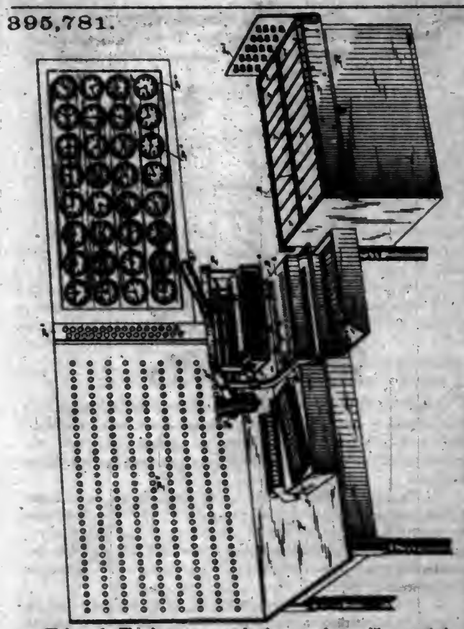
3. In combination with a steam-boiler, pipes or passages B, which extend through the steam-generating space of the boiler to the outside, the connecting heads or chambers B' B², by which said pipes or passages are made to form a return-passage, and suitable pipes by which one end of said return-passage is connected with the feed-pump and the other end with the water room or space in the boiler, substantially as described.

4. The combination of water tubes or passages inside a boiler and extending to the outside through the shell thereof, and connecting heads or chambers B' B², having separate compartments, of which those in one head are in communication with each other through an opening or openings, *b*, and those in the other head have no direct connection, but are connected by suitable pipes or passages, the one with the feed-pump and the other with the water-room of the boiler, substantially as described.

5. In combination with a steam-boiler, water-heating tubes or passages B, extending through the boiler-space to the outside, the connecting heads or chambers B' B², by which said pipes are made to form a return-passage, a feed-water pipe connecting one end of said heater with the feed-pump, a pipe connecting the other end with a filtering-chamber outside the boiler having a filtering diaphragm or partition, a pipe connecting said filter with the water room or space of the boiler, and a blow-off or waste pipe leading from the filtering-chamber, substantially as described, for operation as set forth.

6. A feed-water-purifying apparatus for steam-boilers, consisting of the water-heating tubes or passages leading into and out of the boiler, the connecting heads or chambers B' B², having separate compartments, a feed-water-supply pipe, a steam-pipe, a filtering-chamber divided by a filtering diaphragm or partition, a pipe connecting the compartment on one side of the partition with the heating device in the boiler, and the water room or space within the boiler with the other compartment, a blow-off or waste pipe, and suitable valves in said pipes for controlling the flow and circulation of the water directing the boiler-pressure through the apparatus, substantially as described, for operation as set forth.

395,780. STEAM-BOILER. ADAM HEBERER, Alameda, Cal. Filed May 16, 1888. Serial No. 274,076. (No model.)



Claim.—1. A steam boiler or generator having a central fire chamber or passage, water-chambers C C above and beneath the fire-chamber, a series of separate vertical connecting-passages, D D, on each side between the fire-chamber and outer wall, and upright tubes E E, extending through the fire-chamber and connecting the said vertical chambers above and beneath the fire-chamber with each other, substantially as described.

2. In a steam boiler or generator, an outer shell or body, A, a central fire-chamber, B, generating-chambers C C above and beneath the fire-chamber, upright tubes E E, a series of separate vertical connecting-passages, D D, along the sides of the fire-chamber connecting the generating-chambers C C, and openings I I at the sides through the outer shell between the end walls of passages D D, in combination, substantially as described.

395,781. ART OF COMPILING STATISTICS. HERMAN HOLLERITH, New York, N. Y. Filed June 8, 1887. Serial No. 240,630. (No model.)

395,781.

Claim.—1. The improvement in the art of compiling statistics, which consists in first preparing a series of separate record-cards, each card representing an individual or subject; second, applying to each card at predetermined intervals circuit-controlling index-points arranged, according to a fixed plan of distribution, to represent each item or characteristic of the individual or subject, and, third, applying said separate record-cards successively to circuit-controlling devices acted upon by the index-points to designate each statistical item represented by one or more of said index-points, substantially as described.

2. As an improvement in the art of compiling statistical matters by the aid of mechanical or electrical appliances, the hereinbefore-described method of preparing and manipulating the circuit-controlling record, which consists in forming a separate record-card for each individual or thing by applying to said card at predetermined places index-points representing all the characteristic items pertaining to that individual or thing and subsequently subdividing the series of separate record-cards into groups and submitting the cards in each group or division to the action of the circuit-controlling devices, substantially as and for the purpose set forth.

3. The improvement in the art of compiling statistical matters, consisting in first forming a separate record-card for each individual or thing by applying to said card a series of index-points, each bearing a fixed relation to all the others and to a standard, separating the record-cards into different groups or series, and finally applying the record-cards of the series successively to a series of circuit-controlling devices corresponding in relative position to the predetermined series of index-points representing the several items forming part of the statistical matters to be computed, substantially as described.

4. The hereinbefore-described improvement in the art of compiling statistics, &c., which consists in first forming a permanent record of each individual or thing by applying a series of circuit-controlling index-points upon a separate card or tablet, each point occupying a fixed relation to all the others and to a standard, and subsequently separating the series of record-cards into groups or divisions and by means of electrical appliances co-operating with the index-points counting the series of statistical items represented by any given point or series of two or more points, substantially as described.

5. The improvement in the art of compiling statistical matters, as hereinbefore described, consisting in first locating a series of separate points or spaces upon a series of cards, each point or space having a fixed relation to all the others; secondly, apportioning the spaces or points among the several items entering into the computation and giving to each item one or more of the spaces or points as its representative; thirdly, forming upon each card the complete record of one individual or subject by applying in the representative space or spaces a circuit-controlling index point or points for each one of the series of items which relate to the particular individual or subject, and, finally, applying all the records thus formed separately and successively to the circuit-controlling apparatus operated by the index-points to designate any one or more of the items represented thereby, substantially as described.

6. As an improvement in the art of compiling statistics, the hereinbefore-described method for facilitating the classification of individual records and simplifying the process of computation, which consists in first assigning to each item entering into the proposed series of computations one or more designated points or spaces; secondly, forming a complete record of each individual or subject upon a single card by applying a circuit-controlling index point or points to each space appropriated to or indicative of each separate item in the given series which pertains to the individual or subject, and, finally, feeding said cards successively to an apparatus operated by the index-points on each card to designate the particular division to which it belongs, and depositing each card in a place or receptacle corresponding to the division thus indicated, substantially as described.

7. The hereinbefore-described improved system for compiling statistical matters, consisting, essentially, in the combination, with a series of circuits and operating electro-magnets and a series of pins controlling said circuits, of a series of separate record-cards, each card bearing circuit-controlling index-points indicative of items characteristic of an individual or subject.

8. The combination, to form a system for compiling statistical matters, as hereinbefore described, of a series of separate cards, each card bearing a series of index-points representing the items or characteristics of one individual or subject, an apparatus provided with a series of circuit-controlling devices corresponding and co-operating with the index-points on the cards, a system of electro-magnets connected to said circuit-controlling devices, and a series of operating electro-magnets forming part of said system, substantially as described.

9. In a system such as described, the combination, with the separate record-cards bearing index-points representing items or characteristics of the individual or unit, as described, of a series of pins co-operating with said index-points, a series of circuits controlled by the pins and index-points, and operating-magnets controlled by said circuits, substantially as described.

10. The combination, to form a system such as hereinbefore described, of a series of separate record-cards, each representing an individual or unit provided with circuit-controlling index-points, an indicator controlled by an electro-magnet, a circuit-controlling device co-operating with the index-points on the card, and circuit-connections, such as indicated, connecting the electro-magnet of the indicator with said circuit-controlling devices, substantially as described.

11. The combination, in a system such as described, and with a circuit-controlling apparatus, a system of circuits connected thereto, and a series of record-cards having index-points, of a series of sorting-boxes and indicators therefor included in the system of circuits controlled by the index-points on the cards, substantially as described.

12. The combination, to form a system such as described, of a circuit-controlling apparatus, a system of circuits connected thereto, a series of record-cards provided with index-points co-operating with said circuit-controlling apparatus, a series of electro-magnets included in said system of circuits, indicators controlled by said electro-magnets, and a series of sorting-boxes corresponding with the indicators, substantially as described.

13. In a system such as described, the combination, with a record card or strip, circuit-controlling devices, and a system of circuits connected thereto, of operating-magnets controlled by said circuits, and a series of boxes provided with lids controlled by said operating-magnets, substantially as described.

14. In a system such as described, the combination, with separate record-cards, of circuit-controlling devices co-operating with index-points on the cards, a system of circuits, one or more boxes or receptacles for cards, a movable lid or section controlling the entrance to each box or receptacle, and actuating devices for the movable lid or section, said devices being controlled by the index-points on the record-cards to designate the proper receptacle for each card, substantially as described.

15. The combination, to form a system such as described, of a series of record-cards having index-points, circuit-controlling devices operated by said index-points, a series of circuits connected to said circuit-controlling devices and including operating electro-magnets, a series of boxes or receptacles corresponding to the group into which the cards are to be divided, and indicating and directing devices actuated by said operating-magnets, substantially as described.

16. In a system such as described, and in combination with a record card or strip provided with index-points representing items, a circuit-controlling apparatus provided with a separate contact for each index-point of the series, and a series of operating electro-magnets for actuating independent counting and indicating devices, a system of circuits intermediate the circuit-controlling devices and operating-magnets, said system embracing a series of relay-circuits controlled by one or more of the contacts in the circuit-controlling apparatus, and a series of direct circuits, including the contacts of the relays and

governed by one or more contacts of the circuit-controlling apparatus, substantially as described.

17. The combination, to form a system such as described, of the record-cards bearing index-points, a circuit-controlling contact for each index-point in the series, operating-magnets, and a system of circuits, substantially such as described, embracing a series of circuits including the coils of relays and certain designated circuit-controlling contacts, and another series of circuits embracing one or more designated circuit-controlling contacts and the contacts of one or more relays, said operating-magnet being controlled by at least two pairs of contacts, substantially as described.

18. In a system such as described, the combination, with the perforated record-cards and a system of circuits controlled thereby, of a bed-plate and platen between which the cards are successively fed, a series of yielding-pins mounted upon the platen, and a corresponding series of mercury-cups in the bed-plate, substantially as described.

19. In a system such as described, the combination, with the record-cards provided with the series of index-points, a bed-plate provided with a series of contacts forming the terminals of a system of circuits, such as described, and a reciprocating platen carrying a series of contact-points or pins corresponding in number and arrangement with the index-points on the cards, of a gage or gages for locating the cards, and a pin connected to the ground or return circuit and located at or near the edge of the card to prevent the closing of the circuits until the card has been properly placed, substantially as described.

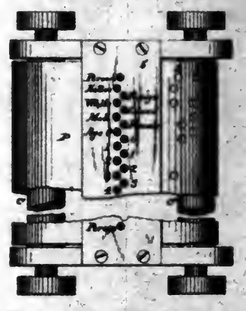
20. In a system such as described, the combination, with the record-cards, the electrically-controlled series of contact-points carried by the platen, and the insulated series of contacts in the bed-plate, of a series of conductors each connected at one end to a contact in the bed-plate corresponding in position to one of the index-points and at the other end to a contact common to all of said circuits, said common contact or ground co-operating with a contact-point in the platen, and thus closing any or all of the circuits, substantially as described.

21. In a system for compiling statistical matters, as hereinbefore described, the combination of a series of record-cards bearing circuit-controlling index-points, a circuit-controlling apparatus for co-operating with said cards, a switch-board to which the circuit-wires of said apparatus are connected, a series of mechanical counters and operating-magnets therefor, and a series of sorting-boxes provided with indicators and operating-magnets therefor, and a system of circuits and connections, substantially as herein described, for connecting the several devices for effecting the operation of counting and sorting, or both counting and sorting, the cards, as well as the items recorded thereon by index-points, substantially as and for the purpose set forth.

395,782. ART OF COMPILING STATISTICS. HERMAN HOLLERITH, New York, N. Y.

Original application filed Sept. 23, 1884, Serial No. 143,805. Divided and this application filed Oct. 27, 1885. Renewed Jan. 4, 1887. Again renewed Sept. 8, 1888. Serial No. 284,982. (No model.)

Brief.—By slight modification cards or sheets of electrically non-conducting material suitably perforated could be used. All the small circles in the diagrammatic figures represent magnets.



Claim.—1. The herein-described improvement in the art of compiling statistics, which consists in, first, forming or arranging a standard or templet indicating the relative position in which each item or characteristic of the individual is to be recorded; secondly, forming a record of each individual or thing by locating index-points upon a strip or tablet, said index-points representing the characteristics of the individual and bearing a determinate relation to each other and to the standard; and, finally, submitting said separate records successively to the action of circuit-controlling devices for operating the registering devices representing the statistical items to be compiled, whereby each statistical item or combination of items when contained in the record of any individual is accurately registered.

2. The herein-described method of compiling statistics, which consists in recording separate statistical items pertaining to the individual by holes or combinations of holes punched in sheets of electrically non-conducting material, and bearing a specific relation to each other and to a standard, and then counting or tallying such statistical items separately or in combination by means of mechanical counters operated by electro-magnets the circuits through which are controlled by the perforated sheets, substantially as and for the purpose set forth.

395,783. APPARATUS FOR COMPILING STATISTICS. HERMAN HOLLERITH, New York, N. Y.

Filed Sept. 23, 1884. Renewed Oct. 27, 1885. Again renewed Jan. 4, 1887. Again renewed Sept. 8, 1888. Serial No. 284,989. (No model.)

Claim.—1. The combination, with perforated sheets of electrically non-conducting materials, said perforations representing statistical items, of electro-magnets and mechanical counters in circuits controlled by said perforated sheets, substantially as and for the purposes specified.

2. The combination, with a series of mechanical counters, as described, and a perforated strip of paper, said perforations representing statistical items, of the drum A, bar D, provided with pointers *p*, and electro-magnets *m*, said electro-magnets being in circuits through the pointers *p* and connected with and operating the before-mentioned mechanical counters.

3. The combination, with a series of electro-magnets and the series of mechanical counters actuated thereby, said electro-magnets being arranged in circuits controlled by relays, of a perforated sheet of electrically non-conducting material, said perforations representing statistical items controlling the circuit through the electro-magnets, of the relays above referred to, substantially as and for the purposes described.

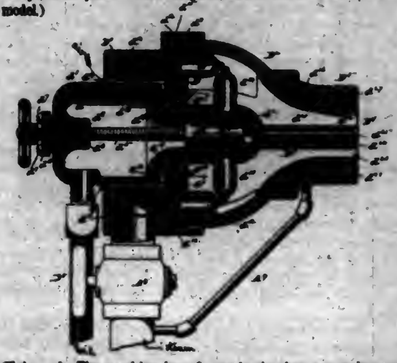
4. The combination, to form a system for automatically compiling and recording statistics, of a strip of non-conducting material perforated at intervals to designate separate items, grades, &c., pertaining to a single individual or object, a series of electric circuits, contact-fingers, or terminals in each of said circuits to vary the current in said circuits as each perforation registers with the corresponding contact-finger, and a recording mechanism for each item, grade, &c., operated by an electro-magnet included in a circuit whose current is thus varied by the contact finger or fingers entering the perforation or perforations in the strip representing the item to be recorded, substantially as described.

5. In a system such as described for automatically compiling and recording statistics, the combination of a series of independent mechanical counters for recording the separate items, an electro-magnet for actuating each of said counters, a series of electric circuits including said electro-magnets, a series of contact-fingers controlling said circuits, and a strip perforated at predetermined intervals denoting separate statistical items, each of said perforations being located in line with and actuating one of the said contact-fingers, whereby each perforation in the strip representing an item, quality, &c., is caused to actuate a contact-finger and thereby energize the electro-magnet whose circuit is controlled by the finger or fingers representing the item to be recorded on the mechanism actuated by the said electro-magnet.

6. In a system such as described for automatically compiling and recording statistics, the combination, with a series of electric circuits, a series of electro-magnets connected thereto, a recording mechanism for each electro-magnet, and a series of circuit-breakers controlling the flow of electricity in the before-mentioned circuits, of a movable record-strip provided with a series of indicating-points representing statistical items for actuating the circuit-breakers, whereby each item or combination of items represented upon said record-strip is automatically distributed and recorded, substantially as described.

7. In a system such as described for automatically compiling and recording statistics, the combination, with a series of recording-instruments, a series of electro-magnets for actuating said recording-instruments, a series of electric circuits including said electro-magnets, and a series of circuit-breakers for controlling said circuits, of a record-strip containing a series of indicators for actuating the circuit-breakers, said indicators each representing separate items characteristic of the person or thing, the whole so combined and arranged, substantially as described, whereby each item or series of items pertaining to each individual is recorded under its appropriate head as a statistical item.

395,784. SCRAPER AND ROLLER. WILLIAM HUGHES, Bushnell, Mich.



Filed Sept. 5, 1888. Serial No. 284,635. (No model.)

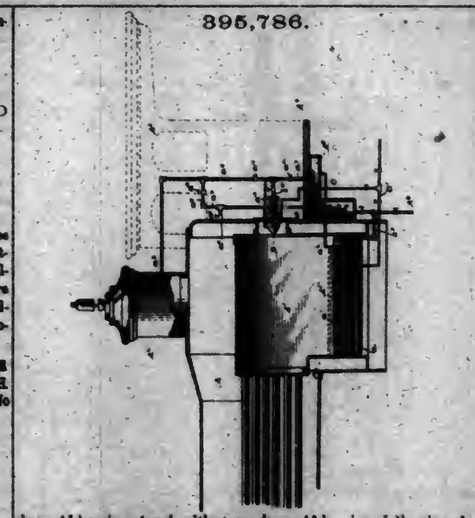
Claim.—The garden implement comprising the beams or handles B, the roller journaled between the beams, the oblique horizontal cutter M, with divergent side arms, the beams adapted to carry the cultivating-teeth P, having their lower ends, B, twisted to form the square or chisel edged teeth T, the said cultivating-teeth having their standards secured to opposite sides of the beam from the cutter M, substantially as described.

395,785. INJECTOR FOR BURNING PETROLEUM IN FURNACES. HENRY H. HYLAND, Pittsburg, Pa., assignor of one-half to Thomas H. Phelps, same place.

Filed Aug. 26, 1887. Serial No. 247,972. (No model.)

Claim.—1. The combination of a casting having an annular steam-chamber, a casting having an oil-chamber partly inclosed by and having an air-space between it and said steam-chamber, a nozzle having nipples, and a flange provided with nipples arranged at right angles to the nipples on the nozzle, and said nipples having communication with said oil and steam chambers, and a nozzle or casting, D^2, covering said nozzle and flange and having a contracted exit-opening.

2. The combination of a casting having an annular steam-chamber, a casting having an oil-chamber partly inclosed by said steam-chamber, a nozzle having nipples, and a flange provided with nipples arranged at right angles to the nipples on the nozzle, and said nipples communicating with said oil and steam chambers, and a nozzle or casting, D^2, covering said nozzle and flange and having a contracted exit-opening.



3. The combination of a casting having an annular steam-chamber provided with nipples, a casting having an oil-chamber, a nozzle having nipples arranged at right angles to the nipples on the steam-chamber and communicating with the oil-chamber, a casting covering said nipples, and a casting secured to the nozzle and having two or more partitions, which form mixing-chambers for each set of steam and oil nipples.

395,786. PETROLEUM-BURNER AND STEAM-GENERATOR. HENRY H. HYLAND, Pittsburg, Pa., assignor of one-half to Thomas H. Phelps, same place.

Filed Aug. 26, 1887. Serial No. 247,974. (No model.)

Claim.—1. In an apparatus for burning hydrocarbons, the combination, with the fire-box of a boiler, of a coil of pipe, A^6, located in the fire-box, and having pipes a^3 and a^4, the water-drum A^7, connected with pipe a^3, the steam-drum A^8, connected with coil A^6 by pipe a^4, the pipe a^5, leading from the steam-dome and connected with drum A^7 by pipe a^6 and with steam-drum A^8 by pipe a^7, the pipe a^8 connecting pipe a^4 with the water-space of the boiler, the injector B, connected with pipe a^5, and the oil-supply pipe connected with the injector and having the branch pipe extending into the fire-box, substantially as described.

2. In an apparatus for burning hydrocarbons, the combination with the fire-box of a boiler, of a coil of pipe, A^6, located in the fire-box and having the outer series of large pipe, *a*, and the inner series of smaller pipes, *a'*, the water-drum A^7, connected by pipe a^6 with pipes *a*, the steam-drum A^8, connected with pipes *a'* of coil A^6 by pipe a^3, the pipe a^5, leading from the steam-dome and connected with

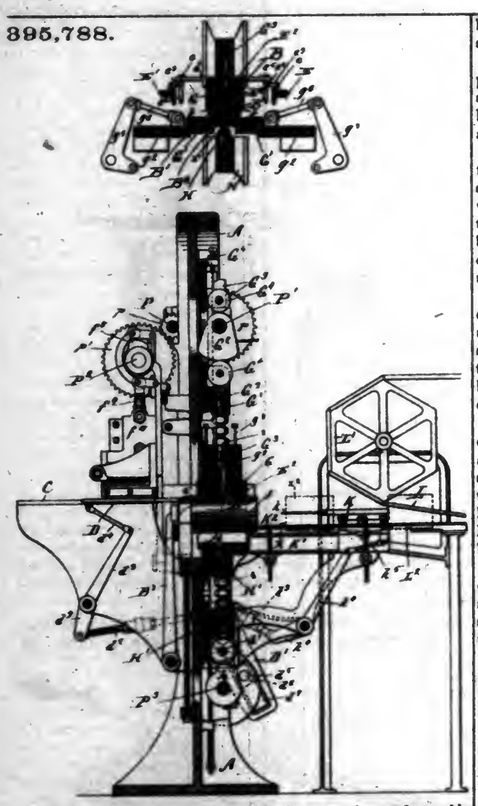
drum A^7 by pipe a^6 and with steam-drum A^8 by pipe a^7, the pipe a^8, connecting pipe a^4 with the water-space of the boiler, the injector B, connected with pipe a^5, and the oil-supply pipe connected with the injector and having the branch pipe extending into the fire-box, substantially as described.

395,787. COMBINED CLOD-CRUSHER AND ROLLER. WILLIAM KNUTSEN, Donahoe, Iowa.

Filed Dec. 22, 1887. Serial No. 258,736. (No model.)

Claim.—The combination of a draft-frame, the front crushing-roller having a series of circumferential V-grooves, and the smooth cylindrical roller arranged to travel directly in rear of the first-named roller, as described and shown, whereby the clods are first pulverized and the surface of the soil formed into ridges, and these ridges subsequently rolled down, as and for the purpose described.

395,788. CAN FORMING AND SOLDERING MACHINE. FRANK M. LEAVITT, Brooklyn, N. Y., and EDWIN NORTON, Maywood, Ill., assignors to said Edwin Norton and Oliver W. Norton, Chicago, Ill.



Filed Sept. 11, 1888. Serial No. 285,105. (No model.)

Claim.—1. The combination, with a can-body-former horn, of two guides above the horn, each of said guides having two separate and distinct guide-faces, one of said guide-faces being parallel to the plane of the sheet for the sheet to rest upon and the other at right angles thereto for the edges of the sheet to abut against to prevent lateral displacement of the sheet, the parallel guide-face being movable to permit the sheet to be folded downward around the horn, substantially as specified.

2. The combination, with a can-body-former horn, of movable guides above the horn for guiding and supporting the edges of the sheet, and means for moving or withdrawing said guides to permit the sheet to be folded downward around the horn, substantially as specified.

3. The combination, with a can-body-former horn, of movable guides above the horn for guiding and supporting the edges of the sheet, means for folding or bending the sheet downward around the horn, and a device for closing or squeezing the seam against the horn, substantially as specified.

395,788.

4. The combination, with a can-body-former horn, of movable guides above the horn, means for moving or withdrawing said guides to permit the sheet to be folded downward around the horn, and a feed-slide for delivering the sheet upon said guides above the horn, substantially as specified.

5. The combination, with a can-body-former horn, of movable guides above the horn, a feed-slide for delivering the sheet upon said guides, folders for bending the sheet downward around the horn, and means for withdrawing said guides out of the way of the sheet as it is bent downward around the horn, substantially as specified.

6. The combination, with a can-body-former horn, of movable guides above the horn for guiding and supporting the edges of the sheet, and a central guide adapted to receive the sheet between the same and the horn, substantially as specified.

7. The combination, with a can-body-former horn, of movable guides above the horn for guiding and supporting the edges of the sheet, a central guide adapted to receive the sheet between the same and the horn, and a folder for bending the sheet downward around the horn, provided with a longitudinal groove to receive said central guide, substantially as specified.

8. The combination, with the guides E, of movable guides E', feed-slide D, edge-folders for forming hooks on the edges of the sheet, a body-former horn below said feed-guides, folders for bending the sheet downward around the horn, and a device for squeezing or closing the interlocked folds of the seam, substantially as specified.

9. The combination of feed-guides E with movable guides E', feed-slide D, edge-folders F F' F², horn B below said feed-guides, vertically-reciprocating folder G, and horizontally-reciprocating folders G' G', substantially as specified.

10. The combination of feed-guides E with movable guides E', feed-slide D, edge-folders F F' F², horn B below said feed-guides E', vertically-reciprocating folder G, horizontally-reciprocating folders G' G', and vertically-reciprocating seam-closer H below said horn, substantially as specified.

11. The combination, with a can-body-former horn and mechanism for folding the sheet downward around the horn to bring the side seam centrally on the under side of the can-body, of a soldering device, M, a can-carrier chain, L, pulleys or sprocket-wheels L' for said chain, mounted above said soldering device, and mechanism for moving or delivering the can-body from said horn under and within the link of said carrier-chain while the same is passing in an inclined position, substantially as specified.

12. The combination of a body-former horn with can-body-supporting tracks or guides, a link-chain carrier, L, and pulleys L' above said tracks, and mechanism for conveying the can-body from said horn under and within the links of said chain-carrier, substantially as specified.

13. The combination of a can-body-former horn with mechanism for folding the sheet downward around the horn, so as to bring the side seam underneath, a solder bath, M, chain-carrier L, polygon wheels L' for said chain, and a reciprocating conveyer, K, having extractor-fingers *k* and feed projections or pawls k^2, whereby the can-bodies are moved from the horn within and under the links of said carrier-chain, one of said polygon wheels being mounted above said reciprocating extractor-slide K, substantially as specified.

14. The combination, with a can-body-former horn, of edge-folders, a reciprocating feed-slide, D, having feed pawls or projections *d* and *d'*, for operating upon two sheets at a time, in front of and above said horn, and a reciprocating feed-slide, K, having pawls or projections k k^2, for conveying two can-bodies at a time, at the rear of said horn, and a soldering device having a carrier into which the cans are delivered by said feed-slide K, substantially as specified.

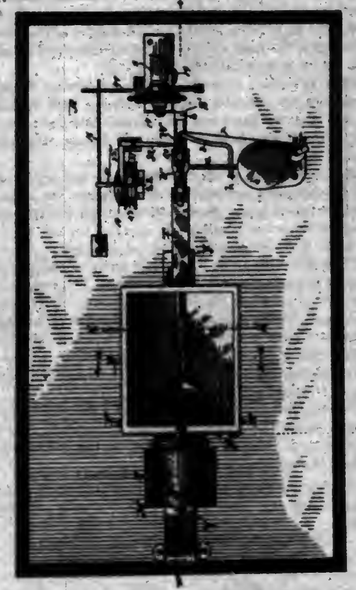
15. The combination, with a can-body-former horn, of edge-folders, a reciprocating feed-slide, D, having feed-pawls or projections *d* and *d'*, for operating upon two sheets at a time, in front of and above said horn, and a reciprocating feed-slide, K, having pawls or projections k k^2, for conveying two can-bodies at a time, at the rear of said horn, a soldering device having a carrier into which the cans are delivered by said feed-slide K, and a common lever, D', for operating both of said feed-slides, substantially as specified.

16. The combination, with a can-body-former horn, of edge-folders, a reciprocating feed-slide, D, having feed pawls or projections *d* and *d'*, for operating upon two sheets at a time, in front of and above said horn, and a reciprocating feed-slide, K, having pawls or projections k k^2, for conveying two can-bodies at a time, at the rear of said horn, and a soldering device having a carrier into which the cans are delivered by said feed-slide K, and a common lever, D', for operating both of said feed slides, connecting-link d^3, lever d^4, link d^5, link k^3, lever k^4, and link k^5, all combined and operating substantially as specified.

17. The combination, with a body-former horn, of movable guides E', for supporting the sheet above the horn, reciprocating folder G, for bending the sheet downward around the horn, and mechanism operated or released by the downward movement of said folder or its slide to withdraw said movable guides E' as the folder G descends, substantially as specified.

18. The combination, with table C, of feed-guides E, feed-slide D, edge-folders F F' F², movable feed-guides E', horn B below said feed-guides and above which the sheet is fed, and mechanism for folding or bending the sheet downward around the horn, substantially as specified.

19. The combination, with a can-body-former horn, of movable guides above the horn for supporting the edges of the sheet, a central guide for holding or clamping the sheet on the horn, and a folder mechanism for bending the sheet downward around the horn, substantially as specified.



395,789. CIGARETTE-MACHINE. EDWIN J. LOMLEY, Washington, D. C., assignor of part to Thomas A. Mitchell, C. Bankes Brooks, Samuel D. Webb, John J. Griggs, and J. C. Haviland, all of same place. Filed Dec. 10, 1887. Serial No. 258,263. (No model.)

Claim.—1. In a cigarette-machine, the combination, with the supporting-table and driving mechanism, substantially as described, of a feed-hopper provided with a forming-tube, a reciprocating feed-bar within the feed-hopper, a pasting-trough connecting with the forming-tube, a paste-receptacle, an endless pasting-thread adapted to pass through the volume of paste in the paste-receptacle and also parallel with and above the pasting-trough, and a spring-pressed roller adapted to press the lap of the cigarette-wrapper as the cigarette is forced through the pasting-trough, substantially as specified.

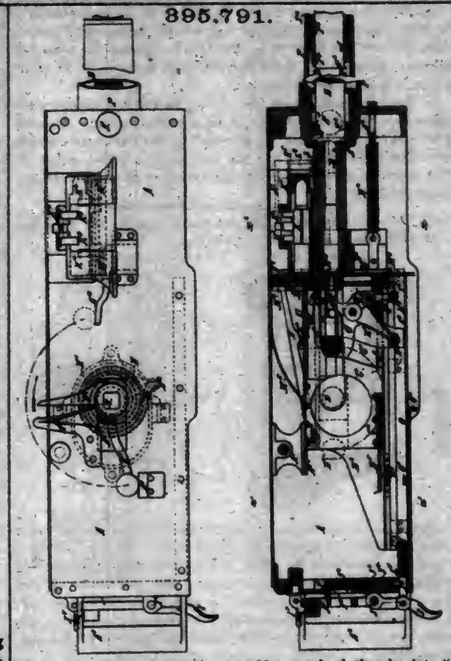
2. In a cigarette-machine, the combination, with the forming-tube and the pasting-trough connecting therewith, of the paste-receptacle provided with the tube *d* and device d^x, the adjustable arm *l*, provided with the pulley *m*, the adjustable standard *e*, provided with the grooved disk *i*, and the endless pasting-thread passing over the grooved disk *i* through the paste-receptacle tube *d*, and device d^x, and over the pulley *m* on the arm *l*, substantially as specified.

3. In a cigarette-machine, the combination, with the standard 1, the parallel swinging arms provided with the rotary trimming-knife, the catch-carrier arm, and the return-spring 19, of the rocking pulley 23, connected to the treadle by the cord 37, the double cam 18 on wheel 20, pasting-roller W, having cam 50, the lever 32, provided with the hinged feed-pawl, and the spring-rod 16, provided with the dog 17, substantially as specified.

395,789.

4. In a cigarette-machine, the combination, with the rocking pulley 23, recessed in its rear face and provided with the spring-pressed plate 27, of the double cam on wheel 20, provided with pins 29 and 30, the lever 32, provided with the spring-pressed feed-pawl hinged thereto, the spring-rod 16, provided with the pawl 17, the swinging knife-carrier, the catch-carrier arm 44, having a shoulder, and the return-spring 19, substantially as specified.

395,790. CHAIN PIPE-WRENCH. GEORGE M. MARSHALL, Kilbourn City, Wis. Filed Aug. 13, 1888. Serial No. 282,580. (No model.)



Claim.—1. In a chain pipe-wrench of the class described, the combination of a lever having a head, C, which is provided with a continuous curved serrated face, *c c'*, a clevis, E, pivoted directly to the head at a point on one side of the horizontal axis thereof and in rear of the convex face and having its free end extended beyond the extreme forward point of the convex face, another clevis, F, pivoted directly to the head on the opposite side of the axis thereof at a point in rear of the pivot of the clevis E and having its free end terminating in rear of the convex face of the head, and a chain connected to the free end of both clevises, substantially as and for the purpose described.

2. A chain pipe-wrench of the character described, consisting, essentially, of a lever, a contracted shank fixed thereto and having an enlarged head, C, at its free end, the face of the head being serrated and curved continuously from one side to the other at *c c'*, a U-shaped clevis, E, pivoted directly to the head at *c*, and having a horizontal slot, *g*, opening through its extreme forward end, another U-shaped clevis, F, pivoted to the opposite side of the head and having a slot, g^3, opening through one of the lateral edges thereof, and a chain having one end connected to the clevis E by a pin, g', and detachably connected at its other end to the clevis F by fitting one of its links over one edge of the slot g^3 of said clevis, substantially as described.

395,791. MACHINE-GUN. HIRAM S. MAXIM, London, England. Filed Oct. 10, 1885. Serial No. 179,454. (No model.) Patented in England July 8, 1885, No. 8,281.

Claim.—1. In a machine-gun, the combination, with a reciprocating breech-block, of a carrier arranged to slide vertically in said breech-block and adapted to engage with the cartridges in a belt or feed mechanism, and a spring in the path of movement of the carrier by which, in the backward movement of the breech-block, the carrier

395,791.

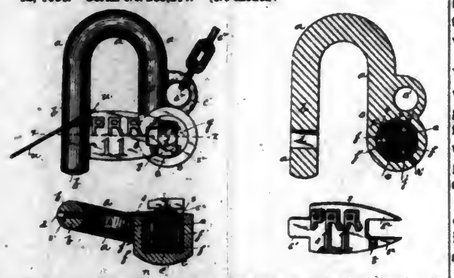
will be depressed to bring the cartridge retained thereby into line with the breech, as set forth.

2. In a machine-gun, the combination, with a reciprocating breech-block, of a carrier arranged to slide vertically in said breech-block and adapted to engage with the cartridges in a belt or feed mechanism, levers pivoted to the reciprocating breech mechanism and engaging with the carrier, a crank connected with the breech mechanism and adapted to be turned by the to-and-fro movement of the same, and pins or projections on the said crank adapted to encounter the levers and raise the carrier at a given point in the forward movement of the carrier, all substantially as herein set forth.

3. The combination, in a machine-gun, with a reciprocating breech-block movable in line with the barrel, of a cartridge-feed belt adapted to be intermittently moved through the gun above the breech, a carrier movable vertically in the breech-block and formed to engage with a cartridge in the feed-belt and that in the breech when the breech-block is in its forward position, and shifters or devices adapted to operate in conjunction with the moving breech-block to encounter the said carrier and raise or depress the same according to its position relatively to the breech, as set forth.

4. In a gun, a fire-arm having a reciprocating breech-block movable in line with the barrel, the combination, with the said breech-block and a cartridge-feeding mechanism, of a carrier movable vertically in said breech-block and adapted to engage with the shells in the breech and feed mechanisms, and shifters or devices placed in positions to encounter the carrier for depressing or raising it according to the position of the breech-block relatively to the breech, as set forth.

5. The combination, with the reciprocating breech-block C, the carrier M, arranged to slide vertically therein, the levers N, pivoted to the carrier, the crank-shaft D, provided with pins or projections D^4, which are adapted to encounter and move the levers N, the spring M^5, in position to bear upon and depress the carrier M, and the cartridge-retaining spring M^3, secured to the carrier, as set forth.



6. The combination, with the frame A and a resisting-spring, A^7, secured thereto, of an inner frame comprising the block B', the side plates B^2 B^2, and the cross-bar B^4, secured together and supporting the breech mechanism, the barrel B, fixed in the block B' of the inner frame and adapted to slide to and fro therewith in the frame A, the crank-shaft and pin for reciprocating the inner frame and thereby operating the breech mechanism, and the arm D^2, carried by the shaft and adapted to encounter the spring A^7, to aid the return or forward movement of the inner frame and breech mechanism, as set forth.

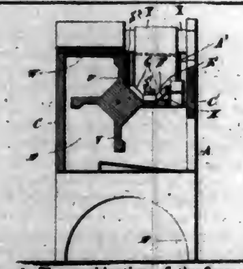
7. The combination, with the reciprocating breech-block, of the slide K^3, provided with the stud K^4, and the pawls K^5, adapted to act in conjunction with pawls K^4 for imparting an intermittent rotary movement to the cartridge-feeding mechanism, the arms L L', mounted

on a shaft in the chamber K', and the lugs B⁷ B⁸ on an extension or arm from the plate B², forming part of the reciprocating breech mechanism, the lugs B⁷ B⁸ being arranged to operate the arms L L' and impart movement to the slide K³ through the stud K⁴, to which the arm L' is connected, as set forth.

8. The combination, with the sliding barrel B of an automatic machine-gun, of a water-chamber, P, surrounding the barrel, the stuffing-boxes P' P³, and pistons P⁴, surrounding the barrel at opposite ends of the water-chamber, and the intermediate coiled spring, P⁵, acting upon the said pistons with equal pressure, as and for the purpose set forth.

395,792. SEAL-LOCK. EDUARD MEIER, Pittsburg, Pa. Filed Sept. 12, 1888. Serial No. 285,217. (No model.)

Claim.—1. In seal-locks, the combination of the bow having in one arm thereof a slot extending longitudinally of the arm, and having locking apparatus in the other arm provided with a locking-bar extending out on the side of said arm, and a seal-plate having one end fitting into said slot and the other end engaging with said locking-bar, so that the face of the seal-plate is exposed when the lock is hanging in a perpendicular position, substantially as and for the purpose set forth.



2. In seal-locks, the combination, with the bow or body *a*, having the socket *c* in one arm thereof, of the sleeve *f*, the rotating block *g* fitting within said sleeve, and the washer *n*, holding the block within the sleeve, and means for securing the sleeve within the socket, substantially as and for the purpose set forth.

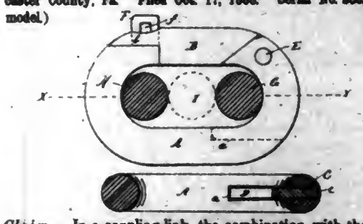
3. In seal-locks, the combination, with the body or bow *a*, having the socket *c*, provided with a keyway, *p'*, of the sleeve *f*, having the corresponding keyway *p*, the key *o*, the rotating block having the collar *i* extending over said sleeve and key, and the washer *n*, engaging with said block, substantially as and for the purpose set forth.

4. In seal-locks, the combination, with a bow-shaped body and a seal-plate closing the ends of said bow and locking apparatus to secure it in place, of an inspection-tag adapted to be clipped upon one arm of the body before the lock is sealed and receive any inspection-marks to be made, substantially as and for the purpose set forth.

395,793. ORANGE-GRADER. THEOPHILUS W. MOORE, Fruit Cove, Fla. Filed May 31, 1888. Serial No. 275,966. (No model.)

Claim.—1. The combination of the frame having the inclined trough provided with the openings H of varying sizes, the revoluble gates arranged in the said openings, the detents or stops to engage the gates, and the weighted traps arranged in the bottom of the trough and connected to and adapted to operate the detents, substantially as described.

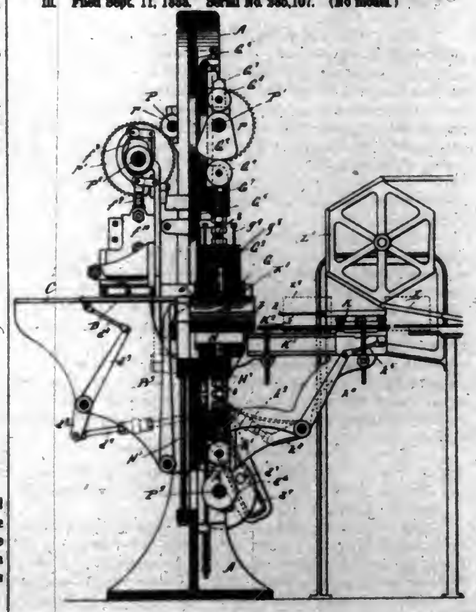
2. The combination of the inclined trough having the beveled groove in its bottom, the weighted traps pivoted in said bottom forming a portion thereof and communicating with the groove, and the revoluble gates arranged in openings in the bottom of the trough, the detents engaging the gates, and the links connecting said detents with the traps, substantially as described.



3. The combination of the inclined trough having the openings of varying sizes, the revoluble gates arranged in said openings, the detents engaging the gates, and the counter-balanced traps in the bottom of the trough connected to the said detents, substantially as described.

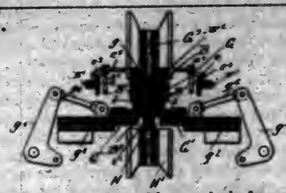
4. The combination of the inclined trough having the openings H, the revoluble gates arranged in said openings, the traps in the bottom of the trough having the detents connected thereto to engage the gates, and the arms or springs W, engaging the rear sides of the vertical wings of the gates, substantially as described.

5. The combination, with the inclined chute, of the pivoted gate Y, having the counterbalancing-weight Z, the yoke A', arranged transversely at the lower end of the chute and having the vertical arms, guiding-loops B' for the said arms, the spring-arms C', having their free ends connected to the lower ends of the yoke-arms, and arranged under the bottom of the chute, and the tappet-pins D', secured to the gate and engaging the spring-arms, for the purpose set forth, substantially as described.



6. The combination of the inclined chute, the gate at the lower end thereof, adapted to tilt or incline, and the stop or yoke guided in suitable ways and connected to the gate, for the purpose set forth, substantially as described.

395,794. COUPLING-LINK. BENJAMIN MORTON, Five Forks, Lancaster County, Pa. Filed Oct. 17, 1888. Serial No. 288,356. (No model.)



Claim.—In a coupling-link, the combination, with the body A, having a recess, *a*, formed therein which increases in width from the outer to the inner edge of the link, of the part B, hinged to the body A and having a tongue adapted to be received in the said recess, substantially as and for the purpose specified.

395,795. CAN FORMING AND SOLDERING MACHINE. ERWIN NORTON, Maywood, assignor to himself and Oliver W. Norton, Chicago, Ill. Filed Sept. 11, 1888. Serial No. 285,107. (No model.)

395,795.

Claim.—1. The combination, with a can-body-former horn, of a side-seam-closing device below the horn, adapted and operating to close the side seam against the lowermost part of the horn, a side-seam-soldering device having a can-body carrier, and mechanism for delivering the can-body from said horn into said carrier, substantially as specified.

2. The combination, in a can-body-forming machine, with a body-blank-feed device, of a can-body-former horn below said feed device and above which the blanks are fed, and mechanism for folding the blank downward around said horn, and a device below said horn for closing the folds of the seam against the horn, substantially as specified.

3. The combination, with a can-body-former horn, of mechanism above the horn for folding or forming the can-body downward around the horn, and a seam-closing device for squeezing or closing the folds of the seam against the horn, substantially as specified.

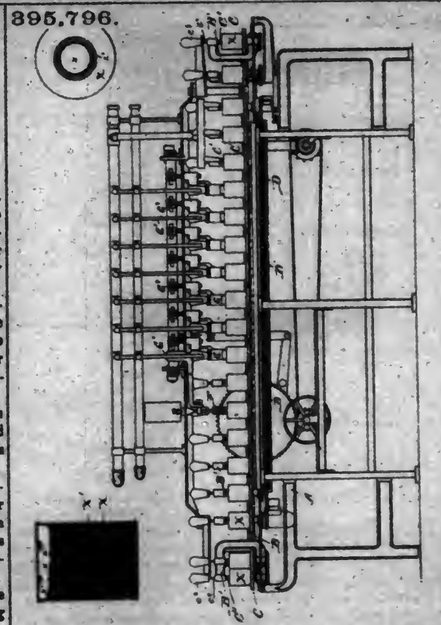
4. The combination, with a can-body-forming machine constructed and adapted to interlock and close the seam at the under side of the can-body, of a side-seam-soldering machine having a bath or soldering device over which the can-body is carried, and means for delivering the can-body from the forming-machine to the side-seam-soldering machine, substantially as specified.

5. The combination, with a can-body-former horn, of a device for feeding the blank sheets in above the horn, a device for folding the sheet downward around the horn, devices for forming the side seam of the can-body, a side-seam-soldering device having a carrier, and a device for moving the can-body from said horn and delivering the same into said carrier, substantially as specified.

6. The combination, with guides for the sheet, of a sheet-feed slide, edge-folders for forming hooks on the edges of the sheet, a body-former horn below said guides and above which the sheets are fed, a vertically-reciprocating folder above the horn for bending the sheet downward around the horn, two longitudinally-reciprocating folders for interlocking the hooks or folds of the seam at the lowermost point of the horn, and a seam-closing device below the horn for closing the folds of the seam against the horn, substantially as set forth.

7. The combination, with guides for the sheet, of a sheet-feed slide, edge-folders for forming hooks on the edges of the sheet, a body-former horn below said guides and above which the sheets are fed, a vertically-reciprocating folder above the horn for bending the sheet downward around the horn, two longitudinally-reciprocating folders for interlocking the hooks or folds of the seam at the lowermost point of the horn, a seam-closing device below the horn for closing the folds of the seam against the horn, a side-seam solderer having a can-body carrier, and an extractor-slide for removing the can-bodies from said horn and delivering them to said carrier, substantially as specified.

8. The combination, with guides for the sheet, of a sheet-feed slide, edge-folders for forming hooks on the edges of the sheet, a body-former horn below said guides and above which the sheets are fed, a vertically-reciprocating folder above the horn for bending the sheet downward around the horn, two longitudinally-reciprocating folders for interlocking the hooks or folds of the seam at the lowermost point of the horn, a seam-closing device below the horn for closing the folds of the seam against the horn, a side-seam solderer having a can-body carrier, and an extractor-slide for removing the can-bodies from said horn and delivering them to said carrier, said side-seam solderer having a fluxing device and a solder bath over or through which the can-bodies are carried by said carrier, substantially as specified.

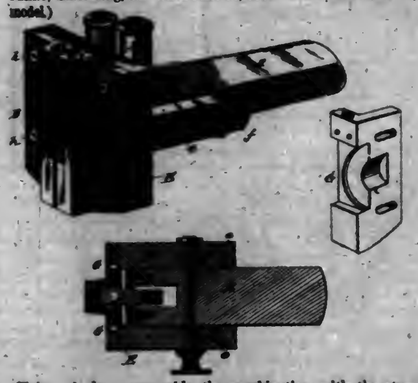


9. The combination, with a can-body former, of a side-seam solderer having a link or chain can-carrier, pulleys upon which said chain is mounted, means for delivering the can-bodies from said former to said carrier, and driving mechanism connecting the farther pulley of said chain carrier with the driving-shaft of the body-former, substantially as specified.

10. The combination, with a can-body-former horn, of a device below the horn for closing the seam against the horn, substantially as specified.

395,796. ART OF SOLDERING CAPS ON FILLED CANS. ERWIN NORTON, Maywood, assignor to himself, and Oliver W. Norton, Chicago, Ill. Filed Oct. 31, 1888. Serial No. 289,613. (No model.)

Claim.—1. The process of closing filled cans, consisting in placing vestless can-caps having their edges hemmed with solder on the cans

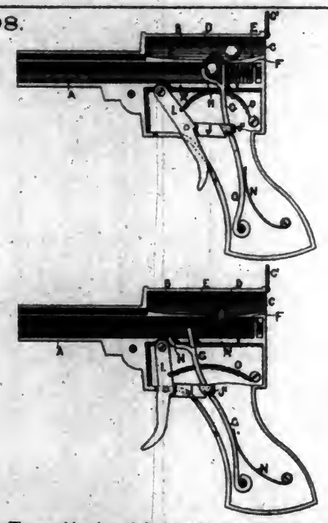


395,796.

and then heating and soldering the joint gradually by a series of successive steps, substantially as described.

2. The process of closing filled cans, consisting in placing vestless caps on the cans and then heating and soldering the joint by a series of successive steps, so that the air and gases under pressure produced during the first part of the heating and soldering operation may escape through the joint before the soldering thereof is completed, substantially as specified.

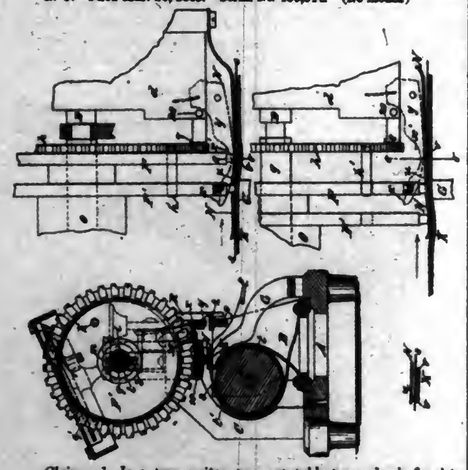
395,797. GUIDE FOR BAND AND SCROLL SAWS. DANIEL W. PERRY, Harrisburg, Pa. Filed June 21, 1888. Serial No. 277,743. (No model.)



Claim.—1. In a saw-guide, the combination, with the stem A, having a roller in its front end and guideways on both sides, of the movable face E, having guide-arms suitably adjusted to slide in the ways on the stem A, the guide-pieces adjustably attached to the face E, substantially as set forth.

2. In a saw-guide, the combination, with the stem A, having a roller in its front end and guideways on both sides, of the movable face E, having guide-arms suitably adjusted to slide in the ways on the stem A, the guide-pieces attached adjustably to the face E, substantially as set forth.

3. The combination, with the stem A, having a roller in its front end, of a movable face, E, adjustably secured to slide on the stem A, the guide-pieces G G cut away in their central portion, substantially for the purpose specified.



395,798. MAGAZINE TOY GUN. HENRY REASON, Brighton, County of Sussex, England. Filed June 4, 1888. Serial No. 276,098. (No model.)

395,798.

Claim.—The combination of the barrel A, connected to a suitable stock, magazine B, placed upon top of the barrel at the breech end and having a feeding-inlet for the shots, hole D, communicating with barrel A, spring F, spring-operated pivoted lever G, the top being provided with a prong, H, slot A' in bottom of barrel, trigger I, sear J, step K, projection L on side of G, and trigger-spring O, all substantially as and for the purposes stated.

395,799. TYPE-WRITING MACHINE. CHARLES SPIRO, New York N. Y. Filed Mar. 20, 1885. Serial No. 159,514. (No model.)

Claim.—1. In a type-writer, two rotatable type-wheels fixed to a common twirling handle and mounted on a depressible support and capable of being shifted longitudinally to and fro, substantially as and for the purpose set forth.

2. In a type-writer, the combination, with a fixed support for the paper or printed sheet, of two distinct rotary and reciprocating type-wheels arranged to reciprocate to and from said support and fastened together and to a common twirling handle, and capable of being shifted longitudinally to bring either wheel in the printing-plane, substantially as herein set forth.

3. In a type-writer of substantially the class described, a slotted guard-plate interposed between the shiftable type-wheels and the paper sheet and provided with feet to hold the plate out of contact with the freshly-printed character, substantially as herein shown and described.

4. In a type-writer substantially such as set forth, the combination, with the type wheel or wheels and fixed anvil G, of the intermittently-moving paper-carriage provided with the cushion-strap K, moving over said anvil, substantially as and for the purpose set forth.

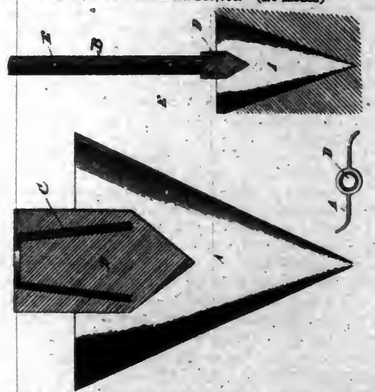
5. The combination, with the type-wheels F F' and anvil G, of the intermittently-moving carriage having the cushion-strap K, with the guard-plate N, interposed between the wheels and strap, arranged and operating substantially as shown and described.

6. In a type-writer, the combination, with the two shiftable rotatable and reciprocating type-wheels F F', having recesses or stops of varying depth on their rims, of the reciprocating feed-pawl *y*, with its tail *x*, arranged in the specified relation to the type-wheels, and with the rack P, and an intermittent paper-carriage to which said rack is fixed, substantially as and for the purpose set forth.

7. The combination, with two rotatable and reciprocating type-wheels fastened together, provided with a common twirling handle and mounted on a depressible support and shiftable longitudinally, of a yielding or snapping spring-catch arranged to engage the support at each end of the longitudinal motion to hold the wheels in either position.

8. In a type-writer, the combination, with the depressible lever D, of the two rotatable and reciprocating type-wheels F F' and common twirling handle *o*, shiftable longitudinally on the end of the lever D, with the spring-catch *m*, and engaging recesses *n n*, arranged and operating substantially as and for the purpose set forth.

9. The combination, with the depressible lever D, locking-wheel A, crank-pin *k'*, and sleeve *g*, of the type-wheels F F' and twirling handle *o*, common to both wheels and shiftable on the sleeve *g*, substantially as set forth.



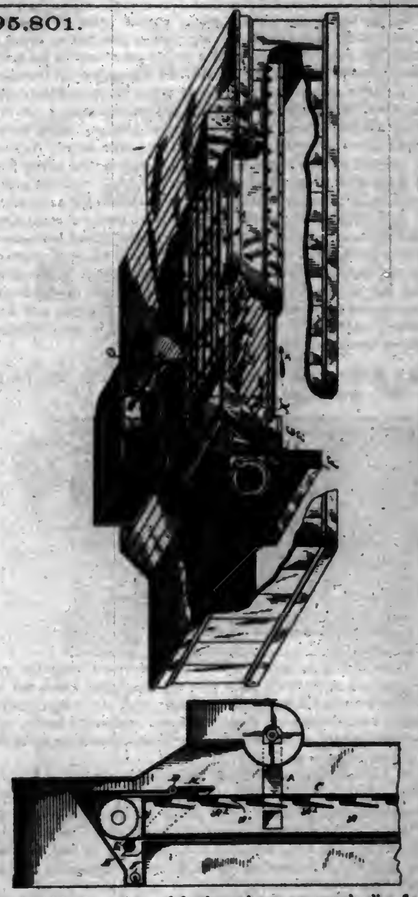
10. The combination, with the two rotatable reciprocating and shiftable type-wheels mounted on a depressible support, of the inking-disk 10, revolving in a plane inclined to the wheels, whereby the disk makes effective contact only with the active wheel, substantially as shown and described.

11. The combination of the two rotatable reciprocating and shiftable type-wheels F F', pendulous inker-arm *b*, and inclined rotary ink-disk 10, bearing upon one of the wheels, substantially as shown and described.

12. In a type-writer, the combination, with a type-wheel and an inking-disk revolving against the typed rim of the wheel, of the radial or pendulous arm supporting the ink-disk and made in two adjustable telescopic sections, *b b'*, with a fastening device, substantially as and for the purpose set forth.

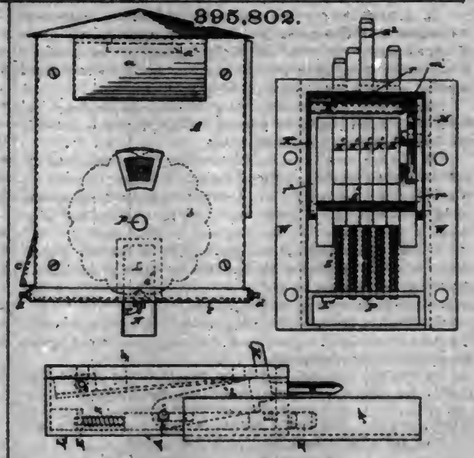
13. The combination, with the shiftable type-wheels F F' and intermittent paper-carriage, of the reciprocating feed-pawl *y*, arranged to operate the carriage, with its tail *x* projecting in the path of the type-wheels, and provided with the gap *x'* to permit the free passage of one of the wheels, substantially as and for the purpose set forth.

395,800. FENCE-POST. WILLETT D. STILLMAN, Madison, Wis. Filed Mar. 19, 1888. Serial No. 267,760. (No model.)



Claim.—An iron fence-post consisting of the base A, having opposite ribs curved reversely and terminating in a point, and having in its upper end the conical-shaped cavity C, with the fixed conical-shaped pin D within it, in combination with the upright tubular post B, having its lower end expanded about the pin within the cavity, as and for the purpose set forth.

395,801. DUST-COLLECTOR. JOSEPH H. WEBER, Battle Creek, Mich., assignor of one-half to Marvin C. Adams, Indianapolis, Ind. Filed Aug. 9, 1887. Serial No. 246,494. (No model.)



Claim.—1. The combination of an exhaust-fan, a dust-collecting apron, an air-trunk having exhaust-air passages leading from the trunk to the fan-case, and a chamber outside the trunk having exhaust-air passages leading from said chamber to the upper surface of the apron, substantially as described.

2. The combination of a casing, a rectangular air box or trunk

395,801.

395,802.

located within the casing and having exhaust-passages leading from below its top to the fan-case and inlet-openings through the top only, a dust-collecting apron, and an exhaust-fan, substantially as described.

3. The combination of a rectangular air-trunk, a dust-collecting apron, an open perforated or wire-covered drum, a compartment or chamber for said drum, air-passages leading from the compartment, and a fan for exhausting air through the drum from the compartment, substantially as described.

4. The combination of the dust-collecting apron, the perforated drum, the exhaust acting from the inner side of the drum, and the balls, operating substantially as and for the purpose set forth.

5. The combination of the box or trunk having inlet-openings through the top only, valved openings arranged in the top of the box or trunk, the endless dust-collecting apron, and an exhaust from within the trunk, substantially as set forth.

6. The combination of the box or trunk having inlet-openings through its top only, the endless dust-collecting apron, the exhaust-fan, and the air-passages communicating with the interior of the box, substantially as set forth.

7. The combination of the trunk, the fan, the perforated drum the conveyer-trough, and the air-spouts communicating with the conveyer-trough and opening on the dust-conecting apron, substantially as and for the purpose set forth.

395,802. LETTER-BOX. MARTIN WIBERG, Stockholm, Sweden, assignor to Charles G. Lundborg, New York, N. Y. Filed Jan. 13, 1887. Serial No. 224,300. (No model.)

Claim.—1. A letter-box provided with a delivery-door and locking mechanism, in combination with a removable pouch provided with a receiving-door and locking mechanism, substantially as described, one of said locking mechanisms provided with a pin or projection, as T, adapted to automatically engage the other mechanism when the pouch and the box are joined, whereby the two mechanisms are compelled to lock and unlock in unison.

2. The box A, its door, the series of slotted tumblers, and the bar R', adapted to enter the slots in said tumblers.

3. The box A, its door, the series of slotted spring-actuated tumblers, the bail or cross-bar adapted to enter the slots in said tumblers, and the depending pin T, in combination with the receiving-pouch, its door, and locking mechanism having a cross-bar adapted to engage the pin T.

4. The box A, its door, and the series of spring-actuated tumblers, in combination with the receiving-pouch, its door, and the series of spring-actuated tumblers, the springs on said tumblers being of variable tension.

5. The box A, its door, and the series of spring-actuated tumblers, in combination with the receiving-pouch, its door, and spring-actuated tumblers, the springs on said tumblers being of different tension, the strong springs on one lock opposing the weak springs on the other lock, as and for the purpose described.

6. The box A, with the trunnions thereon, in combination with the receiving-pouch and the hooks thereon adapted to engage said trunnions, as and for the purpose described and shown, and locking devices for said receptacles.

7. The box A, its door and series of slotted tumblers, and the bar R', adapted to enter said slots, in combination with the receiving-pouch, its door, slotted tumblers, and bar R^2, one or more of which tumblers are constructed to enter and engage with the opposite lock when the two receptacles are placed together, whereby they are automatically locked together.

8. The box, its door, and the series of tumblers, in combination with the receiving-pouch, its door, the series of slotted tumblers, the cross-bar adapted to enter the slots in said tumblers, the lever connected to the door, and intermediate mechanism, whereby the closing of the door effects the release of the tumblers and consequent disconnection of the two receptacles.

9. The box A, its door, its slotted locking-tumbler, the cross-bar adapted to enter the slots in said tumblers, and its rigid depending pin, in combination with the receiving-pouch, its door, the series of slotted tumblers, the bar adapted to enter the slot in said tumblers and containing an opening for the pin T, the angular lever pivoted to the lock and engaging said bar, and projecting outward in the path to the door, and the operating-lever F, connected to the door, whereby the closing of the door trips the lever and causes the two bars to be withdrawn from the slots in the tumblers simultaneously.

10. The box, its door, and tumblers, in combination with the receiving-pouch, its door and tumblers, and the lever pivotally connected to the door of the pouch near its conjunction therewith, whereby the lever can be turned out of the way when not in use.

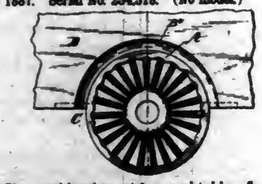
11. The box A, its door, the locking mechanism thereon, and the partition *f*, separating said mechanism from the mail-receiving portion of the box, as and for the purpose described.

12. The box A, its door, the series of spring-actuated tumblers, being reduced in thickness, and the cross-shaft A', seated in such reduced portion, whereby the motion of the tumblers is limited, substantially as and for the purpose described.

13. The receiving-pouch D', its door, the series of slotted tumblers thereon, the bail adapted to enter the slots in said tumblers, and the lever M, engaging said bail and adapted to be engaged by the door of the pouch, whereby the closing of the door will trip said lever and push the bail out of the slots in the tumblers, as and for the purpose described.

14. A letter-box provided with a door and locking mechanism, in combination with a mechanism mounted in a suitable casing, one of said mechanisms provided with a pin or projection, as T, adapted to automatically engage the other mechanism when the two are placed together, whereby one serves as a key to the other.

15. The box, its door and locking-tumblers, the opening *d*, and the shield *n* on the interior of the box for said opening, in combination with the check and receiving-pouch.

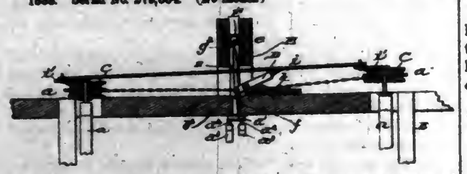


16. The box, its door and locking-tumblers, the opening *d* therein, and the shield *n* on the interior of the box, extending from the top of the opening in an outward and downward direction below the termination thereof, and in contact, or nearly so, with the door when closed, in combination with the check and receiving-pouch.

17. The box, its door and locking-tumblers, the opening *d* therein, located near the bottom of the box, and the exterior and interior shields for said opening, as and for the purpose described, in combination with the check and receiving-pouch.

18. The box, its door and locking-tumblers, the opening *d* therein, and the exterior shield, *n*, covering said opening, in combination with the check and receiving-pouch.

19. The box A, its door and locking-tumblers, and the opening *d* therein, in combination with the receiving-pouch and check.



395,808. POOL-TABLE POCKET. JAMES ADAMS, Newark, N. J. Filed Apr. 9, 1887. Serial No. 234,318. (No model.)

Claim.—1. The combination, with a pool-table, of a pocket-holding plate shaped to conform to the contour of the wood-work of the table and provided with a series of holes, as *a*, and of a pocket composed of a net the upper loops of which are passed through the openings *a*, and a string, *b*, inserted through said loops on the rear side of the plate, as set forth.

2. The combination, with a pool-table having a notch, B*, in its edge, said notch being recessed in the lower portion thereof, as described, of a plate having a pocket secured to it and a leather facing or shield laid over the outer face, said plate with the pocket-facing being secured in the recess, the facing being clamped between the plate and walls of the recess, substantially as set forth.

395,804. GATE. JOSEPH ALDERS, Wells, Oreg. Filed July 13, 1888. Serial No. 279,884. (No model.)

Claim.—1. The combination, with a pair of pivoted gates, of pivoted opening-levers, connections between said levers and the pivots of the gates, a rod connected to the pivots of the gates, and holding-levers operated by the pivoted levers and engaging the said connecting-rod, substantially as described.

2. The combination, with a pair of pivoted gates, of disks on the pivots of the gates, pivoted operating-levers, flexible connections between the said levers and disks, and pivoted holding-levers connected to the flexible connections, substantially as described.

3. The combination, with a pair of pivoted gates, of disks secured to the pivots of the gates, a rod having its ends connected to the disks, pivoted operating-levers, pivoted holding-levers for engaging the said connecting-rod provided with pulleys, and cords or chains connected to the said disks passing around the pulleys of the holding-levers and connected to the operating-levers, substantially as described.

4. The combination, with a pair of pivoted gates, of disks secured to the pivots of the said gates, a rod having its ends eccentrically connected to the disks, holding-levers for engaging the rod provided with pulleys, ropes or chains passing around the pulleys of the holding-levers and connected to the operating-levers, and disks, spring-catches, and a connection between the said holding-levers and catches, substantially as herein shown and described.

5. The combination of a pair of pivoted gates with a notched rod connecting pulleys on the gate, pivoting or hinging posts, and a propping or holding lever engaging said rod, substantially as set forth.

6. The combination, with a pair of pivoted gates, of a notched rod connecting gate-operating pulleys, spring gate-locking plates or catches, and the propping or holding lever connecting with the spring plates or catches and engaging the said rod, substantially as described.

7. The combination, with a pair of pivoted gates and their operating-levers, of the gate-pulley-operating lines or chains, a rod connecting the gate-pulleys, and the holding or propping levers limited in their outward downward movement by a stop suitably disposed and carrying pulleys, said lines or chains connecting the gate-pulleys and the operating-levers and passing up in contact with the pulleys carried by said holding or propping levers, substantially as specified.

8. The combination, with a pair of pivoted gates carrying pulleys at the upper ends of their pivoting or hinging posts and bevel-ended plates or studs at the upper ends of their forward edges, of chains or lines applied to and operating said pulleys and applied to operating-levers, bowed or curved spring plates or catches, and the holding or propping levers connected to said spring plates or catches, said lines or chains passing up in contact with pulleys hung in said holding or propping levers, substantially as set forth.

395,805. CAR-DOOR. HENRY ALSOP, Chicago, Ill. Filed Feb. 18, 1888. Serial No. 264,530. (No model.)

Claim.—1. A car having its door formed with a bridge-like section provided at its lower edge with eyes, combined with a rod on which said eyes are fitted to turn and slide, such rod being extended laterally beyond the eyes, whereby the said bridge-like section may be swung outward or may be moved in the direction of length of the car, substantially as set forth.

2. The combination of the car having a doorway, a rod, F, extended below said doorway, the door-section D, provided with eyes fitting and capable of turning on and moving along said rod F, the rail E, extended above the doorway, the door-section C, having hangers engaging said rail, a fastening device for securing said door-sections together, and fastenings for securing such sections to the car, substantially as set forth.

3. The combination of the car, the door formed of upper and lower sections, a rod extended below the doorway, and eyes secured to the lower section and fitted on the rod, such rod being extended laterally beyond the eyes, whereby the eyes may slide along or turn on said rod, all substantially as and for the purposes specified.

395,806. MACHINE FOR GENERAL FORGING. JOHN R. BLAKESLEE, Cuyahoga Falls, Ohio. Filed Apr. 2, 1888. Serial No. 269,342. (No model.)

Claim.—1. In a machine for general forging, the combination, with a two-part slide and a lock which rigidly locks said portions together, of automatic mechanism which automatically releases said lock from engagement with said slide portions, substantially as set forth.

2. In a machine for general forging, the combination, with a two-part slide, the two portions of which are loosely connected together, and a reciprocating lock which locks said two portions together at will, of mechanism which automatically frees said lock from locking engagement, substantially as set forth.

3. In a machine for general forging, the combination, with a two-part slide, the two portions of which are loosely connected together, said two portions having an opening between them at certain portions of their stroke, and a lock adapted to fit in said opening, and thereby rigidly lock said two portions together, of actuating mechanism that at the will of the operator locks said two portions rigidly together or frees them from engagement with said lock, substantially as set forth.

4. In a machine for general forging, the combination, with a two-part slide, the two parts of which have an opening between them at certain portions of their stroke, of a vertically-reciprocating lock fitting in said opening at will of the operator, substantially as set forth.

5. In a machine for general forging, the combination, with a two-part slide, the two portions of which are respectively provided with bearing-plates on their adjacent faces, of a lock fitting between said two portions at will of the operator, substantially as set forth.

6. In a machine for general forging, the combination of a driving-shaft and movable die-block, the two-part slide connected, respectively, by intermediate mechanism with said shaft and die-block, and a lock which locks the two portions of said slide together, substantially as set forth.

7. In a machine for general forging, the combination of a two-part slide, the two portions of which have an opening formed between them at certain portions of their stroke, a bolt loosely connecting them together, and a lock fitting in the opening between said two portions, substantially as set forth.

8. In a machine for general forging, the combination of a two-part slide, one portion of which is provided with a recess, the other portion of which is provided with a tongue fitting in said recess, an opening being formed between said two parts at certain portions of their stroke, and a lock fitting in the opening between said two portions, substantially as set forth.

9. In a machine for general forging, the combination, with a stock-gage, of adjusting mechanism for adjusting said gage longitudinally and transversely of said machine, substantially as set forth.

10. In a machine for general forging, a stock-gage consisting in the combination of a standard, a rod having sliding bearing therein, a slotted head secured to said rod, and a second rod depending from the latter, substantially as set forth.

11. In a machine for general forging, the combination, with a two-part slide, a joint-lock, and primary and secondary rocking levers rigidly connected together, of actuating mechanism with which said primary lever engages, substantially as set forth.

12. In a machine for general forging, the combination of a two-part slide, a joint-lock, primary and secondary rocking levers rigidly connected together, and a rotary cam engaging with the primary lever, substantially as set forth.

13. In a machine for general forging, the combination of a two-part slide, a lock, a ratchet-wheel and cam rigidly connected, and mechanism adapted partially to rotate said ratchet-wheel at will, substantially as set forth.

14. In a machine for general forging, the combination of a two-part slide, locking mechanism, a cam-wheel, intermediate mechanism connecting the two latter, a ratchet-wheel and pawl, said ratchet-wheel and cam rigidly connected, and actuating mechanism engaging with said ratchet-wheel at the will of the operator, substantially as set forth.

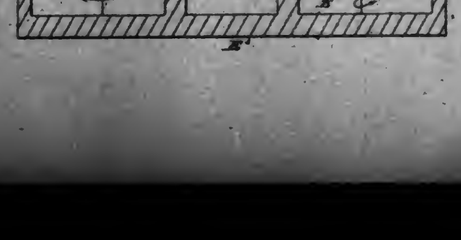
15. In a machine for general forging, the combination of a two-part slide, a joint-lock, primary and secondary rocking levers rigidly connected together, a rotary cam engaging with the former, and mechanism adapted to rotate said cam, whereby said primary lever is raised and lowered as it respectively engages with the swell and depressed portions of said cam, substantially as set forth.

16. In a machine for general forging, the combination of a two-part slide, locking mechanism, primary and secondary rocking levers connected together, a ratchet-wheel, intermediate mechanism connecting said ratchet-wheel with said primary lever, and lever mechanism engaging with said ratchet-wheel at the will of the operator, substantially as set forth.

17. In a machine for general forging, the combination of a two-part slide, locking mechanism, primary and secondary rocking levers connected together, a ratchet-wheel provided on its side face with a pin, intermediate mechanism connecting said ratchet-wheel with said primary lever, and lever mechanism engaging with said pin at the will of the operator, substantially as set forth.

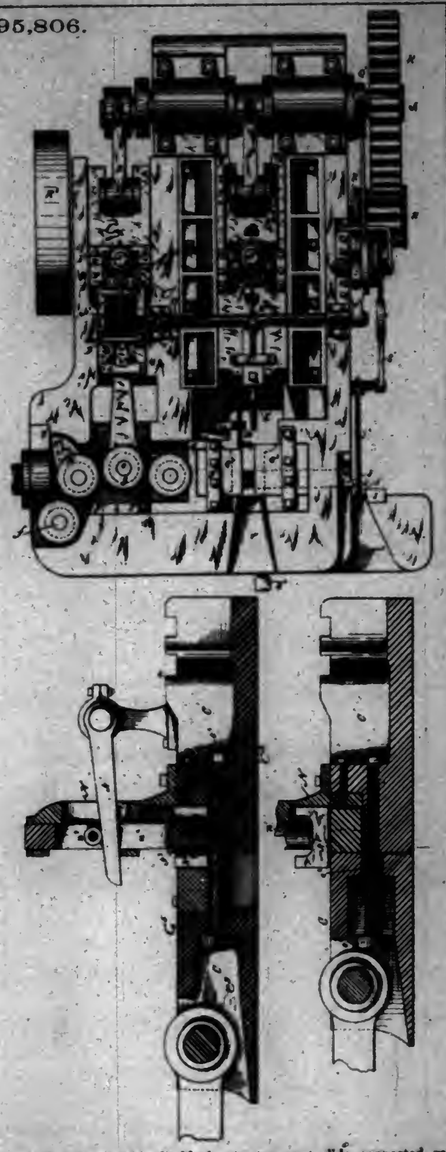
18. In a machine for general forging, the combination of a lock-bracket secured to a slide, a lock having bearing in said bracket, a lever engaging with said lock, and actuating mechanism for raising and lowering said lever, substantially as set forth.

19. In a machine for general forging, the combination of a shaft, primary and secondary levers rigid therewith, a lock having engagement with said primary lever, a cam having engagement with said secondary lever, and actuating mechanism rotating said cam, substantially as set forth.



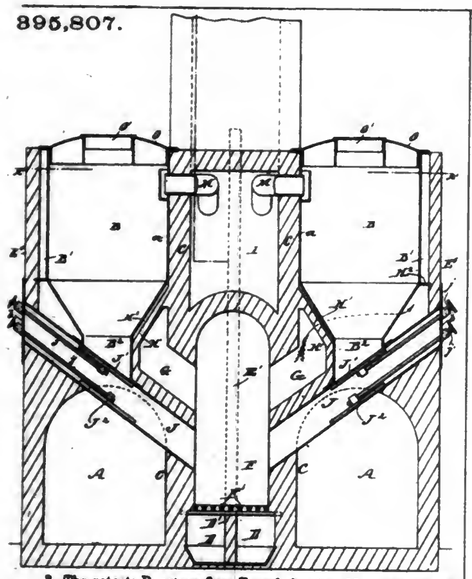
20. In a machine for general forging, the combination of a driving-shaft, a pitman journaled thereon, a secondary shaft, a cam and ratchet-wheel rigid thereon, a pawl-arm journaled on said shaft and having a pawl engaging with said ratchet, and mechanism connecting said pitman and pawl-arm, substantially as set forth.

21. In a machine for general forging, the combination of a die-block provided with a shoulder, a slide provided with an opening, a die-block fitting therein, a bar extending across the face of said die-block, and mechanism connecting said bar and shoulder, whereby the die-block is held rigidly in position, substantially as set forth.



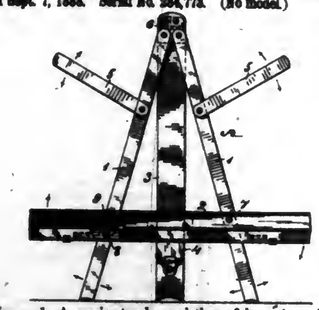
395,807. FURNACE FOR DESTROYING REFUSE MATTER. WILLIAM H. BLISS, Newport, R. I.; Edward Newton administrator of said William H. Bliss, deceased. Filed Nov. 16, 1887. Serial No. 255,305. (No model.)

Claim.—1. A furnace for destroying refuse material, constructed to form a fire-chamber, F, side retort-chambers, F', side flues, G, connecting the furnace with the said retort-chambers, and the return-flues E, connecting the retort-chambers with the furnace F below the fire-grates F', substantially as and for the purposes set forth.



2. In a furnace for destroying refuse material, the fire-chamber F and connected retort-chambers B' and retorts B, in combination with the chutes J, connecting the retorts with the fire-chamber, substantially as and for the purposes set forth.

395,806.

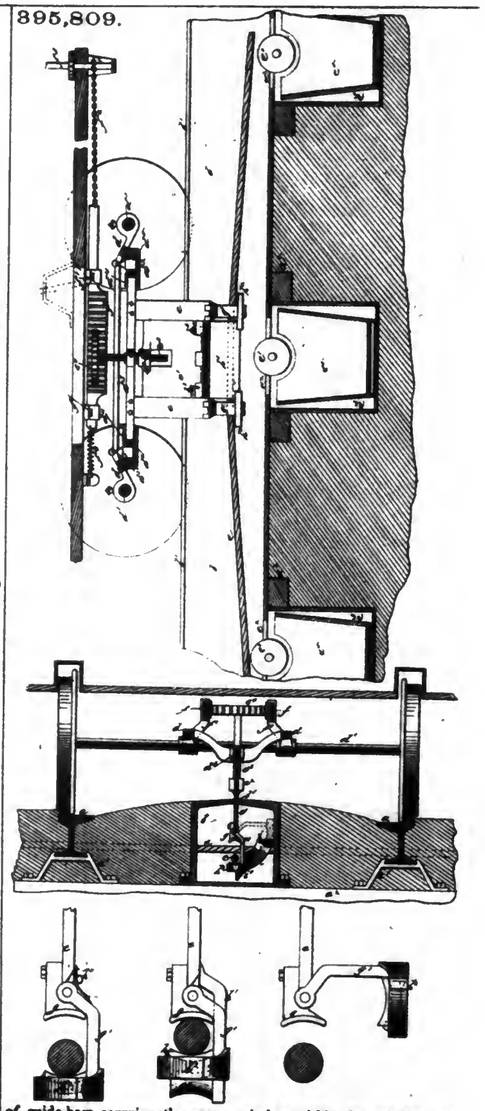


395,807.

3. The retorts B, return-flues E, and the pipes M, connecting the said retorts with the said return-flues, and the fire-chamber F, connected with the return-flues, and the passages G, connecting the fire-box to the retort-spaces, in combination with the chutes J, valve J', chambers A, and valve J³, substantially as and for the purposes set forth.

395,808. MUSIC-STAND. PHILIPP L. BRACHET, Philadelphia, Pa. Filed Sept. 7, 1888. Serial No. 284,773. (No model.)

Claim.—1. A music-stand consisting of legs pivoted to a top plate, a prop hinged to said plate, and a rest pivoted to one leg and having a slot to receive a pin on the other leg, substantially as described.



2. A music-stand having a rest which is pivoted to one leg and engages with the other leg, and formed of parallel bars hinged together, substantially as described.

3. A music-stand consisting of the diverging legs hinged at their upper ends, the rest supported on the legs near the widest portion thereof, and the arms hinged near the top or narrow portion of the legs, whereby said narrow portion is widened when the arms are extended, substantially as described.

4. A music-stand frame formed of legs, a rest, and a prop with a connecting-bar, the latter being provided with a folding tongue, and said rest with a keeper to receive said tongue, the parts being combined, substantially as described.

5. A music-stand consisting of legs pivoted to a top plate, a prop hinged to said plate, a folding rest pivoted to one of the legs and adapted to interlock with the other leg, a keeper on the rest, and a bar hinged to the prop having a hinged tongue which enters said keeper, said parts being combined and operating substantially as described.

395,809. TRACTION-CABLE SYSTEM. MILLARD F. BRADLEY, Chicago, Ill., assignor of one-third to Bruce B. Barney, same place. Filed Dec. 14, 1886. Serial No. 221,961. (No model.)

Claim.—1. In a grip for cable cars, the combination, with a pair of guide-bars carrying the upper grip-bar within the conduit and provided with the cable-supporting rollers on their lower ends, of the sliding grip-plate between the guide-bars provided with the lower grip-bar on its end and adapted, when lifted, to raise the cable and grasp it firmly, and when lowered to drop below the supporting-rollers to allow the cable to rest and move on the same, substantially as and for the purpose set forth.

2. The combination, with a gripping device having its whole lower body within the conduit hinged, of means, substantially as described, within the conduit for turning the hinged portion of the grip outward and upward to an approximately horizontal position, substantially as and for the purpose set forth.

3. In a traction-cable system, the combination, with a gripping device having its whole lower end hinged to swing in one direction, of the crossing cables, and a glide-bar within the conduit to swing this hinged grip aside and upward and support it in sliding over the crossed cables, substantially as and for the purpose set forth.

4. In a traction-cable system, the combination, with the conduit provided with a glide-bar having its ends bent and twisted down and aside, of a hinged grip-section provided with a beveled nose or guard to engage and ride up on the glide-bar, substantially as and for the purpose set forth.

5. In a grip for traction-cable systems, the combination, with a bar from which the whole gripping device is suspended, of a supporting-frame on the car provided with sockets to receive the ends of said bar, slides upon these sockets to confine the ends of the bar, and wedges or keys to lock the slides in place, substantially as shown and described.

395,810. SCREW-CUTTING DIE. ADOLPH E. BRION, Brooklyn, N. Y. Filed June 20, 1888. Serial No. 278,562. (No model.)

Claim.—1. As an improved article of manufacture, a screw-cutting die consisting in the outer soft iron or low-steel rim, B, and the central high-steel cutter, A, having cutting-edges *a* and clearance-spaces, substantially as set forth.

2. As an improved article of manufacture, an adjustable screw-cutting die consisting in the outer soft iron or low-steel rim, B, and the central high-steel cutter, A, having cutting-edges *a* and clearance-spaces, one of which extends through the cutter and rim, whereby when the die is compressed it will retain its position by reason of the soft-iron rim, substantially as set forth.

395,811. MEANS FOR ATTACHING EYEGLASSES TO HEAD-APPAREL. WILLIAM H. BROWNLOW, Brockville, Ontario, Canada, and JOEL S. WARNER, Ogdensburg, N. Y., assignors of one-third to John H. Brownlow, Ogdensburg, N. Y. Filed June 6, 1888. Serial No. 276,237. (Model.)

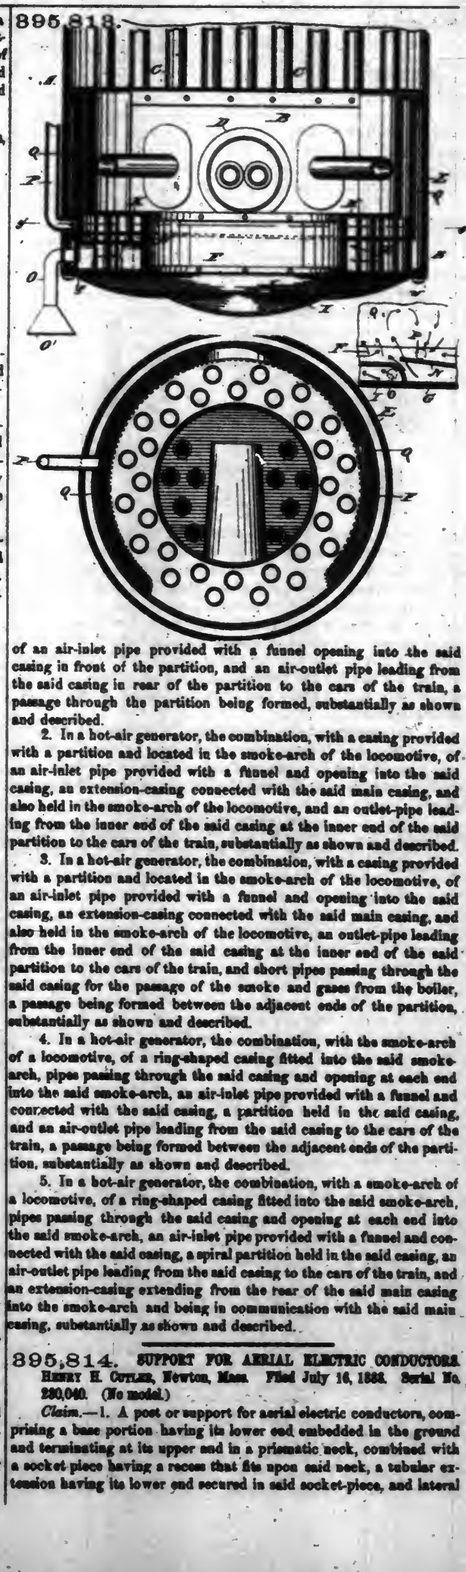
Claim.—1. The combination, with the attaching-plate having lugs, of a spindle journaled in said lugs and provided with a friction-spring bearing at its outer end against one of said lugs, and the eyeglasses depending from the attaching-plate, substantially as set forth.

2. The combination, with the attaching-plate, of an eyeglass-frame, and a lazy-tongs connected to the said plate and frame, substantially as set forth.

3. The combination, with the attaching-plate having a spindle journaled on its lower or under side, of an eyeglass-frame, and a lazy-tongs connected to the said spindle and to the spring of the eyeglass-frame, substantially as set forth.

4. The combination, with the attaching-plate having lugs on its under face, of the spindle journaled in said lugs and provided at one end with a coiled spring bearing at its outer end against the adjacent lug of the attaching-plate, lazy-tongs connected to the attaching-plate, and an eyeglass-frame attached to the other end of the lazy-tongs, substantially as set forth.

395,812. CHALK-HOLDER. FANNIE CHAMBERS, New York, N. Y. Filed Aug. 27, 1888. Serial No. 283,819. (No model.)



Claim.—An improved chalk-holder consisting of a casing, an operating screw-rod, a traveling nut mounted on the screw-rod within the casing, and a chalk-holding clamp on the traveling nut to receive the end of a chalk and firmly hold the chalk as it is projected out of and withdrawn into the casing by the operation of the screw-rod, substantially as shown and described.

395,813. HOT-AIR GENERATOR. ERNEST M. CRANDALL and THOMAS H. TURNER, St. Joseph, Mo. Filed Mar. 6, 1888. Serial No. 266,344. (No model.)

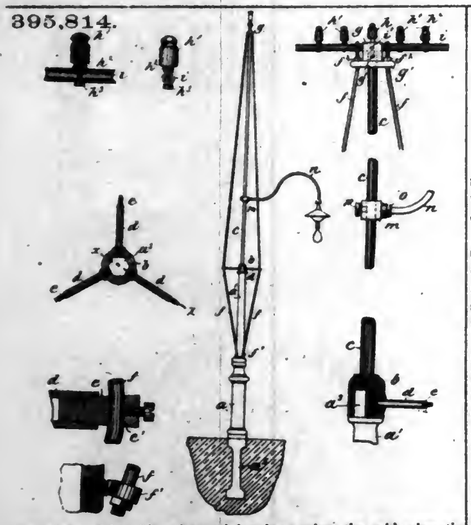
Claim.—1. In a hot-air generator, the combination, with a casing provided with a partition and held in the smoke-arch of a locomotive,

395,818.

of an air-inlet pipe provided with a funnel opening into the said casing in front of the partition, and an air-outlet pipe leading from the said casing in rear of the partition to the cars of the train, a passage through the partition being formed, substantially as shown and described.

2. In a hot-air generator, the combination, with a casing provided with a partition and located in the smoke-arch of the locomotive, of an air-inlet pipe provided with a funnel and opening into the said casing, an extension-casing connected with the said main casing, and also held in the smoke-arch of the locomotive, and an outlet-pipe leading from the inner end of the said casing at the inner end of the said partition to the cars of the train, substantially as shown and described.

3. In a hot-air generator, the combination, with a casing provided with a partition and located in the smoke-arch of the locomotive, of an air-inlet pipe provided with a funnel and opening into the said casing, an extension-casing connected with the said main casing, and also held in the smoke-arch of the locomotive, an outlet-pipe leading from the inner end of the said casing at the inner end of the said partition to the cars of the train, and short pipes passing through the said casing for the passage of the smoke and gases from the boiler, a passage being formed between the adjacent ends of the partition, substantially as shown and described.



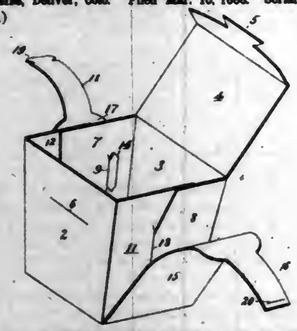
4. In a hot-air generator, the combination, with the smoke-arch of a locomotive, of a ring-shaped casing fitted into the said smoke-arch, pipes passing through the said casing and opening at each end into the said smoke-arch, an air-inlet pipe provided with a funnel and connected with the said casing, a partition held in the said casing, and an air-outlet pipe leading from the said casing to the cars of the train, a passage being formed between the adjacent ends of the partition, substantially as shown and described.

5. In a hot-air generator, the combination, with a smoke-arch of a locomotive, of a ring-shaped casing fitted into the said smoke-arch, pipes passing through the said casing and opening at each end into the said smoke-arch, an air-inlet pipe provided with a funnel and connected with the said casing, a spiral partition held in the said casing, an air-outlet pipe leading from the said casing to the cars of the train, and an extension-casing extending from the rear of the said main casing into the smoke-arch and being in communication with the said main casing, substantially as shown and described.

395,814. SUPPORT FOR AERIAL ELECTRIC CONDUCTORS. HENRY H. CUTLER, Newton, Mass. Filed July 16, 1888. Serial No. 280,040. (No model.)

Claim.—1. A post or support for aerial electric conductors, comprising a base portion having its lower end embedded in the ground and terminating at its upper end in a prismatic neck, combined with a socket-piece having a recess that fits upon said neck, a tubular extension having its lower end secured in said socket-piece, and lateral

395,814.



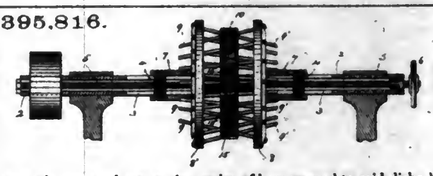
arms fastened in said socket and bearing against the said prismatic neck of the base portion, and tie-rods bearing against the ends of said lateral arms and secured to the base portion below said arms and to the tubular extension above said arms, substantially as described.

2. The combination of the cast-iron lower portion and wrought-iron tubular extension thereof, with lateral brace-arms at or near the juncture of said portions, plugs inserted in the ends of said brace-arms provided with transverse openings and set-screws, and tie-rods passing through said openings and fastened to the cast-iron portion below the wrought-iron portion above said arms, substantially as and for the purpose described.

3. The combination of a post or support composed of a cast-iron lower portion and tubular extension, with braces and tie-rods, with a lamp-supporting bracket connected with said tubular extension and vertically and laterally adjustable thereon, as and for the purpose described.

395,815. KNOCKDOWN BOX AND BLANK THEREFOR. NANCY J. DOBBINS, Denver, Colo. Filed Mar. 10, 1888. Serial No. 266,875. (Model.)

Claim.—1. A blank for a knockdown box, consisting of the base 1, extensions 2 3 4, for forming the sides and cover, extensions 7 8 11 12, for forming the ends, and extensions 15 16 17 18, for forming a looped handle, substantially as set forth.



2. A blank for a knockdown box, consisting of a base, 1, side and end extensions, as shown, and prolonged extensions 15 17, attached to the base and having the one a tongue, 19, and the other a slot, 20, for forming a single loop-handle to the box.

3. The knockdown box herein described, consisting of the base, the sides attached thereto, the ends and cover attached to the sides, and handle-extensions attached to the base, and forming a single loop-handle for the box, substantially as set forth.

395,816. EXPANDING PULLEY. JOHN R. DUNTH, Lawrence, Mass. Filed Aug. 16, 1888. Serial No. 282,902. (No model.)

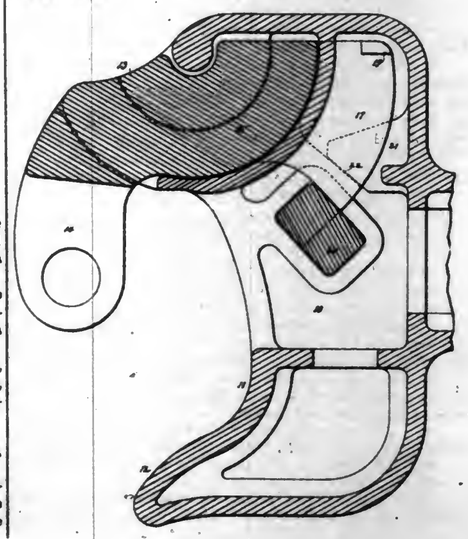
Claim.—1. An expanding pulley consisting of a flat-faced belt-supporting portion, a series of sectoral blocks circularly disposed, two apertured disks or spiders oppositely movable in right lines, and the

395,816.

reversely-arranged converging series of bars secured to said disks, by which the sectoral blocks are caused to converge and diverge concentrically as a unit, substantially as herein explained.

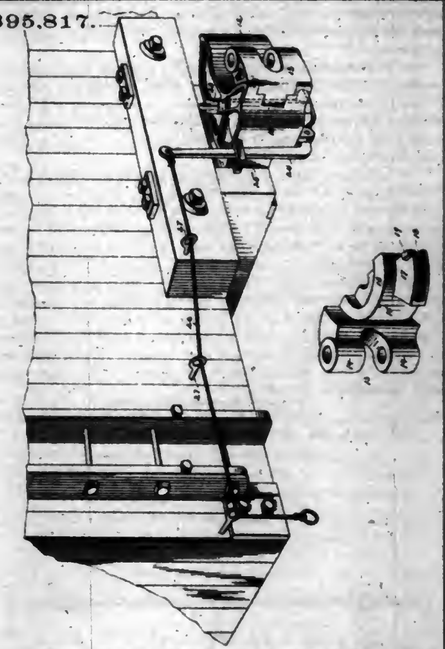
2. An expanding pulley composed of two apertured disks or spiders movable in right lines, two series of converging bars reversely disposed and intersecting midway of the spiders, the sectoral blocks apertured to receive said bars, and the curved plates which connect said blocks to maintain them concentric, substantially as and for the purposes herein described.

3. In combination with a supporting-shaft and the circular hubs movable in right lines thereon, an expanding pulley, substantially as herein described, composed of the apertured disks or spiders, two reversely-arranged converging series of bars, the sectoral blocks operated by the latter, and the rotary right-and-left-screw-threaded rod, and the non-rotary sleeve-nuts movable endwise thereon, substantially as stated.



4. In combination with two oppositely-movable apertured disks or spiders and means, substantially as herein described, for actuating them in right lines, two series of oppositely-converging bars rigidly affixed to said spiders intersecting centrally between said disks, and the sectoral plates having the apertures 12, orifices 14 16, and the interconnecting curved plates 15, all for purposes substantially as herein explained.

5. In an expanding pulley, a circular flat-faced belt-supporting portion composed of sectoral blocks 10 10', having a transverse aperture 12, orifices 14 16, concentric with the face of the block, and a boss with a spring, 13, combined with two series of reversely-converging bars, 9 9 9' 9', affixed upon circular apertured disks or spiders oppositely movable to control the divergence or convergence of said blocks, substantially as herein stated.



6. In combination with two apertured disks or spiders, 8 8', oppositely movable in right lines, and the reversely-converging series of bars 9 9 9' 9', the series of sectoral blocks 10 10', formed with orifices 14 16, the positions of the latter being reversed in each alternate block, and the interconnecting alternating plates 15, affixed in the orifice 14 in one block and movable vertically and longitudinally within the orifice 16 in the next adjacent block, all for purposes herein set forth and described.

395,817. CAR-COUPLING. EDWARD P. EASTWICK, Jr., New York, N. Y. Filed Oct. 10, 1888. Serial No. 287,741. (No model.)

Claim.—1. The combination, with a draw-head, of a buffing-stop which is integral with an inner wall, and whose bearing-surface is coincident with the radial line from the center of revolution, as shown and described.

395,817.

2. The combination, with a draw-head, a knuckle-link revolubly held therein, and a wing provided with a central recess attached to said knuckle, of a buffing-stop projection within the draw-head capable of entering the recess of the wing, substantially as shown and described.

3. The combination, with a draw-head, a knuckle-link revolubly held therein, and a wing extending at an angle from said knuckle provided with a longitudinal recess open at one end, of a buffing-stop projecting within the draw-head coincident, or approximately so, with a radial line from the center of revolution, substantially as shown and described.

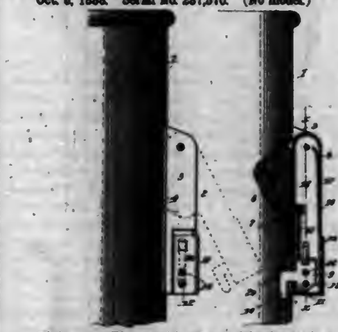
4. The combination, with a link-knuckle for draw-heads, consisting of an outer locking section and a pivotal body-section, of a wing projected from the body-section provided with a longitudinal recess, substantially as and for the purpose specified.

5. The combination, with a draw-head provided with a pin-opening, of an angled lever fulcrumed upon the draw-head having one arm extending beneath the pin-opening and the other extending upward, and a chain or equivalent device attached to said upper arm of the lever, and all arranged to operate substantially as shown and described.

395,818. HEAT-RADIATOR APPARATUS. ASA C. EDWARDS, Westfield, Mass. Filed Aug. 30, 1888. Serial No. 284,171. (No model.)

Claim.—1. A heat-radiator consisting of a heating-drum having a series of rotary tubes with open ends, longitudinal flanges, and handles for operating the tubes, the latter being arranged across the drum and their flanges of a depth equal to the distance between the tubes, substantially as shown and described.

2. A heat-radiator consisting of a heating-drum having transverse rotary tubes with open ends, longitudinal flanges, and operating-handles, the flanges on one side being equal to the distance between the tubes and the walls of the drum, the flanges thereby serving as soot-scrapers and dampers, substantially as shown and described.



3. A heat-radiator consisting of a heating-drum having transverse rotary tubes with open ends, soot-scraper and damper-flanges and operating-handles, and a vertical spiral flange located beneath the tubes, substantially as shown and described.

4. A heat-radiator consisting of a heating-drum having transverse rotary tubes with open ends, soot-scraper and damper-flanges and operating-handles, and a spiral expansible rod having one end connected by a lever to one of the tube-operating handles, substantially as shown and described.

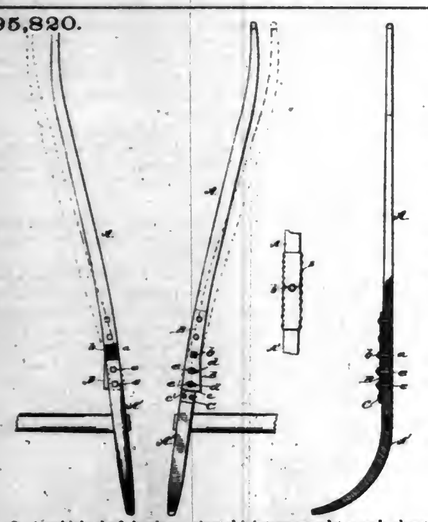
5. In a heat-radiator, a transverse rotary tube with operating-handle, and a soot-scraper rod adjacent to and parallel with the rotary tube, substantially as shown and described.

6. A heat-radiator consisting of drum 1, having the vertical spiral flange 2 mounted in its lower end, the transverse rotary tubes 5, located above the spiral flange 2 with open ends, soot-scraper and damper-flanges 7 and operating-handles 6, and the expansible spiral rod 8, secured in the lower part of drum, a lever pivoted on the outside of the drum and pivotally connected to the upper end of rod 8, and having a forked end, 12, engaging one of the lever-handles 6, substantially as shown and described.

395,819. WHIP-SOCKET. HERBERT ELDER, Harrisburg, Pa. Filed Oct. 6, 1888. Serial No. 287,370. (No model.)

Claim.—1. The combination, with the socket, of the attaching-plates 3 3, an arm pivoted at its upper end between said plates and having a projection on its inner side at the upper part thereof, and a vertically-sliding hook or catch mounted on the lower end of the said arm for locking it in place when closed, substantially as set forth.

2. The combination, with the socket, of the attaching plates or casing 3, the arm 5, pivoted at its upper end between said plates to swing vertically and having a cam projection on its inner edge, a block secured to the lower end of said arm to slide vertically thereon and having on its inner edge a hook, 10, below said projection, and a locking-hook pivoted on said block at right angles to the pivot of the arm 5 and adapted to lock the sliding block to the said swinging arm, substantially as set forth.



3. The combination, with the socket, of the plates or casing 3, the hollow arm 5, open at its outer side, having a projection, 8, at the upper end of its inner side and a slot, 11, below said projection, the cap 15, having sides 14, embracing the lower end of the arm to slide thereon and having a key-hole, 26, the block 9 within the lower end of the said arm and connected with the cap 15 to slide therewith, the downward-projecting hook 10, projecting from the inner face of the block through the slot 11, the transversely-swinging locking-hook 21 on the upper end of the block in line with the key-hole, substantially as set forth.

4. A whip-socket, 1, constructed with the slots 7 and 20 in its side, an arm, 5, pivoted to the side of the whip-socket and having a cam-shaped projection, 6, with a bearing-surface of soft material to clamp a whip in the socket 1, a cap, 15, with opening 26 and interior recess 23, slidable on the arm 5 and connected with a hook, 10, mounted on a sliding block, 9, projecting from arm 5 and adapted to project through slot 20 and engage whip-socket 1, and a hook, 21, with hole 27, pivoted to an extension of hook 10 and adapted to be locked with recess 23, substantially as shown and described.

395,820. ADJUSTABLE VEHICLE-SHAFT. WILLIAM B. FARRAR, Greensborough, N. C. Filed Sept. 21, 1888. Serial No. 285,980. (No model.)

Claim.—1. A vehicle-shaft having a pivotal joint arranged to work about a vertical axis, in combination with a horizontal splice-plate bolted rigidly to one section of the shaft, and having at its other ends transverse slots and bolts for connecting it to the other section of shaft for lateral adjustment, as described.

395,820.

2. A vehicle-shaft having a pivotal joint arranged to work about a vertical axis, in combination with a horizontal splice-plate bolted rigidly to one section of the shaft, and having at its other end transverse slots and bolts for clamping it to the other section of the shaft, and a positive locking device fixed upon the latter shaft-section and adapted to engage with the slotted end of the splice-plate, as described.

3. A vehicle-shaft having a pivotal joint arranged to work about a vertical axis, in combination with a horizontal splice-plate rigidly bolted to one section of the shaft and having transverse slots and bolts for clamping it to the other shaft-section, and a serrated or toothed end and a serrated plate fixed to the other shaft-section, having its teeth engaged with the serrated end of the splice-plate, substantially as shown and described.

4. A vehicle-shaft made in two sections, with square and splayed abutting ends, and a pivotal bolt, *b*, in the joint, in combination with a splice-plate, B, and locking devices for the same, substantially as shown and described.

5. A vehicle-shaft having a transverse joint with a splice-plate, combined with a pintle-bolt passing through said joint, and a leather casing placed under the head of the pintle-bolt and tacked to sides of shaft to prevent water and mud from getting in the joint and to make a neat appearance, as shown and described.

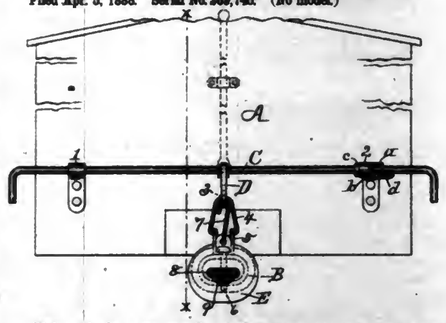
395,821. KNIFE. FREDERICK S. FOOTE, New York, N. Y. Filed Aug. 27, 1888. Serial No. 283,879. (No model.)

Claim.—1. The handle A, beveled at A' and formed with the guard-surface G, in combination with the blade C, formed with side members, *c c*, secured to handle A, and formed with the blade c^2 parallel with the front edge, B, of the handle, substantially as described.

2. The handle A, beveled at its front end, in combination with the blade C, having cutting-edge c^2 and side members, *c*, formed at the upper edge with the cutting-edge *f*, substantially as described.

395,822. STEAM-ENGINE. DANIEL A. FRASER, Mancelona, Mich. Filed Aug. 30, 1888. Serial No. 284,200. (No model.)

Claim.—1. In a steam-engine, in combination with a piston and crank, a connecting-rod having a joint near its middle and a lever pivoted to the frame and to said rod between the said joint and the crank, substantially as described.



2. In a steam-engine, a cylinder having a steam-port at or near its middle, and two single-acting pistons moving in opposite directions from said port and connected to a common crank-shaft, substantially as described.

3. In a steam-engine, a cylinder having a central steam-port, two single-acting pistons moving in opposite directions from said port, one of said pistons attached to the crank by a connecting-rod, and a lever having a fulcrum near its middle and attached at one end to said connecting-rod and connected at the other end to the other of said pistons, substantially as described.

4. In a steam-engine, a cylinder open at both ends having a central steam-port, two pistons moving in opposite directions from said port, one piston attached to the crank by a rod having a joint near its middle, and a lever pivoted near its middle and connected at one end to said rod between said joint and crank and at its other end to the other of said pistons by a connecting-rod, substantially as described.

5. In a steam-engine, two cylinders arranged parallel to each other and open at both ends, each having a central port connecting it to a common steam-chest and opening under the respective ends of a D-valve, in combination with connecting-rods attaching said pistons to a common crank-shaft, whereby each cylinder acts alternately and the pistons in each cylinder operate in opposite directions to turn said shaft, substantially as described.

395,823. CAR-COUPLING. SILAS B. FYLER, East Syracuse, N. Y. Filed Apr. 5, 1888. Serial No. 269,740. (No model.)

Claim.—1. In a car-coupling, a link-guide consisting of a plate provided with a link-slot larger than the link and suspended in front of the draw-head from an arm connected to a horizontal operating-rod adapted to rotate and move longitudinally in its bearings, and adapted to raise or lower vertically the aforesaid link-guide, in combination with the draw-head and link, substantially as described and shown.

2. In a car-coupling, a horizontal operating-rod mounted in bearings upon the car and having rotary and longitudinal movement therein, a lateral arm connected to said rod, and the slotted link-guide suspended from said arm, in combination with the draw-head and link, substantially as described and shown.

3. In a car-coupling, a horizontal operating-rod mounted in bearings on a car and having rotary movement therein, a lateral arm secured to the said rod, and a slotted link-guide suspended at the front of the draw-head from said lateral arm, in combination with the draw-head and link, substantially as described, and for the purpose set forth.

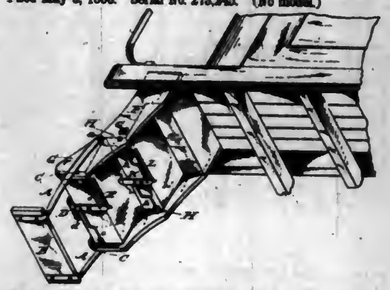
4. In a car-coupling, the horizontal rod mounted in bearings upon the car and adapted to rotate and to move longitudinally therein, and provided with a lateral arm to which is connected a pin-holder consisting of a flat piece of metal with ears formed at its sides, and having an aperture at its bottom for a removable coupling-pin whose head lies upon the base of said holder, in combination with the draw-head and link, all constructed and operating together, substantially as described and shown.

5. In a car-coupling, the horizontal rod mounted in bearings upon the car and having rotary and longitudinal movement therein, one or more of said bearings being provided with a longitudinal slot having an internal shoulder, and the horizontal rod formed with a flanged portion contiguous to one end of the bearing and a ribbed portion adjacent to the opposite end and adapted to operate in the slotway of the bearing, and an arm connected to the horizontal rod and having a link guide or pin connected thereto, in combination with the draw-head and link, substantially as shown and described.

6. In a car-coupling, a guide-bracket provided with a longitudinal slot having an internal shoulder, in combination with the horizontal operating-rod mounted in said bracket and provided with a flanged and a ribbed portion, substantially as shown, all operating together as and for the purposes specified.

7. The guide-bracket 2, constructed with a horizontal slotway, *a*, extending from a side of the bracket part way the length thereof, said slotway being provided at its inner extremity with a rectangular shoulder portion rising perpendicularly above the lower face of the slotway, substantially as described, and for the purposes specified.

8. The operating-rod C, provided with a flange, *c*, and a rib or projection, *d*, contiguous thereto, and having a handle portion, substantially as described.



9. In a car-coupling, a horizontal operating-rod mounted in bearings upon the car and having rotary and longitudinal movement therein, a lateral arm secured to the aforesaid rod, and a vertical operating-rod fulcrumed in a bearing upon the car and having vertical movement therein and pivotally connected to the lateral arm, and the slotted link-guide suspended from the aforesaid arm, in combination with the draw-head, link, and pin, substantially as described.

10. In a car-coupling, a horizontally-disposed operating-rod mounted in guide-brackets upon the car and adapted to rotate and move longitudinally therein, one or more of said brackets being constructed with a longitudinal slotway extending from a side thereof part way its length, and having at its inner extremity a rectangular shoulder portion rising perpendicularly above the lower level of the slotway, the horizontal rod operating in the bracket and provided with a flange contiguous to an end thereof and, adapted to regulate the outward thrust of the rod, and having a longitudinal rib adjacent to the rectangular shoulder of the slotway, said rib being adapted to vertical movement alongside the perpendicular face of said elevated shoulder and adapted to move horizontally onto and rest thereon, and a lateral arm connected to the operating-rod and having a coupling-pin attached thereto, in combination with the draw-head and link, substantially as described, and for the purposes specified.

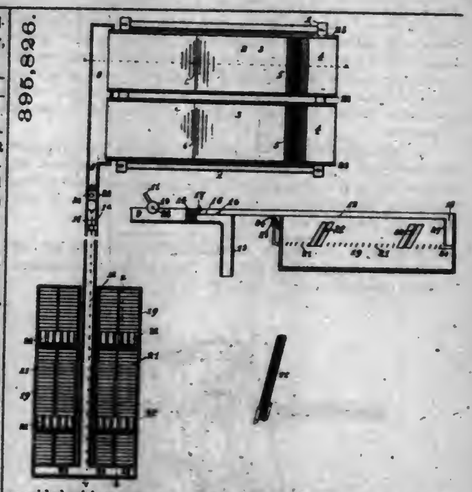
395,824. COSMETIC CREAM. NANCY K. GENTRY, Denver, Colo. Filed Mar. 13, 1888. Serial No. 267,107. (No specimens.)

Claim.—The herein-described composition of matter for a remedial cosmetic or cream, consisting of olive-oil, beeswax, gum-camphor, carbolic acid, glycerine, tincture of calendula flowers, and oil of bay, in the proportions substantially as set forth.

395,825. EXTENSION CAR-STEP. JOHN W. GRAHAM, Nyack, N. Y. Filed May 8, 1888. Serial No. 273,245. (No model.)

Claim.—1. A railroad-car provided with an extensible step rigidly secured to pivoted hangers, and spring-catches for retaining said hangers and step in both their raised and lowered positions, substantially as set forth.

2. The combination, with the steps of a car, of the hangers A, pivoted to the steps, the tread-board B, supported by the hangers, the spring-catches C, for locking the hangers when lowered, and the spring-catches H, for locking the hangers when raised, substantially as described.



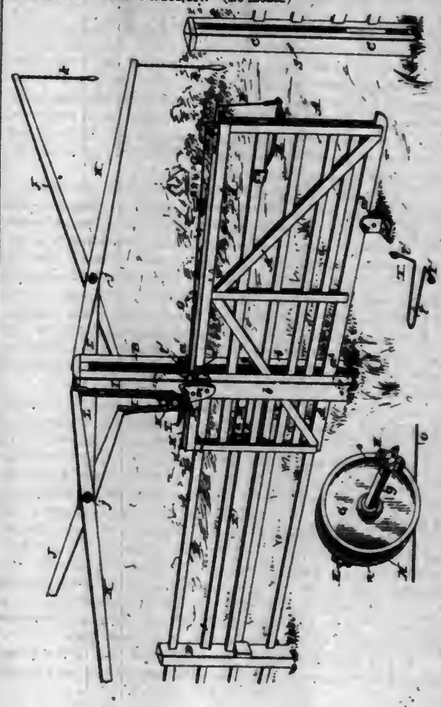
3. The combination of the pivoted hangers A, supporting the tread-board D, of the catches C H, the levers D K, the rods *c* A, connecting the catches with the ends of the levers, and the springs E L, attached to the levers, substantially as described.

395,826. APPARATUS FOR SAVING SLIMES. SOREN HARDER, Leadville, Colo., assignor, by direct and mesne assignments, of one-half to James C. Stephens, same place, and Mary E. Stephens and Harvey G. Brearley, both of Denver, Colo. Filed Jan. 11, 1888. Serial No. 260,446. (No model.)

Claim.—1. An apparatus for separating and saving slimes or floats, comprising a main flume leading from a concentrator or other source of supply of material to be treated, a horizontal and longitudinal partition dividing such main flume into two branch flumes, and a settling-tank, into which one of the branch flumes leads, having removable false bottoms or riffles dividing it into an upper and a lower compartment, such false bottoms being provided with a series or number of upwardly and forwardly projecting spoons for deflecting the slimes, substantially as set forth.

2. A tank for settling and saving slimes, floats, &c., having false bottoms or riffles dividing it into an upper and a lower portion, and

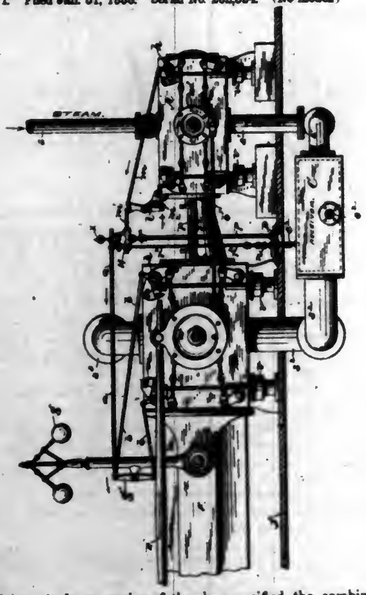
395,826.



provided with one or more series of upwardly-projecting spoons for deflecting the slimes, &c., an inlet leading into the upper portion of the tank, and a discharge pipe or pipes rotatably seated in the walls of the tank, and then bent upwardly so that their point of discharge may be higher than their inlet, substantially as set forth.

3. A tank for saving and settling slimes, &c., having false bottoms or riffles dividing it into an upper and a lower compartment, said false bottoms or riffles being provided with a series of upwardly and forwardly projecting spoons for deflecting the slimes, &c., substantially as set forth.

4. The combination, in a settling and saving tank, of an inlet for the material thereinto, a discharge for the water therefrom, false bottoms or riffles dividing the tank into upper and lower compartments, and series or a series of forwardly and upwardly inclined spoons for deflecting the matter in the water passing through the tank, substantially as set forth.



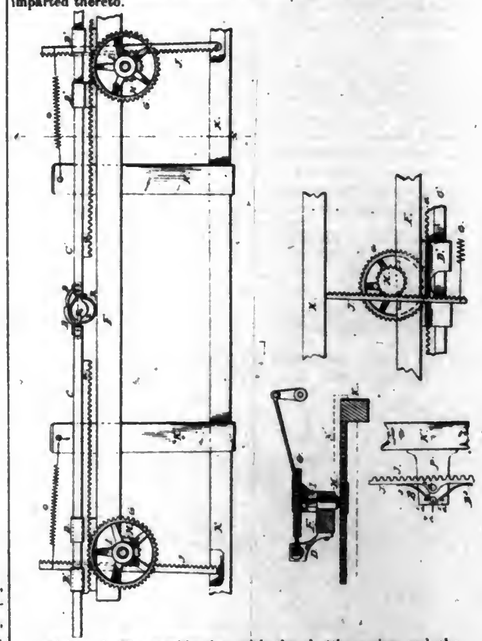
395,827. GATE. HIRAM S. HARRIS, Cincinnati, Ohio. Filed Oct. 18, 1888. Serial No. 288,417. (No model.)

Claim.—1. The combination, with posts and sliding gate, the drum, cords connected with the ends of the gate, and sprocket-wheels on the ends of the drum-shaft, of two chain belts fitted to said wheels, respectively, and pivoted pull-levers J K, arranged in pairs on opposite sides of the gate at right angles thereto, the levers of each pair being attached to the ends of a chain, as shown and described, to operate as specified.

2. The combination of the V-shaped guard T with the sliding gate the central post, a drum, and cords connected with the ends of the gate, the said guard being attached to the post, and its looped portion *t* extending beneath and in contiguity to the drum, as and for the purpose shown and described.

395,828. **AUTOMATIC PRESSURE-REGULATOR FOR THE RECEIVERS OF COMPOUND ENGINES.** JOHN T. HENTHORN, Providence, R. I. Filed Jan. 31, 1888. Serial No. 262,524. (No model.)

Claim.—1. In an engine of the class specified, the combination, with steam-cylinders provided with cut-off-valve gear, a receiver connecting the cylinders, and an auxiliary cut-off-controlling mechanism, substantially as hereinbefore described, actuated by the receiver-pressure, of a speed-controlling governor connected with said auxiliary cut-off-controlling mechanism and the said cut-off-valve gear, substantially as described, and for the purpose specified.

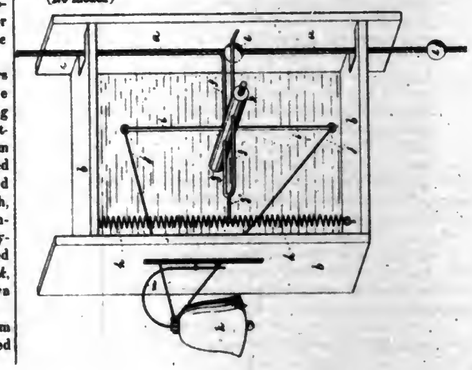


2. In a compound engine, the combination, with the steam-cylinders, a receiver uniting the cylinders, a speed-controlling governor, and cut-off-valve gear, substantially as described, of an automatically-operating pressure-controlling apparatus, substantially as described, communicating with the receiver and connected with the said governor and cut-off-valve gear by means of suitably mounted and supported toothed rods intergearing with a loosely-mounted gear-wheel, all combined, arranged, and operating, whereby any variation in the receiver-pressure from its normal pressure automatically produces a change in the point of cut off of said high-pressure cylinder independently of the governor's action, substantially as hereinbefore described and set forth.

3. In a compound engine, the high and low pressure cylinders provided with suitable valve-gear and mechanism for operating the same, a governor and cut-off rods leading therefrom and connecting with the releasing mechanism of the steam-valves, and an exhaust-receiver, as C, the combination therewith of a mounted diaphragm communicating directly with and adapted to be automatically actuated by the receiver-pressure, a vertically-mounted jointed rod having said diaphragm secured thereto, a frame mounted to travel back and forth, a pinion mounted therein having the upper portion of the diaphragm-carrying rod meshing into the pinion, oppositely-mounted and reversely-arranged toothed rods *a m'*, intergearing with the pinion and adapted to be reciprocated by said governor, and a weighted arm, as *k*, mounted to vibrate by the action of the pinion, substantially as shown and hereinbefore described, and for the purpose specified.

4. In a compound engine, the combination, with a diaphragm mounted in a chamber communicating with the receiver and a jointed and counterweighted vertically-mounted rod having a toothed upper portion, of two reversely-arranged toothed rods adapted to be reciprocated in unison by the governor, an adjustably mounted and guided frame in which the said three toothed rods are mounted, a pinion mounted in the frame and having the rods intergearing therewith, and a counter-weighted arm secured to the pinion-shaft, the whole arranged and operating substantially as shown and hereinbefore described, and for the purpose specified.

395,829. **POSITIVE SHUTTLE-MOTION FOR LOOMS.** WILLIAM F. HITCHCOCK, Homer, N. Y. Filed Jan. 28, 1888. Serial No. 262,283. (No model.)

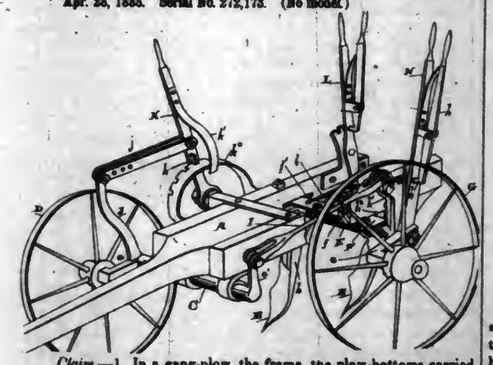


Brief.—As the lay moves up to the breast-beam and then recedes, by means of the racks pivoted to the loom-frame, the eccentric gears engaging therewith, the shafts, and the gears engaging with the racks on the shuttle-carriers, a variable reciprocatory motion is imparted thereto.

Claim.—1. The combination, with the shuttle-carriers and the toothed racks thereto fixed, gear-wheels adapted to engage the fixed racks and the racks on the carriers, and the lay, of the loom-frame and racks pivoted thereto, as and for the purpose specified.

2. The combination, with the shuttle-carriers and toothed racks thereto fixed, the lay, and the eccentric and concentric gear-wheels, combined as described, of the operating-racks and the loom-frame, as and for the purpose set forth

395,830. **OVERFLOW-ALARM.** LOUIS HOFMEISTER and OTTO R. SCHWARZ, New York, N. Y. Filed July 31, 1888. Serial No. 281,595. (No model.)



Claim.—1. The combination of a rock-shaft with a bell, a spring, and a stop, all three of which are connected to said rock-shaft, and with a rope having a series of projections that are adapted to engage the stop and rock the shaft against the action of the spring, substantially as specified.

2. The combination of a rock-shaft with a bell and with a rod, *i*, and wires *j*, that connect the bell to the rock-shaft, and with a spring, *k*, and stop *f*, also connected to the rock-shaft, and with a rope, *a*, having projections *e*, that are adapted to engage stop *f*, substantially as specified.

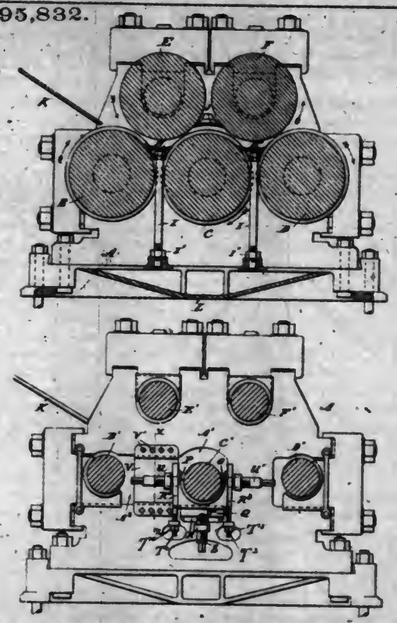
3. The combination of a rock-shaft with a bell, *k*, spring *k*, and U-shaped stop *f*, connected to said rock-shaft, and with a rope having projections *e*, adapted to engage the stop, and having a float and a weight secured to opposite ends, the bell *k* being suspended from spring *m*, substantially as specified.

395,831. **GANG-PLOW.** WILLIAM HOLLOWAY, Gilroy, Cal. Filed Apr. 28, 1888. Serial No. 272,173. (No model.)

Claim.—1. In a gang-plow, the frame, the plow-bottoms carried thereby, and a carrying-wheel on the front of the frame on the furrow side of the plow-bottoms, in combination with the carrying and gage wheel G, mounted opposite to the plow-bottoms and on the land side thereof and arranged to be turned to an angle on either side of the line of travel, whereby the plow is turned to or from the land, substantially as described.

2. In a gang-plow, the frame having the plow-bottoms and the front carrying-wheel on the furrow side, in combination with the rear carrying and gage wheel on the land side, a pivotally-mounted axle carrying said wheel, and a lever and connections with said axle, whereby the gage-wheel may be turned to or from the land, substantially as described.

3. In a gang-plow, the frame having the plow-bottoms and the front carrying-wheel on the furrow side, in combination with the rear carrying and gage wheel on the land side, the axle carrying the wheel, the pivoted bearing-plate carrying the axle, and the lever-and-link connection to the pivoted plate, whereby the gage-wheel may be turned to or from the land, substantially as described.



4. In a gang-plow, the frame having the plow-bottoms, the front crank-axle and carrying-wheel thereon, the rear axle having a pivoted crank and the carrying-wheel on said crank; and the connections, whereby the crank-axles are operated to raise or lower the plow and to level it, consisting of the lever H, connected with the pivoted crank of the rear axle, the pawl of the lever and the independent pivoted rack with which the pawl engages, the lever K, arm J, and connecting-link to the front axle, and the crank *c* and connecting-link l to the pivoted rack of the rear axle, substantially as described.

5. In a gang-plow, the frame having the plow-bottoms, the front crank-axle and carrying-wheel on the furrow side, the rear axle pivotally mounted and having a pivoted crank, and the carrying and gage wheel mounted on said crank and opposite the plow-bottoms on the land side thereof, in combination with the lever L and connections for turning the pivoted rear axle and directing the gage-wheel to or from the land, the lever H, connected with the pivoted crank of the rear axle for leveling the plow, and the lever K, and connections between it and the front axle and between the front axle and the crank of the rear axle, whereby the plows are raised or lowered, substantially as described.

395,832. **CANE-MILL.** CHARLES HUGHES, Matanzas, Cuba. Filed Sept. 22, 1887. Serial No. 250,411. (No model.)

Claim.—1. The combination, with the frame and the upper rolls, of the three lower rolls, the boxes P, receiving the journals of the middle lower roller, longitudinally-slotted wedges adjustable in the direction of the length of the roll under said boxes, vertically-adjustable set-screws having bearings on the frame and passing up through

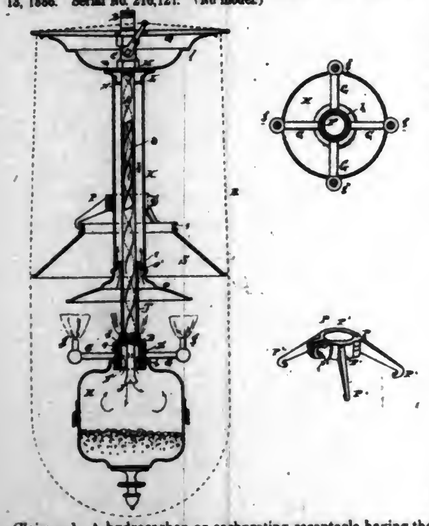
395,832.

said slots for adjusting the boxes vertically, vertically-adjustable slotted wedges at both sides of said boxes, and transverse set-screws having bearings on the frame and extending through said wedges into contact with the vertical sides of the boxes, substantially as set forth.

2. The combination of the frame A, having the horizontal open-ended slots A', the central lower roller having boxes P, supported in the slots at their closed ends, the wedge-shape plates V, closing said slots beyond the roll, the roll B, journaled in the said slots beyond the plates V, the roll D, journaled in the frame in line with the rolls B C, the bottom and side wedges, and adjusting and set screws U U', the set-screws V' being carried by the plates V, substantially as set forth.

395,833. **DRILLING AND CENTERING TOOL.** JOHN E. KITCHEN, Morrilton, Ark. Filed June 22, 1888. Serial No. 277,828. (No model.)

Claim.—1. In a tool substantially as described, the combination of the framing, the slide-rod operating in said framing and provided with an arm or portion supporting the back center, and a spring arranged to actuate said slide-rod, whereby to feed the drill forward in the operation of the device, substantially as set forth.



2. The combination, in a tool substantially as described, of the framing, the slide-rod extended through an opening in the frame and having arm or portion G, supporting the back center, a spring on said slide-rod, and a nut threaded on the slide-rod and forming an adjustable bearing for the actuating-spring, substantially as set forth.

3. The combination, with the framing, the slide-rod, the spring for actuating said slide-rod, and the arm or portion G, of a stay-rod extended from arm G and entering a guide-opening in the framing, substantially as set forth.

4. The improved tool, substantially as described, consisting of the frame having a bearing for one end of the drill or center-marker, the arm or portion arranged in rear of said bearing and supported by the rod, the spring arranged to operate said rod and give the arm a tension toward the bearing in the frame, and the back center supported in said arm or portion and arranged in rear of and in alignment with the bearing in the frame, all substantially as described, whereby the back center may be fed forward automatically, as and for the purposes specified.

5. The improved tool herein described, consisting of the frame having openings *a a'*, the slide-rod H, operating through opening *a* and having arm G, having a back center and provided with a stay-rod extended into the opening *a'*, and the actuating-spring, all substantially as and for the purposes specified.

395,834. CARBURETING-LAMP. ARTHUR KITSON and WILLIAM S. HOREY, Philadelphia, Pa., assignors, by direct and mesne assignments, to the Kitson Gas Light Improvement Company, same place. Filed Oct. 13, 1886. Serial No. 216,127. (No model.)

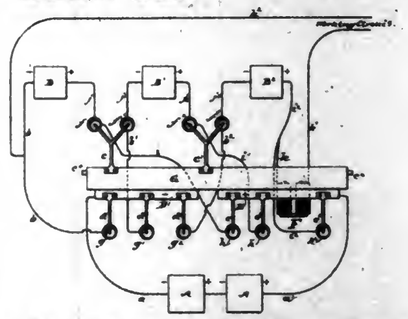
Claim.—1. A hydrocarbon or carbureting receptacle having the gas-burners permanently secured to it, in combination with the gas-supply pipe and a coupling-joint above the burners, whereby the carbureting-vessel and its burners are detachably connected with the supply-pipe, substantially as and for the purpose specified.

2. In a gas-fixture, the depending gas-pipe having burners at the bottom, a surrounding casing for said pipe closed at the top and having an enlarged mouth at the bottom, a clamp to surround and grip said casing, and a shade supported by said clamp, but forming an annular opening through its top, whereby the products of combustion are guided up around the casing and protect it from the action of cold-air currents, substantially as and for the purpose specified.

3. In a gas-fixture, the depending gas-pipe, a surrounding case to arrest and hold products of combustion to heat the incoming gas, the said case having a bell-shaped or flaring mouth at the bottom, a gas-burner at the bottom, a clamp adapted to surround the case and grip the same, and a shade held or supported by said clamp, whereby the shade and its clamps may be put upon a fixture already erected without dismantling the same.

4. In a gas-fixture, the depending gas-pipe, a surrounding case to arrest and hold products of combustion to heat the incoming gas, the said case having a bell-shaped or flaring mouth at the bottom and an enlargement of the top, a gas-burner at the bottom, a removable jointed clamp adapted to surround the case and grip the same, and a shade held or supported by said clamp, whereby the shade and its clamps may be put upon a fixture already erected without dismantling the same, substantially as and for the purpose specified.

5. In a gas-fixture, the combination of central gas-pipe, A, the surrounding heater-case K, forming an annular chamber, *k*, around the gas-pipe, the centering-shield L at the top to practically close said case K at the upper end, the centering-bell O at the bottom, having openings or perforations to support the case K and admit heated products thereto, the sleeve T, to support the bell O, suitable burners and a carbureting-receptacle rigidly secured together and detachably connected to the bottom of the gas-pipe, and a nut to hold said sleeve in place, the construction admitting of ready dismantling or putting of the parts together.



6. In a gas-fixture, the combination of central gas-pipe, A, the surrounding heater-case K, forming an annular chamber, *k*, around the gas-pipe, the centering-shield L at the top to practically close said case K at the upper end, the valve O at the upper end of pipe A, the body of which is adapted to hold shield L down, the centering-bell O at the bottom, having openings or perforations to support the case K and admit heated products thereto, the sleeve T, to support the bell O, suitable burners at the bottom of the gas-pipe, and a nut to hold said sleeve in place, the construction admitting of ready dismantling or putting of the parts together.

7. In a chandelier, a gas-supply tube above the burner having its interior divided into two longitudinal spiral or circuitous passage-ways, in combination with an inlet at one end connecting with both of said passage-ways and a gas-burner at the other end in like connection with both passage-ways, substantially as and for the purpose specified.

395,835. MODE OF PREPARING SOLUTION COMPOUNDS FOR GALVANIC BATTERIES. WILLIAM P. KOOKOGEY, Brooklyn, N. Y., assignor to the Kookogey Electric Company. Filed June 11, 1888. Serial No. 276,773. (No specimens.)

Claim.—The process of making a battery dry compound whose ingredients are sulphate of soda, bichromate of soda, and sulphuric acid, consisting of the following steps, viz: first, dissolving the sulphate and the bichromate in about one half of the quantity of acid to be used, the same being heated, and then adding quickly the remainder of the acid, substantially as described.

395,836. APPARATUS FOR CHARGING AND DISCHARGING SECONDARY BATTERIES. WILLIAM P. KOOKOGEY, Brooklyn, N. Y., assignor to the Kookogey Electric Company. Filed June 11, 1888. Serial No. 276,774. (No model.)

Claim.—1. The combination of the following elements: an electric generator and charging-circuit, a storage cell or battery, a working-circuit, an electro-magnet forming part of such working-circuit, and commutating mechanism controlled by such electro-magnet and operating a series of circuit closers and breakers, whereby the storage cell or battery is alternately connected in circuit with the charging-circuit and with the working-circuit, substantially as described.

2. The combination of the following elements: an electric generator and charging-circuit, a storage cell or battery, a working-circuit, an electro-magnet forming part of the working-circuit, a local battery and circuit, of which the working-circuit forms a part, and commutating mechanism controlled by such electro-magnet and operating a series of circuit closers and breakers, whereby the storage cell or battery is alternately connected in circuit with the charging-circuit and with the working-circuit, substantially as described.

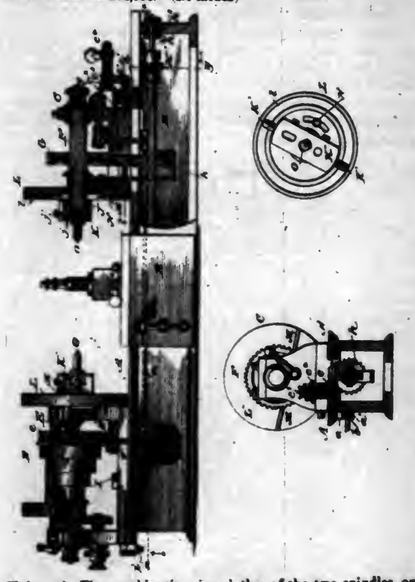
3. The combination of the following elements: an electric generator and charging-circuit, a storage cell or battery, a working-circuit, an electro-magnet forming part of such working-circuit, commutating mechanism controlled by such electro-magnet during the period of discharge and operating a series of circuit closers and breakers, whereby the storage cell or battery is alternately connected in circuit with the charging-circuit and with the working-circuit, a local battery and circuit of which the working-circuit forms a part, and a second electro-magnet in the local circuit, controlling the change of the commutating mechanism from the position of charge to that of discharge, and thereby also breaking the local circuit, substantially as described.

4. The combination of the following elements: an electric generator and charging-circuit, a storage-battery consisting of a number of cells, a working-circuit, and commutating mechanism operating a series of circuit closers and breakers, whereby the storage-battery may be alternately connected in parallel in the charging-circuit and in tension series with the working-circuit, substantially as described.

5. The combination of the following elements: a primary galvanic battery and charging-circuit, a storage-battery consisting of a number of cells, a working-circuit, and commutating mechanism operating a series of circuit closers and breakers, whereby the storage-battery may be alternately connected in parallel in the charging-circuit and in tension series with the working-circuit, substantially as described.

6. The combination of the following elements: an electric generator and charging-circuit, a storage-battery consisting of a number of cells, a working-circuit, an electro-magnet forming part of such working-circuit, commutating mechanism controlled by such electro-magnet and operating a series of circuit closers and breakers, and circuit-connections between the various cells, whereby the storage-battery is alternately connected in parallel in the charging-circuit and in tension series with the working-circuit, substantially as described.

7. The combination of the following elements: an electric generator and charging-circuit, a storage-battery consisting of a number of cells, a working-circuit, an electro-magnet forming part of such working-circuit, a local battery and circuit of which the working-circuit forms a part, commutating mechanism controlled by such electro-magnet and operating a series of circuit closers and breakers, and circuit-connections between the various cells, whereby the storage-battery is alternately connected in parallel in the charging-circuit and in tension series with the working-circuit, substantially as described.



8. The combination of the following elements: an electric generator and charging-circuit, a storage-battery consisting of a number of cells, a working-circuit, an electro-magnet forming part of such working-circuit, commutating mechanism controlled by such electro-magnet and operating a series of circuit closers and breakers, with circuit-connections between the various cells, whereby the storage-battery may be alternately connected in parallel in the charging-circuit and in tension series with the working-circuit, a local battery and circuit of which the working-circuit forms a part, and a second electro-magnet in the local circuit, controlling the change of the commutating mechanism from the position of charge to that of discharge, and thereby also breaking the local circuit, substantially as described.

9. The combination of insulating-piece G, having attached to it conducting-strips D and E, and conducting-arms *c d e*, &c., and pivoted at its ends at such a point that gravity will hold the arms *d e*, &c., within their respective cups, with the lever *m*, carrying an armature, and the electro-magnet F, forming part of the working-circuit, substantially as and for the purpose described.

395,837. METHOD OF PREPARING SOLUTION COMPOUNDS FOR GALVANIC BATTERIES. WILLIAM P. KOOKOGEY, Brooklyn, N. Y., assignor to the Kookogey Electric Company. Filed Aug. 13, 1888. Serial No. 282,627. (No specimens.)

Claim.—The process of making a battery compound whose ingredients are sulphate of soda, bichromate of soda, and sulphuric acid, consisting of the following steps, namely: first dissolving the bichromate in just enough hot water to hold it in supersaturated solution and then mixing therewith the sulphuric acid and sulphate of soda, to be used substantially as described.

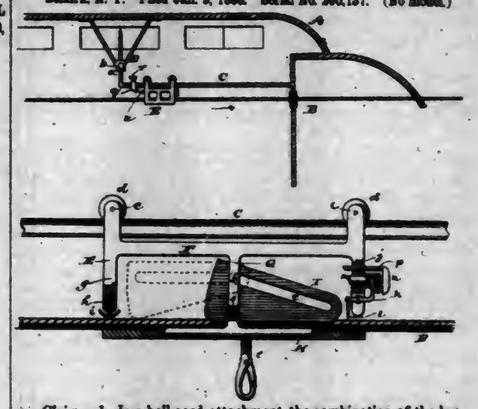
395,838. LATHE FOR TURNING BODIES HAVING ELLIPTICAL CROSS-SECTIONS. JOSEPH K. KOONS, Montgomery, Pa. Filed Apr. 20, 1888. Serial No. 271,358. (No model.)

Claim.—1. The combination, in a lathe, of the two spindles, one of which is movable laterally with reference to the other, the movable work-holders connected therewith, and the gearing and connecting-shaft between said spindles, such shaft being formed in sections united by universal couplings, substantially as set forth.

2. The combination, in a lathe, of the two spindles, the head-stocks supporting same, one of said head-stocks being movable laterally with reference to the other, the bed-frame, and the gearing and connecting-shaft connecting said spindles, such shaft being formed in sections and having its end section supported adjustably in the framing, substantially as set forth.

3. In a turning-lathe, the combination of the spindle, the head J, secured thereon, the plate K, held and movable in a groove in said head J and having a portion or arm, K', and a plate, L, having a groove to receive said portion, the parts J K being provided with openings 1 2, movable into register and adapted to receive a securing-pin, substantially as set forth.

4. In a turning-lathe, the combination of the bed-frame having a rack, *c'*, the tail-stock C, the shaft *c'*, journaled thereto and having a pinion, *c*, engaging rack *c'* and a bevel-gear, *c²*, and the counter-shaft *c⁴*, having a bevel-pinion, *c³*, substantially as set forth.



5. In a turning-lathe, the combination of the bed-frame, the head and tail stocks thereon, one of such stocks being adjustable laterally with reference to the other, the spindles and guide-plates supported by said stocks, the work-holder supports on said spindles and provided with studs or portions arranged to engage the guide-plates, and the gearing and connecting-shaft connecting such spindles, such shaft being formed in sections and having its end section supported adjustably in the framing, substantially as set forth.

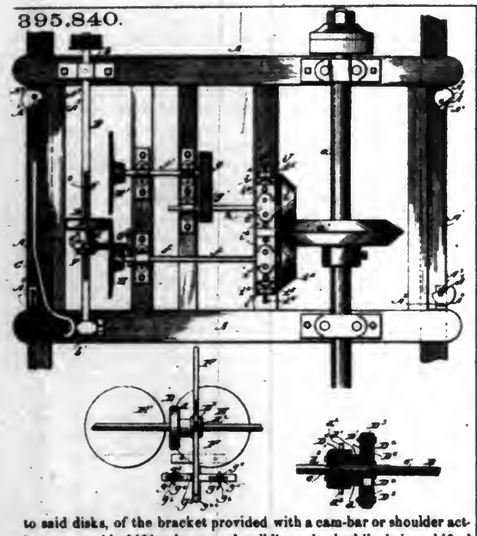
6. The combination of the head supported on the spindle and provided with a dovetail groove, the work-support having a rib fitting said groove, the gib *j*, and set-screw *j'*, all substantially as and for the purposes specified.

7. In a turning-lathe, the combination of the head supported on the spindle, the support K, provided with the spindle O and having a slot, 3, fitted to receive the tail of a carrier, such support being movable radially and provided with a stud or projecting portion, and guides arranged for engagement by said stud or portion, substantially as set forth.

8. The combination, in a turning-lathe, of the bed-frame, the two head-stocks, one of said head-stocks being adjustable laterally with reference to the other, the spindles in said head-stocks, the gear-wheels in said spindles, the connecting-shaft formed in sections united by universal joints, and the pinions on the said shaft, one of said pinions being movable along the shaft, all substantially as and for the purposes specified.

395,839. BELL-CORD ATTACHMENT. GEORGE A. LA PEYRE, Selkirk, N. Y. Filed Jan. 9, 1888. Serial No. 260,137. (No model.)

Claim.—1. In a bell-cord attachment, the combination of the bar C, suspended from the ceiling of the car, the carriage E, provided with rollers *d*, adapted to rest upon the bar C, the slotted clamping-wedge I, inserted in a slot of the bar G, the knife L, the lever K, pivotally connected with the knife and pivoted in the carriage E, and the spring-pressed bar M, provided with the head N, arranged to engage the lever K and operate the knife L, substantially as specified.



2. In a bell-cord attachment, the combination of the adjustable bar C, the frame F, provided with rollers *d*, resting upon the bar C, the grooved bar H, for receiving the rope B, the slotted wedge I, carried by the carriage E, and the spring-pressed follower *i*, carried by the carriage and adapted to clamp the rope B upon the grooved bar H, substantially as specified.

395,840. SAW-MILL FEED MECHANISM. ALON LANG, Atlanta, Ga. Filed Apr. 7, 1883. Serial No. 269,902. (No model.)

Claim.—1. In a saw-mill feed mechanism, the combination of the saw arbor or shaft wheel, the disks disposed edgewise to each other, together with shaft and gearing for transmitting motion from said wheel to said disks, and the sliding wheel having contact with either one or the other of said disks, and the feed-shaft pivotally supported in position, substantially as set forth.

2. In a saw-mill feed mechanism, the combination, with the shifting-lever, the sliding wheel having connection with said lever, the feed-shaft carrying said wheel and pivotally supported in position, and the disks, together with shafts and gearing for transmitting motion

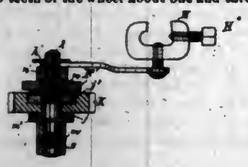
395,840.

to said disks, of the bracket provided with a cam-bar or shoulder acting upon said shifting-lever as the sliding wheel while being shifted arrives opposite the space between the disks, substantially as specified.

3. In a saw-mill feed mechanism, the combination of the disks secured edgewise to each other and upon shafts driven from the saw-shaft wheel, the shifting-lever engaging with a wheel sliding upon a shaft, a lever having a cam-shaped pivoted end for moving the wheel to and from the said disks, and the bracket having a cam-bar adapted to act upon the wheel-shifting lever, substantially as specified.

4. In a saw-mill feed mechanism, the combination of the disks secured edgewise to each other and upon shafts driven from the saw-shaft wheel, the shifting-lever engaging with a wheel sliding upon the feed-shaft, and the bracket having a cam-bar acting upon the shifting-lever, substantially as set forth.

5. In a saw-mill feed mechanism, the combination of the disks secured edgewise to each other and upon shafts driven from the saw-shaft wheel, the shifting-lever engaging with a wheel sliding upon the feed-shaft, and a cam-bracket having arms limiting the throw or movement of the shifting-lever, substantially as set forth.



6. In a saw-mill feed mechanism, the combination of the disks secured edgewise to each other and upon shafts driven from the saw-shaft wheel, the shifting-lever engaging with a wheel sliding upon the feed-shaft, and a cam-bracket having adjustable arms limiting and varying the throw or movement of the shifting-lever, substantially as set forth.

7. In a saw-mill feed mechanism, the combination of the disks secured edgewise to each other and upon shafts driven from the saw-shaft wheel, the shifting-lever engaging with a wheel sliding upon the feed-shaft, all supported upon a frame adjustable by means of angle-irons or brackets having their horizontal arms provided with slots, and eccentrics applied to said brackets and adapted to be manipulated by a wrench, substantially as set forth.

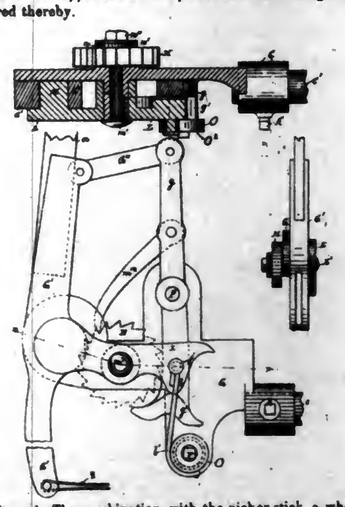
8. In a saw-mill feed mechanism, the combination, with the sliding wheel shaft-boxes, of the plate provided with end pieces, fixed blocks secured upon said plate, sliding blocks, springs acting upon said latter blocks, and holding or adjusting screws working in said plate, end pieces, and against said springs, substantially as set forth.

395,841. SHUTTLE-CHECK FOR LOOMS. CHARLES A. LITTLEFIELD, Fall River, assignor of one-half to Elias A. Tuttle and James T. Milne, Bristol County, Mass. Filed Oct. 29, 1887. Serial No. 253,707. (No model.)

Brief.—The momentum of the shuttle is absorbed by a ratchet-wheel whose rotation is retarded by friction devices, the ratchet-wheel being engaged by a pawl carried by a lever connected to a vibrating arm of the shuttle-operating mechanism. At each pick the pawl is carried over the teeth of the wheel about one and three-fourths teeth.

Claim.—1. The combination, with a vibrating arm or lever of a shuttle-motion and the picker-stick connected thereto, of the lever F', connected to the said vibrating arm or lever, the pawl G, the wheel K, and devices for frictionally retarding the rotation of the said wheel, the combination being constructed and operating substantially as described, and serving to arrest the picker-stick in its outward movement before it reaches the extreme of the said movement and hold it there in position to arrest the flight of the shuttle.

2. The combination, with a vibrating arm or lever of a shuttle-motion and the picker-stick connected thereto, of the lever F', the link A, the collar H, means for adjustably securing said collar upon the said arm or lever of the shuttle-motion, the pawl G, the wheel K, and devices for frictionally retarding the rotation of the said wheel, the combination being constructed and operating substantially as described, and serving to arrest the picker-stick in its outward movement before it reaches the extreme of the said movement and hold it there in position to arrest the flight of the shuttle.



3. The combination, with a vibratory arm or lever of a shuttle-motion and the picker-stick connected thereto, of the collar H, the set-screw H°, the link A, the lever F', the pawl G, the wheel K, and devices for frictionally retarding the rotation of the said wheel, the combination being constructed and operating substantially as described, and serving to arrest the picker-stick in its outward movement before it reaches the extreme of the said movement and hold it there in position to arrest the flight of the shuttle.

4. The combination, with the wheel K and devices for frictionally retarding the rotation of the said wheel, of the pawl G, the lever F', the link A, the collar H, and means for clamping the said collar in place upon a vibrating arm or lever of a shuttle-motion, all being as and for the purposes set forth.

5. The combination, with the stock B and stud *k*, of the washer *m'*, the friction-washers *j' j'*, the wheel K, the nut *n*, having a reduced exterior portion, as described, the check-nut *n'*, the lever F', mounted upon the reduced portion of nut *n* and held in place laterally by the nut *n'*, and the pawl G, all substantially as described.

395,842. SHUTTLE-OPERATING MECHANISM FOR LOOMS. CHARLES A. LITTLEFIELD, Fall River, assignor of one-half to Elias A. Tuttle and James T. Milne, Bristol County, Mass. Filed Nov. 1, 1887. Serial No. 253,864. (No model.)

Brief.—The momentum of the shuttle is absorbed by a ratchet-wheel whose rotation is retarded by friction devices, the wheel being engaged by a pawl carried by a lever connected to the picker-stick. Said lever has at its lower end a cam portion adapted to engage the inner end of a lever carrying the picker-stick pivoted at its outer end, movement of the upper end of the picker-stick in a straight line being secured thereby.

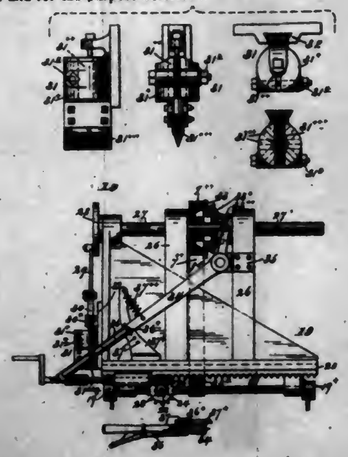
Claim.—1. The combination, with the picker-stick, a wheel, and devices for frictionally retarding the rotation of said wheel, of a pawl connected with the said picker-stick and adapted to engage with the wheel in the outward movement of the picker-stick, the picker-stick being thereby stopped in the outward movement and held at a slight distance from the extreme end of the said movement and in position to receive the shuttle and check it in its flight from the opposite box, substantially as described.

2. The combination, with the picker-stick, of a wheel, devices for retarding the rotation thereof, and a pawl connected with the said picker-stick, the said pawl during the inward movement of the picker-stick moving over more than one tooth on the said wheel, but not far enough to engage with the following tooth, and the combination being and operating substantially as described, whereby the outward movement of the picker-stick is arrested by the engagement of the pawl with the tooth of the wheel passed over by the pawl, and the picker-stick is held in position to receive the shuttle.

3. The combination, with the picker-stick, of the pawl-carrying lever connected thereto, a wheel and devices for retarding the rotation thereof, the combination being and operating substantially as described, whereby during the increased movement of the picker-stick the pawl is moved a distance sufficient to carry it over more than one tooth on the wheel, but not far enough to engage with the following tooth, and whereby the outward movement of the picker-stick is arrested by the engagement of the pawl with the tooth of the wheel passed over by the pawl, and the picker-stick is held in position to receive the shuttle.

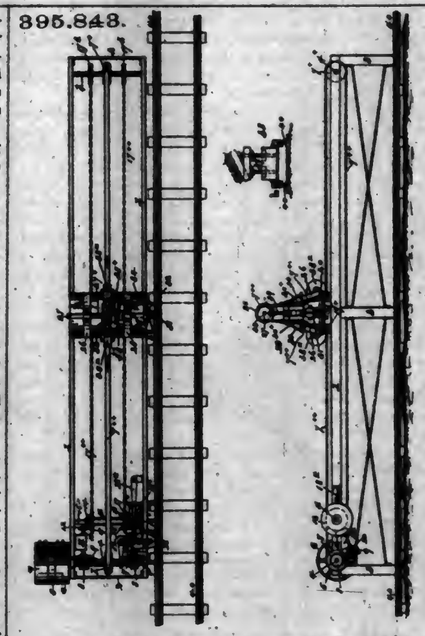
4. The combination, with the picker-stick, of the link G", the lever *g*, pawl m^{12}, wheel H, and devices for frictionally retarding the rotation of said wheel, the said pawl during the inward movement of the picker-stick moving over more than one tooth on the said wheel, but not far enough to engage with the following tooth, and the outward movement of the picker-stick being arrested by engagement of the pawl with the tooth passed over by the pawl, and the picker-stick held in position to receive the shuttle, substantially as described.

5. The combination, with the picker-stick and its holder or stock, of the lever on one end of which said holder or stock is pivoted, and a lever connected with the stock or holder and having a cam-formed portion engaging with the said lever, substantially as described, whereby the upper end of the picker-stick is caused to move in a horizontal straight line.



6. The combination, with the picker-stick and its holder or stock, of a supporting-lever on which said holder or stock is pivoted, a second lever connected with the holder or stock and provided with a cam-formed portion acting upon said supporting-lever, and a spring for holding the supporting-lever in contact with the cam portion of the second lever, substantially as described, whereby the upper end of the picker-stick is caused to move in a horizontal straight line.

7. The combination, with the stock G' and the lever L, of the lever *g*, connected with said stock and provided with the cam portion *g'*, and the spring *o*, connected with the said lever L, substantially as described.



8. The combination, with the stock G' and the supporting-lever L, of the lever *g*, connected with the said stock and provided with the cam-formed portion *g'*, the spring *o*, connected with the supporting-lever L, the pawl m^{12}, the ratchet-wheel H, and devices for frictionally retarding the rotation of the said wheel, substantially as described.

395,843. MACHINE FOR DRESSING STONE. FRANK MANNING, Narberth, Pa., assignor to the Manning Machine Company, of New Jersey. Filed July 13, 1888. Serial No. 279,855. (No model.)

Claim.—1. In a stone-dressing machine, the combination, with the bevel gear-wheels on the inclined shafts, of the transverse shaft-carrying gear-wheels meshing therewith, one of said gear-wheels being loose on said shaft, and having a cut-out portion or notch, a sleeve enveloping the shaft and carrying sprocket-wheels, and a clutch-collar connected with one of the wheels and having a lug or projection for engaging the cut-out portion or notch in the bevel gear-wheel, substantially as and for the purpose described.

395,843.

2. In a stone-dressing machine, the combination, with the shaft having the collar or flange provided with a lug, and carrying the gear-wheels, one of which is loose and is provided with a notch, of the sleeve encircling said shaft and carrying the sprocket-wheels, the clutch or coupling collar having arms which pass through one of the sprocket-wheels and provided with a lug for engaging the notch in the bevel gear-wheel, and a notch to receive the lug on the collar or flange of the shaft, all arranged and adapted to serve substantially as and for the purpose described.

3. In a stone-dressing machine, the combination, with the frame, the shaft journaled therein, the loose cupped driving-pulley and clutch on said shaft, the crank-wheel, rod, spring, and hammer carrying the cutter, of the lever fulcrumed to the frame, having one end engaging the clutch for shifting the same, and devices carried by the lever for engaging means to retain said lever in the position to which it is shifted, substantially as described.

4. In a stone-dressing machine, the combination of a frame, shafts mounted in the frame carrying sprocket-wheels, sprocket-chains passing over said wheels, a carriage connected with said chains and traveling on the frame, and mechanism for imparting different speeds to the chains to cause the carriage to travel at different speeds, substantially in the manner and for the purpose set forth.

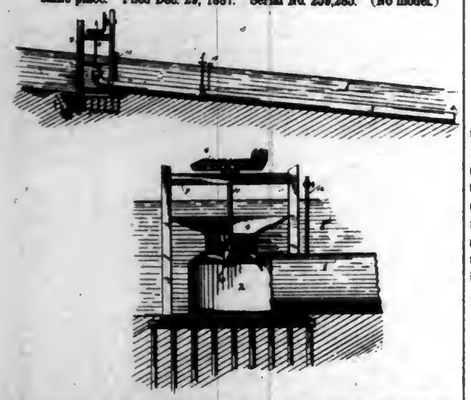
5. In a stone-dressing machine, the combination of a frame, shafts carrying sprocket-wheels mounted thereon, chains passing over said wheels, a carriage mounted on the frame and connected with the chains, the driving-shaft mounted in the frame and carrying worm-wheels, worm-gears meshing with said worm-wheels, bevel gear-wheels operated by the worm-gears, and bevel gear-wheels on one of the shafts carrying the sprocket-wheels meshing with said bevel-gears, whereby motion is transmitted to the sprocket-chains for moving the carriage on the frame, substantially in the manner and for the purpose described.

6. In a stone-dressing machine, the combination of a frame, the driving-shaft mounted therein carrying a pulley, shafts mounted in the frame carrying sprocket-wheels, a pulley on one of said shafts, a carriage mounted on the frame carrying pulleys, a band passing over the pulleys on the carriage and shafts, sprocket-chains passing over the sprocket-wheels on the shaft and connected to the carriage, and mechanism for imparting motion from the driving-shaft to the sprocket-wheels and pulleys, whereby the chains and band are caused to travel, substantially in the manner and for the purpose described.

7. In a stone-dressing machine, the combination of the sprocket-wheels, the chains passing over said sprocket-wheels, the carriage connected with said chains, the transverse rack carried by the carriage, the pinion engaging said rack, and the worm-wheel for operating the pinion, all operating as described, whereby the carriage is caused to travel longitudinally and transversely, substantially in the manner and for the purpose described.

8. In a stone-dressing machine, the hammer-head having the clamping-jaws, the cutter having an arm or extension adapted to be clamped in said jaws, and means in the hammer-head for causing the jaws thereof to clamp the arm of the cutter, substantially in the manner and for the purpose described.

9. In a stone-dressing machine, the hammer-head consisting of two spring clamping-jaws and a screw passing through said jaws for causing them to clamp the cutter in any desired position in said jaws, substantially in the manner and for the purpose described.



10. In a stone-dressing machine, the stone-carrying trucks having the depressions or recesses on the support thereof, and the screws having heads fitting in said depressions and capable of vertical adjustment in the frame of the truck, whereby the support of said truck can be adjusted to present the surface of the stone horizontally, or incline the stone to either side to present the edges thereof, on both sides of the stone, to the action of the cutter, substantially as described.

11. In a stone-dressing machine, the combination of the carriage, the cutting mechanism, the shaft mounted in the carriage for operating said mechanism, the loose pulley on said shaft, the clutch for making said pulley fast, devices for shifting said clutch into and out of contact with the loose pulley, and devices for retaining the shifting mechanism in the desired position, substantially in the manner described.

12. In a stone-dressing machine, the combination of the carriage, the shaft mounted therein, the loose pulley on said shaft, the guiding-pulleys on the carriage, the driving-belt passing over all of said pulleys, the clutch for making the loose pulley on the shaft fast, so as to rotate said shaft, and means for throwing the clutch into and out of operation, substantially in the manner described.

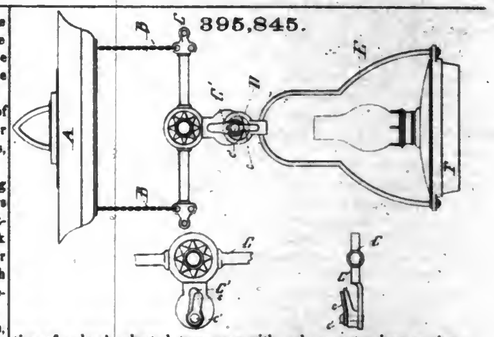
395,844. APPARATUS FOR UTILIZING HYDRAULIC PRESSURE.

JOHN M. MARTY, Cleveland, Ohio, assignor of one-half to Francis J. Wing, same place. Filed Dec. 29, 1887. Serial No. 259,285. (No model.)

Claim.—1. In the application of hydraulic power, the combination of an inclined open-ended pipe submerged in a stream of water and provided with a shut-off gate, and a water-wheel within the pipe connected with gearing, substantially as shown and described.

2. In hydraulic machinery, a conduit-pipe open at either end, the pipe at its upper end having an upright arm a cross-section of which is of less area than a cross-section of the main pipe, which upright arm is provided with a turbine wheel connected with gearing, such conduit-pipe being provided at its lower end with a shut-off gate or valve and with a vent-pipe with cock, the whole pipe being inclined at the angle of a stream of water and having both its upper and lower ends submerged therein, substantially as shown and described.

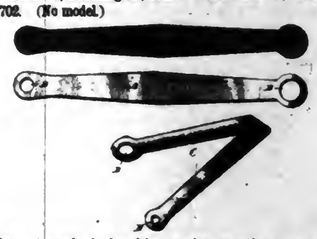
3. In hydraulic machinery, an inclined open-ended conduit-pipe provided with a water-wheel and gearing at its upper end and with a shut-off gate, such pipe being submerged at either end in a stream and inclined at the angle of descent of such stream, and being provided with a shut-off gate or valve at any point in the pipe below the level of the water at the lower end of such pipe, substantially as shown and described.



4. In machinery for the application of hydraulic power, the combination of the conduit-pipe 1, provided with arm 2 and flood-gate 5, and vent-tube and cock 12, with horizontal wheel 4, provided with shaft 11 and gearing 6, substantially as shown and described.

395,845. LAMP-HANGER.

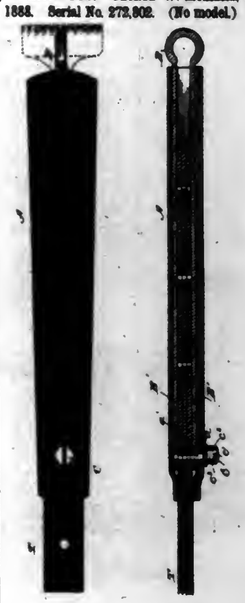
EDWARD MILLER, Meriden, Conn., assignor to Edward Miller & Company, same place. Filed June 20, 1888. Serial No. 278,326. (No model.)



Claim.—In a hanger for lamps and other articles, the combination of a hook adapted to engage with and support a loop or ring, and a button pivotally attached at one end to the lower end of said hook and adapted to be turned upward in a line with said hook, so as to permit the engagement of said loop or ring and to be afterward turned downward to prevent the disengagement of said loop or ring, substantially as described.

395,845.

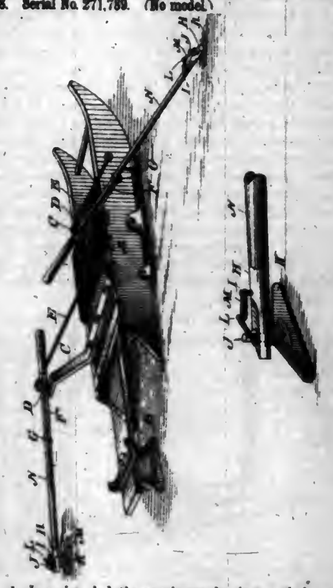
395,846. METHOD OF MAKING STEEL-TRAP SPRINGS.



SAMUEL MITCHELL, Southington, Conn. Filed June 11, 1888. Serial No. 276,702. (No model.)

Claim.—A method of making steel-trap springs, consisting in cutting, straightening, and heating worn-out steel wagon and carriage wheel tires, then hot-rolling them to the thickness required for the springs, then working the strips so formed into trap-spring blanks, then perforating the ends of the blanks, or reaming out or enlarging such openings as may be in their ends, then heating each blank about midway of its length and bending it, then tempering them in water, and then dipping them in oil and burning off the adhering film thereof, those portions of the strips having unobliterated nail-holes being utilized in the ends of the blanks, substantially as set forth.

395,847. HAME-TUG.



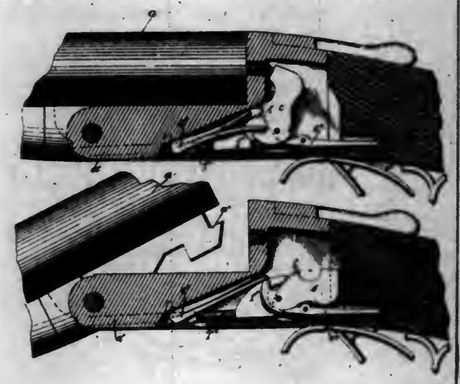
GEORGE W. MOLIERE, Ocean View, Cal. Filed May 4, 1888. Serial No. 272,802. (No model.)

Claim.—A hame-tug consisting of a hollow leather casing for the reception of the entire end of the trace, a metal eye or clip with shanks extending along the inside walls of the leather casing and leaving space between them for the tug, and a set-screw passing through the rear ends of the hollow casing, the extended shanks, and the trace, substantially as shown and described.

395,848. ICE-BOAT.

JOHN MCGRATH, Danbury, Conn. Filed Apr. 25, 1888. Serial No. 271,789. (No model.)

Claim.—1. In an ice-sled, the outriggers having at their extremities upwardly-projecting thole-pins, in combination with the oars having attached thereto keepers free at their outer ends, and the safety-catch adapted to slide on the oar-handles and close the keepers, substantially as set forth.



2. In an ice-boat, the combination, with the oar-handle having a ferrule at its outer end, of a swinging and resilient blade attached to said ferrule, substantially as shown and set forth.

3. The combination, with the oar-handle having a ferrule on its outer end, of the post extending upward through said ferrule, the oar-blade secured to the bottom of said post, the cross-pin extending through said post immediately above the ferrule, the pin projecting from said ferrule, and the coil-spring connecting the said pin and cross-pin, substantially as and for the purposes set forth.

395,849. BREECH-LOADING FIRE-ARM.

EDWARD G. PARRY, Ithaca, N. Y. Filed Mar. 19, 1888. Serial No. 267,616. (No model.)

Claim.—In a breech-loading gun, the combination, with the hinged barrels provided with a beveled catch, of a beveled spring-latch in the breech having its rear end flanged, a pair of headed pins engaging the flanged latch, and a breaking-lever having a rocking stud cut away on one side to engage and operate the pins, substantially as and for the purpose set forth.

395,849.

395,850. PITMAN.

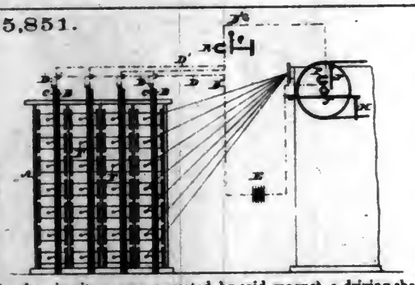
FRANK H. ROGERS, Golden, Colo. Filed May 7, 1888. Serial No. 273,043. (No model.)

Claim.—1. The combination of a pitman or other connecting rod, two straps thereon having concaved ends forming the socket of a joint, and a second rod to be connected to the pitman-rod and carrying the head or ball of a ball-joint, the head or ball having a cylindrically-shaped lubricant-reservoir in its interior, an inclined plug or stopper therefor, and a passage or passages leading thence to the bearing to be lubricated, substantially as set forth.

2. The combination of a pitman or other connecting rod, two straps, one permanently secured thereto and one removably secured thereto, both straps having concaved ends for forming a socket for a ball-and-socket joint, and a second rod or shaft carrying the head of the joint, said head having a cylindrically-shaped lubricant chamber or reservoir in its interior, provided with a stopper or plug and with one or more inclined passages leading thence to the bearing to be lubricated, substantially as set forth.

3. The combination of a rod or shaft carrying the head or ball of a ball-and-socket joint, a pitman or other connecting rod, two straps, one permanently and one removably secured thereto and both formed with concaved ends for forming the socket of the joint, a loop for securing the rear end of the removable strap to the rod, a bolt seated against the fixed strap and having an elongated head adapted to pass through a correspondingly-shaped slot in the removable strap, and means for locking such head in holding position, substantially as set forth.

4. The combination of a pitman or other driving rod, a second rod or shaft, and a ball-and-socket joint uniting them, consisting of a socket attached to one rod and a head or ball carried by the other, said head or ball having an interior cylindrically-shaped oil or lubricant chamber, a plug or stopper closing the same, and an inclined passage or passages leading from the chamber to the bearing to be lubricated, substantially as set forth.



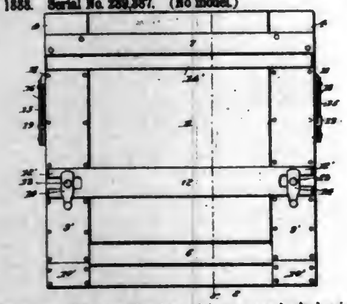
395,851. STOP-MOTION FOR WARPING-MACHINES.

LEWIS H. A. SCHWARTZ, Philadelphia, Pa., assignor to John A. Wiedersheim, same place. Filed Mar. 30, 1887. Serial No. 232,949. (No model.)

Brief.—The invention consists in improved electrically-actuated devices for stopping the warping-machine upon the breaking of a yarn.

Claim.—1. The electrically-insulated plates C and F, in combination with the yarn-guide F, pivoted to said plate F, and having the heel G, an electric generator with wires leading to said plates, a mag-

395,851.



net in the circuit, an arm operated by said magnet, a driving-shaft with fast and loose pulleys thereon, the sleeve K, feathered on said shaft, and the loose sleeve K', with abutment M, said sleeves having cam contact-faces, the arm J, with shipper H, and a driving-belt, substantially as and for the purpose set forth.

2. The creels A, having the uprights B, the series of insulated plates C and F, secured to said uprights B, a series of guides, F, pivoted to one of the series of plates and normally disconnected from the other, an electric generator with main wires and a series of branch wires, the latter connecting the main wires to the said plates, the magnet P in said main circuit, a pivoted arm controlled by said magnet, a driving-shaft with fast and loose pulleys thereon, a belt, a shipper-actuating mechanism mounted on said driving-shaft and consisting of two sleeves having cam contact-faces, one of said sleeves having an abutment adapted to be in contact with the magnet-controlled arm, and the other sleeve feathered on said shaft, an arm actuated by the feathered sleeve and having a shipper, and a magnet and an indicator in each branch circuit, said parts being combined substantially as and for the purpose set forth.

3. A warping-machine having creels, and uprights secured to the frame of said creels, yarn-guides having supports connected to said frame, an electric generator, main wires connected with the generator, branch wires connected with the main wires and secured to said uprights, electric connections between said main wires and the yarn-guides, a magnet in the circuit, an arm operated by said magnet, a driving-shaft with fast and loose pulleys thereon, a sleeve feathered on said shaft, a loose sleeve on said shaft provided with an abutment, said sleeves having cam contact-faces, an arm with a shipper, and a driving-belt, substantially as described.

395,852. END-GATE. FRANK S. SEARS, Atkinson, Ill. Filed Oct. 29, 1888. Serial No. 289,367. (No model.)

Claim.—1. The combination, with a wagon-body having a projecting strip or ledge at the rear end of its bottom, of an end-gate adapted to rest on the projecting strip and connected to the wagon-body on each side by metallic straps pivoted together and hooks on the sides of the wagon-body with which the straps pivoted to the end-gate engage, substantially as described.

2. An end-gate constructed with a detachable panel and means for fastening the panel to the end-gate, substantially as described.

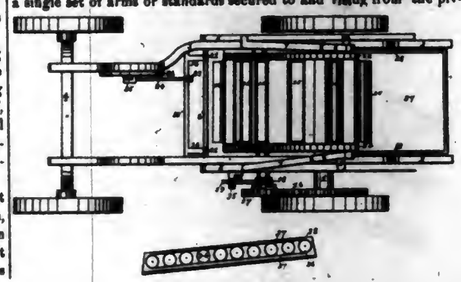
3. An end-gate constructed with the vertical portions 4, having projecting screw-threaded bolts 13, the bottom connecting-bar, 6, the top connecting-bar, 7, and the panel 11, with its upper end projecting within the bar 7 and its lower end resting on bar 6, the cross-bar 14', secured to panel 11 and having projecting ends overlapping vertical portions 4, and the cross-bar 12, secured to panel 11 and having projecting slotted ends 12', engaging bolts 13, and held in place by crank-nuts 14 on the bolts 13, substantially as described.

4. The combination, with a wagon-body having a projection at the rear end of its bottom, of an end-gate resting on the projection, brackets on the sides of the wagon-body, and hooks and straps on each side of the end-gate pivoted together at their inner ends and at their outer ends to the brackets and end-gate, respectively, the straps pivoted to the end-gate being laterally movable into engagement with the bracket-hooks, substantially as described.

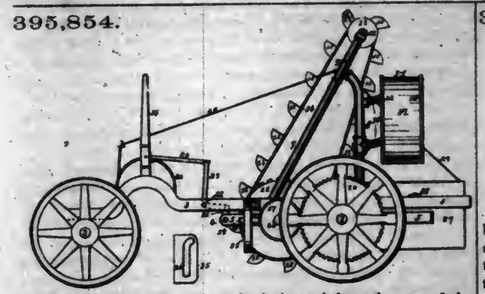
5. The combination, with the wagon-body 1, having the projecting strip 2 at the rear end of its bottom provided with metallic plates 10', having inwardly-projecting hooks 10, and the brackets 18, with hooks 19, on the sides 5 of the wagon-body, of an end-gate formed with vertical portions 4, having a connecting-bar, 6, at their lower ends and a connecting-bar, 7, adjacent to their upper ends, metallic plates 9' on the vertical portions 4, provided with outwardly-projecting hooks 9 at their lower ends engaging hooks 10, and screw-threaded bolts 13, projecting from vertical portions 4, and a detachable panel, 11, having its upper end projecting within bar 7, a bar, 14', secured to panel 11 adjacent to bar 7, with projecting ends overlapping vertical portions 4, a cross-bar, 12, secured to panel 11 adjacent to its lower portion, having slotted ends 12', engaging bolts 13, and fastening crank-nuts 14 on bolts 13, adapted to register with slots 12', metallic straps 15 and 16 on each side of the wagon-body and pivoted together at their inner ends, the straps 15, which are laterally movable into and out of engagement with hooks 19, being pivoted at their outer ends to the end-gate, and the straps 16 being pivoted at their outer ends to the brackets 18, substantially as described.

395,853. SLAT-AND-WIRE-FENCE MACHINE. HENRY SNYDER, HIRAM STAPLER, and MATT BARR, Battle Creek, Mich. Filed Sept. 19, 1888. Serial No. 285,312. (No model.)

Claim.—1. In a slat-and-wire-fence machine, the combination, with a twister-frame, of an upright parallel thereto, L-irons pivoted to the twister-frame and having a sliding connection with the upright, and a lever for operating the twister-frame and upright, whereby independent movement of the twister-frame and upright over rough and uneven ground is permitted, substantially as described.



2. In a slat-and-wire fence machine, the combination of an upright twister-frame, an upright flexibly connected to the twister-frame, and a lever connecting the two, slotted at its bearing upon the upright to permit independent movement of the uprights, substantially as described.



3. A tension device for wires, consisting of two relatively-adjustable parts, one convex and the other concave, the former fitting upon the latter to hold the wire taut, each part suitably grooved for the passage of the wire, and the convex part having a slotted overlapping flange for guiding the wires, substantially as described.

4. In a slat-and-wire-fence machine, the combination of a twister-frame and upright so connected together that they may be moved toward and from one another, the upright being provided with a clutch or gripping device consisting of the brace d, the handle d', connecting-rods d^3, and claws d^3, substantially as described.

395,854. EXCAVATOR. GEORGE J. STAFFORD, Aztec Springs, Colo. Filed Apr. 13, 1888. Serial No. 270,563. (No model.)

Claim.—1. The combination of the wheels and axles, a main frame rigidly supported thereon, a second frame pivotally supported on an axle and lying normally substantially parallel to the fixed frame, a single set of arms or standards secured to and rising from the pivoted frame, a set of sprocket-wheels journaled at the top of the standards, a set of sprocket-wheels journaled in the pivoted frame, an endless chain of buckets passing over the two sets of sprocket-wheels, gearing for actuating the lower sprocket-wheels, gearing upon the main driving wheel or axle, and a clutch mechanism for connecting and disconnecting such gearings, substantially as set forth.

2. The combination of the supporting wheels and axles, a main frame rigidly supported thereon, a second frame pivotally supported on the main axle, arms or standards secured thereto and rising therefrom, sprocket-wheels journaled in the upper ends of such arms or standards, sprocket-wheels journaled in the pivoted frame, an endless belt of scoops or buckets passing around such sprocket-wheels, a gear loose upon the shaft of the lower sprocket-wheels, a gear attached to the main driving wheel or axle, a clutch mechanism for locking the loose gear to the shaft of the lower sprocket-wheels, a lever-arm pivoted upon the fixed frame, and lever-arms connecting it to the pivoted frame to simultaneously rock the pivoted frame upon the main axle, lifting its forward end, and operate the clutch mechanism, substantially as set forth.

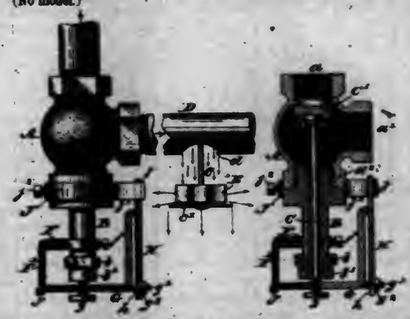
3. The combination of the supporting wheels and axles, a main frame rigidly supported thereon, a second frame pivoted upon the main axle, arms or standards secured thereto and rising therefrom to support an upper set of sprocket-wheels, a lower set of sprocket-wheels journaled in the pivoted frame, an endless band of scoops or buckets traveling around such wheels, a loose gear upon the shaft of the lower band or sprocket wheels, a clutch mechanism for locking such gear to its shaft, gearing attached to the main driving-wheel or its axle, arms 30, vertically adjustable upon the rear of two of the upright standards or arms, and a discharge-chute supported by such arms 30, substantially as set forth.

4. The combination of the supporting wheels and axles, a main frame rigidly supported thereon, a second frame pivotally supported on the main axle, arms or standards secured thereto and rising therefrom, a set of band or sprocket wheels journaled at the top of such arms or standards, a set journaled in the pivoted frame, an endless belt of buckets or scoops passing over such wheels, gearing actuated by the main drive-wheel or its axle for imparting motion to the sprocket-wheels and belt or chain of buckets, a clutch mechanism for such gearing, a lever-arm pivoted to the rigid frame, connections therefrom to control the clutch mechanism and swing or rock the pivoted frame, and a tilting overbalanced receiving box or hopper pivoted in the rear of the fixed frame, substantially as set forth.

5. The combination of the supporting wheels and axles, a main frame rigidly supported thereby, a second frame pivotally supported upon an axle, arms or standards secured thereto and rising therefrom, and each consisting of tubular sections united by a screw-ring coupling forming means for longitudinal adjustment, two sets of sprocket or band wheels, one set journaled in the upper ends of the standards and one set journaled in the pivoted frame, an endless belt or chain of buckets passing over such wheels, a gearing loose upon the shaft of the lower sprocket-wheels, a clutch mechanism for locking such gear to its shaft, and a gearing upon the main driving-wheel or its axle, substantially as set forth.

6. The combination of a rigid frame, a pivotally-supported frame, two sets of pulley or sprocket wheels journaled therein, an endless series of scoops or buckets traveling thereover, gearing connecting the wheels or pulleys to the main driving-wheels, and a clutch mechanism in such gearing having a projecting handle taking in a cam-groove attached to the rigid frame, substantially as set forth.

395,855. FEED-TROUGH. MARTIN V. B. STEVENSON, Jesup, Iowa. Filed May 22, 1888. Serial No. 274,733. (No model.)



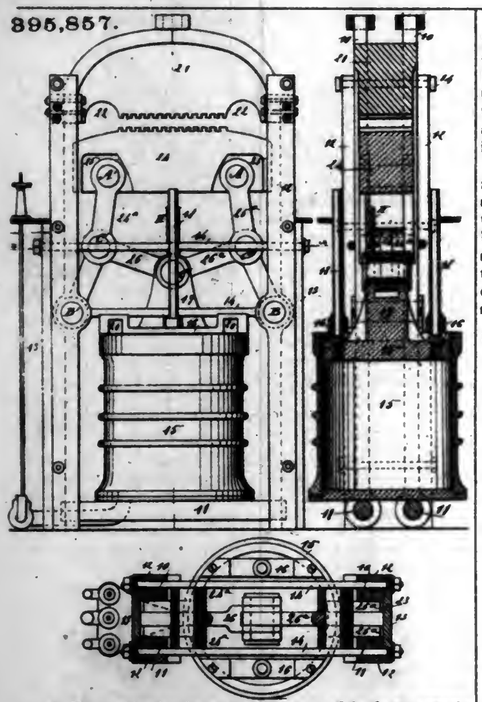
Claim.—1. The combination, with a feed-receptacle having an outlet in one side, of a laterally-swinging ∩-shaped agitator journaled above said outlet, with its arms depending in front and rear thereof, substantially as set forth.

2. In a feed-box, the combination, with a receptacle and a partition dividing the same into two compartments, the said partition being provided at the base with an opening, of a slide reciprocating over said opening, and an essentially U-shaped agitating-bar passing through said slide and journaled in said partition above said opening, the said bar having arms extending downward in each of the compartments, as and for the purpose specified.

3. In a feed-box, the combination, with a receptacle and a partition dividing the same into two compartments, the said partition provided with an opening at the base, of an inclined false bottom secured in one of the compartments, a slide covering the opening in the partition, and an essentially U-shaped agitating-bar passing through the said slide and journaled in the partition, and having arms extending vertically downward within each of the compartments, as and for the purpose specified.

395,856. AUTOMATIC FIRE-EXTINGUISHER. J. FRANKLIN STOCKERT, Philadelphia, Pa. Filed Apr. 28, 1888. Serial No. 272,155. (No model.)

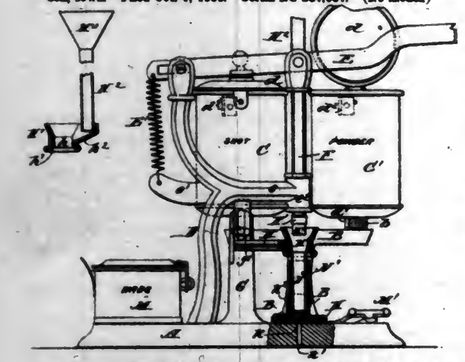
Claim.—1. A fire-extinguisher consisting of a valve-chamber with inlet and outlet passages, a valve controlling said inlet-passage, an angle-arm supporting the stem of the valve and having a screw attachment, a second angle-arm secured to an attachment of the chamber and having a rounded lower end, a collar secured to the valve-chamber and having an opening in one side, a bifurcated bar with its upper end in said side opening of the collar and its bifurcated end embracing the screw attachment, and a clamping-nut, substantially as described.



2. The combination of the chamber A, with an inlet and an outlet opening, a valve with stem C and screw g, a pipe secured to said chamber and having a discharge-opening, d, in one side thereof, the sleeve B, secured to said chamber A, the angle-arm F', secured to said sleeve B and having a rounded end, d, the angle-arm G, forming a bearing for the screw g and having a threaded extension, g', the bar H, with bifurcated end, and the fusible nut g^3, and a turbine below said discharge-opening d, substantially as described.

3. The valve-chamber A, with inlet-opening a, outlet-opening a', and lower opening, a^3, the sleeve B, secured in said opening a^3, the discharge-pipe D, with opening d, a collar with extended opening f' on its side, secured to said chamber and sleeve, the angle-arm F', secured to said sleeve B and provided with a round end, f, the angle-arm G, with end resting on the rounded end f' and forming a bearing for screw g, and provided with screw G', bar H, with upper end in opening f' of collar and having bifurcated lower end, A, and the fusible nut g^3, said parts being combined, substantially as described.

396,857. COTTON-COMPRESS. GEORGE TAYLOR, Hillsborough, Tex. Filed Apr. 12, 1888. Serial No. 270,398. (No model.)

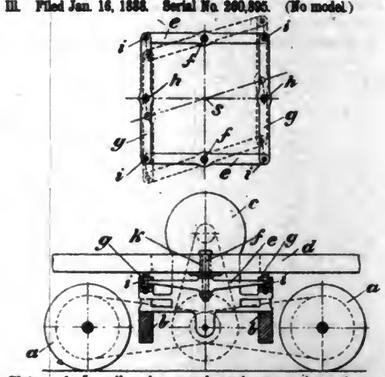


Claim.—1. The combination, in a cotton-compress, of the frame comprising vertical spaced angle-bars 12, the inner vertical spaced bars, 10, within the angles of said bars 12 and curved inwardly at their upper ends and there secured together to form the arch, and the tie-rods 14, with the upper platen, 21, curved to correspond to the said arch and bolted in the upper end of the frame, the lower platen working at its ends in the ways formed between said spaced bars 12 10, the cylinder, the piston, and the toggle-levers connecting the piston and lower platen, substantially as set forth.

395,857.

2. The combination, in a cotton-compress, of the frame comprising vertical spaced angle-bars 12, the spaced bars 10 within the angles of the bars 12 and curved inwardly at their upper ends to form the arch, the base-rods 11, the upper and lower tie-rods 14, said lower rods having eyes at their ends between the inner adjacent faces of the spaced bars 10 12, and the toggle centers or pivots B B', mounted in the sides of the frame at or near the upper end of the cylinder and passing through the eyes on said lower tie-rods, with the upper platen bolted in the said arch, the lower platen sliding in the ways formed by the spaces between said vertical bars 10 12, and having the pivots or centers A A', the toggle-levers 24^a 25^a, journaled at their opposite ends on said centers A A' B B', and the links 26 26^a, pivotally connected with the inner pivoted ends of the levers 24^a 25^a, the cylinder, and the piston having a vertical central post, 17, to the upper end of which the inner ends of the said links are pivotally connected, substantially as set forth.

395,858. CARTRIDGE-LOADER. JAMES V. THOMPSON, Fort Madison, Iowa. Filed Oct. 9, 1888. Serial No. 287,687. (No model.)



Claim.—1. The combination, with an essentially vertical standard, a horizontal arm projected from the same, a vertical sleeve integral with the said arm, and a spring-actuated lever pivoted in the top of said standard, of a plunger-carrying rod attached to the lever and reciprocating in said sleeve, a vertically-adjustable arm, a filling-cup attached to the arm, a disk beneath the cup, and a cushion embedded in said disk, substantially as shown and described.

2. The combination, with an essentially vertical standard, a horizontal arm projected from the same, a vertical sleeve integral with said arm, and a spring-actuated lever pivoted in said standard, of a plunger-carrying rod attached to the lever and reciprocating in said sleeve, a vertically-adjustable arm, a spouted filling-cup attached to the arm, a filling-tube passing through the said sleeve into the cup, a disk beneath the cup, and an apertured elastic cushion embedded in said disk, substantially as shown and described.

3. The combination, with an essentially vertical standard, a horizontal arm projected from the same, a vertical sleeve integral with said arm, a spring-actuated lever pivoted in said standard, and a detachable shot and powder magazine provided with a transverse scraper-bar, of a plunger-rod pivoted to the lever and reciprocating in said sleeve, a vertically-adjustable arm, a bottomless spouted cup attached to said arm, a filling-tube passing through the sleeve into the cup, a disk beneath the cup, and an apertured elastic cushion embedded in said disk, substantially as shown and described.

395,859. CAR-TRUCK CONNECTION. AARON TWYMAN, Pullman, Ill. Filed Jan. 16, 1888. Serial No. 260,995. (No model.)

Claim.—1. In railroad car and truck connections, the combination, with the car and truck, of a series of bars pivoted or jointed to one another around or outside of the center of the swiveling motion of the truck, to form an open central space, and pivoted, respectively, in sets, one to the car-body and another to the truck, substantially as specified.

2. In railroad car and truck connections, the combination, with the car and truck, of the within-described system or series of bars arranged in pairs in crossing relation with each other, to form an open central space, and pivoted to each other at their ends, the one pair of bars being pivotally connected intermediately of their length to the truck and the other pair of bars having each combined with them a socket and pin arranged to connect them intermediately of their length with the car-body, whereby the car is not only held in a central position upon the truck, but the bars may be made to sustain the weight of the car, essentially as shown and described.

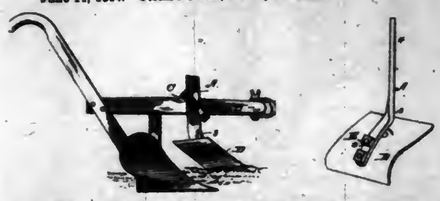
3. In railroad car and truck connections, the combination, with the truck, of the car having an opening in its bottom or floor arranged over the center of the truck, and a series of parallel or crossing bars arranged in relation with said opening, to form an open central space thereunder, and pivoted or jointed to each other, also pivoted or connected intermediately of their length in pairs to the car and truck, substantially as and for the purpose or purposes herein set forth.

395,860. RAILWAY-CAR. GERALD P. WARREN, San Antonio, Tex. Filed Oct. 22, 1888. Serial No. 288,865. (No model.)

Claim.—1. A railway-car provided with a safety-compartment,

the sides of said compartment formed of sections hinged at their lower ends to the car-body, whereby the upper end may be swung outward, said sections provided at their ends with inwardly-projecting wing portions adapted to form end walls of the side sections when said sections are swung outward, substantially as and for the purpose described.

2. A railway-car provided at one end with a safety-compartment having hinged sections forming the sides thereof, doors arranged in said compartment and adapted to close the entrance to same from the platform and from the interior of the car, the inner faces of the sections, the end walls, and the doors of said compartment being lined with bullet-proof material, substantially as shown and described.



3. In a railway-car, the combination, with the car-body, of a safety-compartment constructed in one end thereof, said compartment consisting of the auxiliary compartments B and C and the partition-wall D, provided with a doorway, E, said compartments B and C provided with doors I K, the said doors hinged to swing outward, the door I adapted to close the passage-way E, and the door K adapted to close against the platform-door F when said doors are opened outward, said compartment provided with port-holes in the side and end walls thereof, all arranged as and for the purposes set forth.

4. The combination of the car-body A, provided with a compartment in one end thereof, the side walls of said compartment provided with cut-away portions, forming openings, and movable sections G, hinged at the lower edge of said openings, the upper ends of said sections G provided with inwardly-extending arms adjustably secured to end walls of the compartment, whereby the upper ends of said sections may be moved outwardly, substantially as shown and described.

5. A car-body having a safety-compartment formed therein, said compartment provided with open side walls, and movable sections hinged at their lower ends to the lower edge of the openings in the walls, side and consisting of the body portion G, and the inwardly-projecting wings G', said portions G and G' provided with port-holes, the upper ends of said sections provided with inwardly-projecting arms H, adapted to be adjusted to the side walls of the compartment, substantially as shown and described.

6. A car-body provided with a safety-compartment, said compartment having open side walls, movable sections hinged at their lower ends to the lower edge of said openings in the side walls, and consisting of the body portion G, the side wings, G', and the top piece, G^3, said sections provided with inwardly-slotted curved arms adapted to receive the adjusting-screw J, said movable section provided with port-holes N N', having sliding covers n n', all arranged substantially as and for the purpose described.

395,861. PLOW. JEREMIAH R. WHITE, Raymond, Miss. Filed June 11, 1887. Serial No. 241,060. (No model.)

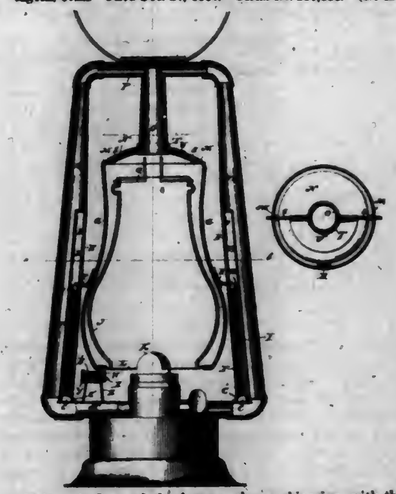
Claim.—1. The scraper-blade as described, in combination with the standard twisted at a point just above the blade, the curve or twist of said standard being such that the face of the standard above the bend and the lower rear corner of the scraper-blade shall be approximately in line, and fastenings for securing the scraper-blade to the standard, substantially as set forth.

2. A reversible scraper-blade made of oblong diamond form and cylindrical in curve, so that all the corners will touch a flat surface, and having a central bolt-hole and indentations or gashes on either side of the center, substantially as set forth.

395,862. APPARATUS FOR INDICATING AND RECORDING CHANGES AT A DISTANT POINT. GEORGE R. WINSLOW, Waltham, Mass. Filed Mar. 27, 1888. Serial No. 268,667. (No model.)

Claim.—1. The combination of a movable actuator the changes in position of which are to be indicated with two electric contact-makers and two corresponding weights each having a part that engages and operates the corresponding contact-maker when the weight falls, and a weight-lifting pawl corresponding to each of said weights operatively connected with the said movable actuator, one pawl engaging its corresponding weight only when the actuator moves in one direction and the other pawl engaging the other weight only when the actuator moves in the opposite direction, substantially as described.

2. The combination of a shaft capable of rotary movement in either direction with a pawl-carrier and two connected oppositely-extended pawls thereon and weighted cam-hubs loose on said shaft, each provided with a shoulder to be engaged by the corresponding pawl, as set forth, whereby one is operated by movements of the shaft in one direction and the other by movements of the shaft in the opposite direction, substantially as described.



3. The combination of the shaft and pawl-carrier thereon with two pawls supported on said pawl-carrier and connected together, as set forth, and two weighted cam-hubs loose on said shaft, each hub having a raised portion provided with a notch to be engaged by the corresponding pawl, and the raised portion of one of said cam-hubs holding the other pawl in the notch engaged by it, substantially as and for the purpose set forth.

4. In a receiving-instrument, a toothed wheel capable of moving in either direction, combined with two electro-magnets and armature-levers therefor, provided with pawls, one of which rotates the said wheel in one direction and the other in the other direction, and a locking device for said wheel, consisting of the finger having a beveled portion and a square portion of proper width to enter between the teeth, and elbow-levers that operate the said locking device and are themselves operated by each of said armature-levers, as described, whereby the wheel is unlocked before the pawl of either armature-lever engages it, substantially as described.

5. The combination of a transmitting-instrument having two sets of contacts and a battery and line connected with the said contacts, as set forth, whereby one set of contacts connects the battery to line in one position and the other in the opposite position, with a polarized relay in said main circuit and a neutral electro-magnet in said circuit and armature therefor, having a notched projection that engages the armature of the polarized relay and retracts it to an intermediate position between its magnet-poles when the said armature of the neutral magnet is retracted, and a receiving-instrument having two electro-magnets and circuits therefor, controlled by the armature of said polarized relay and contacts at either side thereof, respectively, substantially as described.

6. The combination of a transmitting-instrument having two sets of contacts and a battery and a line connected with said contacts, as set forth, and the polarized relay at the receiving-station in said line, with a ground branch from said line at the transmitter and normally-open circuit-closer therein, a branch from said line between the transmitter and relay at the receiving-station, including a battery and relay connected with the ground, and a local circuit for said battery controlled by said relay, and the signal or alarm instrument included in said local circuit, substantially as described.

395,863. TUBULAR LANTERN. OLIVER D. WOODRUFF, Southington, Conn. Filed Dec. 27, 1887. Serial No. 258,118. (No model.)

Claim.—1. In a tubular lantern, the combination, with the main

draft-tubes thereof, of a globe and globe-carrier, and springs located entirely within the said tubes and connected with the globe-carrier for automatically lifting the globe, substantially as set forth.

2. In a tubular lantern, the combination, with the main draft-tubes thereof, of a globe and globe-carrier, a sealed spring-receiving tube located entirely within each of the said main tubes, and connection between such springs and the globe carrier, whereby the globe is automatically lifted, substantially as set forth.

3. In a tubular lantern, the combination, with main draft-tubes tapered at their upper ends, of a globe and globe-carrier, a spring-receiving tube located entirely within each of the tapered main tubes, and connection between such springs and the globe-carrier, whereby the globe is automatically lifted, substantially as set forth.

4. In a tubular lantern, the combination, with the main draft-tubes thereof, of the globe and the globe-carrier, a spring located entirely within each of the said tubes, and two short arms respectively projecting from the opposite sides of the carrier and connected with the said springs, substantially as set forth.

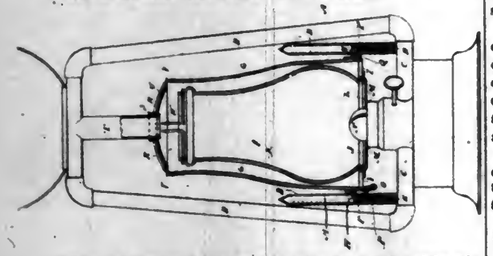
5. In a tubular lantern, the combination, with the main draft-tubes thereof, of a globe and globe-carrier, a spring-receiving tube located entirely within each of the main tubes and sealed from communication therewith, a spring located in each of the said spring-receiving tubes, which are slotted at their upper ends, and a short arm projecting from each side of the globe-carrier and connected with the spring in the adjacent spring-receiving tube, substantially as set forth.

6. In a tubular lantern, the combination, with main draft-tubes of oval transverse section, of a globe and globe-carrier, a spring-receiving tube located entirely within each of the main draft-tubes, and a spring located in each of the spring-receiving tubes and connected with the globe-carrier, substantially as set forth.

7. In a tubular lantern, the combination, with a central draft-tube and a globe-cap arranged to slide vertically thereupon, of a globe, a globe-carrier adapted to have vertical movement independent of the said cap, and a plate carried by the upper end of the carrier and located above the cap, substantially as set forth.

8. In a tubular lantern, the combination, with a central draft-tube and a globe-cap arranged to slide thereupon, of a globe, a globe-carrier constructed to have vertical movement independent of the said cap and a catch arranged to engage with the lower end of the carrier which is adapted thereto, substantially as set forth.

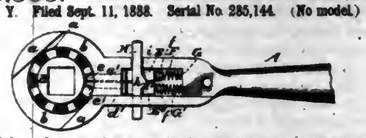
9. In a tubular lantern, the combination, with a globe, of a globe-cap and a globe-carrier adapted to have vertical movement independent of the globe-cap, substantially as set forth.



10. In a tubular lantern, the combination, with a central draft-tube and a globe-cap arranged to slide vertically thereupon, of a globe, an automatically-lifted globe-carrier arranged to slide vertically independent of the glnbe-cap and extending above the same, and finger-pieces located at the lower end of the globe-carrier, substantially as set forth.

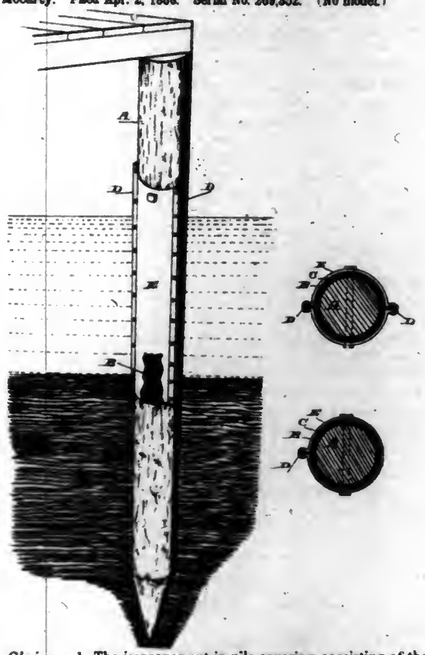
11. In a tubular lantern, the combination, with a central draft-tube and a globe-cap located thereon, of a globe and a globe-carrier adapted to embrace the said tube at a point above the cap and to slide up and down thereupon independent of such cap, substantially as set forth.

12. In a tubular lantern, the combination, with a central draft-tube and a vertically-movable globe-cap, of a globe-carrier arranged to move vertically independent of the said cap, substantially as set forth.



395,864. LANTERN. OLIVER D. WOODRUFF, Southington, Conn.

Filed Jan. 23, 1888. Serial No. 261,612. (No model.)



Claim.—In a tubular lantern, the combination, with a globe, of a globe-carrier, two perpendicular tubes respectively located in the lower corners of the lantern-frame, two springs respectively located in such tubes and connected with the said globe-carrier, so as to automatically lift the same, and a long loop-shaped spring connected at its upper end with one of such tubes, having its lower end adapted to engage with the lower end of the carrier and arranged to be operated by grasping it on opposite sides of the adjacent draft-tube of the lantern which supports the hand, substantially as set forth.

395,865. RATCHET-WRENCH. CHARLES E. ABRAMS, Chatham, N. Y. Filed Sept. 11, 1888. Serial No. 285,144. (No model.)

Claim.—In a ratchet-wrench, the combination, with the handle, the ratchet-wheel, and the pawls having recesses in their sides and having the corners *i* and *i'* beveled, of the reversing-bar having the double cam fitted in the said recesses and adapted to have the cam fit in the space formed between the beveled corners *i* and *i'*, substantially as described.

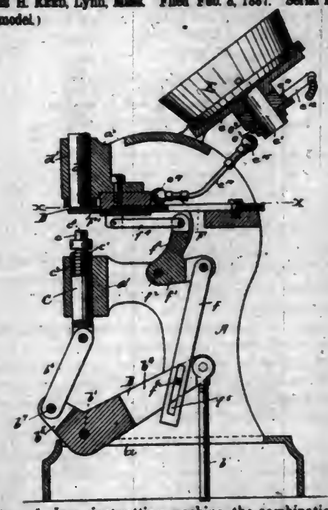
395,866. PILE-COVERING. HENRY ANDERSON, Oakland, and HUGH ELLAS, San Francisco, Cal., assignors of part to Robert W. King, Frank Cavagnaro, John Gambetta, Marino Monaco, James A. Orr, Benjamin F. Kohlberg, Herman O. Haas, Robert E. Murray, A. Reilly, and James M. McCarty. Filed Apr. 2, 1888. Serial No. 269,352. (No model.)

Claim.—1. The improvement in pile-covering, consisting of the pile turned to a smooth surface between the points which are to be protected, a coating consisting of a preparation of pitch or asphaltum, followed by a fibrous wrapping, and a second coating of the material, and a final inclosure or covering of metal, substantially as herein described.

2. The pile having the surface to be protected turned smooth, a coating of protecting material spread over this surface, a wrapping of cloth or fibrous material outside of the coating, and a final coating of material outside of the wrapping, in combination with a flanged cylindrical metallic case having bolts or rivet holes in the flanges, and a hole or holes, by which it is secured directly to the pile, substantially as herein described.

3. A pile-protector consisting of the exterior cylindrical metal casing having the flanges with bolt or rivet holes, by which it is drawn together about the pile, in combination with a packing or filling for the joints, substantially as herein described.

395,867. DETONATING TOY. DAVID BALDWIN, New York, N. Y.



Filed Feb. 28, 1888. Serial No. 265,561. (No model.)

Claim.—1. A toy for producing loud explosions, consisting of a string coated at intervals with an explosive compound, with a cone-shaped tube for holding and causing the explosion of the same, as set forth.

2. The combination, in a detonating toy, of a string having a series of beads of explosive material, the said beads being covered with paper, with a tapering tube for causing the explosion of said beads, as set forth.

395,868. RIVET-SETTING MACHINE. FORREST W. BEALE and JAMES H. REED, Lynn, Mass. Filed Feb. 3, 1887. Serial No. 226,905. (No model.)

Claim.—1. In a rivet-setting machine, the combination, with the frame A, having the projecting arms or sections a' a^3, of the stationary header secured in the said arm or section a^3, the spindle or plunger C, sliding vertically in the said arm or section a' and provided with the die piece or block *c*, a rivet-hopper, a stationary rivet-feeding chute, a horizontally-movable rivet-transferring sliding plate, F F', moving beneath the said sliding header adjacent to the end of said chute, a rivet-holding hopper, a rotary mechanism for said hopper connected with said sliding plate, an operating-lever, and connections between said operating-lever and the said spindle or plunger and sliding plate, substantially as set forth.

2. In a rivet-setting machine, the combination, with the frame A, having the arms or sections a' a^3, of the reciprocating spindle or plunger fitted to slide vertically in the said arm or section a' and provided with the die piece or block *c*, having the threaded extension c' screwed into the said spindle or plunger, the stationary header D *d*, secured in the arm a^3, the rivet-hopper E, the stationary rivet-feeding chute G, the sliding rivet-transferring plate adjacent to the end of the said chute, the operating-lever B, and connections between said lever and the said spindle or plunger and transferring-plate, substantially as set forth.

3. The combination, in a rivet-setting machine, of the chute with a transferrer or carrier arranged to be moved below the end or foot thereof and having the arms *m m'*, one of which is provided with a point, m^4, and a curved surface, m^2, and the recess m^3, for receiving the shank of a fastening, substantially as described.

4. The combination of the chute G, the carrier F', with the chute-closer m^5, comprising a plate having an arm, a shoulder, m^6, and a notch or recess, m^{10}, and adapted to be moved outward by a rivet held by the carrier and to be moved inward by a spring, substantially as described.

5. The combination, in a rivet-setting machine, of the stationary header D, a reciprocating plunger, C, the rock-lever B, adapted to be operated by a treadle and connected with the plunger C by the link b^2, the said link, the carrier-plate F, the lever f' f^2, connected with said carrier-plate by the link f^4, and the link f, connecting the lever f' f^2 with the rock-lever B, substantially as described.

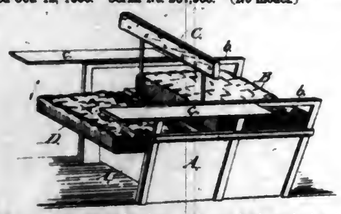
6. The combination of the head D, a reciprocating plunger, C, with the slide-plate F, the hopper feed-pawl c^5, the arm c^{13}, and the rod c^{14}, connecting the slide-plate with the feed-pawl, substantially as described.

7. The combination of the hopper E, having the latch-holes g^2, with the latch H, its operating-spring h^4, the arm h^3, and disengaging-block h^5, carried by the oscillating collar or plate operating the feed-pawl, substantially as described.

8. The combination of the hopper E, having the latch-holes g^2, with the latch H, its operating-spring h^4, arm h^3, and disengaging-block h^5, carried by the oscillating collar or plate operating the feed-pawl, and the latch L, carried by the spring-arm *l*, substantially as described.

395,869. LAWN-MOWER. DAVID BRAELY, New Castle, Ind. Filed Feb. 18, 1887. Serial No. 228,264. (No model.)

Claim.—1. In a lawn-mower, the combination of two separate and distinct revolving cutters upon separate and distinct axles, G^2 G^2, supported by carriers C D, pivoted to each of the plates B by pivots I I', the plates B, one on each side of the machine, and having projecting sleeves Q, upon which revolve the drive-wheels and through which passes the central shaft Q', the plates having slots H H', and sockets E for handles, and notches O O' O^2 O^2, for receiving and retaining the spring-levers F F', the wheels or pinions U, the flange-cogs on the wheels A, the side cutters, M, and lifting points N, rigid with the plates B, the carriers C and D, having the lugs J J and screw J' and having attached to said carriers the spring-levers F F', the knife-bars K', each bearing the stationary knife K, pivoted in hole K^3, boxes G and G' in carriers C and D, for receiving the axles of the revolving cutters, the plate T, the connecting-bar R, with tool-box S', all substantially as and for the purposes set forth and described.



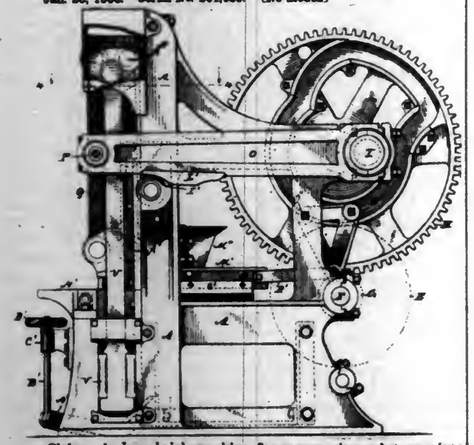
2. In a lawn-mower, the combination of two revolving cutters supported in movable carriers C D, attached by pivots to plates B B, the plates B B, one on each side of the machine, having projecting sleeves upon which revolve the drive-wheels A A and through which passes the central shaft, Q', the said plates B B having slots H H', sockets E for handles, and notches O O' O^2 O^2, for receiving and retaining the spring-levers F F', the wheels or pinions U, with ratchet-shaped notches in their central hole, the wheels A A, with flange-cogs, the movable carriers C and D, pivoted to the plates B B and having attached thereto the levers F F', the knife-bars K', each bearing a stationary knife, K, boxes G G' in carriers C D, for receiving the axles G^2 G^2 of the revolving cutters, the side cutters, M, and lifting-points N, the axles G^2 G^2, with slots for pawl W, the pawl W, and the connecting-bar R, the several parts arranged, as described, so that each of said revolving cutters may be simultaneously or alternately thrown in or out of gear by means of the spring-levers F F', attached to the movable carriers C D, moving said axles supported by said carriers back and forth in the slots H H', and retaining them in place by means of the levers F F', resting in the notches O O' O^2 O^2 in plates B B, substantially as and for the purposes set forth and described.

3. In a lawn-mower, the combination of the drive-wheels A A, each having a flange with cogs pointing to the central axis of the wheel, plates B B, with notches O O' O^2 O^2 in their marginal flanges, slots H H', hollow sleeve Q, and sockets E, side cutters, M, and lifting-points N, levers F F', pinions U, revolving cutters V and their axles, shaft Q', the carriers C D, pivoted to plates B, with lugs J J and boxes G G', the knife-bars K' K', and knives K, and setting-screws J' J', all substantially as and for the purposes set forth and described.

4. In a lawn-mower, the combination of the drive-wheels A A, having flange-cogs, the plates B B, with flanges having notches O O' O^2 O^2, sleeves Q, side cutters, M, lifting-points N, with carrier C, one on each side of machine, having spring-lever F, said carriers pivoted to plates B B and movable on said pivots, the slots H H' in plates B B for axles G^2 G^2 to move back and forth in as carriers C and D are moved on their pivots, and carriers D, one on each side, having spring-levers F', the cog-wheels U, with hole in center for receiving the ends of the axles of the revolving cutters, axles G^2 G^2, having a slot near each end for receiving pawl W, the four ratchet-shaped notches in the circumference of the hole in wheels U for engaging with pawl W, the pawl W, arranged to engage with said notches and to throw the cutters in gear when the mower is pushed forward and out of gear

when it is pulled backward, an upper and lower revolving cutter on axles G^2 G^2, stationary knives K, central shaft, Q', and cross-bar R, with tool-box S', all substantially as and for the purposes set forth and described.

395,870. VEHICLE. CHARLES M. BLYDENBURGH, Riverhead, N. Y. Filed Oct. 12, 1888. Serial No. 287,905. (No model.)



Claim.—1. The combination, with a vehicle-body having an internal chamber and a seat hinged to the front thereof and provided with a lazy-back, of a supplemental seat hinged in the rear of said front seat and adapted to serve as a rear seat, said rear seat being also adapted to fold up against and be secured to the said lazy-back, substantially as and for the purpose described.

2. The combination, with a vehicle-body having a folding seat, of suitable arm-supports secured to said body and projecting behind the body of the vehicle, substantially as and for the purpose herein described.

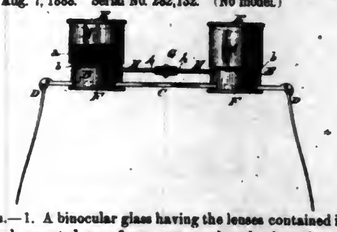
3. The combination, with a vehicle-body having a hinged front seat, of a rear seat adapted to fold within the body, and suitable supports, c, for the arms, said supports being secured to the sides of the body and projecting rearwardly beyond said body, whereby they serve as a protection to the occupant of the rear seat, substantially as described.

4. An improved vehicle comprising a chambered body portion, a front seat hinged thereto and provided with a lazy-back, a supplemental seat hinged in rear of the front seat and adapted to fold within said body and up against said lazy-back, and suitable arm-supports secured directly to the body and projecting in rear thereof, substantially as and for the purpose described.

395,871. BRICK-MACHINE. JOHN J. BREWIS, Chicago, Ill. Filed Jan. 23, 1888. Serial No. 261,655. (No model.)

Claim.—1. In a brick-machine for compressing substances into form, a toggle-lever or series of toggle-levers connected at their upper ends to a movable cross-head which in turn is secured or connected to a cross-head supporting the lower plungers, and mechanism, substantially as described, for operating said toggle-levers, in combination with the shelves G', having irregular surfaces, whereby pressure is exerted first on one and then on the other side of the brick, as set forth.

2. In a brick-machine of the character described, the toggle-levers provided with friction-wheels F', in combination with the shelves or ways G', having an irregular or broken surface, as set forth, whereby the plungers are caused to exercise a variable pressure on the clay.



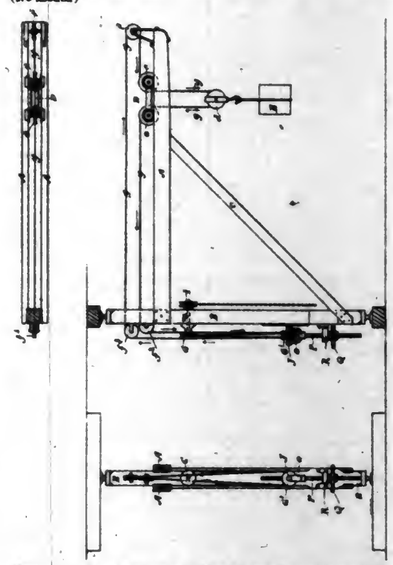
3. In a brick-machine of the character described, the pitman or lever O, for operating the toggles, in combination with the fixed or stationary friction-wheels I', operating as a fulcrum for said levers, as set forth.

4. In a self-feeding brick-machine of the character described, the table N', having inclined surfaces, as described, in combination with the feed-box M', having the adjustable sides S', as and for the purpose set forth.

5. The cross-head V, provided with the rubber cushion E', in combination with the lever A', rod B', and hand-wheel D', whereby the lower plungers are adjusted in the molds, as set forth.

6. In a brick-machine of the character described, the adjustable stud or bolt A'', secured to the cross-head R, as described, whereby the downward movement of the upper plungers is arrested, as set forth.

395,872. BINOCULAR GLASS. JAMES E. BRIGGS, Brooklyn, N. Y. Filed Aug. 7, 1888. Serial No. 282,132. (No model.)



Claim.—1. A binocular glass having the lenses contained in tubes secured and mounted to a frame, arranged and adapted to support the glass in front of the eyes by the head of the spectator, as and for the purposes set forth.

2. A binocular glass having the lenses contained in tubes secured and mounted to the frame C D, arranged and adapted to support the glass by the head of the spectator, as and for the purposes set forth.

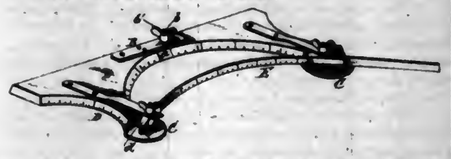
3. A binocular glass having adjustable tubes containing the lenses secured and mounted on the frame C D, arranged and adapted to support the glass by the head of the spectator, as and for the purposes set forth.

4. A binocular glass having adjustable tubes containing the lenses and provided with the bars H and nut G, secured and mounted on the frame C D, arranged and adapted to support the glass by the head of the spectator, substantially as and for the purposes set forth.

395,873. HOISTING AND CONVEYING MACHINE. ALEXANDER E. BROWN, Cleveland, Ohio. Filed Mar. 15, 1887. Serial No. 231,023. (No model.)

Claim.—1. In combination with the suitably-supported elevated tramway of a hoisting and conveying machine of the type shown, a carriage adapted to travel on said tramway, the single endless rope or cable *g*, the load-supporting sheave-block *d*, the wheels *f*, f^1, f^2, and G, having fixed axes of motion, and the set of rope-wheels G', having their shaft or axis of motion J mounted in a vertically-movable carriage, O, the whole constructed and operating in the manner and for the purposes set forth.

2. In a hoisting and conveying machine of the type hereinbefore mentioned, the combination, with the elevated tramway, the carriage



D, the endless cable *g*, the series of rope-wheels *f*, f^1, f^2, and G, of a drive-wheel, I, mounted fast on the shaft of wheel G, the vertically-adjustable carriage O, in which are mounted the wheels G', and provided with the screw-shaft P, and an actuating nut-wheel, Q, in engagement with said screw-shaft and bearing against a fixed stand, R, the whole arranged and operating substantially as and for the purposes set forth.

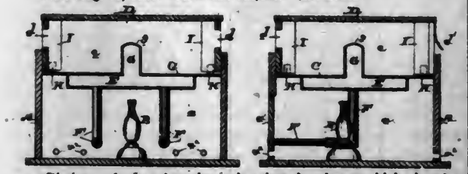
395,874. DRAFT-EQUALIZER. ALFRED G. BROWN, Egan, Dak. Filed Oct. 25, 1888. Serial No. 289,094. (No model.)

Claim.—As a new article of manufacture, the draft-equalizer herein described, consisting of the unequal levers A B, pivotally secured to each other, having terminal appliances for attaching the draft-animals, the lever C, whose ends are respectively joined to the levers A B by the pull-straps E, as shown, and the wear-plate G, to whose rear end the load is secured, and the forward end, G', whereof is secured, respectively, to the levers A B C by the hammer-straps D F, as shown and described, and for the purpose set forth.

395,875. PROTRACTOR. ABEL BUTLER, Dale, Ind. Filed Aug. 9, 1888. Serial No. 282,336. (No model.)

Claim.—1. A protractor formed of two parts hinged together and forming a semi-circle, and provided with an adjustable spring, substantially as described.

2. A protractor formed of two parts forming a semi-circle graduated as described, and a spring connecting the outer ends of said semi-circle, substantially as and for the purpose specified.



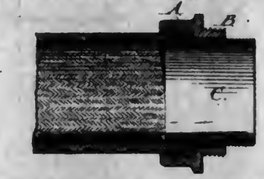
3. A protractor formed with graduated semi-circle formed of two parts hinged together, graduated arcs, and a graduated straight-edge on the back of the parts forming the semi-circle, substantially as described.

4. A protractor composed of a graduated hinged semi-circle, a graduated straight-edge, and graduated spring, and made adjustable, substantially as described.

5. A protractor formed with a semi-circle graduated as described, graduated arcs, straight-edge and ears, and a spring connecting the ends of the semi-circle and graduated as described.

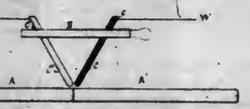
6. A protractor formed with a graduated semi-circle, a graduated straight-edge, ears, and arcs, a graduated spring connecting the ends of the semi-circle, and swiveled holders for said spring, substantially as described.

395,876. CHICKEN-BROODER. LYMAN C. BYCE, Petaluma, Cal. Filed Aug. 10, 1888. Serial No. 282,470. (No model.)



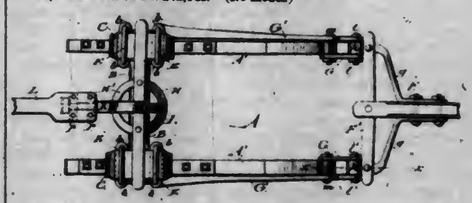
Claim.—1. In a brooder, a heating-chamber, a chick-chamber above, and a floor-plate separating the two, in combination with the air-chamber under said floor and terminating short of its edges, fresh-air pipes communicating with the outer air and with said air-chamber, said pipes passing through the heating-chamber, a supply-pipe let through the floor-plate and communicating with the center of the air-chamber below and the chick-chamber above, and escape-flues for the products of combustion from the heating-chamber located within the corner-posts of the upper box and passing through the chick-chamber, substantially as herein described.

2. In a brooder, the combination of the main box forming the heating-chamber, the floor-plate in the top of said box, the upper box forming the chick-chamber and having perforated or hollow corner-posts, the short flues in the corners of the floor-plate and connecting the heating-chamber with the hollow corner-posts of the upper box, whereby the products of combustion escape, and fresh-air pipes for supplying the chick-chamber, substantially as herein described.



3. In a brooder, the combination of the main box forming the heating-chamber, the floor-plate in its top having the short flues at its corners communicating with the heating-chamber, the upper box set upon the floor-plate and forming the chick-chamber, said box having hollow corner-posts fitting over the short flues, the air-chamber on the bottom of the floor-plate, the fresh-air pipes communicating with the outer air and with said air-chamber and passing through the heating-chamber, and the supply-pipe connecting the air-chamber with the chick-chamber, substantially as herein described.

395,877. HOSE-COUPLING. CORNELIUS CALLAHAN, Boston, Mass., assignor to the Cornelius Callahan Company, same place. Filed Feb. 28, 1888. Serial No. 265,560. (No model.)



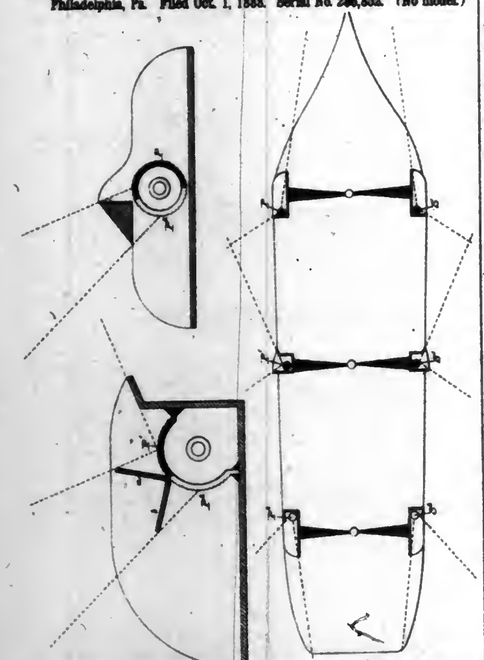
Claim.—In combination with a hose-coupling, the clamping-ring C, having parallel smooth sides for a portion of its length, and having the remaining portion threaded and adapted to project beyond the end of the coupling for the reception of a suitable tool, said ring having its inner end beveled or tapered, thereby adapting it to be forced into the end of the hose and to be held by frictional contact between the clamping-ring and coupling-section, substantially as described.

395,878. PROCESS OF ELECTRIC WELDING. CHARLES L. COFFIN, Detroit, Mich. Filed Sept. 18, 1888. Serial No. 285,742. (No model.)

Claim.—The process herein described of welding two articles together, which consists in subjecting the articles to the action of a voltaic arc of which one pole is metal conductor, fusing said conductor, depositing the molten metal on the joint of the two articles, and reenforcing said joint by such molten metal, substantially as set forth.

395,879. SLED. FRANCIS M. CONNER, Aurelia, Iowa. Filed May 3, 1888. Serial No. 272,643. (No model.)

Claim.—1. In a sled, the combination, with the runners and the oscillating axle-tree, of the braces D, having T-shaped heads, the head-blocks in which the ends of the axle-tree are mounted, and the clips E upon the ends of said head-blocks, by which said blocks are secured to the braces, and also prevented from splitting, substantially as described.



2. In a sled, the runners, the braces D, having T-shaped heads, and the head-blocks clipped thereto, in combination with the axle-tree having rounded ends fitted to rotate in said heads, the cap-plates on the outside of the heads between the clips, and the headed bolts passing through said plates into the ends of the axle-tree and holding the runners in place, substantially as described.

3. In a sled, the runners, the braces D, and the head-blocks clipped thereto, in combination with the axle-tree mounted to rotate in said boxes and provided with the lower fifth-wheel plate and king-bolt, the bolster swiveled on said bolt and carrying the upper fifth-wheel plate, the plate or connection K, secured to the bolster and provided with a rounded or cylindrically-formed rear end, and a reach secured thereto and having a grooved under face for said end, whereby said reach is permitted to turn thereon, substantially as described.

4. The runners, the oscillating axle-tree, the head-blocks, and the braces to which the latter are clipped, in combination with the pole or shaft having the tubular sockets A, the brace-rods G G', extending beyond the front of the runners, the bolts passing through the ends

of said rods and the tubular sockets, whereby the pole is pivotally secured, and the adjusting-nuts on said bolts, substantially as described.

395,880. SIGNAL-LIGHT FOR VESSELS. JOSEPH W. COULSTON, Philadelphia, Pa. Filed Oct. 1, 1888. Serial No. 286,852. (No model.)

Claim.—1. The combination, in signal-lights for vessels, of colored port and starboard lights, with a white warning or object light visible from dead astern and from a number of points to port or starboard of dead astern, but shielded from view from a point within the range of the said port and starboard lights, all substantially as specified.

2. The combination, in signal-lights for vessels, of colored port and starboard lights, with white supplementary side lights constituting warning or object lights visible from dead astern and from a number of points to port or starboard of dead astern, but shielded from view from all points within the range of the colored port and starboard lights, all substantially as specified.

3. The combination, in signal-lights for vessels, of the usual colored port and starboard lights, colored supplementary side lights visible through a range including a number of points to port or starboard, respectively, and one or more white warning or object lights visible from dead astern and through a range including a number of points to port and starboard of dead astern, but shielded from view from all points within the range of the colored port and starboard lights, all substantially as specified.

4. The within-described compound side light, consisting of a single lantern-box having a colored side light and a white warning or object light, the latter being visible from dead astern and from a number of points to port or starboard of dead astern, but shielded from view from all points in the range of the colored side lights, all substantially as specified.

5. The combination of the single lantern-box having a colored side light visible to port or starboard, and a white warning or object light visible from dead astern and from a number of points to port or starboard of dead astern, with adjustable shields for governing the range of said colored and object lights, all substantially as specified.

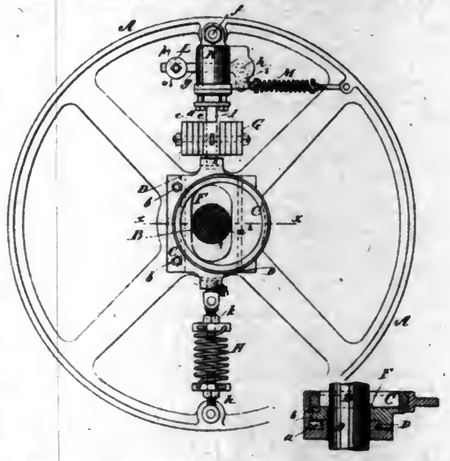
395,881. LINE-CARRYING ROCKET. PATRICK CUNNINGHAM, New Bedford, Mass., assignor to the American Carrier Rocket Company, same place. Filed Nov. 30, 1887. Serial No. 256,502. (No model.)

Claim.—1. The combination, with the charge-carrying tube of a rocket, of a line-carrying tube attached to and supported by the base of the same, said line-carrying tube tapering at its forward end toward the point of connection, as set forth.

2. The combination, of a metal rocket-case, a metal choke, a metal fuse-piece having a central conical deflector formed integral with said fuse-piece, and a surrounding series of diverging vents opening on the rear surface of the fuse-piece.

3. The combination, with the explosive-carrying tube provided with a perforated disk, D, at its rear end, of a line-carrying tube attached to said disk and entirely in the rear of the same, substantially as set forth.

4. A line-carrying rocket consisting of a head containing the rocket-charge, the base of the head being provided with an external screw-threaded projection, in combination with a carrying-tube having a tapering head engaging with said screw-threaded projection, as set forth, and containing a coiled line to be paid out as the rocket passes through the air, substantially as shown and described.



5. The combination, with the firing-head, of a hollow line-carrying tube, said tube being substantially the same diameter as the head, and being connected with said head at the center of the base thereof, the extremity of the carrying-tube next to the firing-head tapering at an angle nearly coincident with the vents for the propelling-gases in the base of said head, substantially as shown and described.

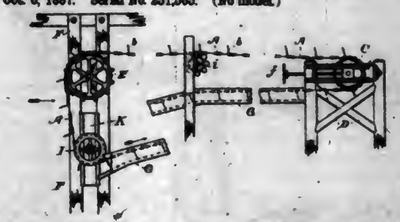
6. In a rocket of the character herein specified, a hollow line-carrying tube forming the tail of the rocket, said tube consisting of a body, H, screw-threaded at *g* for engaging with a tapering cap, G, cap G provided with internal cross-bar, G′, said cap having a screw-threaded perforation therein for engaging with the projection from the base of the head carrying the firing-charge, substantially as shown and described.

7. The combination, with the body A, carrying the firing-charge, of the plug D, having perforations *d* passing therethrough at an angle to its axis, external screw-threaded projection, E, and the line-carrying tube engaging with said projection, substantially as shown and described.

8. The combination of an explosive-carrying tube, a line-carrying tube attached thereto, a line located within said latter tube, and a non-conducting jacket or casing between said line-carrying tube and said line, for the purpose set forth.

395,882. GOVERNOR FOR ENGINES. DAVID P. DAVIS, Allendale, N. J. Filed Aug. 4, 1888. Serial No. 281,936. (No model.)

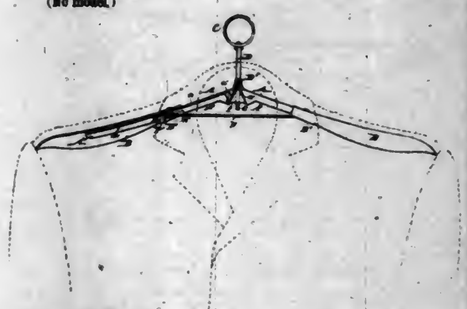
Claim.—1. In a governor for engines, the combination of an eccentric operating the cut-off mechanism, capable of variable adjustment of its center to or from the axis of the shaft, with a liquid-confined locking-piston connected with said eccentric and adapted to hold the same against displacement during rotation or to release the eccentric by release of the liquid confining said piston.



2. In a governor for engines, the combination of an eccentric operating the cut-off mechanism, capable of variable adjustment of its center to or from the axis of the shaft, with a liquid-confined locking-piston connected with said eccentric, check-valves normally opposing the escape of the liquid confined upon either side of said piston, and an automatic check-valve-tripping mechanism, consisting, substantially, of a centrifugally-operated weighted lever, a retracting-spring, and a tripping cam or toe operated by said weighted lever and spring to release the confined liquid, in the manner set forth.

3. The combination, with an eccentric transversely movable in parallel guideways for the adjustment of its center at variable distances from the axis of the shaft, of the herein-described liquid-confined locking-piston, liquid-releasing valves, centrifugal valve-operating weight, and counteracting spring, adapted as and for the purposes herein set forth.

4. The combination, with an eccentric swiveled upon a fulcrum aside from its center to move transversely for the adjustment of its center at variable distances from the axis of the shaft, of the herein-described liquid-confined locking-piston, liquid-releasing valves, centrifugal valve-operating weight, and counteracting spring, adapted as and for the purposes herein set forth.

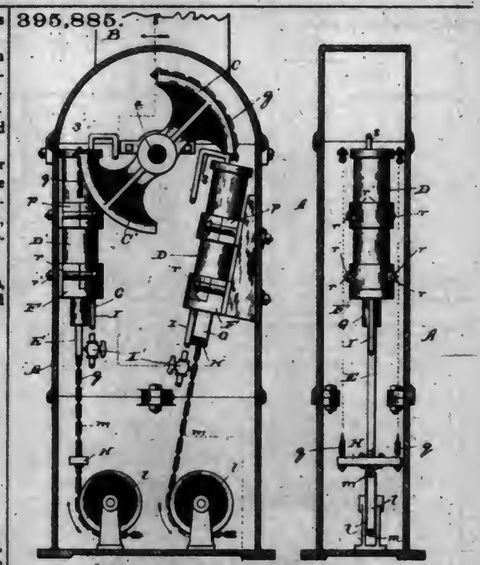


5. The combination, with an eccentric transversely movable for the adjustment of its center at variable distances from the axis of the shaft, a centrifugal eccentric moving weight, as G, and a retracting-spring, as H, of the herein-described liquid-confined locking-piston, liquid-releasing valves, centrifugal valve-operating weight, and counteracting spring, all adapted as and for the purposes set forth.

395,883. CHAIN CONVEYER. JAMES M. DODGE, Philadelphia, Pa., assignor to The Ewart Manufacturing Company, of Illinois. Filed Oct. 6, 1887. Serial No. 251,565. (No model.)

Claim.—In a chain conveyer of the type shown and described, the combination of the following instrumentalities, to wit: first, the endless chain A, provided with the usual flights, *b*; second, the stationary driving sprocket-wheel E and the adjustable driven sprocket-wheel C, around which said endless chain passes; third, the usual conveyer-trough, G, arranged or located to permit the action therein of the flights of the lower run of the chain; and, fourth, the automatic or gravitating take-up sprocket-wheel I, arranged beneath the driving-wheel within the double run of the flighted conveyer-chain and in the vicinity of the point of co-operation between the flights and the trough, the said instrumentalities all arranged and operating together substantially in the manner and for the purposes hereinbefore set forth.

395,884. FOLDING HANGER FOR GARMENTS. GEORGE H. DONALDSON, New York, N. Y. Filed Aug. 31, 1888. Serial No. 284,246. (No model.)



Claim.—1. In a folding hanger for garments having sections capable of sliding to adjust the width, the screws M, rigidly fixed to the sliding sections B, in combination with the nuts P and slotted main sections A *a*, arranged for joint operation, as herein specified.

2. In a folding hanger for garments, the slotted main sections A *a*, sliding sections B, screws M, set in the latter, and nuts P, having large heads P′, in combination with each other and with the spring-loop W, all arranged to serve as herein specified.

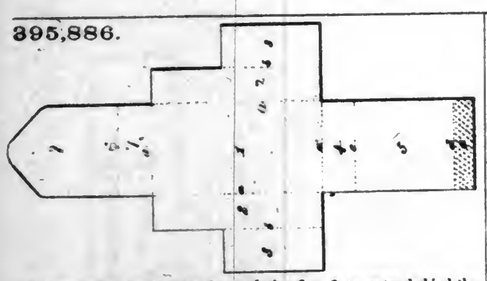
395,885. GATE. WILLIAM P. ELLIOTT and ARTHUR FARRAR, Chicago, Ill. Filed Jan. 31, 1887. Serial No. 226,957. (No model.)

Claim.—1. In a gate having a vertically-swinging bar on a post, and a cylinder having its piston connected with the bar on one side of the axis thereof, to actuate the same by fluid-pressure introduced against one side of the piston, the combination, with the cylinder, of a cap, F, having a hollow extension, G, forming a guide for the piston-rod, a valved air-inlet, *o*, and a controllable discharge-outlet, *n*, substantially as and for the purpose set forth.

2. In a gate having a vertically-swinging gate-bar on a post, and a cylinder having its piston connected with the bar on one side of the axis thereof, to actuate the same by fluid-pressure introduced against one side of the piston, the combination, with the cylinder and gate-bar, of a cap, F, having a hollow extension, G, forming a guide for the piston-rod, a cross-head, H, on the piston-rod, and a pulley-section on the axis of the gate-bar, recessed on its periphery and connected on opposite sides of its recess with the cross-head H, substantially as and for the purpose set forth.

3. In a gate having a vertically-swinging bar on a post, and a cylinder having its piston connected with the bar on one side of the axis thereof, to actuate the same by fluid-pressure introduced against one side of the piston, the combination, with the cylinder on the opposite side of the piston, of a valved air-inlet, *o*, and a controllable discharge-outlet, *n*, and, on the side of the piston against which the pressure is introduced, of an adjustable valve device, K, substantially as and for the purpose set forth.

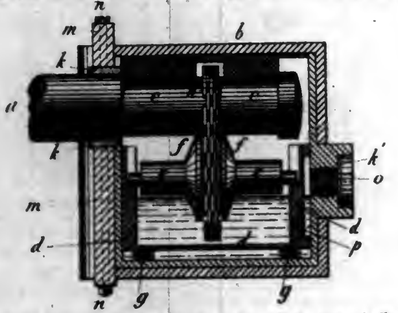
4. In a gate having a vertically-swinging bar on a post and actuated by fluid-pressure introduced against a piston in a cylinder and connected with the gate-bar, means for connecting the piston with the gate-bar, comprising a recessed pulley or pulley-section on the gate-bar axis and a cross-head, H, on the piston-rod, connected near opposite ends with the recessed pulley or pulley-section, substantially as and for the purpose set forth.



5. In a gate having a vertically-swinging bar on a post and actuated by fluid-pressure introduced against a piston in a cylinder, and connected with the gate-bar, the combination, with the gate-bar and cylinder, of a cap, F, having a guide-extension, G, for the piston-rod, a cross-head, H, on the piston-rod, and a recessed pulley or pulley-section on the gate-bar axis, connected with the cross-head H near its opposite ends, substantially as and for the purpose set forth.

395,886. PAPER BOX. WILLIAM H. EMERY, Brooklyn, N. Y., assignor to Charles G. Emery, same place. Filed June 21, 1888. Serial No. 277,731. (No model.)

Claim.—1. A paper box consisting of the back 1, the sides 2, having short flaps 3, bent toward each other in front, the bottom end, 4, provided with the short front 5, turned up and having its top end bent around the upper portion of the short flaps and fastened thereto, and the top closing end, 7, having the closing-flap 8 to pass down behind the short flaps and front, substantially as described.



2. A paper box consisting of the back 1, the sides 2, having the short flaps 3, bent toward each other in front, the bottom end, 4, provided with the short front 5, turned up outside the short flaps and secured thereto to form a permanent short front wall, and the top

395,886.

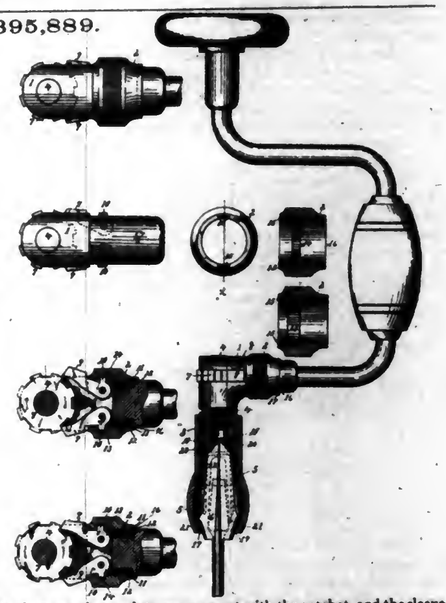
closing end, 7, having the front closing-flap, 8, to enter behind the permanent short front wall, substantially as described.

395,887. CAR-AXLE LUBRICATOR. THOMAS F. H. FINCH, Worcester, County of Worcester, England. Filed Oct. 9, 1888. Serial No. 287,615. (No model.) Patented in England Nov. 7, 1887, No. 15,147.

Claim.—The combination of the axle-box *b*, the internal oil-carrying box, *d*, having the side oil-inlet opening, *p*, and carrying a loosely-journaled grooved wheel, *f*, revolving in superficial contact with the under side of the axle to supply the same with lubricant, the flexible chain *h*, passing around the grooved part of the wheel and over the axle to supply the uppermost portions of the latter with lubricant, and springs *g*, pressing the internal box upward, all substantially as shown and described.

395,888. METHOD OF FORMING METAL BLANKS FOR CAPPING NAILS. HENRY P. FISKE, Waterbury, Conn., assignor to the American Ring Company, same place. Filed June 25, 1888. Serial No. 278,123. (No model.)

Claim.—The method herein specified of forming metal blanks, the same consisting in cutting a piece of metal by suitable dies from a strip or sheet of metal which is narrower in width than the finished blank, and then compressing the blank and forming a circular rib upon one surface and simultaneously spreading the metal laterally to fill the die, substantially as specified.

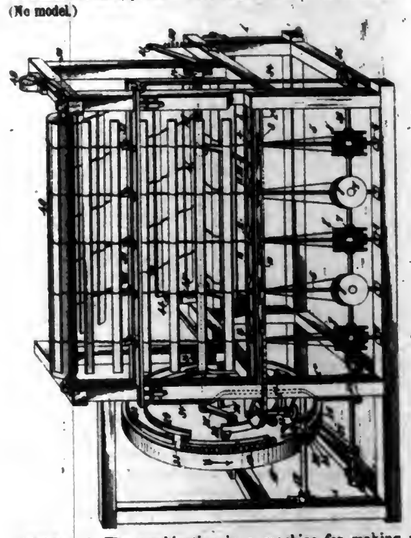


395,889. RATCHET-BRACE. JOHN S. FRAY, Bridgeport, Conn. Filed July 14, 1888. Serial No. 279,933. (No model.)

Claim.—1. In a brace, the combination, with the ratchet, of pivoted dogs adapted to engage opposite sides thereof and having lugs 10, and a sleeve having grooves 13, 14, and 15, adapted to be engaged by said lugs, whereby either dog may be lifted out of engagement with the ratchet, as and for the purpose set forth.

2. The ratchet, and the dogs having lugs 10, in combination with a sleeve having longitudinal grooves 15, and wide and narrow circumferential grooves on opposite sides thereof, whereby when either lug is caused to engage the narrow groove that dog is lifted out of engagement with the ratchet, but when neither lug is in engagement with the narrow groove both dogs are free to engage the ratchet.

3. The combination, with the ratchet, and dogs pivoted in the horizontal plane thereof, and having lugs 10, of springs 11, whereby



395,889.

the dogs are thrown into engagement with the ratchet, and the sleeve having wide and narrow circumferential grooves adapted to be engaged by said lugs, whereby either dog may be lifted out of engagement with the ratchet.

4. The stock having a pin, 17, the ratchet, and the dogs having lugs 10, in combination with the sleeve having cut-out portion 16, the ends of which are engaged by said pin to limit the oscillation of the sleeve, and wide and narrow grooves which are engaged by said lugs.

395,890. MACHINE FOR MAKING WIRE FENCING. LEANDER W. FREEMAN, Liberty, Ind. Filed May 17, 1888. Serial No. 274,162. (No model.)

Claim.—1. The combination, in a machine for making wire fencing, of a series of twister-heads having sprockets, a shaft having a sprocket-wheel and a bevel-gear, an endless belt connecting the sprocket-wheel with the sprockets of the twister-heads, a shaft having a pinion and a bevel-gear engaging the gear on the sprocket-wheel shaft, and a master-wheel having teeth to intermittingly rotate said pinion, substantially as described.

2. The combination, with a revolving master-wheel, of a series of twister-heads, rising and falling supports having spring-grippers, a spacing-shaft having arms or fingers, and means, substantially as described, for intermittingly rotating the twister-heads, intermittingly

raising the gripper-supports, and intermittingly rocking the spacing-shaft by the revolution of the master-wheel.

3. The combination, in a machine for making fences, of a series of twister-heads having sprockets, a shaft having a bevel-gear and a sprocket-wheel, an endless belt engaging the sprocket-wheel and alternately passing in front of and behind the sprockets of the twister-heads, a shaft having a pinion and a bevel-gear engaging the bevel-gear on the sprocket-wheel shaft, and a master-wheel having a segmental toothed flange for intermittingly rotating the said pinion, substantially as described.

4. The combination, in a machine for making wire-fencing, of a series of twister-heads having sprockets, a shaft having a sprocket-wheel and a bevel-gear, an endless belt connecting the sprocket-wheel with the sprockets on the twister-heads, a shaft having a concave stop-plate, a pinion and a bevel-gear engaging the gear on the sprocket-wheel, a master-wheel having a segmental toothed flange to intermittingly rotate the pinion, and a flange extending around the master-wheel and terminating at a short distance from the ends of the toothed flange, substantially as described.

5. The combination, with the intermittingly rotating twister-heads and a master-wheel having a cam-flange, of a spacing-shaft having arms or fingers and a crank-arm intermittingly operated by the cam-flange for turning the shaft to depress the arms or fingers, and a spring for turning the shaft to elevate the arms or fingers, substantially as described.

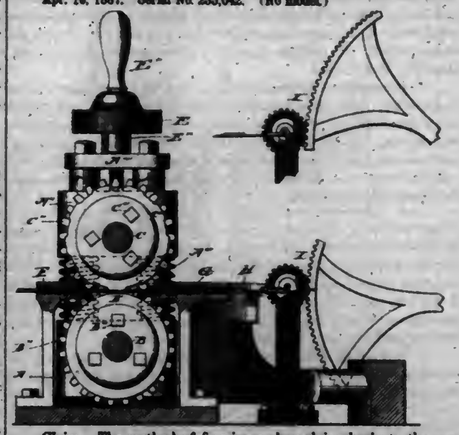
6. The combination, with intermittingly rotating twister-heads, of a master-wheel having a cam-flange on its inner vertical face, a spacing-shaft having at one end a crank-arm provided with a roller-stud operated by the cam-flange, a spring, and a crank-arm on the spacing-shaft connected with the spring, substantially as described.

7. In a machine for making wire fencing, the combination, with the twisting mechanism, of a feed for the completed web, consisting of a reciprocating support having cam-faced grippers pivotally mounted thereon, between which the web passes, substantially as described.

8. In a machine for making wire fencing, the combination, with the twisting mechanism, of a feed for the completed web, composed of a reciprocating support having cam-faced spring-actuated grippers pivotally mounted thereon, pitmen actuating the support, and a shaft vibrating the pitmen, said shaft having a crank-arm provided with a roll engaging a cam-flange on the outer vertical face of the master-wheel, substantially as described.

9. The combination, in a machine for making wire fencing, of intermittingly-rotating twister-heads and a support for said twister-heads, with guides for the palings consisting of elastic plates connected at one end with said support and having their other ends converged toward the respective twister-heads, substantially as described.

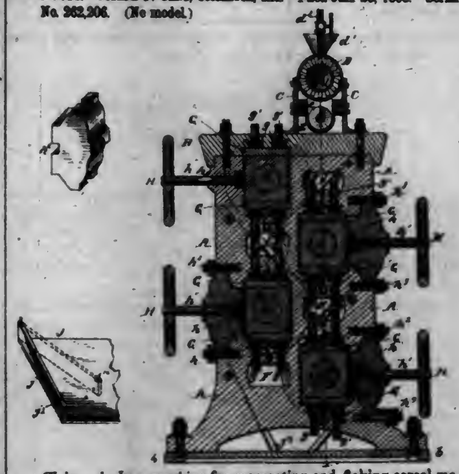
395,891. RAILWAY-SWITCH STAND. GEORGE F. GAGE, Huntingdon, Pa. Filed Oct. 19, 1888. Serial No. 288,529. (No model.)



Claim.—1. The combination, with the main-track and the switch rails, of the operating mechanism for said switch-rails, and a weight loosely sleeved to slide on the operating-lever, substantially as and for the purpose specified.

2. The combination, with the main and switch rails, of the operating-lever carrying at one end a pinion, a pinion connected with the switch-rails and meshing with said pinion, and a weight loosely sleeved to slide on the operating-lever, the movement of the weight being limited by a stop arranged near the free end of the lever, substantially as shown and described, and for the purpose specified.

3 The combination, with the main and switch rails, of the arm pivotally connected with the switch-rails, the segmental pinion pivoted within journals secured to one of the cross-ties and secured to said arm, the operating-lever, fulcrumed as described, the segmental pinion on said lever and meshing with the aforesaid pinion, and a weight free to slide on said lever, its movement being limited by a stop near the free end of the lever, substantially as and for the purpose specified.



4. The combination, with the main and switch rails, of the cross-arm connecting said switch-rails, the arm pivotally connected thereto, the segmental pinion pivoted within journals secured to one of the cross-ties and secured to said arm, the operating-lever, the segmental pinion thereon, the pivotal connection between said arm and the first-mentioned pinion, and a weight loosely sleeved on said lever and free to slide thereon, substantially as and for the purpose specified.

395,892. PROCESS OF FORMING FENCE-WIRE BARBS. WILLIAM GENT, Rockford, assignor to Hiram Ellwood, De Kalb, Ill. Filed Apr. 16, 1887. Serial No. 235,042. (No model.)

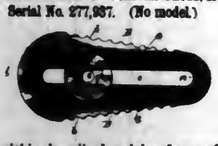
Claim.—The method of forming and applying barbs to the supporting-wires in wire fencing, which consists in flattening the round wire from which the barbs are to be formed at certain intervals throughout its length, then coiling the same at the foremost flattened portion around the supporting-wire, and simultaneously or subsequently severing the wire at the round portion between the flattened parts by a diagonal cut to form the barbs, and continuing the operation, substantially as described.

395,893. MACHINE FOR MAKING SHEET OR FLAKE PRODUCTS. JOSEPH F. GENT, Columbus, Ind. Filed Jan. 26, 1888. Serial No. 262,206. (No model.)

Claim.—1. In a machine for macerating and flaking cereal materials, the combination, with the compressing-rollers, of the feeding device therefor, consisting of a cylinder having a feed-opening at the top at one end and a discharge-opening at the bottom at the opposite end, a trough having a series of fine perforations in the bottom of the same beneath the cylinder, a stirring device for said cylinder, and a conveyer for said trough, the said stirring device being adapted to move the material from its feed-opening to its discharge-opening, and the conveyer adapted to move the material in the opposite direction, substantially as described.

2. In a machine for macerating and flaking cereal materials, the combination, with the compressing-rollers, of the feeding device therefor, consisting of a cylinder having a feed-opening at the top at one end and a discharge-opening at the bottom at the opposite end, and steam and water inlet pipes, a trough having a series of fine perforations in the bottom of the same beneath the cylinder, a stirring device for said cylinder, and a conveyer for said trough, the said stirring device being adapted to move the material from its feed-opening to its discharge-opening, and the conveyer adapted to move the material in the opposite direction, substantially as described.

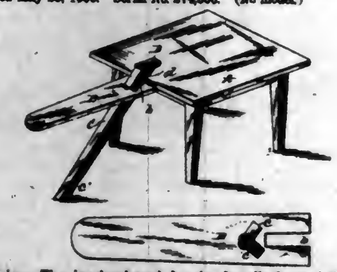
3. In a machine for macerating and flaking cereal materials, the combination, with the supporting-frame and the rollers, the said frame being provided with recesses in different horizontal and vertical planes and having bearings for the rollers in said recesses, of adjusting-screws mounted in said frame engaging the bearings above and below the same, whereby the vertical adjustment of said rollers is secured, substantially as described.



4. In a machine for macerating and flaking cereal materials, the combination, with the supporting frame and rollers, the said frame being provided with bearing-recesses and recesses above and below said bearing-recesses, of bearings for the rollers within said bearing-recesses, and screws above and below each of said bearings extending into the recesses of the frame above and below the bearing-recesses, substantially as described.

5. In a machine for macerating and flaking cereal materials, the combination, with the main frame provided with open bearing-recesses in different horizontal and vertical planes, said recesses opening on opposite sides of the frame, of movable bearings in said recesses, rollers mounted in said bearings, castings detachably secured to the main frame and closing the open side of said bearing-recesses, and screws passing horizontally through said castings and impinging against said bearings, substantially as described.

6. In a machine for macerating and flaking cereal materials, the combination, with the main frame having a bearing-recess open on one side of the same, and recesses above and below said bearing-recess, of a bearing in said bearing-recess, screws above and below said bearing, extending into the recesses above and below said bearing-recess and engaging the bearing, a casting detachably secured to the frame and closing the open side of the bearing-recess, and a screw passing through said casting and engaging said bearing, substantially as described.

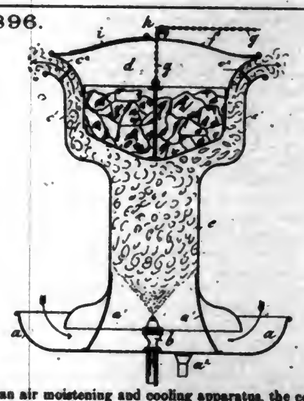


7. In a machine for macerating and flaking cereal materials, the combination, with the compressing-rollers, of a feeding-chute for the same, having the upper ends of its side pieces pivoted near the upper edge of the chute, and the free ends adapted to be secured at different points adjacent to the lower edge of the same, whereby the width of the delivery edge of the said chute can be regulated, substantially as described.

395,894. SASH-HOLDER. JOHN M. GRUBB, Ironton, Ohio. Filed June 22, 1888. Serial No. 277,937. (No model.)

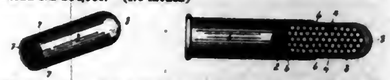
Claim.—The within-described article of manufacture, consisting of a window-sash holder having semicircular ends of different diameters, a central longitudinal slot, *c*, the raised parallel internal side walls, *a a*, the corrugated external walls, *b*, converging toward the smallest end of the holder, and a wheel, C, adapted for use between the said walls *a a*, as specified.

395,895. IRONING-BOARD. BENJAMIN GUDE, St. Anthony, Ind. Filed May 23, 1888. Serial No. 274,868. (No model.)



Claim.—The ironing-board herein described, consisting of the board having a longitudinal slot and buttons *c c*, and the standard C, having notches *d d* on opposite sides, all combined and arranged to operate substantially as shown and described, and for the purpose set forth.

395,896. APPARATUS FOR MOISTENING AND COOLING AIR. HERMANN D. R. GONTOW, Vienna, Austria-Hungary, and MAXIMILIAN A. LUTHER, Berlin, Germany. Filed July 7, 1888. Serial No. 279,227. (No model.)

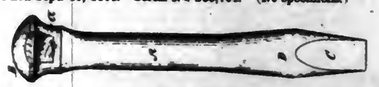


Claim.—1. In an air moistening and cooling apparatus, the combination, with an air-conductor, of a vertically-adjustable vessel in the outlet-opening of the conductor, said adjustable vessel having its bottom beveled from the center upward and outward, substantially as herein shown and described.

395,896.

2. In an air moistening and cooling apparatus, the combination, with a casing or shell, of a vertically-adjustable receptacle in the upper part of the same, said receptacle having its under side beveled upward and outward, and a cover above said receptacle, the edge of said cover and the top edge of the shell forming an outlet-opening for the moistened air, substantially as herein shown and described.

395,897. SHOT-CARTRIDGE. MARCELLUS HARTLEY, New York, N. Y., and ALFRED J. HOBBS, Bridgeport, Conn., assignors to the Union Metallic Cartridge Company, Bridgeport, Conn. Filed Sept. 6, 1888. Serial No. 284,689. (No model.)



Claim.—1. A shot-cartridge consisting of a metallic shell and a wooden shot-case bored out to form a chamber for the shot, the walls of said chamber being thickest at the forward end, the edge of the shell being crimped upon and pressed into the wood of the shot-case, whereby the latter is held firmly in place.

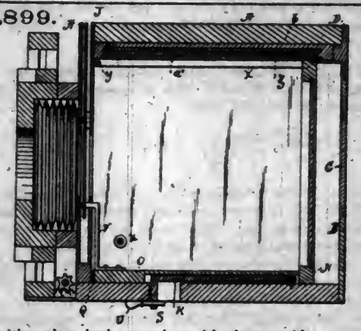
2. A shot-cartridge consisting of a metallic shell and a wooden shot-case bored out to form a chamber for the shot and having exterior longitudinal grooves, for the purpose set forth, the edge of the shell being crimped into the wood of the shot-case, thereby holding the shot-case firmly.

3. A wooden shot-case for cartridges, having a solid strengthening portion at its forward end, and exterior longitudinal grooves, as and for the purpose set forth.

395,898. RAILROAD-SPIKE. HAYWARD A. HARVEY, Orange, N. J. Filed Sept. 19, 1888. Serial No. 285,791. (No specimens.)

Claim.—1. As a new article of manufacture, a rolled and headed metallic spike provided with a chisel-point the width of the cutting-edge of which is slightly less than the diameter of the adjacent round portion of the shank.

2. A rolled and headed metallic spike having the portion of its shank adjacent to the head enlarged in diameter and having a chisel-point the width of the cutting-edge of which is slightly less than the diameter of the smaller part of the shank.



3. A rolled and headed metallic spike having the portions of its shank respectively adjacent to its head and point larger than the intermediate portion of its shank and provided with a relatively narrow chisel-point, substantially as and for the purpose set forth.

395,899. PHOTOGRAPHIC CAMERA. SYDNEY P. HASEY, New York, N. Y. Filed June 19, 1888. Serial No. 277,507. (No model.)

Claim.—1. The combination, in a detective camera, of a spring-actuated shutter, a movable ground-glass-holding frame provided with a catch which holds the frame in its forward position in the camera, a swinging frame which holds the sensitive plate, a holding device for the shutter, and a support for the frame of the sensitive plate, constructed and arranged to release the shield and the sensitive plate, respectively, by the rearward movement of the ground-glass-holding frame, substantially as set forth.

2. The combination, in a detective camera, of a spring-actuated shutter, a movable spring-actuated ground-glass-holding frame provided with a catch which holds the frame in its forward position against the action of its spring, a swinging frame for the sensitive plate, a holding device for the shutter, and a support for the frame of the sensitive plate, both engaging with the movable parts of the ground-glass-holding frame and constructed and arranged to release the shutter and the sensitive plate on the rearward movement of the ground-glass-holding frame, substantially as set forth.

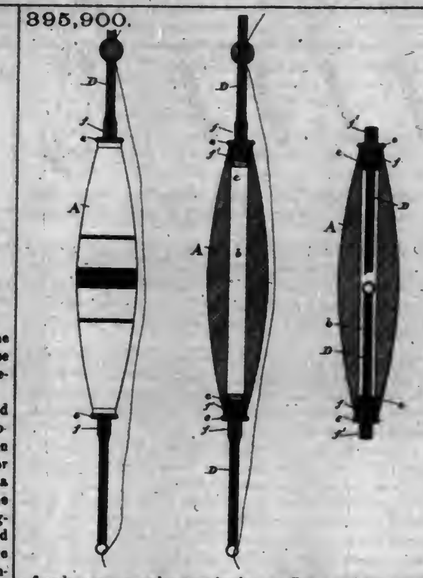
395,899.

3. The combination, in a detective camera, of a spring-actuated shutter, a movable spring-actuated ground-glass-holding frame provided with a catch which holds the frame in its forward position against the action of its spring, a trigger operated from the exterior of the camera, which releases the catch of the ground-glass frame, a swinging frame for the sensitive plate, and a holding device for the shutter and a support for the frame of the sensitive plate, both engaging with the movable parts of the ground-glass frame and constructed and arranged to release the shutter and the frame of the sensitive plate on the rearward movement of the ground-glass frame, substantially as set forth.

4. The combination, in a detective camera, of a spring-actuated shutter, a movable ground-glass-holding frame provided with a catch which holds the frame in its forward position in the camera, a swinging frame which holds the sensitive plate, a holding device for the shutter, and a support for the frame of the sensitive plate constructed and arranged to release the shutter and the sensitive plate, respectively, by the rearward movement of the ground-glass-holding frame, and a stop for the shutter automatically operated by the falling of the sensitive plate, substantially as set forth.

5. The combination, in a detective camera, of a spring-actuated shutter, a movable spring-actuated ground-glass-holding frame provided with a catch which holds the frame in its forward position against the action of its spring, a swinging frame for the sensitive plate, a holding device for the shutter and a support for the frame of the sensitive plate, both engaging with the movable parts of the ground-glass-holding frame and constructed and arranged to release the shutter and the frame of the sensitive plate on the rearward movement of the ground-glass-holding frame, and a stop for the shutter automatically operated by the falling of the sensitive plate, substantially as and for the purposes set forth.

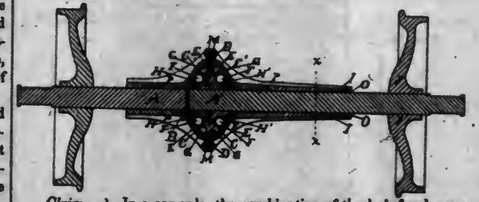
6. The combination, in a detective camera, of a spring-actuated shutter, a movable spring-actuated ground-glass-holding frame provided with a catch which holds the frame in its forward position against the action of its spring, a trigger operated from the exterior of the camera which releases the catch of the ground-glass frame, a swinging frame for the sensitive plate, a holding device for the shutter and a support for the frame of the sensitive plate, both engaging with the movable parts of the ground-glass frame and constructed and arranged to release the shutter and the frame of the sensitive plate on the rearward movement of the ground-glass frame, and a stop for the shutter automatically operated by the falling of the sensitive plate, substantially as set forth.



7. The combination, in a detective camera, of a spring-actuated shutter, a movable ground-glass-holding frame, a swinging frame for the sensitive plate, a holding device for the shutter and a support for the frame of the sensitive plate, both engaging with the movable parts of the ground-glass-holding frame and constructed and arranged to release the shutter and the frame of the sensitive plate on the rearward movement of the ground-glass-holding frame, and a stop for the shutter automatically operated by the falling of the sensitive plate, substantially as set forth.

395,900. FLOAT FOR FISHING-LINES. EDWARD J. HAYES and JOHN T. OGIER, Baltimore, Md. Filed June 23, 1888. Serial No. 278,045. (No model.)

Claim.—1. A float for fishing-lines, having a cavity and provided at its end with a reversible stem coupled to the float, whereby when the float is in use on a bait-line the stem may be attached and when not in use the stem may be inserted in the cavity.



2. The combination of a float-body having a cavity provided with

395,900.

a female screw, *c*, and a stem having a collar, *e*, and two screw-couplings, one each side of said collar, for the purpose set forth.

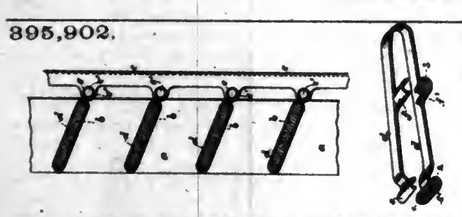
395,901. CAR-AXLE. WILLIAM HAYES, Los Angeles, Cal. Filed May 18, 1888. Serial No. 274,283. (No model.)

Claim.—1. In a car-axle, the combination of the hub fixed upon the severed end of one section of the divided axle, the case fixed upon the severed end of the other section of the axle and inclosing the hub and leaving on each side of the hub, between it and the case, an annular chamber, the cross-section of which tapers from the inside of the annular chamber toward the periphery thereof, and anti-friction rollers within the chambers larger in cross-section than the cross-section of the outer edge of the annular chamber.

2. The combination of the hub L, fixed upon the severed end of one section of the divided axle, the case C C', fixed upon the severed end of the other section of the divided axle, inclosing the hub and leaving an annular chamber, E, upon each side of the hub between it and the walls of the case, and the balls F G within the chambers.

3. The combination of the sections A A' of the axle, the case C C', provided with the annular ribs H H', the hub L, and the balls F G.

4. The combination of the sections A A' of the axle, the case C C', provided with the axial opening O and the peripheral openings N, the hub L, and the balls.



5. The combination of the sections A A' of the axle, the case C C', provided with the sleeve I, the hub L, and the loose balls within the chamber E.

6. In a car-axle, anti-friction rollers confined in chambers, the cross-section of which, taken on line of the axle, tapers outward from the axle, such chambers being located upon opposite sides of a hub fixed upon one of the severed ends of the axle and surrounded by a case fixed upon the other severed end of the axle, the hub, and the case forming the walls of each chamber, whereby the centrifugal force induced by the rotation of the axle projects the loose bodies into the narrower portion of the chamber and preserves contact between the hub and the case.

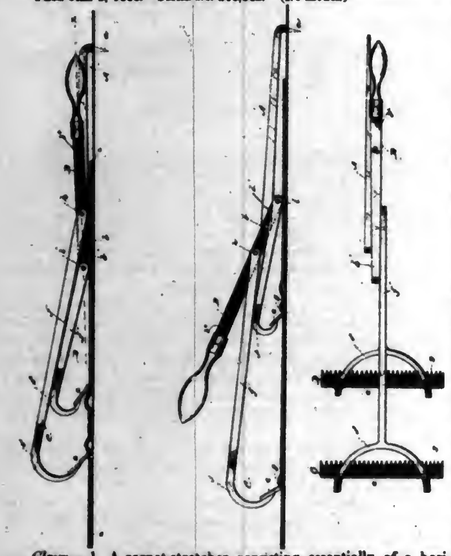
395,902. WINDOW-BLIND. ALLEN P. HEIDT, New York, N. Y. assignor to himself and Joseph C. Divine, same place. Filed Aug. 2, 1888. Serial No. 281,757. (No model.)

Claim.—1. A fastening device for slats, consisting of a metal strap, *d*, adapted to pass around the slat, laterally-projecting pivotal

395,902.

ends *c c'*, formed with said strap *d*, and a vertical bar, *c*, having openings for receiving the ends *e e'*, substantially as and for the purposes set forth.

2. A fastening device for slats, consisting of a metal strap, *d*, adapted to pass around the slat, half-round pivotal jaw ends *c c'* upon the ends of said strap, which ends are of greater length than the width of the strap, and a vertical U-shaped bar, *c*, having bearings *e'* adapted to receive the ends *e e'*, substantially as and for the purposes set forth.

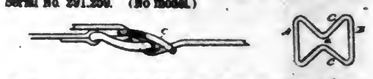


3. The combination, with the shutter-frame *a*, slats *b*, and vertical bar *c*, of the metal strap *d*, adapted to surround the slat and having pivotal bearings *f f'* to pass into holes in the frame and cause a friction between the respective parts, so as to hold the slats in any desired position, substantially as set forth.

4. A friction device for blind-slats, consisting of a metal strap, *d*, to pass around the slat, pivotal jaw ends *c c'*, and pivotal bearings *f f'*, substantially as and for the purposes set forth.

5. The combination, with the blind-slat *b* and the bar *c*, of the metal strap *d*, to be passed around the slat and having pivotal ends to be brought together to form a connection with the vertical bar, whereby a friction is caused at the pivot from the spring of the ends of the strap, substantially as specified.

6. The combination, with the blind-slat and the metal strap passing around the same and having pivotal ends, of a U-shaped vertical metallic bar having holes for the reception of the pivotal ends of the strap, substantially as specified.



395,908. CARPET-STRETCHER. BURTON HOLDEN, Geneva, Ohio. Filed Jan. 5, 1888. Serial No. 260,012. (No model.)

Claim.—1. A carpet-stretcher consisting, essentially, of a horizontal fulcrum-bar having a depending tooth or spur for insertion into the floor to hold said bar in a fixed position, a lever pivoted at an intermediate point of its length to the horizontal fulcrum-bar, and the oppositely-movable toothed claws pivoted to the lever at equidistant points on opposite sides of the fulcrum of the lever, substantially as described, for the purpose set forth.

2. A carpet-stretcher consisting, essentially, of a fulcrum-bar provided with means for fixing the same in a stationary position to a floor, a hand-lever pivoted at an intermediate point of its length to the fulcrum-bar and adapted to fold close thereto, and the oppositely-movable claws pivoted to the lever at equidistant points on opposite sides of the fulcrum thereof, the pivots of said claws and the fulcrum of the lever being relatively located with respect to each other to all fall in a line drawn through the lever and the point of engagement with the carpet of one of the claws when said lever is depressed alongside the fulcrum-bar, substantially as described.

395,904. BUCKLE-GUARD. GEORGE M. HUBBARD, New Haven, Conn., assignor to W. & E. T. Fitch, same place. Filed Nov. 19, 1888. Serial No. 291,259. (No model.)

Claim.—1. The herein-described buckle-guard, consisting of the ends parallel with each other, connected by two sides, the said two sides bent inward midway of their length and toward each other, and longitudinally concavo-convex, substantially as described.

2. A buckle-guard made from wire bent to form two ends, A B, parallel with each other, and connecting sides C C, the said sides bent inward and toward each other, the two ends of the wire brought together upon one end of the frame and formed longitudinally concavo-convex, substantially as described.

395,905. CLEANER FOR SLATES, BLACKBOARDS, &c. NICHOLAY JENNES, Washington, D. C. Filed June 2, 1888. Serial No. 275,858 (No model.)

Claim.—1. A cleaner for slates, blackboards, glass, and like articles, consisting of receptacles for containing a liquid-supply and for drying material, said liquid-receptacle being composed of elastic material and provided with an opening normally closed by the tension of said elastic material, substantially as described.

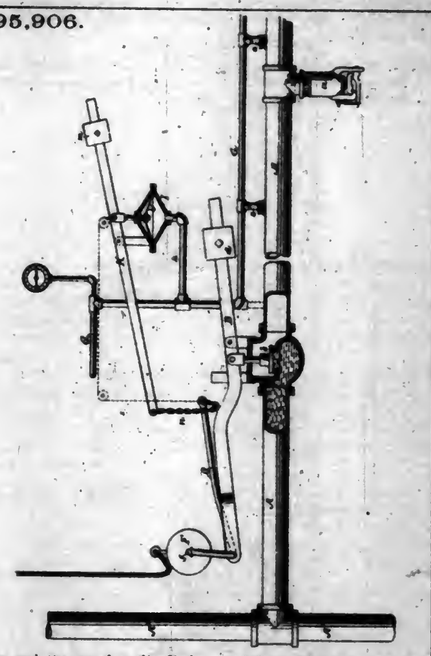
2. In a cleaner for slates, blackboards, glass, and like articles, the combination, with a liquid-receptacle for containing absorbent material and having an opening for the insertion of the same, of a receptacle adjacent to said liquid-receptacle, the liquid-receptacle being composed of elastic material and provided with a discharge-opening, both of said openings being normally closed by the tension of the elastic material, substantially as described.

3. In a cleaner for slates, blackboards, glass, and like articles, the the combination, with a liquid-receptacle having a thickened bottom portion provided with an aperture the diameter of which is the smallest at its top, of a receptacle for drying material, substantially as described.

4. In a cleaner for slates and other articles, the combination, with an elastic receptacle, complete in itself, of a receptacle for absorbent material, the said receptacles being separable, but connected end to end, substantially as described

5. In a cleaner for slates, blackboards, glass, and like articles, the combination, with a liquid-receptacle composed wholly of elastic material and provided with an elastic flange, of a receptacle for drying material having rigid walls and provided with a diverging flange adapted to be engaged by said elastic flange, substantially as described.

6. In a cleaner for slates, blackboards, glass, and like articles, the combination, with a liquid-receptacle composed of elastic material and provided with a thickened bottom portion having an opening therein for the insertion of absorbent material, and being also provided with an elastic flange, of a receptacle for drying material having rigid walls and provided with a diverging flange adapted to be engaged by said elastic flange, substantially as described.



7. A cleaner for slates, blackboards, glass, and like articles, consisting of receptacles for containing a liquid supply and for drying material, said liquid-receptacle being composed of elastic material and provided with absorbent material within the same, substantially as described.

8. A cleaner for slates, blackboards, glass, and like articles, consisting of a liquid-receptacle composed of elastic material and having an absorbent material wholly within the said liquid-receptacle, substantially as described.

395,906. FIRE-EXTINGUISHER. JOHN KANE, Philadelphia, Pa. Filed Oct. 2, 1888. Serial No. 287,701. (No model.)

Claim.—1. The combination of the sprinkler-pipe of a fire-extinguishing system and a valve controlling the flow of water into the same with a valve-lever, a tilting weight-carrier hung thereto and having a weight loosely mounted upon it, whereby the valve is kept closed, an air-pipe having discharge-valves with fusible retainers, a casing communicating with said air-pipe and having a yielding diaphragm or its equivalent, and means whereby the movement of said diaphragm is transmitted to the tilting weight-carrier of the valve-

395,906.

lever, and thus causing the discharge of the weight therefrom and permitting the opening of the valve, all substantially as specified.

2. The combination of the sprinkler-pipe, its valve-lever, a tilting weight-carrier pivoted to the latter and having a weight loosely mounted upon it, whereby the valve is held closed, the air-pipe with its casing and diaphragm, and a weighted lever acted on by the stem of the diaphragm and connected to the tilting weight-carrier of the valve-lever, all substantially as specified.

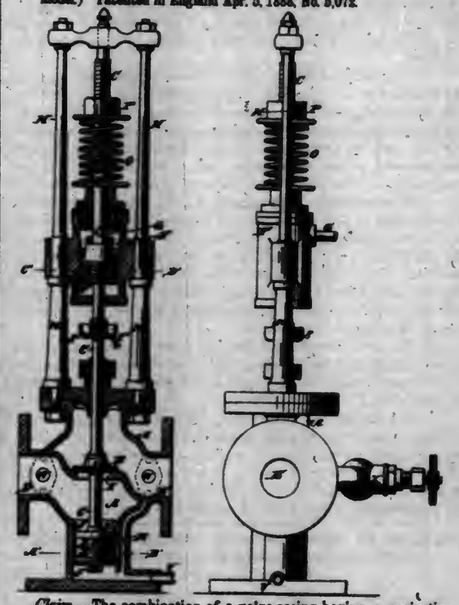
3. The combination of the sprinkler-pipe, its valve and valve-lever, the air-pipe having discharge-valves with fusible retainers, a casing communicating with said air-pipe and having a yielding diaphragm or its equivalent, a lever fulcrumed on the valve-lever and having a forked short arm, a weight having trunnions mounted upon said forked arm, and serving when in position thereon to depress the valve-lever and keep the valve closed, and means whereby the movement of the diaphragm is transmitted to the weight-carrying lever to effect the tilting of the same and the discharge of the weight therefrom, all substantially as specified.

395,907. SEWER-TRAP. WILLIAM KERR, Cleveland, Ohio. Filed Sept. 10, 1888. Serial No. 285,058. (No model.)

Claim.—1. A sewer-trap consisting of a fixed upper section having the inlet and the outlet pipes wholly connected therewith, a detachable lower section, and a diaphragm extending down through the center of the trap near to the bottom of the lower section, substantially as set forth.

2. A sewer-trap consisting of two sections, each section having part of a central vertical diaphragm formed integral therewith and meeting substantially on the line of the joint between the sections, whereby the water entering upon one side of the trap is forced beneath the diaphragm to cross to the other side, substantially as set forth.

3. In a sewer-trap, a stationary upper section having the inlet and outlet pipes of the trap, a detachable lower section, a central diaphragm, a part of which is formed in each section, and arms supported on the upper section and engaging the lower section, whereby said sections are held together, substantially as set forth.



4. A sewer-trap consisting of two sections with a diaphragm, a part of which is formed in each section, a projecting rim on the lower section, and packing around said rim and between the parts of the diaphragm, substantially as set forth.

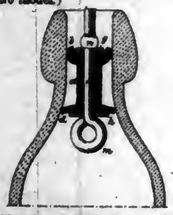
5. In a sewer-trap formed in two sections, an upper section having a transverse slot, the walls of which form a part of a diaphragm a lower section with a part of a diaphragm therein, the said parts matching each other, and a lock in the transverse slot to hold the lower section in position, substantially as set forth.

6. In a sewer-trap, an upper section having a transverse slot with walls forming a diaphragm, a lower section with a diaphragm immediately beneath the diaphragm in the upper section, and yoke-arms and screw in said slot to support the lower section, substantially as set forth.

7. In a sewer-trap, a cup-shaped detachable section, a fixed upper section having a transverse slot, pivoted yoke-arms in said slot with a thumb-nut for raising and lowering said arms, and shoulders on which said arms bear when being raised, substantially as set forth.

395,908. VALVE MECHANISM FOR AUTOMATICALLY STARTING STEAM-PUMPS. ERNEST KNOWLES, Mossfield Mill, Bolton, County of Lancaster, England. Filed July 21, 1888. Serial No. 280,596. (No model.) Patented in England Apr. 5, 1888, No. 5,072.

Claim.—The combination of a valve-casing having a projecting steam-cylinder and provided with an inlet and outlet, a valve-seat and a by-pass connecting the outer end of the steam-cylinder with the steam-outlet, a steam-packed piston in the steam-cylinder, a hydraulic cylinder located adjacent to the valve-casing and having a liquid-supply pipe for connecting with liquid-distributing sprinklers, a piston in the hydraulic cylinder moved by the liquid pressure therein, a valve-spindle connected with the piston in the hydraulic cylinder, having a valve to close on the valve-seat and extending through the valve-seat to the piston in the steam-cylinder, and a spring acting on the valve-spindle to move the valve from its seat when the pressure in the hydraulic cylinder is reduced for passing steam through the valve-casing to a pump and through the by-pass to the steam-piston, substantially as described.



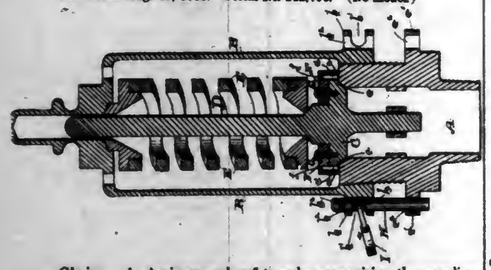
395,909. REAMER-HEAD FOR TAPS. DANIEL G. LANGLANDS and ORIN B. MOULTON, Dover, N. H., assignors to the Somersworth Machine Company, same place. Filed Nov. 7, 1887. Serial No. 254,573. (No model.)

Claim.—The combination, with the tap A, having at its lower

end the central stud or projection, a^4, the dowel-pins b^3, and the threaded hole b^4, of the independent cutting, drilling, or boring tool B, having holes b' for the reception of the said dowel-pins, the central opening or hole, b^3, fitting on the said projection a^4, and the countersink or recess b^5 in its lower face, and the screw b^4, the head of which fits in the said countersink or recess, substantially as set forth.

395,910. BOTTLE-STOPPER. EDWIN L. LLOYD, Philadelphia, Pa., assignor to the Joly Stopper Company, same place. Filed June 25, 1888. Serial No. 278,127. (No model.)

Claim.—1. The combination, in a bottle-stopper, of the stem having an upper flexible disk and a washer above and of slightly smaller diameter than the disk, and having below said disk a lock free to yield on the inward movement of the stopper, but expanding for engagement with the tapering neck after the stopper is inserted, and beyond said lock a portion for engaging with an extractor, whereby the stopper may be withdrawn when inverted, all substantially as specified.

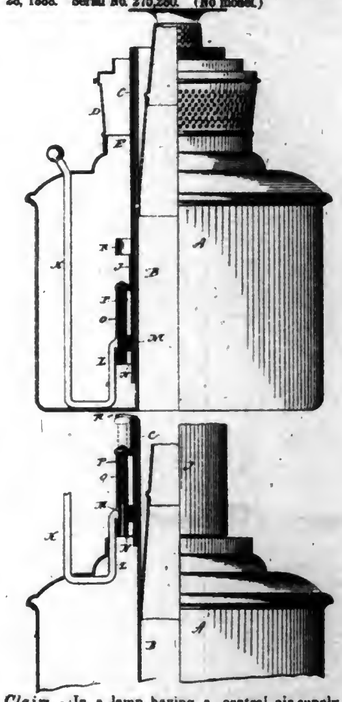


2. The combination, in a bottle-stopper, of a stem having an upper flexible disk and a washer of slightly smaller diameter than the disk, and having below said sealing-disk another flexible disk free to yield on the inward movement of the stopper, a washer against which the disk bears to prevent yield in the other direction, and beyond said washer a portion for engaging with an extractor, whereby the stopper may be withdrawn when inverted, all substantially as specified.

3. The combination, in a bottle-stopper, of a tubular shank, having a sealing-disk at the upper end and a locking-disk at the lower end, with a stem passing through said tubular shank and having above the sealing-disk a washer of slightly smaller diameter than the disk, said stem also having below the locking-disk a washer serving as a backing for said disk, and beyond said washer a portion for engaging with an extractor, whereby the stopper may be withdrawn when inverted, all substantially as specified.

4. The within-described sealing device for a bottle-stopper, the same consisting of a tubular shank with disks at top and bottom, the whole being of rubber or equivalent flexible material, all substantially as specified.

5. The combination of the sealing portion of the stopper, comprising a tubular shank having a sealing-disk at the top and a locking-disk at the bottom, confining-washers at the opposite ends of said shank, and a central stem having an eye at the inner end bearing against the lower washer, and a flattened portion forming shoulders for retaining the upper washer, all substantially as specified.



395,911. POP SAFETY-VALVE. FREDERICK A. MILLER, Oakland, Cal. Filed Aug. 15, 1888. Serial No. 282,796. (No model.)

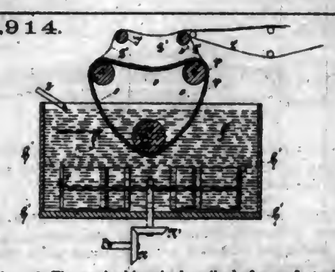
Claim.—1. An improved safety-valve comprising the coupling and shell secured together and each provided with perforated flanges, the flange of the shell having also the groove b', a locking-bolt fitted in the perforations, and a lock secured to the pin in the said groove portion, a perforated valve and perforated cap-plate axially rotating thereon, and a spring above the valve for returning the latter to position, substantially as herein described.

2. In a safety-valve, the coupling and the shell screwed together, as described, in combination with the means for locking the shell, comprising the perforated flange on the coupling, a perforated grooved flange on the shell, a locking-bolt passing through the perforations of the two flanges and having a hole which is exposed in the groove of the shell-flange, and the lock engaging said hole, substantially as herein described.

395,912. CENTRAL-DRAFT LAMP. JOHN C. MILLER, Meriden, Conn., assignor to the Meriden Bronze Company, same place. Filed May 28, 1888. Serial No. 275,280. (No model.)

Claim.—In a lamp having a central air-supply tube and a wick encircling it, the fount having an open neck of larger diameter than the wick, a sleeve, J, adapted to surround and hold the wick when on the tube, the adjusting-rod K, arranged vertically through the fount outside the burner, the lower end of the said rod turned upward to form the arm L and terminating in a socket, M, the said sleeve constructed with ears N O, the one over the other, and between which the said socket M is adapted to set, with a removable pin, P, through said ears and socket to form the connection between said sleeve and adjusting-rod, substantially as and for the purpose described.

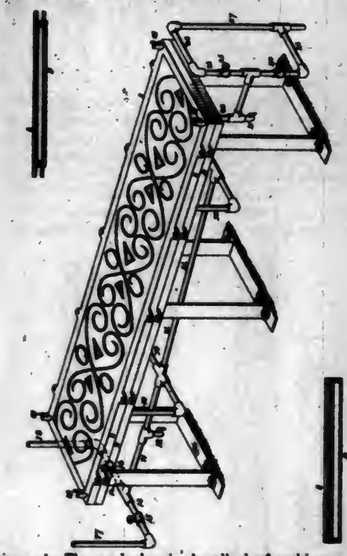
395,913. HAMMER FOR FIRE-ARMS. WILLIAM R. MILLER, Baltimore, Md. Filed Oct. 2, 1888. Serial No. 286,984. (No model.)



Claim.—In a gun, the hammer thereof having a secondary recess in the rear of the normal one, into which the thumb involuntarily enters as the hammer is lowered by hand, substantially as and for the purpose specified.

395,914. METHOD OF MANUFACTURING THREAD FROM SHORT FIBERS. ALEXANDER MITSCHERLICH, Freiburg, Baden, Germany. Filed Sept. 11, 1884. Serial No. 142,774. (No model.) Patented in England Aug. 28, 1884, No. 11,746; in Austria-Hungary Oct. 3, 1884, No. 30,411 and No. 44,963; in Italy Oct. 18, 1884, XVIII. 17,401, and in France Dec. 26, 1884, No. 163,787.

Brief.—The object of the invention is the utilization for the manufacture of threads of very short fibers, such as are obtained by boiling wood or other vegetable substance with a chemical agent.



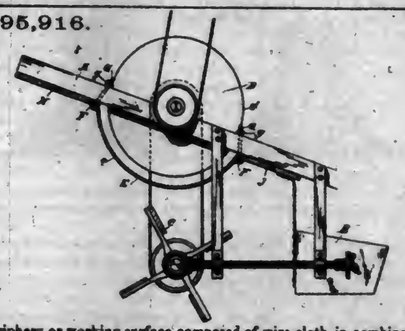
395,914.

Claim.—1. The method herein described of manufacturing thread from short fibers, (such as sulphite cellulose or soda cellulose,) said method consisting in forming these short fibers into a pulp, arranging the fibers substantially parallel to each other, producing fiber strips therefrom, and spinning the strips thus formed, substantially as described.

2. The method herein described of manufacturing thread from short fibers, (such as sulphite cellulose or soda cellulose,) said method consisting in first forming these short fibers into an aqueous pulp, producing directly from this pulp strips of pasteboard with the fibers parallel to each other, and spinning these strips into thread, substantially as described.

395,915. METHOD OF EMBOSSING CANVAS FOR DECORATING WALLS OR OTHER SURFACES. WILLIAM S. MORTON, Edinburgh, County of Mid-Lothian, Scotland. Filed Feb. 15, 1887. Serial No. 227,458. (No model.) Patented in England Nov. 13, 1884, No. 15,161, and Dec. 2, 1885, No. 14,793; in France Sept. 22, 1885, No. 171,381, and in Belgium Sept. 23, 1885, No. 70,264.

Claim.—1. The mode herein described of making embossed decorative work, said mode consisting in sizing the canvas, then working it into the intaglio parts of a mold, and afterward applying heat to the mold with the canvas on it.

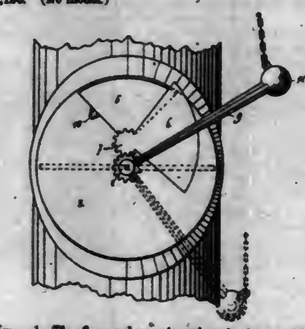


2. The mode herein described of making embossed decorative work, said mode consisting in sizing canvas, then working it into the intaglio parts of the mold, packing the deeper parts of the embossed canvas with paper-pulp or similar material and applying heat to the mold, and pasting a paper backing over the whole.

395,916. RAISIN-STEMMER. CHARLES L. NORTH, Fresno, Cal. Filed July 27, 1888. Serial No. 281,239. (No model.)

Claim.—1. In a raisin-stemmer, the horizontal rotary cylinder having its periphery or working-surface composed of wire-cloth, in combination with the concave under said cylinder and having its surface composed also of wire-cloth, the spring-strips *c*, supporting the wire-cloth, the rods on which the ends of the concave are supported, and the adjustable eyebolts supporting the rods, whereby the concave may be adjusted with relation to the cylinder, substantially as herein described.

2. In a raisin-stemmer, the horizontal rotary cylinder having its

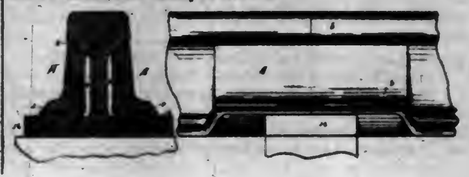


395,916.

periphery or working-surface composed of wire-cloth, in combination with an underlying concave having its surface composed also of wire-cloth and its frame made up of spring-strips, substantially as herein described.

3. In a raisin-stemmer, a horizontal rotary cylinder having its periphery or working-surface composed of wire-cloth, in combination with an underlying concave having its surface composed also of wire-cloth and its frame made of spring-strips, the rods supporting the spring-strips, and the adjustable eyebolts passing through the frame-timbers at an angle in converging planes, as described, whereby the concave may be adjusted up or down and its spring-frame bent to conform to the curvature of the cylinder in any position, substantially as herein described.

395,917. CHECK-DRAFT. WILLIAM J. OWENS, Utica, N. Y., assignor to Sayre, Owens & Co., same place. Filed July 5, 1888. Serial No. 278,126. (No model.)



Claim.—1. The flue and opening therein, in combination with a pivoted lid having a gear-sector partially surrounding the pivotal point, the damper in the flue having an extended pivotal bearing, a weighted arm held to the end of the pivotal bearing of the damper, and a gear-sector on the pivotal bearing arranged to mesh with the gear-sector on the cover, substantially as set forth.

2. The head having an opening, in combination with a pivoted swinging cover having a gear-sector partially encircling the pivotal point of the cover, and the pivoted weighted arm having a gear-sector partially surrounding the pivotal point meshing into the gear sector on the cover, arranged substantially as set forth.

3. The combination of the flue, the damper in the flue, the weighted arm for operating the damper, the swinging cover for closing and opening into the flue, and the gear-sectors engaging each other, whereby the cover and damper are simultaneously movable, substantially as set forth.

395,918. AUTOMATIC LOCK-JOINT FOR RAILWAY-RAILS. JOHN L. PORT, Cleveland, Ohio. Filed Apr. 17, 1888. Serial No. 270,962. (No model.)

Claim.—1. In a rail joint, the fish-plates and rails having their surfaces of contact inclined downward and converged toward the web of the rail, substantially as set forth.

395,918.

2. In a rail-joint, a fish-plate having bearings along its edges converging inwardly and downwardly in straight lines, substantially as set forth.

3. In a rail-joint, a fish-plate having its lower edge provided with a bearing-surface at an acute angle and its upper edge with a bearing-surface at an obtuse angle to the plane of the web of the rail, and an inwardly-converging seat for the plate, substantially as set forth.

4. In a rail-joint, a fish-plate having bearings on its respective edges at differing angles to the plane of its sides and converging inwardly and downwardly, the lower bearing-surface having greater width than the upper, in combination with a converging seat in which the plate gravitates to a locking position, substantially as set forth.

5. In a rail-joint, a fish-plate having its lower edge re-enforced by a projection extending laterally outward therefrom and provided with a plain bearing-surface the full width of said edge and a plain bearing-surface along the upper edge of the plate, in combination with a seat for the plate at the side of the rail formed on lines converging inward and downward toward the web, substantially as set forth.

6. In a rail-joint, a rail having a bearing on its foot at an acute angle to the web and a bearing on its head at an obtuse angle to the web, substantially as set forth.

7. In a rail-joint, a rail having its foot turned up so as to bring the upper surface thereof to an acute angle to the web and a bearing on the head at an obtuse angle to the web, substantially as set forth.

395,919. STOVE-PANEL. JOHN A. PRICE, Scranton, Pa. Filed Mar. 30, 1888. Serial No. 268,977. (No model.)

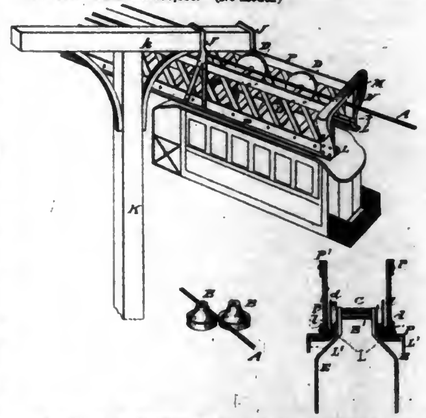
Claim.—1. In a stove-panel, the combination, with the base-plate and the frame having the sunken ledge and raised rim, of the removable panel lying on the ledge below the level of the raised portion, and the screws passing through the panel for securing the same in position, substantially as described.

2. In a stove-panel, the combination, with the base-plate, the frame having the ledge, and the cross-bars, of the panel with the openings therein overlying said ledge and cross-bars, the tiles held in position in said openings by the cross-bars, and the screws uniting the panel and base-plate, substantially as described.

3. In a stove-panel, the combination, with the base-plate, the frame having the ledge, cross-bars, and projections, as described, of the panel overlying said ledge and cross-bars, having the openings opposite the latter, the tiles held in the openings by the cross-bars and engaging said projections, and the screws for holding said parts in position, as and for the purpose set forth.

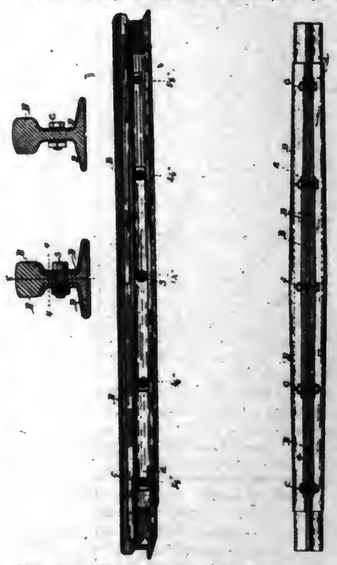
4. In a stove-panel, the combination, with the base-plate and frame having the ledge and cross-bars, of the panel overlying and having openings opposite said cross-bars, the tiles held in the openings by the cross-bars, and the fastening-screws passing through the panel for drawing the parts together, substantially as and for the purpose set forth.

395,920. BORING AND REAMING TOOL. CHARLES ROHR, Chester, Conn. Filed Jan. 11, 1888. Serial No. 260,389. (No model.)



Claim.—1. In a boring and reaming tool, the combination, with a suitable bit and cutting-knives, of the head A, having chamber *c* and openings *d*, to form outlets for the chips to pass out at the top of the tool, substantially as and for the purpose set forth.

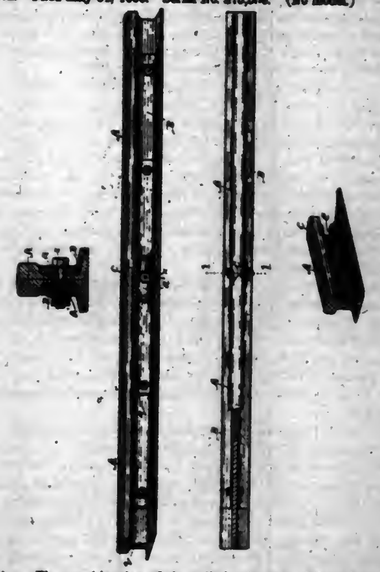
395,920.



2. In a boring and reaming tool, the head A, having chamber *c* and openings *d* at the top, and cast with the sleeve *a* and shank *d*, substantially as and for the purpose specified.

395,921. ELEVATED STREET-RAILROAD. ROBERT F. ROBISON and HARRY M. CROCKER, Kansas City, Kans.; said Crocker assignor, by mesne assignments, to Howard A. Williams, same place. Filed Dec. 27, 1887. Serial No. 259,065. (No model.)

Claim.—In an elevated railway, the track-rails made with the two flanges *l l'*, in combination with arch cross-braces M N and longitudinal rails P P', the parts M N P P' being fastened to the flanges *l l'*, whereby the track-rails are firmly held in position and prevented from lateral displacement.



395,922. RAILWAY SPLICE-BAR. GEORGE P. ROSE, Fenton, Mich. Filed May 31, 1888. Serial No. 275,555. (No model.)

Claim.—1. A splice-bar shaped to fit against the exterior of the rail below the tread-surface, all portions of said bar, including its upper and lower flanges, being beveled longitudinally each way from the center, substantially as set forth.

2. The combination of rails and splice-bars having bolt-holes graduated as to size, said bars, including their upper and lower flanges, being beveled longitudinally each way from the center, and bolts graduated in size, as stated, all substantially as set forth.

395,923. RAILWAY SPLICE-BAR. GEORGE P. ROSE, Fenton, Mich. Filed May 31, 1888. Serial No. 275,556. (No model.)

Claim.—The combination of the rails having the oblique lapping ends, the splice-bars re-enforced at the center and the outer one being provided with the boss, and the securing-bolts, substantially as set forth.

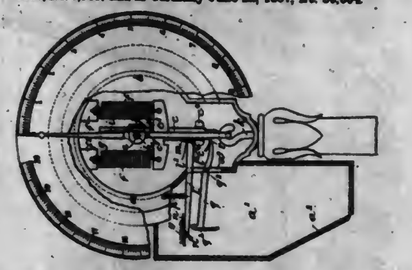
395,924. RAILWAY SPLICE-BAR. GEORGE P. ROSE, Fenton, Mich. Filed May 31, 1888. Serial No. 275,557. (No model.)

Claim.—1. The combination of the rails having the holes the size of the bolts, the washers provided with the boss, the splice-bars having the slots longer than the boss on the washer, and the securing-bolts, substantially as set forth.

2. The combination of the rails having the end slot and bolt-holes the size of the bolts, the splice-bars having the central boss, and the slots to receive the washers, the washers having the boss of a length less than said washer-slots, and the securing-bolts, substantially as set forth.

3. The combination of the rails having the bolt-holes of a size to just receive the bolts, the splice-bars having the washer-slots, the washers having the boss of a length less than said slots, the holes in the washers on one side of the rail being screw-threaded, and the bolts having the screw-threaded ends in said screw-threaded holes, substantially as set forth.

4. The combination of the rails having the bolt-holes of a size to receive the bolts, the splice-bars having the washer-slots, the washers provided with the boss of a length less than said slots, the holes in the washers on one side of the rail being screw-threaded, the bolts having the screw-threaded ends in said holes, and the lock-nuts on the extended ends of the bolts, substantially as set forth.



5. The combination of the rails having the end slots and bolt-holes, the splice-bars provided with the central boss and having the washer-slots, the washers provided with the boss of a length less than the washer-slots, the washers on one side of the rail having their bolt-holes screw-threaded, the bolts having the screw-threaded ends in said holes, and the lock-nuts, substantially as set forth.

395,925. RAILWAY-SPIKE. GEORGE P. ROSE, Fenton, Mich. Filed May 31, 1888. Serial No. 275,559. (No model.)

Claim.—The T-headed spike having threads on the two opposite sides, the upper side of which threads is at right angles to the spike, and having vertically-straight spaces between the threads and a bearing portion between the T-head and upper thread, which portion is circular in cross-section, and the wedge-point of the spike having two of its diagonally-opposite corners chamfered off to facilitate turning in the wood, substantially as set forth.

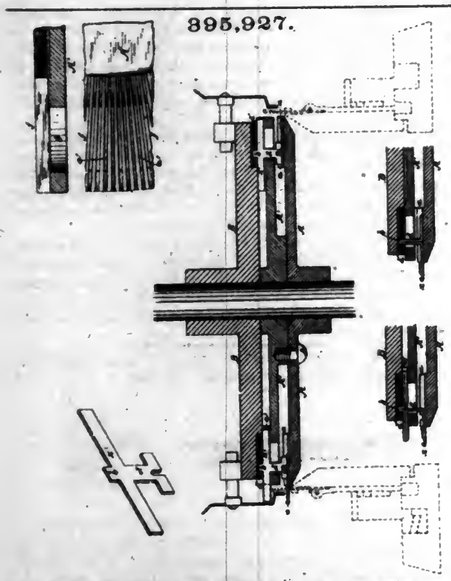
395,926. COIN-OPERATED WEIGHING-MACHINE. GEORGE SALTER, West Bromwich, County of Stafford, England. Filed Mar. 17, 1888. Serial No. 267,557. (No model.) Patented in England May 26, 1886, No. 6,983, and in Germany June 22, 1887, No. 39,664.

Claim.—1. In a weighing-machine, the combination, with weighing mechanism, of a lever one end of which engages said mechanism to hold it from operation, and whose other end is provided with a coin-receptacle, and means operated by the movement of the weighing mechanism for discharging the coin from said receptacle, substantially as set forth.

2. In a weighing-machine, the combination, with weighing mechanism, of a lever one end of which engages said mechanism to hold it from operation, a tilting plate on the other end of said lever for receiving a coin, and an arm moved by the weighing mechanism for tilting said plate to discharge the coin, substantially as set forth.

395,927. CIRCULAR-KNITTING MACHINE. ROBERT W. SCOTT and LOUIS M. D. WILLIAMS, Philadelphia, Pa. Filed Aug. 24, 1888. Serial No. 283,051. (No model.)

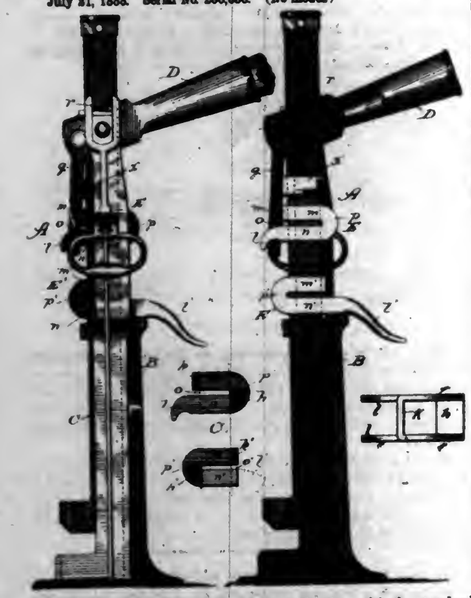
Brief.—The objects of the invention are to remove side strain or twist from the needles of the dial and to obviate the necessity of lubricating the needles.



Claim.—1. The combination of the dial and its needles with a supplementary guiding-dial and a cam for actuating said needles, substantially as set forth.

2. The combination of the dial of a knitting-machine with a supplementary guiding-dial and a cam, and with needles having jacks adapted to grooves in said guiding-dial, substantially as described.

3. The combination of the dial and its needles, the supplementary dial and its guided jacks, and a dial-plate having cams for acting on said jacks, all substantially as specified.



4. The supplementary dial having radical grooves in its upper

395,927.

face and having beneath said grooved portion an annular recess bridged by the ribs between the grooves, all substantially as specified.

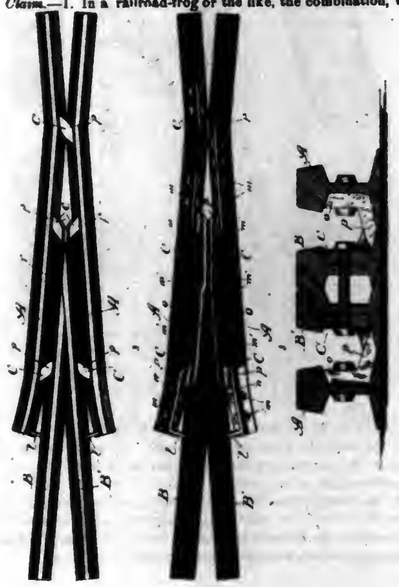
395,928. LIFTING-JACK. AXEL A. STROM, Austin, Ill. Filed July 21, 1888. Serial No. 280,638. (No model.)

Claim.—1. In a lifting-jack, the combination, with the standard and lifting-bar, of a friction-clutch having a bar extending across the lifting-bar, cross-bars extending from opposite ends of said bar across opposite sides of the lifting-bar, and a handle rigidly connected or integral with and extending from one of said cross-bars at one side of the lifting-bar toward the opposite side of the latter, substantially as described.

2. In a lifting-jack, the combination, with the standard, lifting-bar, and operating-lever, of a friction-clutch, E, having a U-shaped bar, *p*, composed of rigidly-connected or integral bars *m* and *n*, a cross-bar, *k*, extending from the bar *m* across one side of the lifting-bar, and a cross-bar, *h*, extending across the opposite side of the lifting-bar, and a handle portion, *l*, on the bar *n*, connected by a suitable link-connection with the operating-lever D, substantially as described.

3. In a lifting-jack, the combination, with the standard, lifting-bar, and operating-lever, of a lifting-clutch, E, comprising two U-shaped bars, *p*, embracing the lifting-bar and each composed of the rigidly-connected or integral bars *m* and *n*, a cross-bar, *k*, connecting corresponding ends of the bars *m* at one side of the lifting-bar, a cross-bar, *h*, extending between the bars *p* across the opposite side of the lifting-bar, and a handle portion, *l*, forming extensions of the bars *n*, connected by a suitable link-connection with the operating-lever D, and a suitable retaining-clutch, substantially as described.

4. In a lifting-jack, the combination, with the standard, lifting-bar, and operating-lever, of a lifting-clutch, E, comprising two U-shaped bars, *p*, embracing the lifting-bar and each composed of the rigidly-connected or integral bars *m* and *n*, a cross-bar, *k*, connecting corresponding ends of the bars *m* at one side of the lifting-bar, a cross-bar, *h*, extending between the bars *p* across the opposite side of the lifting-bar, and handles, *l*, forming extensions of the bars *n*, extending beyond the side of the lifting-bar at which the cross-bar *k* is provided, and connected by a suitable link-connection with the short end of the operating-lever D, and a suitable releasing-clutch, substantially as described.



5. In a lifting-jack, the combination, with the standard, lifting-bar, and operating-lever, of a suitable lifting-clutch and a retaining-clutch, E′, having a U-shaped bar, *p′*, composed of rigidly-connected or integral bars *m′* and *n′*, a cross-bar, *k′*, extending from the bar *m′* across one side of the lifting-bar, and a cross-bar, *h′*, extending across the opposite side of the lifting-bar, and a handle portion, *l′*, on the bar *n*, at which the clutch is supported on the standard, substantially as described.

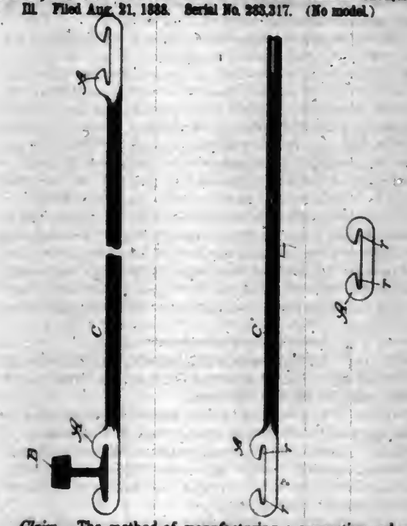
6. In a lifting-jack, the combination, with the standard, lifting-bar, and operating-lever, of a suitable lifting-clutch and a retaining-clutch comprising two U-shaped bars, *p′*, embracing the lifting-bar and each composed of the rigidly-connected or integral bars *m′* and *n′*, a cross-bar, *k′*, connecting corresponding ends of the bars *m′* at one side of the lifting-bar, a cross-bar, *h′*, extending between the bars *p′* across the opposite side of the lifting-bar, and a handle portion, *l′*, forming extensions of the bars *n′*, and at which the retaining-clutch is supported on the standard, substantially as described.

7. In a lifting-jack, the combination, with the standard, lifting-bar, and operating-lever, of a suitable lifting-clutch and a retaining-clutch, E′, comprising two U-shaped bars, *p′*, embracing the lifting-bar and each composed of the rigidly-connected or integral bars *m′* and *n′*, a cross-bar, *k′*, connecting corresponding ends of the bars *m′* at one side of the lifting-bar, a cross-bar, *h′*, extending between the bars *p′* across the opposite side of the lifting-bar, and handles *l′*, forming extensions of the bars *n′*, extending beyond the side of the lifting-bar at which the cross-bar *k′* is provided, and affording a lever for releasing the retaining-clutch at which it is supported on the standard, substantially as described.

395,929. RAILWAY-FROG. AXEL A. STROM, Austin, Ill. Filed Aug. 21, 1888. Serial No. 283,316. (No model.)

Claim.—1. In a railroad-frog or the like, the combination, with

395,929.



adjacent rails, of a brace, C, formed of a bent metal bar having foot portions *n* at opposite ends and an intermediate trough, *p*, substantially as and for the purpose set forth.

2. In a railway-frog, the frog-point comprising a point-rail, B′, and a point-rail, B, secured to the rail B′ and having its wedge-shaped end beveled on its upper side, as shown at *r*, in a downward direction toward the pivoted end of the frog, substantially as described.

3. In a railway-frog or the like, the combination, with adjacent rails, of a brace, C, comprising a body portion, *e*, having foot portions *n* at opposite ends extending laterally of the body portion, and a trough, *p*, between each foot portion and the adjacent end of the body portion, substantially as and for the purpose set forth.

4. A rail-frog having its point braced on opposite sides by means of flanged bearings resting flatwise against the adjacent flanges of the wing-rails and secured flatwise to the web portion of the point, substantially as described.

395,930. TIE-ROD FOR SWITCH-RAILS. AXEL A. STROM, Austin, Ill. Filed Aug. 21, 1888. Serial No. 283,317. (No model.)

Claim.—The method of manufacturing a connecting-rod or tie-bar, which consists in bending toward each other the opposite ends of a bar or bars of metal, thereby forming each bar into a clamp, A, and welding to one or each end of a bar one of said clamps, substantially as described.

395,931. FISHING-ROD. CHARLES S. TREADWAY, Bristol, Conn., assignor to the Horton Manufacturing Company, same place. Filed Oct. 8, 1888. Serial No. 287,495. (Model.)

Claim.—1. The herein-described fishing-rod, consisting of several sections made from tubular metal, the sections tapering except at the butt and tip portions, which said butt and tip portions of the respective sections are substantially cylindrical and integral with said tapering portions, the butt-end of one section corresponding to the tip-end of the next section at the rear, and so that the cylindrical portion of one may be set into the corresponding cylindrical portion of the other, substantially as described, and whereby the joint portions of each section are made integral therewith and the several sections separable.

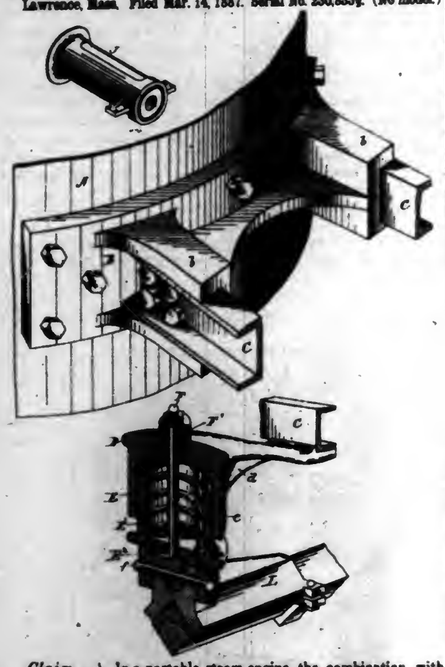
2. A tubular metallic fishing-rod made in several sections, the body of each section tapering from the butt toward the tip, the butt and tip ends of each section made cylindrical and corresponding in diameter to the butt or tip end of the adjacent sections, as the case may be, and so that the adjacent end of one section may be set into the corresponding end of the next section, the said sections provided with a stationary band or collar at the junction of the cylindrical tapering portions, substantially as and for the purpose described.

395,932. MEDICAL BATTERY. HENRY R. WAITE, New York, N. Y. Filed Aug. 15, 1888. Serial No. 282,772. (No model.)

Claim.—1. In a medical battery, the combination, with a series of cells, a pole-changer, and adjustable switches for including more or less of cells in the circuit, of a pole-changer, electrodes for the patient, a series of resistances, a millampère-meter, and switches, whereby the resistance of the patient may be readily ascertained and the desired amount and kind of current applied, substantially as described.

2. In a medical battery, the combination, with the electrodes, of an interrupter located in and breaking the circuit of the electrode and an independent battery-circuit for operating the interrupter, substantially as described.

3. In a medical battery, the combination, with the primary circuit of the inductorium, of a loop-circuit including electrodes connected therewith and a key in a short circuit of the primary for opening and closing the same, substantially as described.

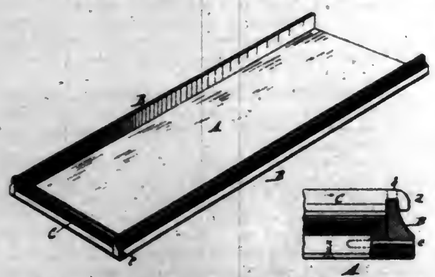


4. In a medical battery, the combination, with the primary of the inductorium, of a loop-circuit including electrodes connected therewith and a key for opening and closing a short circuit of the primary, and a secondary circuit including electrodes and a key for opening and closing said secondary circuit, substantially as described.

5. In a medical battery, the combination, with a base-piece containing switches and connections, substantially as described, of a mill-

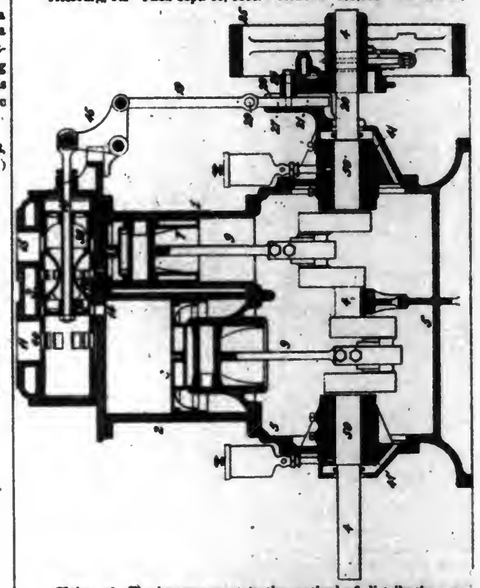
ampere-meter connected thereto and provided with an inclined reflector, whereby the indications of the current through said circuits and switches may be observed, substantially as described.

6. In a medical battery, the combination, with a base-piece, of a switch arranged to include more or less battery-cells in the circuit, a pole-changer, a millampere-meter, an interrupter, a series of resistance-coil switches, an induction-coil, a key for opening and closing the primary of said coil, and circuits and switches, substantially as described, all arranged on the base, whereby the different therapeutic effects may be produced in the manner set forth.



895,983. PORTABLE PUMPING-ENGINE. WILLIAM O. WEBBER, Lawrence, Mass. Filed Mar. 14, 1887. Serial No. 230,833. (No model.)

Claim.—1. In a portable steam-engine, the combination, with the boiler A, of the saddle B, secured thereto and provided with the forwardly-projecting lugs *b*, the channel-bars C, secured to the said lugs, and the spring-rocker D at the fore carriage, to which the forward ends of the said channel-bars are attached, substantially as set forth.



2. In a portable steam-engine, the combination, with the saddle L, of the rocker D, having cup-shaped housing E, the housing E', having the flange or portion E^3, the spring *e*, the eyebolt F, the counter-spring F', and the transverse bolt *f*, substantially as set forth.

895,984. PRINTER'S GALLEY. FERDINAND WIBEL, New York, N. Y. Filed June 5, 1888. Serial No. 276,132. (No model.)

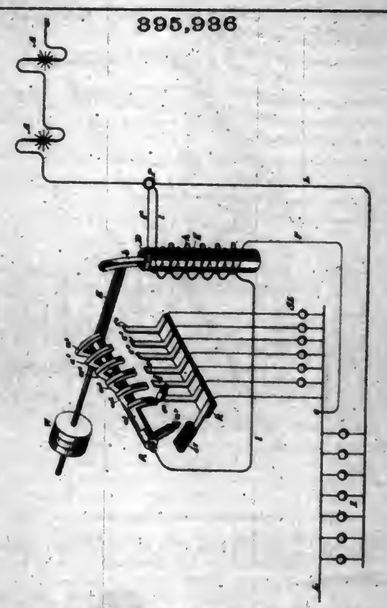
Claim.—The combination, in a printer's galley, of the bottom of the galley with the side walls and head connected by screws to said bottom, the head being provided with hook-shaped ends, which engage recesses in the upper edges of the side walls, substantially as set forth.

895,985. METHOD OF DISTRIBUTING MOTIVE FLUID IN COMPOUND ENGINES. HENRY H. WESTINGHOUSE and FRANCIS M. RITER, Pittsburg, Pa. Filed Sept. 12, 1888. Serial No. 285,201. (No model.)

Claim.—1. The improvement in the method of distributing motive fluid in compound engines, which consists in supplying the same to a preliminary or high-pressure cylinder and a continuously-communicating clearance-chamber of determined volume, substantially greater than that required to serve as an avenue for the passage of motive fluid, exhausting the same under compound expansion into a secondary or low-pressure cylinder, and thereafter closing the exit from said clearance-chamber and raising high-pressure compression to initial pressure therein, substantially as set forth.

2. The improvement in the method of distributing motive fluid in compound engines, which consists in raising high-pressure compression to initial pressure in a chamber of suitable determined volume without limitation by or disturbance from variations of load or initial pressure by commencing high-pressure compression coincidently with low-pressure expansion, substantially as set forth.

3. The improvement in the method of distributing motive fluid in compound engines, which consists in supplying the same to a preliminary or high-pressure cylinder and a continuously-communicating clearance-chamber of suitable determined volume, exhausting the same under compound expansion into a secondary or low-pressure cylinder, varying the grade of simple expansion in the same direction in both the high and the low-pressure cylinders, and effecting high-pressure compression to initial pressure in the clearance-chamber by initiating said compression coincidently with each and every variation of the grade of low-pressure expansion, substantially as set forth.



4. The improvement in the method of distributing motive fluid in compound engines, which consists in counteracting and compensating for the tendency of variations of the point of cut off to induce variations in terminal high-pressure compression by effecting a corresponding variation of pressure at the point of initial compression coincidently with each variation of the point of cut off, substantially as set forth.

895,986. REGULATOR FOR INCANDESCENT ELECTRIC-LIGHTING SYSTEMS. MERLE J. WIGHTMAN, Hartford, Conn. Filed June 29, 1888. Serial No. 278,008. (No model.)

Claim.—1. In a regulator for an electric-lighting system, an electro-magnet one of whose coils is in a constantly-closed circuit, an assisting-coil, branches, and a series of contacts in the circuit thereof, which are automatically brought into circuit and removed therefrom by increases and decreases of current in said circuits to correspond with the number of lamps in use.

2. In a regulator for an electric-lighting system, an electro-magnet one of whose coils is in a constantly-closed derived circuit, an assisting-coil, branches, and a series of contacts in the circuit thereof, said branches containing compensating resistances which are automatically and successively brought into circuit and removed therefrom by the reciprocal action of said coils due to increases and decreases of current in said circuits corresponding to changes of resistance in the external circuit.

895,986

3. In a regulator for an electric-lighting system, an electro-magnet one of whose coils is in a constantly-closed derived circuit, an assisting-coil, branch circuits, and a series of contacts in the circuit thereof, said branch circuits containing compensating resistances connected with the line which are automatically and successively brought into circuit and removed therefrom by increases and decreases of current in said circuits to correspond with the number of lamps in use, and a cut-out circuit constituting one of said branch circuits.

4. A regulator for an electric-lighting system, consisting of circuit-controlling devices, branch circuits connected with the main line containing compensating resistances, two solenoids for controlling said circuit-controlling devices, one in a derived circuit and the other in the circuit of said compensating resistances, which circuit is normally broken, but which is completed by said circuit-controlling devices through the action of the first solenoid, as set forth.

5. A regulator for an electric-lighting system, consisting of circuit-controlling devices, branch circuits connected with the main line containing compensating resistances, two solenoids for controlling said circuit-controlling devices, one in a derived circuit and the other in the circuit of said compensating resistances, which circuit is normally broken, but which is completed by said circuit-controlling devices through the action of the first solenoid, and a cut-out for the lamps in the external circuit and for the compensating resistances brought into action by said solenoids after the last resistance has been introduced, as set forth.

6. A series multiple regulator for incandescent lamps, embodying a derived circuit containing safety-lamps in multiple arc, a series of contacts in electrical connection therewith, and two assisting-solenoids, one in the aforesaid derived circuit and the other in a derived circuit parallel therewith, for placing a greater or less number of said safety-lamps in circuit, as set forth.

7. A series multiple regulator for incandescent lamps, embodying a derived circuit containing safety-lamps in multiple arc, a series of contacts in electrical connection therewith, and two assisting-solenoids, one of low and the other of high resistance, for controlling said contacts, one located in the aforesaid circuit, which is normally broken, and the other in a derived circuit, which is always closed.

8. A series multiple regulator for incandescent lamps, embodying a derived circuit containing safety-lamps in multiple arc, a series of contacts in electrical connection therewith, and two assisting-solenoids, one of low and the other of high resistance, for controlling said contacts, one located in the aforesaid circuit, which is normally broken, and the other in a derived circuit, which is always closed, and a cut-out for both the external lamps and the safety-lamps controlled by said solenoids at a predetermined time, as set forth.

9. A regulator for a series multiple of incandescent lamps, consisting of an arbor having a plurality of curved arms mounted thereupon at different radial distances, a lever secured to said arbor substantially at right angles thereto, a solenoid composed of two coils, one in a constantly-closed derived circuit of high resistance, the other in a low-resistance circuit parallel therewith, normally open, but closed by said curved arms, and having multiple branches containing safety-lamps, and a core for said solenoid suitably connected with and actuating said lever, for the purpose set forth.

10. A regulator for a series multiple of incandescent lamps, consisting of an arbor having a plurality of curved arms mounted thereupon at different radial distances, a lever secured to said arbor substantially at right angles thereto, a solenoid composed of two coils, one in a constantly-closed derived circuit of high resistance, the other in a low-resistance circuit parallel therewith, normally open, but closed by said curved arms, and having multiple branches containing safety-lamps, and a core for said solenoid suitably connected with and actuating said lever, an adjustable counterpoise for the latter, and a cut-out, also mounted upon said arbor.

11. A regulator for a multiple series system of incandescent lamps, having a series of contacts mounted upon an arbor, another series of contacts co-operating therewith, circuits therefrom containing safety devices connected with the main line *l*, a solenoid and suitable connections therefor, intermediate devices for operating said lever by the current flowing in said solenoid, and a cut-out, also mounted upon said arbor, operating as and for the purpose described.

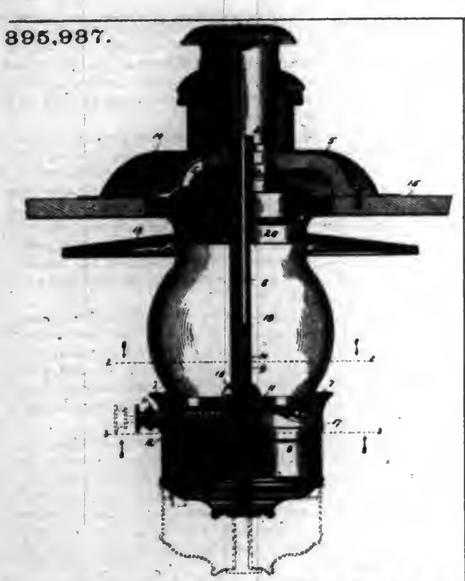
12. A retracting device for an incandescent electric-light regulator, having a pivoted lever actuated by changes of current, and safety devices cut in or out of circuit through the instrumentality of said lever and other suitable devices, consisting of a roller freely mounted upon said lever, and a retracting-spring suitably connected with said roller, whereby the retracting leverage, and thereby the retracting force, is changed at a predetermined time as the inclination of the lever increases.

13. A retracting device for an incandescent electric-light regulator, having a pivoted lever actuated by changes of current, and safety devices cut in or out of circuit through the instrumentality of said lever and other suitable devices, consisting of a roller freely mounted upon said lever, a retracting-spring suitably connected with said roller, whereby the retracting leverage, and thereby the retracting force, is changed at a predetermined time as the inclination of the lever increases, and a cut-out modified in its action by the aforesaid means.

14. A retracting device for an incandescent electric-light regulator, having a pivoted lever actuated by changes of current, and safety devices cut in or out of circuit through the instrumentality of said lever and other suitable devices, consisting of a roller freely mounted normally in a notch in said lever, a retracting-spring suitably connected to the said roller, and an adjustable counterpoise for the lever for regulating the operation of the parts above enumerated.

15. A regulator for a series multiple of incandescent lamps, consisting of an arbor having a plurality of curved arms mounted thereupon at different radial distances, a lever secured to said arbor, a solenoid having a core governed by the reciprocal action of the current flowing in two coils connected with the main line, which core is suitably fastened to said lever, circuits controlled by said curved arms, safety-lamps in said circuits, a cut-out, also mounted upon the aforementioned arbor, and a shifting retracting device for said lever, for the purpose set forth.

895,987. CAR-LAMP. WARD W. WILLIS, Chicago, Ill., assignor to the Adams & Westlake Company, same place. Filed May 9, 1888. Serial No. 273,349. (No model.)



Claim.—1. In a lamp, a globe-holding device consisting of a bottom globe-support, in combination with a spider secured to the roof or ceiling and a rod depending therefrom, running through said globe, and connecting said spider and bottom support.

2. In a lamp, the globe-holding device comprising the spider adapted to be secured to the roof, the central rod depending therefrom, the single globe surrounding said rod, the globe-support at its lower end, and the metal top between the spider and the globe.

3. In a lamp, the combination of a single central supporting-rod, 6, the supporting-spider adapted to be attached to the roof, the globe-support 7, spring-catch 11, and pin 9, projecting upwardly from the oil-pot, and the oil-pot adjustably supported by said pin.

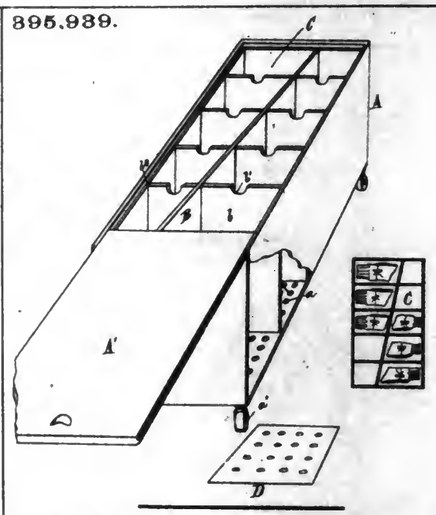
395,937.

4. In a lamp, the combination of a spider, 5, adapted to be attached to the roof of the car, a central supporting-rod, 6, globe-support 7, and hinged burner-plate 17, attached to the globe-support.

395,938. TOP ROLL FOR SPINNING-MACHINES. EDWARD WRIGHT, Worcester, assignor to the Davis & Furber Machine Company, North Andover, Mass. Filed Sept. 10, 1888. Serial No. 284,970. (No model.)

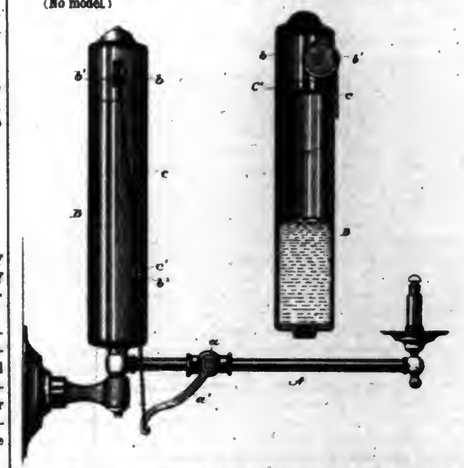
Claim.—1. A top roving-roll for spinning-machines, consisting of the axle-arbor A, having upon each of its ends a roller composed of two sheet-metal die-drawn cups, *b* and *c*, fitted one within the other and concentrically fixed upon said arbor, substantially as described.

2. In a top roving-roll for wool-spinning machines, the combination, with the axle-arbor A, having the bearing portion *a* and shoulders *d* and *e*, of the pair of rollers B, each composed of the cylindrical die-drawn sheet-metal cup *b*, fitted upon the arbor against the shoulder *d*, and the die-drawn sheet-metal cup *c*, fitted upon the arbor against the shoulder *e*, with its peripheral rim fitting within and supporting the rim of the cup *b*, and retained by riveting the end of the arbor at E, substantially as set forth.



395,939. MERCHANDISE-CABINET. SAMUEL C. ADLER, Philadelphia, Pa. Filed Sept. 15, 1888. Serial No. 285,450. (No model.)

Claim.—1. A cabinet for shoes or articles of graded sizes, which consists in a main inclosure subdivided lengthwise by an obliquely-inclined removable partition into two trapezoid compartments, each of which is subdivided by removable transverse partitions, each provided with an upper cut-away notch, *b'*, into a series of smaller compartments successively graduated in length, as and for the purpose intended, substantially as described.



2. A cabinet for shoes or articles of graded sizes, consisting of a case, A, provided with a foraminous bottom, said case subdivided into two rows of compartments, C, one of which rows gradually increases in length from end to end of the incasement, the other row having compartments C, each increasing in length in a direction reversed from the opposite row, in combination with removable perforated sheets D, adapted to lie intermediate of layers of merchandise when placed within said compartments, substantially as described.

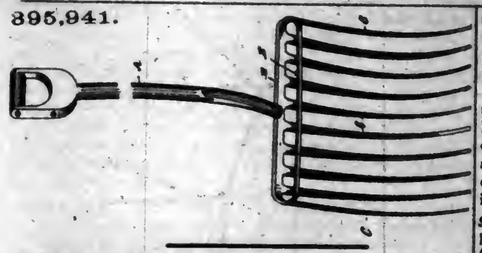
3. A cabinet for displaying and holding articles of merchandise of diverse length in separation, which consists of the following elements: a main incasement, A, having a cover, A', removable partitions B, arranged to reach lengthwise of the case in an oblique direction, and transverse partitions *b*, each having midway of its upper edge a notch, *b'*, the incasement provided with a foraminous bottom, *a*, all in combination with removable perforated sheets D, as and for the purpose intended and set forth, substantially as described.

395,939.

395,940. AUTOMATIC GAS-EXTINGUISHER. CHARLES L. ALEXANDER, Charlotte, N. C. Filed Dec. 21, 1887. Serial No. 258,606. (No model.)

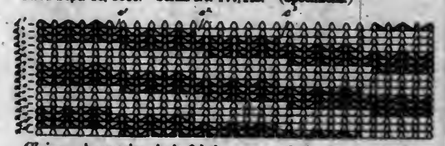
Claim.—1. An automatic light-extinguisher comprising a valve or cut-off, a receptacle adapted to be partially filled with liquid, and a suspended hollow body open at its lower portion, provided with a vent and connected with the valve or cut-off, substantially as described.

2. An automatic light-extinguisher comprising the receptacle partially filled with liquid, a hollow body suspended therein, provided with air-vents at its top and open at its lower portion, a valve or cut-off provided with an operating-lever, and a connection between the hollow body and the lever, substantially as described.



3. In an automatic light-extinguisher, a valve or cut-off provided with an operating-lever, a receptacle partially filled with liquid, a hollow body suspended therein, provided with air-vents at its top and open at its lower portion, a chain or the like for connecting the suspended body and the lever, and a projection or button on the outside of the receptacle to engage the chain or the like, substantially as described.

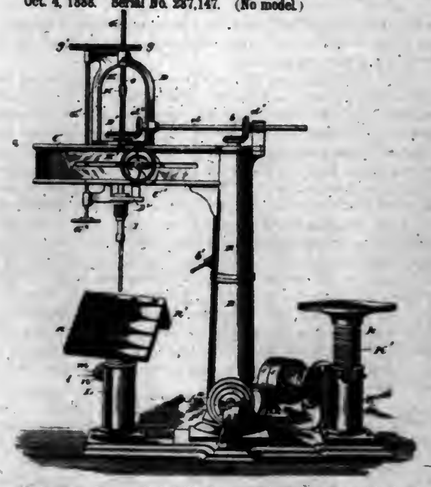
395,941. FORK. FAIRMAN L. ANDREWS, Miles Grove, Pa. Filed July 16, 1888. Serial No. 280,104. (No model.)



Claim.—1. A coke-fork having a guard integral therewith secured above the fork-head and parallel thereto extending from one end of the fork-head to the other, substantially as and for the purpose set forth.

2. A guard extending from one end of a fork-head to the other and made integral and parallel therewith, substantially as and for the purpose set forth.

395,941.



395,942. KNIT FABRIC. ROBERT M. APPLETON, Lake Village, N. H. Filed Sept. 18, 1886. Serial No. 177,443. (Specimens.)

Claim.—A seamless knit fabric composed alternately of continuous stripes of tuck-stitch and plain-stitch knitting extending spirally around the fabric, said stripes being formed of circumferential rows of stitches, part of which are tuck-stitches and part plain stitches, the tuck-stitch parts forming offsets in the contours of the stripes and the plain-stitch parts likewise forming offsets corresponding to those of the tuck-stitch parts, substantially as herein shown and described.

395,943. RADIAL DRILL. JOHN J. BAYMAN, Sunbury, Pa. Filed Oct. 4, 1888. Serial No. 287,147. (No model.)

Claim.—1. In a radial drill, the combination of a table having circumferential grooved column or stock M, the upper end of which is bifurcated and provided with a clamping-bolt, *p*, for securing the table of said column or stock, and a slotted support, L, for said column or stock, carrying a shaft, *m*, with pinion *n*, and a nut on said shaft for jamming the support upon the stock, substantially as shown, and for the purpose set forth.

2. In a drill, the combination of the drill-frame D, constructed substantially as shown and provided with a movable guide, H, having a central recess, within which the upper end of the spindle lies, and a screw-threaded recess, *k*, above the recess for the spindle, with which the lower end, *k'*, of the feed-screw engages, so as to bear upon the upper end of the spindle, substantially as shown, and for the purpose set forth.

3. The combination, in a drill, of the drill-frame provided with upper and lower bearings for the spindle, the lower opening, J, of said drill-frame being conical and provided with a conical split sleeve, J', the upper portion of which is screw-threaded, and a nut, *j*, for tightening and holding said sleeve in place, substantially as shown, and for the purpose set forth.

4. The combination, in a drill, of a drill-stock constructed substantially as shown and provided with guide-rods *e e*, the transverse bar made of two corresponding parts bolted together, so as to embrace said guide-arms and the upper portion of the spindle, and a feed-screw having the lower end provided with threads, which engage with the screw-threads in the arms H H, said threads being of different pitch from the feed-threads, substantially as shown, and for the purpose set forth.

5. The combination, in a drill, of a drill-stock constructed substantially as shown and provided with laterally-projecting arms E and E', guide-rods *e e*, supported thereby, removable cross-bar mounted on the guide-rods and carrying centrally the upper end of the spindle and lower end of the feed-screw, a lower bearing for the spindle carrying a conical sleeve, through which the spindle passes, a driving-wheel, D, for rotating the spindle, and a shaft, G', carrying a pinion, *g'*, which engages with a pinion, *g*, for turning the feed-screw, the parts being organized substantially as shown, and for the purpose set forth.

6. The combination, in a drill, of a table support or column provided with circumferential grooves, a support for said column having a vertical slot, adjacent to which are provided outwardly-projecting ears forming bearings for a bolt or shaft, upon which is placed a pinion, which engages with a support, said shaft having a nut for clamping the parts together, so as to be in frictional contact, substantially as and for the purpose set forth.

395,944. SIGHT FOR FIRE-ARMS. JOHN S. BLANKMAN, Washington, D. C. Filed June 26, 1883. Serial No. 279,250. (No model.)

Claim.—1. In combination with a gun, an open sight-tube of substantially uniform bore secured to the gun to narrow the field of sight and direct the vision, substantially as set forth.

2. For use with a gun, a sight-tube having a groove in its external wall parallel with the bore of the tube, substantially as set forth.

3. For use with a gun, an open sight-tube having in its bore two sight-pins, the bore having a practically uniform diameter, substantially as set forth.

4. A sight-tube having two sight-pins in its bore and two sight pins on its exterior, substantially as set forth.

5. An open sight-tube journaled to move about a journal or support and in a vertical plane, in combination with a sight-leaf and with a vertically-adjustable clamp, whereby the tube and its bearings can be moved up or down on the leaf, substantially as set forth.

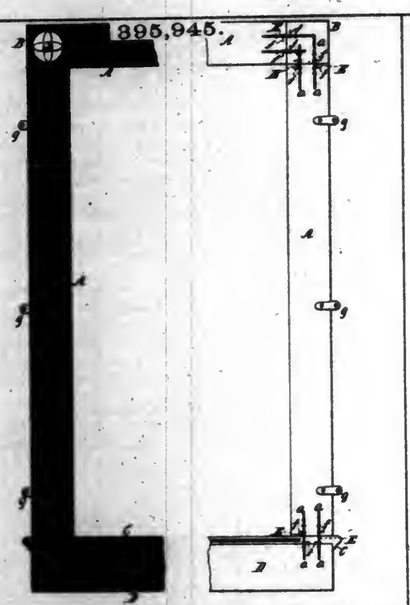
6. An open sight-tube having journal-bearings in a clamp, the journal having a screw-threaded thumb-nut, the elastic clamp, and the leaf, all combined substantially as set forth, whereby the clamp can be made to firmly hold both the tube and the leaf.

7. The open sight-tube journaled in the folding or hinged support and said support adapted to be attached to a gun, in combination with the gun, substantially as set forth.

8. The clamp to support the sight-tube upon the leaf or equivalent part of a gun, adapted to embrace the leaf and provided with wings having bearings for the journals of a sight-tube, in combination with said tube, substantially as set forth.

9. An elastic sheet-metal clamp provided with perforated wings or extensions, combined with a sight-tube and journal and a sight-leaf or equivalent, substantially as set forth.

10. An open sight-tube adjustable about its bearings, provided on its exterior surface with a graduated scale of angles, in combination with an index, substantially as set forth.



11. A sight-tube adjustable about its bearings and provided with a graduated scale of angles, combined with a clamp which constitutes an index, substantially as set forth.

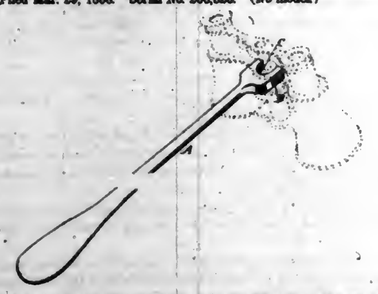
395,945. FINISHING OF HOUSE INTERIORS. WILLIAM J. BODA, Dayton, Ohio. Filed Apr. 16, 1888. Serial No. 270,730. (No model.)

Claim.—1. In a finished window-casing, the combination of the pilasters, the apron, and the interposed stool-board secured together by tie-bars driven into coincident kerfs cut in their inner sides and extending across the joints between the parts, substantially in the manner and for the purpose described.

2. In a finished window-casing, the combination, with the pilasters and the apron, of a two-part stool-board, the inner part of which is interposed between and secured to the apron and pilasters by tie-bars

395,945.

driven into coincident kerfs cut in the inner sides of said three parts and extending across the joints between them, substantially as and for the purpose described.



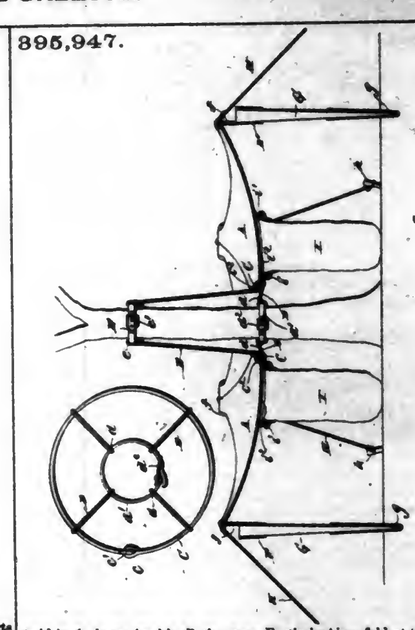
3. In a finished window-casing, the combination, with the pilasters and the apron, of a stool-board composed of two parts tongued and grooved together, the inner part of which is interposed between and secured to the apron and pilasters by tie-bars driven into coincident kerfs cut in the inner sides of said three parts and extending across the joints between them, substantially as and for the purpose described.

4. In a finished casing, the combination, with the pilasters, top facing, and interposed corner-blocks having flat abutting joints, of tie-bars driven into coincident kerfs cut in the inner sides of said parts and extending across the joints between them, substantially as and for the purpose described.

5. The combination, with the pilasters A and apron D, of the interposed stool-board C, the parts secured together by the tie-bars E, driven into coincident kerfs *a*, cut in their inner sides and extending across the joints between them, substantially as and for the purpose described.

395,946. OPERA-GLASS HOLDER. HENRY BORSCH, Chicago, Ill.

Filed Mar. 29, 1888. Serial No. 268,823. (No model.)



Claim.—A detachable opera-glass holder provided with slots at right angles to each other, forming a four-pronged clasp adapted to embrace the opposite sides of the cross-bar and to receive the nut on one side of said bar and the spindle or screw on the other, substantially as described.

395,947. FRUIT-GATHERER. JAMES G. BRADLEY, Allegheny, Cambria County, Pa. Filed Mar. 3, 1888. Serial No. 265,905. (No model.)

Claim.—1. In a fruit-gatherer, the combination of the canvas having the central conical portion and the outer flaring portion extending from the base of the conical portion, the wire hoop at the base of the conical portion with its ends hooked together, the radial wires swung to said hoop and having their inner ends looped, the strap *d'*,

395,947.

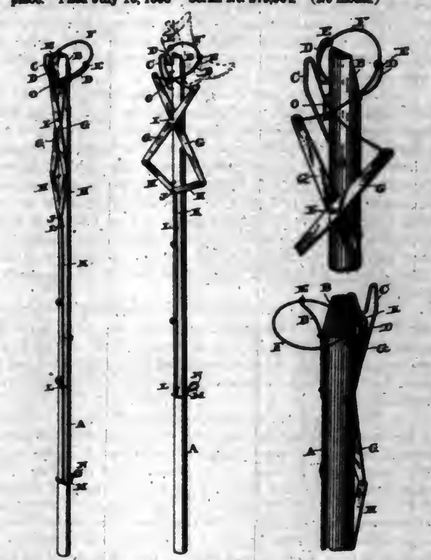
held in the loops, buckle d^2, the strap E, stitched in a fold at the upper end of the central conical portion, and supports for the outer edge of the flaring portion, as set forth.

2. In a fruit-gatherer, the combination of the canvas having the central conical portion and the outer flaring portion extending from the base of the conical portion with its ends hooked together, the radial wires swung to said hoop and having the inner ends looped, the strap *d'*, held in the loops, the strap E, stitched in a fold at the upper end of the central conical portion, the socket-pieces at the outer edge of the flaring portion, and the pointed iron-shod stakes secured in said socket-pieces, as set forth.

3. The combination of the canvas having the central conical portion and an outer flaring portion extending from the base of the conical portion and provided with the openings i^3 and depending folds *i'*, the wire hoop C at the base of the conical portion, the radial wires D, swung to said hoop, the straps *d'* E at the inner ends of the wires and upper end of the cone, respectively, having buckles d^2 *d'*, respectively, the socket-pieces F at the edges of the flaring portion, the iron-shod stakes G, secured in said socket-pieces, the brace-cords H, secured to the socket-pieces, pins *h*, and the sacks I, suspended by the hooks *i* below the openings i^3, as set forth.

395,948. TAPE AND RIBBON DELIVERING DEVICE. JAMES BRADY, Brooklyn, assignor to the Dunn Safety Ticket and Register Company, New York, N. Y. Filed Apr. 23, 1888. Serial No. 271,561. (No model.)

Claim.—1. In an apparatus for feeding or delivering tapes, ribbons, or other continuous strips wound in rolls, the combination, with a supporting-frame having parallel slots, of a strip-roll having its journals in said slots and a riding roll upon which said strip-roll rests, the free end of the strip being taken or drawn from between said rolls, substantially as described.



2. The combination, with a supporting-frame having parallel slots, of a strip-roll having its journals lying in said slots, a riding roll upon which the periphery of the strip rests, and a weight-roll resting upon the strip-roll and having its journals also lying in the slots of the frame and descending therein as the diameter of the strip-roll diminishes, substantially as described.

3. The combination, with a supporting-frame consisting of two parallel upright arms having parallel slots, of a riding roll having the journals of its shaft resting at the bottoms of the slots in the arms, and a strip-roll resting upon the riding roll and having its journals also lying

in the slots of the frame and descending therein as the strip-roll is consumed, the free end of the strip being drawn between the strip-roll and riding roll, substantially as described.

4. In an apparatus for feeding or delivering tapes, ribbons, or other continuous strips wound in rolls, the combination, with a suitable support for a strip-roll, of a riding roll upon which said strip-roll turns, the parts being so arranged that as the diameter of the strip-roll decreases by the withdrawal of the strip the axes of the said strip-roll and of the riding roll shall in a corresponding degree approach each other, substantially as described.

395,949. DEVICE FOR HANDLING SHELF GOODS, &c. GEORGE CADE, Memphis, Tenn., assignor of one-half to John W. Maumee, same place. Filed July 19, 1888. Serial No. 279,564. (No model.)

Claim.—1. The combination of the pole, the sliding rod, the toggle joint or lever, the flexible loop, and the arms for guiding and supporting the latter, substantially as and for the purpose shown and set forth.

2. A compound implement comprising the pole beveled at its upper end, the arms attached to opposite sides of the same and provided with eyes at their outer ends, the flexible loop inserted through said eyes, the toggle joint or lever, the sliding rod for operating the latter, and the fixed hook, all constructed and combined to operate substantially as and for the purpose shown and set forth.

395,950. ELECTRICAL HEATING. JOHN V. CAPEK, Brooklyn, assignor to himself, and Edward H. Johnson, New York, N. Y. Filed Mar. 12, 1888. Serial No. 266,922. (No model.)

Claim.—1. In an electrical heater, a conducting body of little thickness and large surface provided with electrical circuit-connections, the resistance and radiating surface of such body being so proportioned to the current that such body is heated to a temperature below the igniting-point of wood, paper, and like combustible materials, substantially as set forth.

2. An electrical heater consisting of insulating strips or plates provided with thin coatings of carbon and electrical circuit-connections to said carbon, the resistance and radiating surface of said carbon being so proportioned to the current that said carbon is heated to a temperature below the igniting-point of wood, paper, and like combustible materials, substantially as set forth.

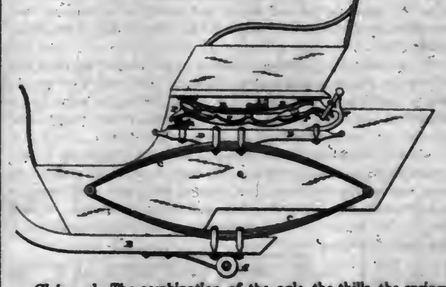
3. An electrical heater for rooms and inclosed spaces, consisting of a thin coating of electrical conducting material—such as carbon—placed upon the walls of the room and provided with electrical connections, the resistance and radiating surface of the conducting material being so proportioned to the current that said conducting material is heated to a temperature lower than the igniting-point of wood, paper, and like combustible materials, substantially as set forth.

4. An electrical heater consisting of one or more non-conducting strips or plates coated with carbon and a protecting-covering for the carbon and provided with electrical connections, substantially as set forth.

5. In an electrical heater, the combination of two or more non-conducting strips or plates coated with carbon, placed side by side, and electrically connected at their edges, substantially as set forth.

6. In an electrical heater, the combination of two or more non-conducting strips coated with carbon and united by conducting-strips laid upon their meeting edges, substantially as set forth.

7. An electrical heater consisting of strips or plates of graphitized card-board and electrical connections, the resistance and radiating surface of the carbon being so proportioned to the current that said carbon surfaces may be raised to a temperature below the igniting-point of the card-board, substantially as set forth.



8. In an electrical heater, the combination of an insulating-frame, plates or strips of insulating material coated with carbon secured to said frame, conducting-strips joining the meeting edges of the carbon-coated strips, and a protecting-covering for the carbon surface substantially as set forth.

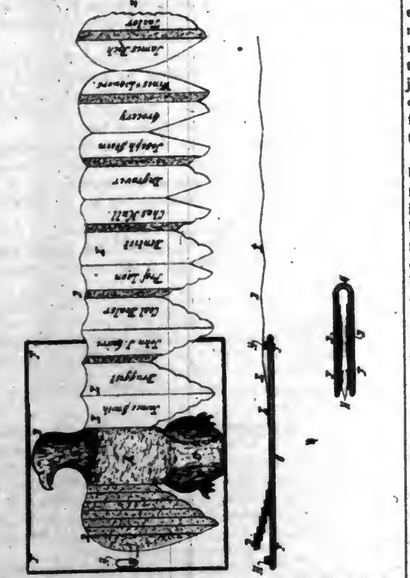
395,951. PROCESS OF TREATING FIBER WARE. HENRY CARMICHAEL, Malden, Mass. Filed Apr. 13, 1887. Serial No. 234,630. (Specimens.)

Claim.—1. The art or method of treating articles of pulp or other fiber, which consists, first, in saturating the article with a solution of indurating substance; second, freeing the article from the solvent, and, lastly, subjecting the article freed from solvent, but containing the indurating substance, to a baking process, whereby the indurating substance in the fiber is oxidized or hardened, substantially as and for the purpose specified.

2. The art or method of treating articles of pulp or other fiber, which consists, first, in saturating the article with a solution of indurating substance; second, freeing the article from the solvent; third, subjecting the article freed from solvent, but containing the indurating substance, to a baking process; fourth, subjecting the baked article to a bath of linseed-oil or a mixture thereof, and, lastly, subjecting the article to a second baking, substantially as described.

395,952. ROAD-CART. CHARLES D. CARTER, Spring Arbor, Mich. Filed July 14, 1888. Serial No. 279,355. (No model.)

Claim.—1. The combination of the axle, the thills, the springs, and the side bars with the supporting-brackets placed upon the rear ends of the side bars, the links, the supports secured to the seat or body and connected at their rear ends to the links with the front brackets, the friction-roller, and the bearing secured to the seat or body which rests upon the roller, whereby the seat or body has a vibratory movement independently of the side bars, substantially as shown.



2. The combination of the side bars, the brackets L, secured thereto, the supporting-bar connected at its rear end to the link, and which is supported at its front end by the friction-roller N upon the bracket L, the top bar loosely connected to the supporting-bar and rigidly secured to the seat or body, and the friction-rollers, which are placed between the two bars, substantially as described.

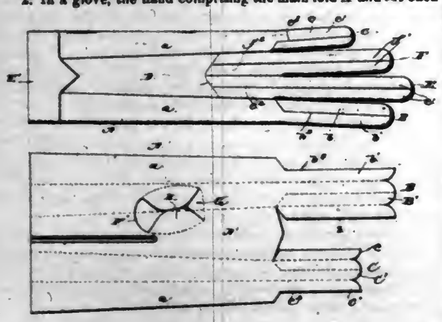
3. In a cart, the combination of the side bars, the seat or body, which is supported at its rear corners by means of supporting-links loosely connected to the side bars, suitably-grooved bearings at the front corners of the seats, and friction-rollers, which are placed between these bearings, whereby the seat has a movement independently of the side bars, substantially as shown.

4. The combination of the body or seat of a cart, side bars between which the seat or body is suspended, suitable supporting-bars loosely connected to the side bars, and friction-rollers placed between the supporting-bars, whereby the seat automatically adjusts itself into a horizontal position, substantially as specified.

5. In a road-cart, the combination, with the frame, of the seat, bars between which the seat is suspended, and the bearings placed between the seat and the frame, and which extend in the radius of a circle of which the axle is the center, and upon which the seat rests, whereby the frame is allowed a free movement without affecting the seat, substantially as shown and described.

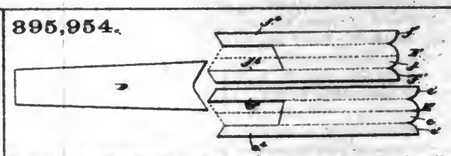
395,953. DEVICE FOR ADVERTISING. THOMAS CLARK, Brooklyn, N. Y., assignor to Anna Jane Clark, same place. Filed May 3, 1888. Serial No. 272,696. (No model.)

Claim.—1. An advertising device consisting of the body in the form of a bird having the wings at opposite sides each composed of a series of sections to fold and unfold, and the several sections of each wing having spaces to receive advertisements or the like, substantially as described.



2. An advertising device consisting of the body in the form of a bird having the wings at opposite sides each composed of a series of sections to fold and unfold, and locks H, for holding the wings folded, the several sections of each wing having spaces to receive advertisements or the like, substantially as shown and described.

3. An advertising device consisting of the folding cover F, having the joint G, and the body A in the form of a bird mounted on the cover, and having the wings D at opposite sides, each composed of a series of sections to fold and unfold, and the several sections of each wing having spaces for advertisements or the like, substantially as shown and described.

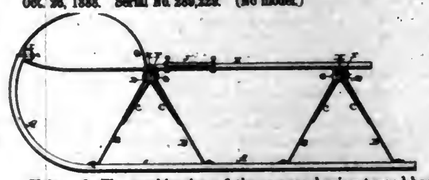


395,954. GLOVE. JENNINGS CORRIE, Gloversville, N. Y. Filed Jan. 17, 1888. Serial No. 261,037. (No model.)

Claim.—1. In a glove, the hand having the oval opening F therein, the ears H on opposite sides of the opening and formed integral with the hand, and the thumb arranged at its inner edges under the ears and stitched to the palm around the opening F, the said ears being stitched to the sides of the thumb, substantially as specified.

2. In a glove, the hand comprising the main fold A′ and the back

395,954.



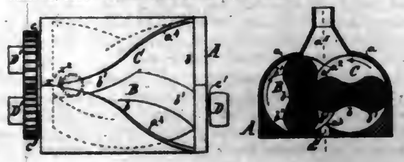
flaps, *a a*, in combination with the gore D, inserted between the adjacent edges of the said back flaps and terminating above their lower ends, the said gore being provided in its lower end with a V-shaped notch, the outer fingers at the lower end of the hand, and the intermediate fingers, E F, attached together and to the hand, and having tongues e^2 f^2 on their upper ends stitched together to form a projection or extension which is secured between the exposed lower ends of the flaps *a a*, and is provided with a wedge-shaped upper end fitting in the V-shaped notch in the lower end of the gore, substantially as specified.

3. In a glove, the hand A, comprising the main fold A′ and the back flaps, *a a*, the gore D, arranged between the adjacent edges of the flaps *a a* and terminating above their lower ends, and the fingers B C, integral with the hand A, in combination with the fingers E F, arranged between the fingers B C, and comprising the main folds *e f*, the back flaps, *e′ e′* and *f′ f′*, stitched, respectively, together at their adjacent edges, and the tongues e^2 e^2 and f^2 f^2 on the upper ends of the said back flaps, respectively stitched together to form extensions, which extensions are stitched together at their adjacent edges, stitched at their upper ends to the lower end of the gore, and stitched at their outer edges to the exposed edges of the flaps *a a*, substantially as specified.

4. In a glove, the combination of the hand having a thumb-opening, F′, the integral wedge-shaped point G at the lower end of the opening F′, the integral ears H H on the sides of the opening F′, and the thumb stitched in the said opening and having the ears H and the point G stitched thereto, substantially as and for the purpose hereinbefore specified.

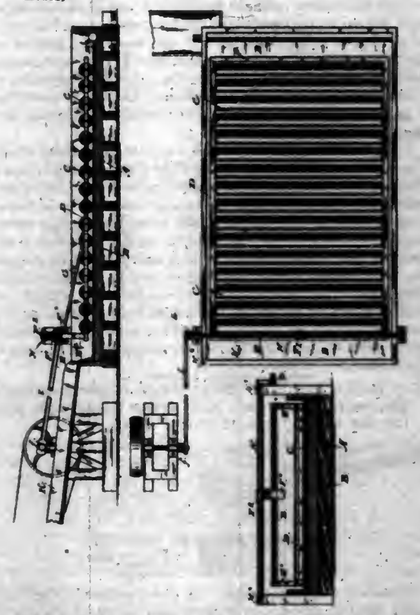
5. The herein-described glove, comprising the hand A, consisting of the main fold A′ and the back flaps, *a a*, on its edges, the gore D, stitched between the opposing edges of the flaps *a a*, the outer fingers, B C, integral with the lower end of the hand and consisting of the main folds B′ C′, the back folds, *b′ c′*, on the outer edges of the main folds, having recesses b^2 c^2 therein, the tongues *b c* on the inner edges of the main folds, fitting within the said recesses and stitched to their edges, the intermediate fingers, E F, provided with extensions or tongues on their upper ends, stitched to the lower end of the gore, and fitting between the lower ends of the flaps *a a*, and the thumb stitched in a suitable opening in the hand, substantially as specified.

395,955. SLEIGH. HENRY A. CURRIER, Almont, Mich. Filed Oct. 26, 1888. Serial No. 289,229. (No model.)



Claim.—1. The combination of the runners having turned-back ends, the knees, the raves, and the cross-bars, with the castings applied to the ends of the cross-bars, and to which the ends of the knees, the raves, and the ends of the runners are secured, and the two clamping-bolts by which the parts are held in position, substantially as shown.

2. The combination of the runners having the ends of the wooden portions beveled, as shown, the raves having their ends turned upward and applied to the wooden portions, the draft-bar, which is applied to the ends of the raves, and the clamping-bolts, substantially as described.



3. The combination of the runners, the knees, the raves, cross-bars, clamping-bolts, and the castings applied to the ends of the bars, the castings being provided with recesses to receive the ends of the knees and the raves, substantially as set forth.

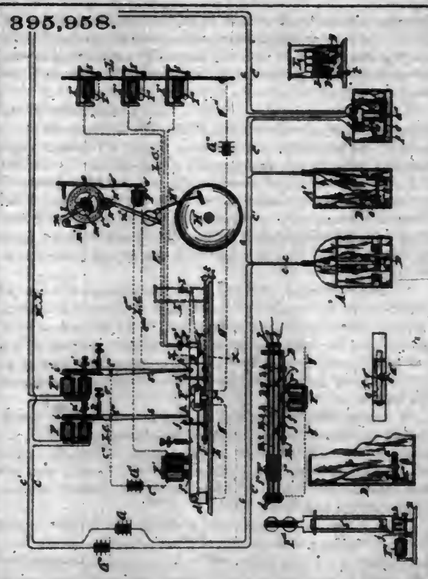
395,956. FORGE-BLOWER. JOHN DAY, Malta Bend, Mo. Filed Mar. 23, 1888. Serial No. 268,192. (No model.)

Claim.—The combination, with twin screws formed, respectively, with two blades, each blade having a half-twist, of the case having a small outlet on top, above and near one end of the screws, and a relatively-large tapering inlet in its bottom beneath the screws, and extending from end to end of the screws and equally on opposite sides of the center of the bottom of the case, substantially as and for the purpose described.

395,957. PULVERIZER AND AMALGAMATOR. ESTEBAN DEMMER, San Francisco, Cal. Filed Jan. 31, 1888. Serial No. 262,574. (No model.)

Claim.—The combination, with a solid bed with inclosed sides and overlaid plates, of the system or series of pressure-rollers, a frame within which they are mounted, said frame being provided with a transverse bar at the upper end thereof, a rock-shaft with forked arms engaging said bar, and means, substantially as described, for operating the rock-shaft, as set forth.

395,958. ELECTRIC SIGNALING APPARATUS. MARK W. DEWEY, Syracuse, N. Y., assignor of two-thirds to Emil Lenze and Charles H. Duell, same place. Filed Mar. 31, 1888. Serial No. 269,163. (No model.)



Claim.—1. A plurality of transmitting-stations, a number whereof are each equipped with a single circuit maker and breaker connected with a single line-wire, and the remainder of said stations being each equipped with a combination of two or more circuit makers and breakers connected with a corresponding number of line-wires, in combination with a plurality of interchangeably-movable feelers, magnets in the main-line circuits, and armatures for said magnets controlling the movements of said feelers, as set forth.

2. In combination with a plurality of line-wires, a plurality of interchangeably-movable feelers, magnets in the line-wires, armatures for said magnets controlling the movements of said feelers, a series of signal-boxes, a number thereof equal to the number of the aforesaid wires being provided with a single circuit maker and breaker, and the remainder of said boxes being each equipped with a combination of circuit makers and breakers connected with two or more of the aforesaid wires, and the circuit makers and breakers being operated automatically with the opening and closing of the doors of the boxes containing the same, as set forth.

3. A signaling system comprising a plurality of transmitting-stations, a number whereof are each equipped with a single circuit maker and breaker connected with a single line-wire, and the remainder of said stations being each equipped with a combination of two or more circuit makers and breakers connected with a corresponding number of line-wires, in combination with a plurality of interchangeably-movable feelers, magnets in the line-wires, armatures for said magnets controlling the movements of said feelers, and an audible signal in a local circuit also controlled by the movements of said armatures, substantially as set forth.

4. A signaling system comprising a plurality of transmitting-

395,958.

stations, a number whereof are each equipped with a single circuit maker and breaker connected with a single line-wire, and the remainder of the said stations being each equipped with a combination of two or more circuit makers and breakers connected with a corresponding number of line-wires, in combination with a plurality of interchangeably-movable feelers, one for each transmitting-station, magnets in the line-wires, armatures for said magnets controlling the movements of said feelers, and an annunciator operated by the movements of the aforesaid feelers, substantially as set forth.

5. In a signaling apparatus, the combination of a plurality of line-wires, transmitting-stations connected with said line-wires, magnets F F^x at the receiving-station connected with the said line-wires, plates *s s′*, operated by said magnets, feelers B B, operated by a local circuit, a clock-work having the detent M arranged to be actuated by the feeler, the metallic disk P, rotated by said clock-work, metallic arms *x x*, projecting from said disk, insulators *y y* between the arms, the pivoted bar P′, the gong R′, hammer R, magnet Q, arranged to actuate the hammer, the battery P″, and wires connecting the disk P, magnet Q, and bar P′ with the battery, substantially as described and shown.

6. In combination with the feelers B B and movable plates *s s′*, the battery G′, contact-stops *j j*, magnet F′, audible signal mechanism, magnet F″, for operating said signal mechanism, and an electric conductor connecting the plates, stops, and magnets with the battery, substantially as described and shown.

7. In combination with the feelers B B and pivoted plates *s s′*, the batteries G G″, main-line circuit-wires, circuit makers and breakers connected with said wires, magnets F F^x in said circuits and arranged to actuate the aforesaid plates, battery G′, magnet F′, arranged to actuate the feelers, circuit-closers *j j*, and an electric conductor connecting magnet F′ with the battery G′, as and for the purpose set forth.

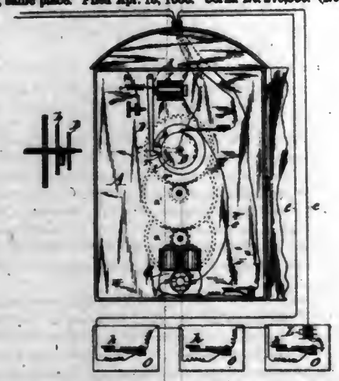
8. In combination with the feelers B B and pivoted plates *s s′*, the batteries G G″, main-line circuits M L, composed of separate wires, one for each of said plates, magnets F F^x, for operating the plates, signal-boxes each connected with one or more of the aforesaid wires, circuit-breakers connected to said boxes, and the plurality of circuit-breakers in a box, arranged to operate simultaneously, substantially as set forth.

9. In combination with the feelers B B and pivoted plates *s s′*, the batteries G G″, main-line circuits M L, composed of separate wires, one for each of said plates, magnets F F^x, connected with the main lines and arranged to operate said plates, signal-boxes each connected with a different wire or different set of wires of said circuits, circuit-breakers connected to said boxes, the battery G′, stops *j j*, and the magnet F′, arranged to operate the feelers, and electric conductors connecting the plates *s s′*, stops *j j*, and magnet F′ with the battery G′, substantially as set forth and shown.

10. In combination with the feelers B B, magnet F′, for operating said feelers, and pivoted plates *s s′*, the battery G′, arranged to operate the feelers, the rock-shaft *j′*, stops *j j*, connected to said rock-shaft, the alarm-tripper *o″*, magnet F″, for operating said tripper, local

circuit-wire connecting the plates *s t* with one of the poles of the battery G', wire connecting the rock-shaft *j'* with the magnet F'', wire connecting the magnet F'' with the magnet F', and wire connecting the magnet F' with the battery G', substantially as described and shown.

11. In combination with the feelers B B and pivoted plates *s t*, the rock-shaft *j'*, stops *j j* and armature *j''*, connected to said rock-shaft, magnet F'', for attracting said armature, battery G'', contact-points *p*, attached to the feelers, contact-points *p'*, annunciator L, magnets I'' I'' I'', wire *g*, and feelers B, connecting the magnet F'', respectively, with the contact-points *p* and with the battery G'', and wires *p''* and *g''*, connecting the annunciator-magnets, respectively, with the contact-points *p'* and with the aforesaid battery, and an audible signal operating electrically and simultaneously with the annunciator, substantially as described and shown.



12. The combination, with a signal-box having a movable door, of an electric contact-point secured stationary to the interior of the box, an electric contact-point supported movably in the box and normally separated from the other contact-point, a push-bar projecting from the movable contact-point toward the door, and a latch adapted to lock the push-bar and prevent the same from following the movement of the door, as set forth.

13. In a plurality of line-circuits, a signal-station in said circuits, a plurality of primary circuit makers and breakers at said station, and a supplemental circuit maker and breaker carried on movable electric conducting-supports adapted to make and break contact with the metallic portions of the primary circuit makers and breakers, substantially as specified and shown.

14. In a fire-alarm signal-box, a pluranty of primary circuit makers and breakers, through each of which a separate current flows, and a supplemental circuit maker and breaker actuated automatically by the primary circuit makers and breakers and carried on movable electric conducting-supports adapted to make and break contact with the metallic portions of the primary circuit makers and breakers, substantially as set forth and shown.

15. In a fire-alarm signal-box, the combination of a plurality of primary circuit makers and breakers, consisting of stationary contact-points *a'* and movable contact-points *a*, carried on spring-arm *b* and actuated by the opening and closing of the door of the box, the spring 6, connected at one end to the metallic portion of one of the said contact-points and having its free end adapted to make and break contact with its opposite contact-point, the spring-arms *b'* and *b''*, with springs 5 5 attached to said arms and adapted to make and break contact with the conducting material of the contact-points *a a'*, stops 2 2, for limiting the movement of the spring-arms *b' b''*, concentrating circuit making and breaking contact-points *a''' a'''*, carried on the spring-arms *b' b''*, the insulating material 3, interposed between the contact-points *a''' a'''*, and the spring 4, connected at one end to one of said contact-points and having its free end adapted to make and break contact with the conducting material of the opposite contact-point, substantially as described and shown.

395,959. ELECTRIC SIGNALING APPARATUS. MARK W. DEWEY, Syracuse, N. Y., assignor of two-thirds to Emil Lenz and Charles H. Duell, same place. Filed Apr. 13, 1888. Serial No. 270,589. (No model.)

Claim.—1. In an electric-alarm system, the combination, with the transmitting-instrument, of an auxiliary circuit and an electromotor in said circuit and connected with the transmitting-instrument to operate the same, and a stop to limit the movement of said motor, as set forth.

2. In combination with a main circuit and a public alarm-box in said circuit, a circuit-breaking mechanism in said box, an auxiliary circuit, and an electric motor connected with the latter circuit and adapted to move said circuit-breaking mechanism, and a stop arranged to limit the movement of said motor, substantially as set forth.

3. In combination with a main circuit and a public alarm-box in said circuit, a circuit-breaking mechanism, an auxiliary circuit, a detent controlled by an electro-magnet in the auxiliary circuit for restraining and releasing the movement of the main-circuit breaking mechanism, and an electric motor in the auxiliary circuit adapted to operate said mechanism, whereby the loss of time and expense of manual labor of winding up said mechanism are dispensed with, substantially as set forth.

4. In combination mith the main circuit and an electric-alarm box in said circuit, having a circuit-breaking wheel, an auxiliary circuit, an electric motor connected with said circuit and adapted to rotate said breaking-wheel, a detent controlled by an electro-magnet in the auxiliary circuit and adapted to stop and release the motion of the breaking-wheel, and keys or equivalent devices for controlling the current of the auxiliary circuit, substantially as described and shown.

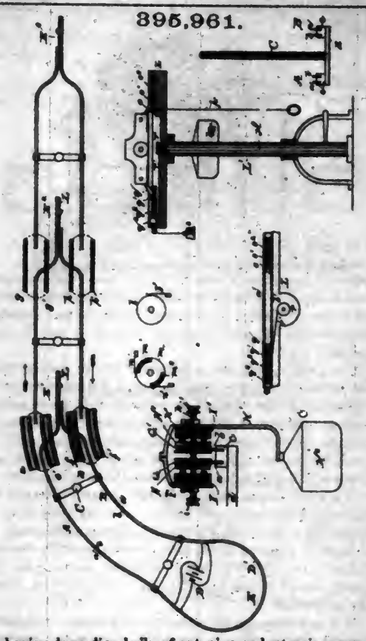
5. In an electric signaling system comprising a plurality of signaling-boxes, each having a circuit-breaking wheel, an electric motor within each of said boxes connected with and adapted to rotate said breaking-wheels, a detent adapted to engage and release the breaking-wheel, a magnet for operating said detent, an auxiliary circuit extending from a generator successively to the electric motors of the respective boxes, branches extending from said circuit to sub-stations in the neighborhood of the boxes, and return-paths for the branches to the generator, each branch including the magnet in one of the boxes, and keys or devices at said sub-stations for controlling the current through said branch and thereby releasing and operating the aforesaid electric motor and breaking-wheel or restraining the same, substantially as described and shown.

395,960. CARPET-SWEEPER. WALTER J. DREW, Grand Rapids, Mich., assignor to The Bissell Carpet Sweeper Company, same place. Filed Mar. 21, 1888. Serial No. 267,980. (Model.)

Claim.—1. The combination, with a sweeper-case having a bail pivoted centrally thereto and shiftable from one side of the case to the other, of a spring acting on the case and bail to raise that side of the case nearest the operator and depress that side farthest from the operator, substantially as described.

2. The combination, with a sweeper-case having a bail pivoted centrally to the ends thereof above the axis of the brush-shaft and shiftable from one side of the case to the other, of a spring connected at one end with the case and at the other end with the bail above its pivotal bearing, and acting on the case and bail to raise that side of the case nearest the operator and depress that side farthest from the operator, substantially as described.

395,961. ELECTRICAL STORE-SERVICE APPARATUS. RICHARD N. DYER, East Orange, N. J. Filed July 1, 1887. Serial No. 243,116. (No model.)



Claim.—1. In electrical store-service apparatus, the combination, with two ways, each composed of two parallel tracks placed close together, of supports connecting such ways together and supporting them from their inner sides, whereby the tracks will be left clear upon their tops and their outer sides and beneath for the movement of the carrier-receptacles, wheeled carriers traveling on such ways and having electric motors by which they are driven, taking current from the tracks, and provided with bails hanging down on the outer side of the ways and curved laterally beneath such ways to support the receptacles, and a source of electrical energy connected with the tracks of both ways, substantially as set forth.

2. In electrical store-service apparatus, the combination, with outgoing and returning ways, each consisting of two tracks, and carriers with electric motors traveling upod such ways, of a source of electric energy connected from one pole to the inner tracks of the two ways and from the other pole to the outer tracks, and a turn-table for reversing the position of the carrier in shifting from one way to the other, substantially as set forth.

3. In an electrical store-service apparatus, the combination, with the two ways supported and connected together on their inner sides, of carriers having electric motors traveling on such ways and provided with bails depending on one side, and a turn-table for reversing the position of the carriers in shifting them from one way to the other, substantially as set forth.

4. In electrical store-service apparatus, the combination, with

395,961.

carriers having depending bails, of outgoing and returning ways, each of which is broken and deflected laterally at stations, and bridging switching-plates at such breaks for lifting carriers to or from succeeding stations over such breaks, substantially as set forth.

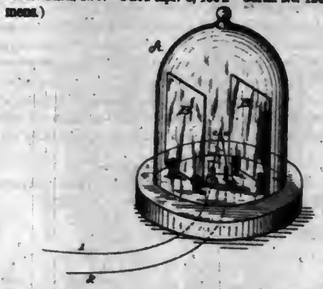
5. In electrical store-service apparatus, the combination, with carriers having depending bails, of outgoing and returning ways, each of which is broken and deflected laterally at stations, and bridging switching-plates at such breaks for lifting carriers to or from succeeding stations over such breaks, and a turn-table at each sales-station for reversing the position of the carriers in shifting from one way to the other, substantially as set forth.

6. In electrical store-service apparatus, the combination, with outgoing and returning ways, each consisting of two tracks, and carriers with electric motors traveling upon such ways, of a turn-table for reversing the position of the carrier in shifting from one way to the other, and a spring which is put under tension by the turning of the table and acting when the carrier is released to start it onto the return way, substantially as set forth.

7. In electrical store-service apparatus, the combination, with outgoing and returning ways, each consisting of two tracks, and carriers with electric motors traveling upon such ways, of a turn-table for reversing the position of the carrier in shifting from one way to the other, a spring-stop with pivoted releasing-latch, and a spring starting device with a pivoted latch over which the carrier rides, substantially as set forth.

8. In electrical store-service apparatus, the combination, with outgoing and returning ways, each consisting of two tracks, and carriers with electric motors traveling upon such ways, of a turn-table for reversing the position of the carrier in shifting from one way to the other, a turning pipe on which the turn-table is mounted, a stationary shaft within said pipe, a spring mechanism for starting the carrier on its return journey, and a connection between the stationary rod and the spring, substantially as set forth.

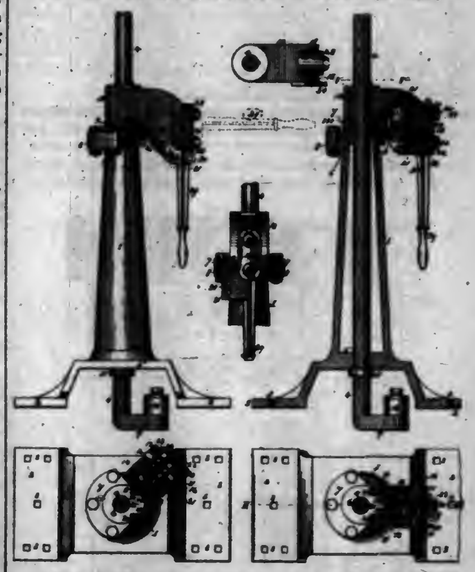
9. In electrical store-service apparatus, the combination, with outgoing and returning ways having each two tracks connected with the source of electrical energy, of a section of track disconnected from the circuit and joining the ways together at the cashier's end, substantially as set forth.



395,962. METHOD OF MANUFACTURING ELECTRIC LAMPS. THOMAS A. EDISON, Menlo Park, N. J., assignor to the Edison Electric Light Company, New York, N. Y. Filed Sept. 22, 1888. Serial No. 72,337. (No specimens.)

Claim.—1. The process of producing a high vacuum in the inclosing-globe of an incandescing electric lamp, consisting in placing within said globe a compound of chlorine or equivalent element and then withdrawing the air from said globe, the filament of the lamp being heated to incandescence by an electric current during a portion of the latter step, substantially as set forth.

2. The process of producing a high vacuum in the inclosing-globe of an incandescing electric lamp, consisting in placing on the clamps which hold the filament of said lamp a quantity of bichloride of platinum and then withdrawing the air from said globe, the filament being heated to incandescence by an electric current during a portion of the latter step, substantially as set forth.



3. The process of producing a high vacuum in the inclosing-globe of an incandescing electric lamp, consisting in placing on the clamps which hold the filament of said lamp a quantity of bichloride of platinum and then withdrawing the air from said globe, said filament being heated to incandescence by an electric current during a portion of the latter step, substantially as set forth.

395,963. INCANDESCENT-LAMP FILAMENT. THOMAS A. EDISON, Menlo Park, N. J. Filed Apr. 5, 1884. Serial No. 126,802. (No specimens.)

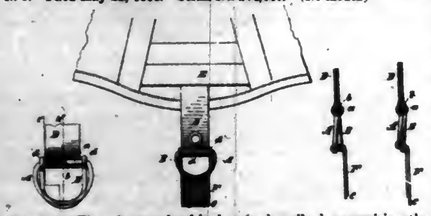
Claim.—The process of preparing material for the manufacture of filaments for incandescent electric lamps, consisting in volatilizing a substance having a high electrical resistance by electrically heating such substance in a vacuum, causing such substance to be deposited in the form of filaments or as a sheet from which filaments are formed, substantially as set forth.

395,964. AUTOMATIC SWITCH-STAND. HENRY ELLIOT, St. Louis, Mo. Filed May 31, 1888. Serial No. 275,537. (No model.)

Claim.—1. The combination, in a switch-stand, of a fixed part having locking-recesses, an upright signal-shaft, 4, with a crank connected with the switch-rails, and a pivoted block upon the signal-shaft having a spring-bolt with beveled end adapted to engage in the locking-recesses, substantially as and for the purpose set forth.

2. The combination, in a switch-stand, of a fixed part, 7, having recesses 24, a bolt, 15, housed in a pivoted block, 14, guide-pins 20, springs 23, screw-threaded bearings 22, and screw-plugs 28, substantially as and for the purpose set forth.

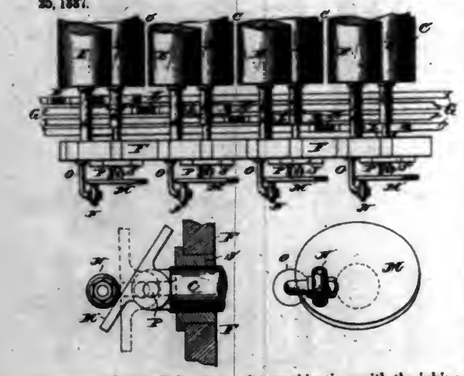
3. The combination, in a switch-stand, of the block 7, having recesses 24, the signal-shaft carrying a head, 12, with block 14, pivoted thereto, a spring-bolt working in said block and adapted to engage in



the recesses, and a handle, 29, upon the block 14, for the purpose set forth.

4. The combination, in a switch-stand, of a fixed part of the stand-pillar having locking-recesses, an upright signal-shaft, a block pivoted upon the signal-shaft and turning in a vertical plane and carrying a handle, by which it may be turned, and a spring-bolt having bearing in the block and having a beveled end adapted to engage in the locking-recesses when the block is in a certain position, substantially as described.

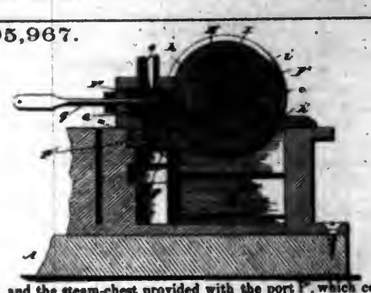
5. The combination, in a switch-stand, of a fixed part of the pillar having recesses 24 and a tongue, 25, the signal-shaft 4, a head, 12, secured to the shaft, a block, 14, pivoted to the head by a horizontal pivot or arbor, 16, a bolt, 15, working in the block 14 and having guide-pins 20, surrounded by springs 23, and handle 29 upon the block 14, all substantially as and for the purpose set forth.



6. The combination, in a switch-stand, of a fixed part of the pillar having recesses 24 and a tongue, 25, between the recesses, the signal-shaft 4, a head, 12, secured to the shaft, a block, 14, pivoted to the head by a horizontal pivot or arbor, 16, a bolt, 15, working endwise in the block 14 and having guide-pins 20, surrounded by springs 23, for the purpose set forth, and a handle, 29, upon the block 14, with a slotted lug, 31, engaging on a fixed staple, 30, all substantially as set forth.

395,965. CLASP OR BUCKLE. SHERWOOD B. FERRIS, Lakewood, N. J. Filed May 22, 1888. Serial No. 274,649. (No model.)

Claim.—The clasp or buckle herein described, comprising the semicircular loop A, having the inwardly-bent ends *a*, the loop B, narrower than loop A, and having the eyes *d* at the ends of its arms pivoted on the ends *a* and arranged within the sides of loop A, said loop B being longer than loop A, so that its central portion bears upon the central portion of loop A, and the tube *b*, inclosing the inwardly-bent ends *a*, substantially as described.

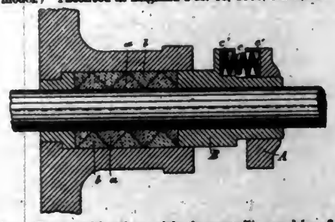


395,966. MEANS FOR RECIPROCATING INK-DISTRIBUTING ROLLS OF PRINTING-MACHINES. HENRY C. A. PYNOT, Sydney, New South Wales. Filed Sept. 15, 1887. Serial No. 249,796. (No model.) Patented in Victoria Feb. 4, 1887, No. 4,921; in New Zealand Feb. 27, 1887; in New South Wales Apr. 6, 1887, No. 2,064, and in England Apr. 25, 1887.

Claim.—In a printing-press, the combination, with the inking-roll and the ink-distributing roll, of devices for imparting endwise motion to the distributing-roll, which consists of a disk pivoted on the roller-journal to adapt the same to be set to an inclination relatively to the axis of the roll, an abutment bearing on the face of the disk, and a spring for returning said roll into its normal position when moved out of it, substantially as and for the purposes specified.

395,967. STEAM-ENGINE. GEORGE W. FITZ, New Richmond, Ohio. Filed Aug. 10, 1888. Serial No. 282,406. (No model.)

Claim.—1. In a steam-engine, the combination of the cylinder provided with the chambers G G', the piston H, mounted in the cylinder and provided with the radial wings *h h'*, fitting in the said chambers, and the steam-chest provided with the port P, which communicates with the chambers of the cylinder on opposite sides of the wings *h h'*, and the port P', which communicates with the said chambers on the reverse sides of the said wings, substantially as and for the purpose specified.



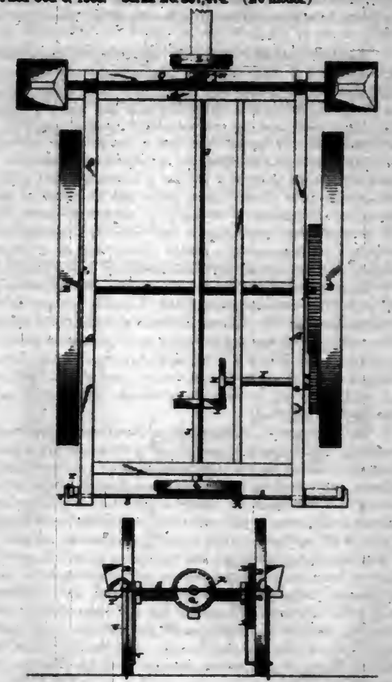
2. In a steam-engine, the combination of the cylinder provided with the chambers G G', the piston H, having the wings *h h'*, mounted in the cylinder, and the steam-chest provided with the steam-port P, which communicates through the channels *p* and p^2 with opposite ends of the said chambers G' and G, respectively, and the steam-port P', which communicates through the channels p^3 and p^4 with opposite ends of the chambers G and G', respectively, substantially as specified.

3. In a steam-engine, the combination of the cylinder provided with the chambers G and G', and having the heads I and K, provided, respectively, with the channel p^3 and the diverging channels p^3 and p^4, the piston H, mounted in the said cylinder, and the steam-chest provided with the ports P P', which communicate with the cylinder through the sets of channels *p* p^2 and *p'*, p^3, and p^4, respectively, substantially as specified.

4. In a steam-engine, the cylinder divided into chambers G G', and provided with the channels *p* p^2, which communicate, respectively, with the adjacent and remote sides of the chambers G' and G, and the channels p^3 and p^4, which communicate, respectively, with the adjacent and remote sides of the chambers G and G', in combination with the piston H, mounted in the cylinder and provided with wings *h h'*, and the steam-chest provided with the port P, which communicates with the channels *p* and p^2, and the port P', which communicates with the channels p^3 and p^4, substantially as specified.

5. In a steam-engine, the combination of the cylinder provided with chambers G and G', and steam-channels *p*, p^2, p^3, and p^4, communicating, respectively, with the ends of the said chambers, the piston H, having the wings *h h'*, mounted in the cylinder, the steam-chest provided with the exhaust-port *o*, and the steam-ports P and P', communicating, substantially as described, with the said channels, and the valve covering the said exhaust-port and one of the steam-ports, substantially as and for the purpose specified.

395,968. METALLIC STUFFING-BOX PACKING. FRIEDRICH O. FRANKE, St. Gall, Switzerland. Filed Mar. 19, 1888. Serial No. 267,639. (No model.) Patented in England Feb. 18, 1888, No. 2,456.



Claim.—The combination, with the metallic packing formed triangular in cross-section, substantially as described, of the box B, bearing against said packing and provided with the cavities *c'* and the projecting portion on its front end, the flange, also provided with cavities *c'* and sliding upon the said projection, the springs in the cavities between the flange and the box, and the nuts *d* for tightening up the said flange and increasing the pressure of the springs upon the metallic packing, substantially as set forth.

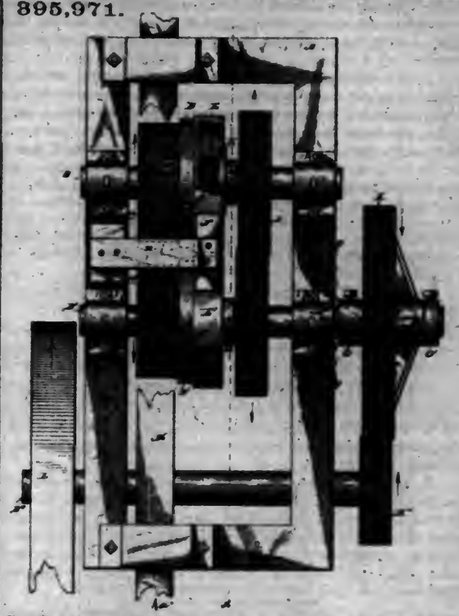
395,969. LAMP. JOHN FRANKLIN, Cincinnati, Ohio. Filed Feb. 7, 1888. Serial No. 263,306. (No model.)

Claim.—The combination of the ring 15, the burner-tubes 13, the lava tips 18, and the bushing 42, composed of lava or other refractory non-conductor.

395,970. CORN-PLANTER. JAMES A. FULLERTON, Mounts, Ind. Filed Oct. 8, 1888. Serial No. 287,474. (No model.)

Claim.—1. The combination of the driving-wheel, the axle upon which it is placed, the cog-wheel D, secured to the axle, the axle F, the cog-wheel G, secured thereto, the arm or lever H, secured to the end of the shaft F, the shaft J, the wheel or ratchet I, secured to the shaft J, the wheel L, secured to the front end of the shaft J, the pinion N, and the crank O for operating the seed-slide, substantially as shown.

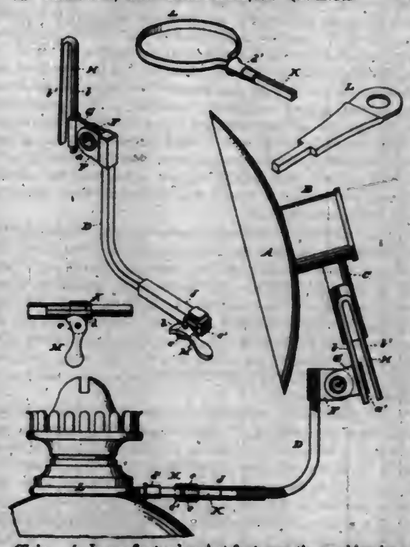
2. The combination of the shaft J, provided with the wheel or ratchet, I, and the arm or lever H and its operating mechanism for operating the shaft J, with the wheel Q, secured to the rear end of the shaft, the shaft S, pinion R, secured to the shaft, the cranks T upon the ends of the shaft S, the markers U, and the guides V, secured to the frame through which the markers operate, substantially as described.



395,971. MECHANICAL MOVEMENT. JAMES C. FULTON, Rockport, Tex. Filed July 11, 1888. Serial No. 279,646. (No model.)

Claim.—1. In a device of the class described, the combination, with a suitably-mounted shaft, of two gear-wheels, one mounted loosely and the other rigidly upon said shaft, a reciprocating rack-bar engaging said loose gear, a pulley mounted loosely on said shaft, and a pawl pivoted to said loose pulley and provided with a finger engaging said loose gear, said pawl having a limited oscillation upon its pivot, whereby it may be thrown out of or into engagement with said rigidly-mounted gear-wheel, substantially as and for the purpose set forth.

2. The combination, with the shaft B, of the loose gear C and rack-bar M, the rigidly-mounted pinion G, the loose pulley E, and the pawl F, pivoted to said loose pulley and provided with the finger *f*, passing through a slot, *e*, in the pulley E and engaging the loose gear C, whereby the movement of the rack-bar in one direction throws the pawl F into engagement with the pinion G and rotates said pinion and the shaft B, and the movement of the rack-bar in the opposite direction throws the pawl out of engagement with the pinion and rotates the pawl about the shaft B without affecting the shaft.

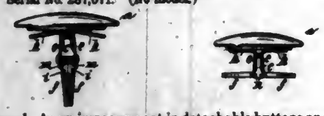


3. The combination, with the suitably-journaled parallel shafts B B', of the loose gears C C', mounted on said shafts respectively, the pinions G G', rigidly mounted on said shafts, the pulleys E E', loosely mounted on said shafts, and the oppositely-placed pawls F F', pivoted to the pulleys E E', respectively, and provided with fingers *f f'*, engaging the gears C C', whereby the movement of the rack-bar in either direction throws one of said pawls into engagement with the corresponding pinion and throws the other of said pawls out of engagement with the other pinion, substantially as and for the purpose set forth.

395,971. (duplicate)

4. The combination, with the shafts B B', of the loose gears C C and fixed gears G G', mounted on said shafts, the loose pulleys E E', also mounted on said shafts respectively, the oppositely-placed pawls F F', pivoted to the pulleys E E' and provided with fingers engaging the loose gears C C', the rack-bar M, engaging the loose gears C C' and adapted when moved in one direction to rotate one of said shafts and when moved in the opposite direction to reversely rotate the other shaft, and the gears I I', rigidly mounted on the shafts B B' and engaging each other, whereby the reciprocal movement of the rack-bar rotates the shaft B' constantly in one direction.

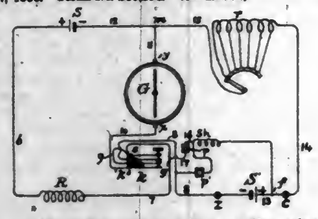
395,972. REFLECTOR-BRACKET. HENRY M. GOULD, Pittsburg, Pa. Filed Feb. 1, 1888. Serial No. 262,613. (No model.)



Claim.—1. In a reflector-bracket for lamps, the combination, with the collar L, of the curved holder having the broad bearing-plates F thereon, the lug G, having the socket *d'*, the tubular rivet *a*, the spring-

pintle H, having the downwardly-turned arms rounded on their exterior surface, one of said arms engaged in the socket *a'*, and the reflector having the tubular leg engaging said pintle, substantially as specified.

2. In a reflector-bracket for lamps, the combination, with the collar having the tang square in cross-section, of the curved arm having at one end the square or angular socket having a slot, *e*, and having the broad bearing-plates F at the other end, the cam-lever fulcrumed in the bearings on the socket, the sheet-metal lug G, having the socket *a'*, the tubular rivet *a*, the spring-pintle having its arms rounded on the exterior surface, and the reflector having the tubular leg engaging said pintle, substantially as specified.



395,973. BUTTON OR STUD. HEINRICH F. HAMBRUCH, Hamburg, Germany, assignor to Aug. F. Richter, same place. Filed Oct. 3, 1888. Serial No. 287,071. (No model.)

Claim.—1. As an improvement in detachable buttons or studs, the button herein described having the spring-arms *e e* secured thereto, the movable shank disposed between said spring-arms, and the wings *f f*, pivoted to said shank and acted upon by said spring-arms, substantially as set forth.

2. As an improvement in detachable buttons or studs, the button herein described having the plate *g*, the spring-arms secured thereto at their upper ends, movable shank disposed between said spring-arms, the wings *f f*, pivoted at their inner ends to said shank and having holes or openings through which the lower ends of said spring-arms project, and the levers A A, secured to said plate *g*, bearing at their inner ends upon said shank, substantially as set forth.

395,974. ELECTRICAL MEASURING APPARATUS. HAMMOND V. HAYES, Cambridge, and ANTHONY C. WHITE, Boston, Mass. Filed Oct. 27, 1888. Serial No. 289,351. (No model.)

Claim.—1. The combination, in a direct-reading voltmeter, of a standard battery, a fixed resistance, terminals for connecting a battery or other generator to be tested, an adjustable and calibrated resistance, all in circuit together, a galvanometer in a bridge or derived circuit, a circuit-closer for simultaneously closing the circuit of the standard battery through the fixed resistance and the circuit of the generator under test through the adjustable resistance, and for directing the currents of both immediately thereafter, but in opposite directions, through the galvanometer, and means for varying the adjustable resistance until the currents through the galvanometer, as indicated by the absence of deflection, are equal, the said adjustable resistance being so calibrated that the figures representing the amount of adjustable resistance in circuit shall indicate in direct terms the electro-motive force required.

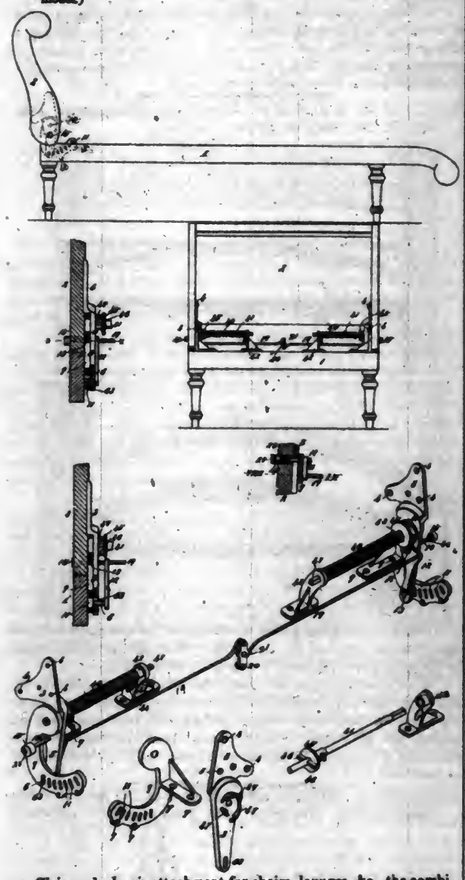
2. In an electrical measurement apparatus, the combination of the testing-circuit, the galvanometer in a bridge dividing said circuit into two parts, a standard battery and fixed resistance on one side of said bridge, an adjustable resistance and terminals for introducing a generator to be tested on the other side of said bridge, so that the current of said generator will oppose that of the standard battery in the galvanometer, and a compound circuit-controlling key normally maintaining both divisions of the circuit as well as the bridge open, but adapted when depressed to close both divisions and also said bridge, substantially as described.

3. The combination, substantially as hereinbefore described, in a direct-reading voltmeter, of a normally-open testing-circuit, a galvanometer in a bridge or derivation of the said circuit, the said bridge acting to divide the said circuit in two parts, itself being common to both, a standard battery and a fixed resistance included in the said circuit on one side of the bridge, terminals for the connection in said circuit of a battery or other generator to be tested, the said terminals being located upon the remaining side of the bridge and adapted to connect with the said generator so that its current shall pass through the galvanometer in a direction opposite to that of the standard battery, a key normally maintaining both divisions of the circuit and also the bridge-circuit open, and adapted when depressed to close both, and also the said bridge, and an adjustable resistance connected in that part of the circuit which includes the generator under test, and having its several coils so proportioned, calibrated, and graduated that the figures opposite the coils introduced shall when the galvanometer-needle remains without deflection upon the depression of the key indicate the electro-motive force in volts of the generator under test.

4. In a direct-reading voltmeter for measuring the electro-motive force of a battery or other electrical generator, the combination of a testing-circuit, including a variable resistance through a galvanometer, and a standard battery in a circuit through said galvanometer, including a fixed resistance, the current of said standard battery in the galvanometer being in opposition to that of the generator under test, the said variable resistance being so calibrated and graduated that the amount required to effect a balance indicates in direct terms the electro-motive force of the battery under test by means of figures placed opposite the resistance-varying plugs, substantially as described.

5. In an electrical measurement apparatus, the combination of a test-circuit, a galvanometer in a bridge dividing said circuit into two divisions, a standard battery and fixed resistance in one division, and in the other a variable resistance and terminals for connection of a generator to be tested in such manner that its current will pass through the galvanometer in the opposite direction to that of the standard battery, means for closing the circuit of both generators and of the galvanometer when a test is to be made, a normally-open shunt-circuit around the terminals for the generator to be tested, a fixed resistance in said shunt, and a circuit-closer therefor, substantially as and for the purpose described.

6. The combination, substantially as hereinbefore described, in an electrical measurement apparatus, of a direct-reading voltmeter comprising a testing-circuit, including a variable resistance and galvanometer, and a standard battery in circuit through said galvanometer with a fixed resistance, the battery or generator to be tested being in operation connected in the test-circuit, so that its current will oppose that of the standard battery in said galvanometer, the said variable resistance being calibrated and graduated in such manner that the amount required to effect a balance indicates in direct terms the electro-motive force of the generator under test, with a normally-open shunt-circuit connected around the said battery under test or looping from the fixed terminals thereof, and a circuit-closer therefor, whereby a second reading may be taken with the said shunt closed and the resistance of said battery deduced from the relations of the two readings, as set forth.



7. The combination, in an instrument for measuring electro-motive forces and resistances, of a standard battery, terminals for connecting a battery or other generator to be tested in such a way that its current will re-enforce that of the standard battery in direct circuit, a fixed resistance, an adjustable resistance consisting of a number of spools of wire adapted to be introduced and withdrawn from circuit by the withdrawal or introduction of plugs, and calibrated, as described, to indicate electro-motive forces in direct terms, a normally-open electric circuit serially connecting the said instrumentalities, a galvanometer, a bridge or derived circuit, including the said galvanometer, and connecting with the said normally-open circuit so as to divide it in two parts, itself being common to both, one including the standard battery and fixed resistance and the other the terminals of the battery to be tested, and the adjustable resistance, a compound key controlling both parts and adapted to close the circuits of the standard battery and of the battery under test through the galvanometer, and a shunt-circuit shunting the terminals of the battery under test, and controlled also by the said key, whereby the internal resistance of a battery may be calculated from its shunted and unshunted electro-motive forces.

8. In an instrument for electrical measurement, the combination, with a standard cell, a fixed resistance in circuit therewith, and a galvanometer, circuit-connections whereby the cell to be measured may be caused to oppose its current to that of the standard cell in the galvanometer-coils, a circuit-closing key controlling the circuit of both batteries and adapted to direct by the same motion the current of both, but oppositely, through the galvanometer, devices for varying the resistance in the circuit of the cell under test, the said devices being calibrated and graduated so that the amount of resistance introduced will indicate in direct terms the electro-motive force of the cell under test, and a shunt-circuit of known resistance arranged to short-circuit the said cell under test, substantially as and for the purposes specified.

9. In an instrument for measuring electrical magnitudes, the combination, with a standard cell, a fixed resistance in circuit therewith, and a galvanometer, of circuit-connections whereby the battery or like appliance to be tested may be connected and caused to traverse the galvanometer coils in a direction opposite to that of the standard cell, a circuit-closing key controlling the circuit of both batteries and adapted to close both, and thereupon to direct their currents through

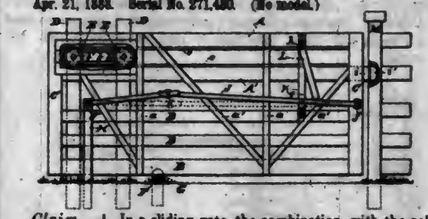
the galvanometer, so as to oppose one another therein, devices for varying the resistance in the circuit of the cell under test, the said devices being calibrated and graduated in such a manner that the amount of resistance introduced will indicate in direct terms the electro-motive force of a cell under test, a shunt-circuit of known resistance arranged to short-circuit the said cell under test for the measurement of its internal resistance, and circuit-changing devices interposed in the said shunt-circuit, whereby it may be closed direct or diverted through the circuit-controlling key, substantially as specified.

395,975. ATTACHMENT FOR CHAIRS, LOUNGES, &c. JOHN HOGAN, St. Louis, Mo. Filed May 14, 1883. Serial No. 273,614. (No model.)

Claim.—1. In an attachment for chairs, lounges, &c., the combination of the members 3 and 7, members 7 being attached to the body of the chair or lounge at the sides and member 3 to the movable portion at the sides, plates 12, arranged parallel with members 3 and 7, and having pins 6 near their lower ends and push-rods 13 near their upper ends, the members 7 having slots or elongated openings 11 to receive the pins 6, and springs adapted to act on said pins and hold them normally in engagement with said slots, substantially as and for the purpose set forth.

2. In an attachment for chairs, lounges, &c., the combination of the members 3 and 7, members 7 being attached to the body of the chair or lounge and members 3 to the movable portion, vertical plates 12, having pins 6 near one end and push-rods 13 near the other end, having buttons 15 on each side of the movable portion of the chair or lounge, the members 7 having openings to receive the pins 6, and the buttons 15, having recessed or countersunk faces, substantially as and and for the purpose set forth.

3. In an attachment for chairs, lounges, &c., the combination of the members 3 and 7, plates 12, pins 6, secured to the plates, push-rods 13, provided with buttons on their outer ends, connecting-rods 19, and link 20, the members 7 having openings to receive the pins 6, all substantially as and for the purpose set forth.

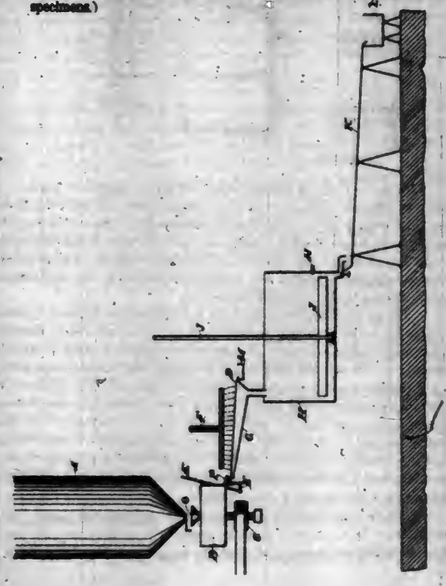


4. In an attachment for chairs, lounges, &c., the combination of the members 3 and 7, the latter having perforations 11 and the former having a slot, 63, plate 12, pins 6, and rods 13, secured to the plates, buttons 15 on the outer ends of the rods 13, and springs 23, all arranged and operating substantially as and for the purpose set forth.

5. In an attachment for chairs, lounges, &c., the combination of the main members 3 and 7, pivoted together, members 7 being attached to the body of the chair or lounge and members 3 to the movable portion, removable pin for connecting the members at their lower ends, and spring-shafts 41, having non-circular ends for the application of a key, substantially as and for the purpose set forth.

6. In an attachment for chairs, lounges, &c., the combination of the members 3 and 7, members 7 being attached to the body of the chair or lounge and members 3 to the movable portion, shafts or spindles 41, having disks 45 at their outer ends, projections 46 on the faces of the disks, teeth or projections 47 on the members 7, with which projections 46 engage, and springs 40 surrounding the shafts substantially as and for the purpose set forth.

7. In an attachment for chairs, lounges, &c., the combination of the members 3 and 7, the members 7 having openings 11, plate 12, having pins 6 passing through openings in the lower ends of the members 3 and 7, push-rods 13 on the plates 12, shafts or spindles 41, springs 40 surrounding the shafts or spindles, disks 45 on the shafts or spindles, projections 46 on the disks, and teeth or projections 47 on the members 7, all substantially as and for the purpose set forth.

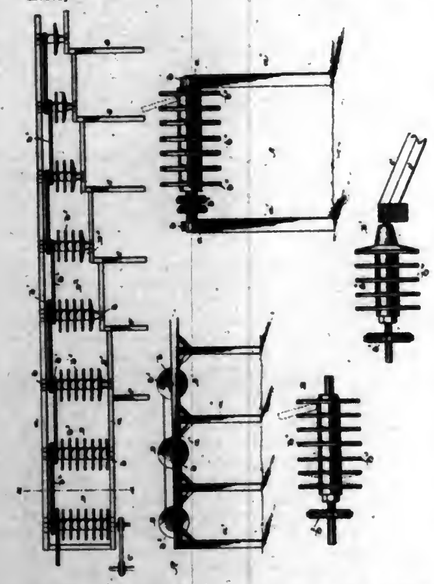


395,976. GATE. THOMAS J. HOWARD, Highland, Kans. Filed Apr. 21, 1888. Serial No. 271,480. (No model.)

Claim.—1. In a sliding gate, the combination, with the rollers journaled on the upright posts, the roller-ways, the bar A, the toggle-joint bar, and the post M, of the bar A', having the extended end adapted to enter a recess in the post M, the strip K, having the guide-opening, and the locking-block pivoted within the guide-opening, substantially as specified.

2. In a sliding gate, the combination of the bars A, A', and B, the roller-way on the bars A A', the flanged rollers, the bearing-roller, the upright posts D, the bolts *b'*, the post H, the standards C C', the toggle-joint bar pivoted at one end to the standard C' and at its opposite end to the post H, the strip having the guide-opening, and the locking-block pivoted therein, substantially as specified.

395,977. PROCESS OF MANUFACTURING STARCH. JOHN H. HURTT, Indianapolis, Ind. Filed Feb. 21, 1888. Serial No. 264,894. (No specimens.)



Claim.—1. The process of manufacturing starch, substantially as described, which consists in subjecting the maize or other cereal grain in a substantially unfermented condition to the action of chloride of sodium and separating the gluten and other impurities therefrom by flotation.

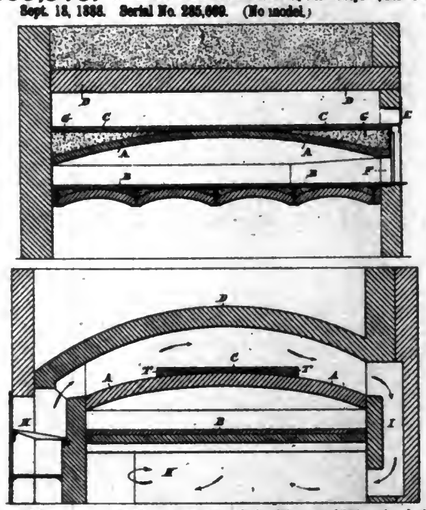
2. The process of manufacturing starch, substantially as described, which consists in first steeping, grinding, and sifting the maize or other cereal grain, and then subjecting the starch-liquor in a substantially unfermented condition to the action of chloride of sodium and separating the gluten and other impurities therefrom by flotation.

3. The process of manufacturing starch, which consists in first steeping the grain a sufficient length of time to soften but not perceptibly ferment it, then grinding it, then sifting it under a flow of water through sieves or screens, whereby the starch and finer particles are precipitated into vats and the coarser products run off untreated to be used for feed, then, after the starch has settled, drawing off the supernatant water until the liquid remaining is equal to about twenty-five gallons for each bushel of grain originally used, then adding chloride of sodium either in solution or otherwise, substantially as described, then mixing the starch-milk so treated thoroughly, then adding thereto sufficient water to make the whole quantity about thirty-three gallons for each bushel of grain, and then separating the starch from the other ingredients by settling or passing over runs and floating the by-products away, substantially in the manner described.

395,978. MECHANISM FOR CONVEYING AND DISTRIBUTING LUMBER. THEODORE B. HYMAN, Goldsborough, N. C., assignor to Anna C. Hyman, same place. Filed June 16, 1888. Serial No. 277,284. (No model.)

Claim.—1. In an apparatus for conveying boards or planks in different parallel paths, a series of succeeding power-driven rolls, each provided with a series of narrow circumferential grooves having a depth much greater than the width, said grooves open or unobstructed at the top to permit the insertion of the boards therein, whereby the rolls are adapted to receive and maintain the boards on edge and carry them endwise in their respective grooves.

2. In an apparatus for conveying and distributing lumber, a series of parallel or substantially parallel power-driven rolls, each having deep and relatively narrow circumferential grooves open or unobstructed at the top, the rolls at the receiving end of the system having a greater number of grooves than the remainder, the rolls at an intermediate point in the system having a less number of grooves than those of the receiving end, and the rolls at the terminal end of the system having a less number of grooves than those at intermediate points, whereby the lumber inserted in the different grooves at the receiving end is carried forward and delivered automatically at different points in the length of the apparatus.

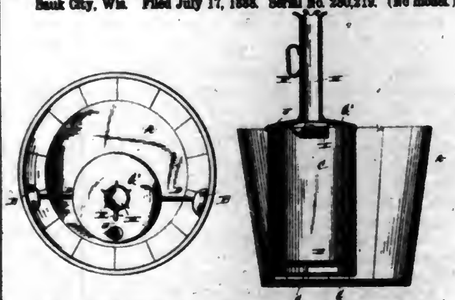


3. In an apparatus for conveying and distributing lumber, the combination of a series of parallel power-driven rolls provided with open unobstructed narrow and relatively deep circumferential grooves, the grooves of the successive rolls diminishing in number toward the delivery end of the system.

4. In an apparatus for conveying and distributing lumber, two or more parallel power-driven rolls having narrow and relatively deep grooves to sustain and carry the lumber on edge therein and a succeeding roll having a beveled flange or hub to effect the lateral delivery of the lumber as it passes thereto.

5. In an apparatus for conveying and distributing lumber, a conveyer-roll provided with a series of narrow and relatively deep grooves to sustain and carry the boards on edge therein, and having also at one end a beveled flange or hub to effect the lateral delivery of boards received at that point.

6. In an apparatus for conveying and distributing lumber, a series of horizontal grooved rolls mounted in suitable bearings, successive rolls at the delivery end of the series, with diminishing number of grooves and conical ends, and the receiving ways or platforms located at different points in the length of the system.

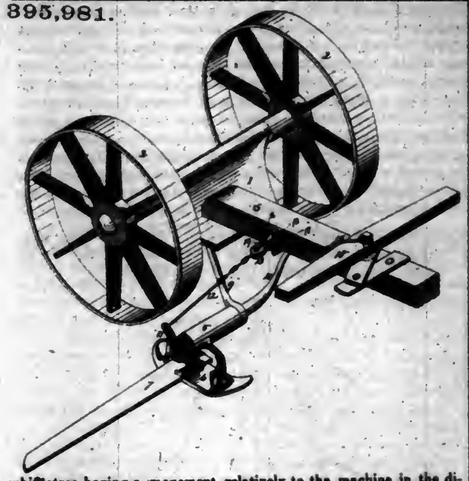


395,979. BAKING-OVEN. JULIUS JUNKER, Philadelphia, Pa. Filed Sept. 18, 1888. Serial No. 285,669. (No model.)

Claim.—1. A baking-oven provided with an additional sole laid upon the thin crown of the oven, and with a door for giving access to the space above said sole, substantially as described.

2. In a baking-oven, the combination, with the sole, thin crown, and thick crown, of an additional sole laid upon the thin crown, forming a baking-chamber between it and the thick crown, said sole extending the full length of the oven and about half-way across the same, and a door opening into the space above said sole, substantially as described.

395,980. HEATING APPARATUS. JOHN JUST and PETER JUST, Sauk City, Wis. Filed July 17, 1888. Serial No. 280,219. (No model.)



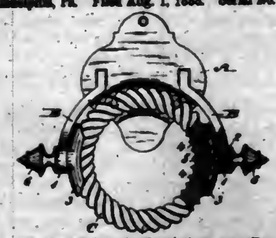
Claim.—The combination, with the fire-pot or heater having an interior draft-flue, of the removable cover having an opening registering with said draft-flue and rotatable upon said fire-pot or heater to permit of the closing of the latter flue, substantially as set forth.

395,981. MOWING-MACHINE. WILLIAM A. KNOWLTON, Rockford, Ill., assignor to Dexter A. Knowlton. Filed Feb. 23, 1886. Serial No. 192,806. (No model.)

Claim.—1. In a mower, the combination, with a rising-and-falling cutting apparatus connected at one end to the main frame, and a

395,981.

whiffletree having a movement relatively to the machine in the direction of the line of draft, of a flexible connection of the whiffletree with the folding or finger-bar portion of the cutting apparatus, substantially as set forth.

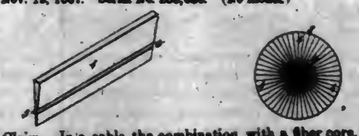


2. In a mower, the combination, with a rising-and-falling cutting apparatus connected at one end to the main frame, and a whiffletree having a movement relatively to the machine in the direction of the line of draft, of a flexible connection of the whiffletree with the folding or finger-bar portion of the cutting apparatus, and a bearing for the flexible connection intermediate of its end connections, the said bearing being located at one side of the direct line between the linked connection with the whiffletree and the folding or finger-bar portion of the cutting apparatus, substantially as set forth.

3. In a mower, the combination, with a rising-and-falling cutting apparatus connected at one end to the main frame, and a whiffletree having a movement relatively to the machine in the direction of the line of draft, of a flexible connection of the whiffletree with the folding or finger-bar portion of the cutting apparatus, and a bearing for the linked connection located at one side of the direct line between its connections with the whiffletree and the folding or finger-bar portion of the cutting apparatus, the said bearing having a vertical adjustment, substantially as set forth.

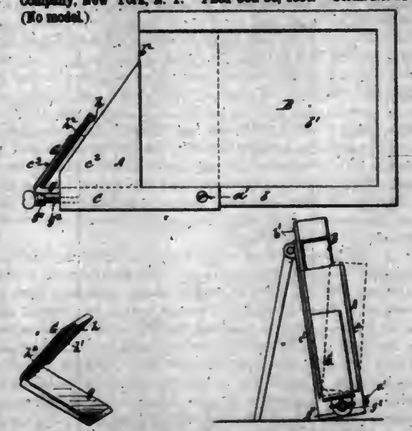
4. In a mower, the combination, with a rising-and-falling cutting apparatus connected at one end to the main frame, and a whiffletree having a movement relatively to the machine in the direction of the line of draft, of a flexible connection of the whiffletree with the folding or finger-bar portion of the cutting apparatus, said flexible connection of the whiffletree being connected with this portion of the cutting apparatus in vertical adjustment, substantially as set forth.

5. In a mower, the combination, with a rising-and-falling cutting apparatus connected at one end to the main frame, and a whiffletree having a movement relatively to the machine in the direction of the line of draft, and a bearing for the linked connection secured to the machine in vertical adjustment, of the flexible connection of the whiffletree and folding or finger-bar portion of the cutting apparatus, the said flexible connection engaged in said bearing and having a vertical adjustment at the end connected with the folding or finger-bar portion of the cutting apparatus, substantially as set forth.



395,982. COFFIN-HANDLE. BENJAMIN C. KOEHLER and DAVID HERR, Philadelphia, Pa. Filed Aug. 1, 1888. Serial No. 281,642. (No model.)

Claim.—1. The handle of a burial-casket or coffin, having a grip of angular form and rising and falling arms on which said grip is journaled, substantially as described.



2. The handle of a burial-casket or coffin, having a grip, segments connected with opposite sides of said grip, journals projecting laterally from said segments, arms having bosses forming bearings for said journals, and a back or attaching plate to which said arms are pivoted, the parts being combined and operating substantially as described.

395,983. WIRE CABLE. HENRY LISCHEN, St. Louis, Mo. Filed Nov. 19, 1887. Serial No. 255,636. (No model.)

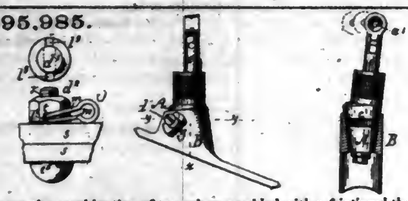
Claim.—In a cable, the combination, with a fiber core, of a number of strands twisted around and resting upon said core, and each of said strands consisting of bevel flat wires, the cross-section of each of which is a sector of a circle, arranged radially and provided with interlocking corrugations near their inner edges, substantially as set forth.

395,984. LEAD AND RULE HOLDER FOR TYPE-COMPOSITORS USE. A. AUGUSTUS LOW, Brooklyn, assignor to The Alden Type Machine Company, New York, N. Y. Filed Oct. 30, 1886. Serial No. 217,616. (No model.)

Claim.—1. In a lead and rule holder substantially such as described, the combination, with the inclined floor of the holder and with the inclined end rest, G, and the side wall, c^2, formed with a front edge parallel to the said end rest, G, and creating therewith a lateral opening in the channel, for the purpose and substantially in the manner described, of a movable gravity line-end rest or follower formed with a line-end bearing-surface which is inclined at an angle substantially parallel to that of the said front end rest, G, and front edge of the side wall, c^2, substantially as set forth.

2. In combination with a lead and rule holding compartment and with means for controlling the delivery of the leads or rules from the front end of the compartment, substantially as described, the hinged lateral support for the said compartment, arranged and operating substantially in the manner and for the purpose described.

3. In a lead and rule holder substantially such as described, the combination, with the stationary side wall formed with the inclined front edge and with the inclined rear line-end support or follower, of a parallel front end-line support which is adjustable with relation to the said inclined front edge of the side wall, for the purpose and substantially in the manner described.



4. In a lead and rule holder substantially such as described, a front line-end support formed with an inner bearing-surface which decreases in width downward, in combination with the adjoining portion of the channel-floor, formed of less width than the width of the leads or rules to be accommodated in the holder, substantially in the manner and for the purpose described.

5. An attachment to a printer's type-galley formed with an inclined front end-line rest and with a side wall having an inclined edge parallel to the said inclined front end-line rest, in combination with the galley and with means for securing the attachment thereto, substantially in the manner and for the purpose described.

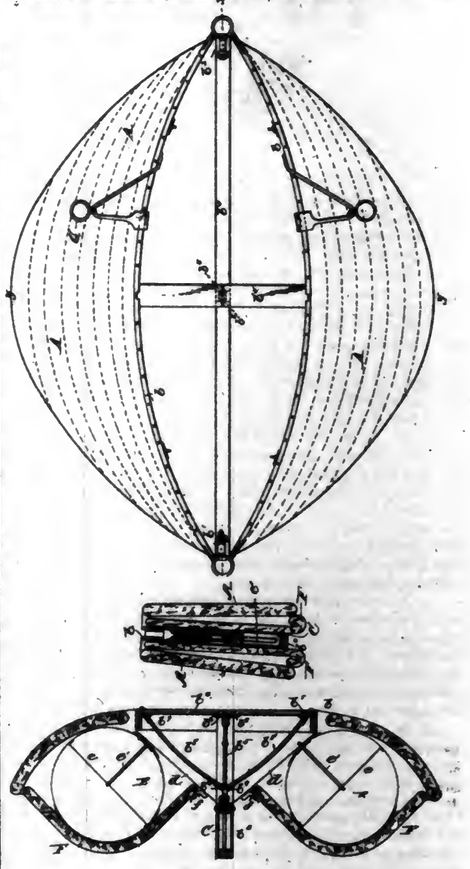
395,985. CLAMPING OPERATING-HANDLE FOR ADJUSTING-SCREWS. WILLIAM LYMAN, Middlefield, Conn. Filed July 10, 1888. Serial No. 279,516. (No model.)

Claim.—1. In mechanism operated or adjusted by a rotatable arbor

395,985.

or part, the combination of the arbor provided with a frictional thrust collar or flange and a head having a recess or recesses in its face extending from the periphery inward, the fixed bearing for receiving the arbor, and fixed faces or shoulders in juxtaposition with and corresponding to the working-faces of the arbor-head and the frictional thrust-collar, and an operating clamp-handle consisting, essentially, of a forked, looped, or U-shaped spring having its ends received or journaled and held in the recess or recesses of the arbor-head and adapted as the spring is swung around the recess as a pivotal point to press against the arbor-head, and corresponding fixed bearing to clamp the frictional thrust-collar to its seat or to bear against the sides of the recess to release the arbor, for the purpose specified.

2. In mechanism operated or adjusted by an adjusting-screw, the combination of the adjusting bolt or screw provided with journals, a frictional thrust-collar, and a collar or flange having recesses or slots in its face extending from the periphery inward toward the body of the screw, the fixed bearings for receiving the journal or journals of the screw, and faces or radial bearings corresponding to and in juxtaposition with the screw-head and thrust-collar, and a looped or U-shaped spring having each leg or part of its loop forked or bifurcated to swing over the screw-head and formed with an inwardly-projecting prong at each end of each fork adapted to be received in the recesses in the screw-head and bear against the sides thereof when the spring is vertically over the screw-head and to press between the screw-head and its fixed seat when the spring is folded down in the plane of the screw-head, thereby clamping the frictional collar to its seat to hold the screw stationary.



3. In mechanism operated or adjusted by an adjusting-screw, the combination of the adjusting-screw provided with journals, a frictional thrust-collar, and a head or flange having opposite recesses or slots extending from the periphery inward toward the body of the screw, the fixed bearings for receiving the journal or journals of the screw, and faces or radial bearings corresponding to and in juxtaposition with the working-faces of the screw-collars, and the looped or U-shaped springs arranged one on each side of the screw-head and joined by a connecting-web or tie part forming a handle and having at each end of each loop an inwardly-projecting prong or point, which prongs are adapted, when the springs are compressed, to be received in the recesses under the head of the screw and clamp the screw upon its frictional seat or release it therefrom as the handle is folded down in the plane of the screw-head, with the oppositely-acting prongs bearing, respectively, upon the screw-head and face of the screw-bearing, or is swung up vertically over the screw-head, with the prongs resting against the sides of the recesses, for the purpose specified.

4. In mechanism operated by a rotatable arbor or screw, the combination of the arbor provided with a friction-shoulder and a head having opposite recesses or slots in its face extending from the periphery inward and being enlarged back from the face of the head, fixed journal-bearings for receiving the arbor, and fixed shoulders corresponding to the face of the arbor-head and the friction-shoulder, and an operating clamp-handle consisting, essentially, of a double-looped spring having a loop fork or bight on each side of the arbor-head joined by a connecting-web, and the points of each loop being bent inward and received in the corresponding recess of the head, substantially in the manner and for the purpose specified.

5. In mechanism operated by an adjusting-screw, the combination of an adjusting-screw provided with journals, a frictional thrust-collar, and a head or flange having opposite recesses or slots *l* on the under side thereof, fixed bearings h h^3, for receiving the journals of the screw, and faces or radial bearings h' h^3, corresponding with and contiguous to the bearing-shoulders of the screw, and a looped or U-shaped spring, J, having each leg or part of the loop forked or bifurcated to swing over the screw-head and formed with an inwardly-projecting prong or projection, *n*, on each end of each fork adapted to be received in the recesses of the screw-head, and whereby the tension of the spring is adapted to be exerted between the screw-head and a fixed bearing or upon the respective sides of the recesses as the handle is folded down in the plane of the screw-head or swung into a position vertical thereto, substantially in the manner and for the purpose specified.

6. In a wind-gage sight for fire-arms, the combination of the sight-base B, the conical eccentric A, having a circular rack on its periphery and seated in the base carrying the sight-post, the adjusting-screw *d*, journaled in the base of the sight with its threads intermeshing with the rack of the conical eccentric and provided with the friction collar or nut *i*, and the head *f*, having the recesses on its inner side, and the combined folding and clamping operating-handle consisting, essentially, of a flat looped spring, J, having each part of its loop forked or spread to admit the body of the screw-head, and formed with an inwardly-extending prong or projection, *n*, on each end of each part of the loop, which projections are received in the recesses in the screw-head, whereby the operating-handle may be turned on the prongs as a journal and swung from a position at right angles to the screw-head down into the plane thereof to release or clamp the screw, substantially in the manner and for the purpose specified.

395,986. COMBINED LIFE-BOAT AND MATTRESS. JOHN MARTIN, Daylesford, Victoria. Filed July 13, 1888. Serial No. 280,292. (No model.) Patented in Victoria May 21, 1887, No. 5,080.

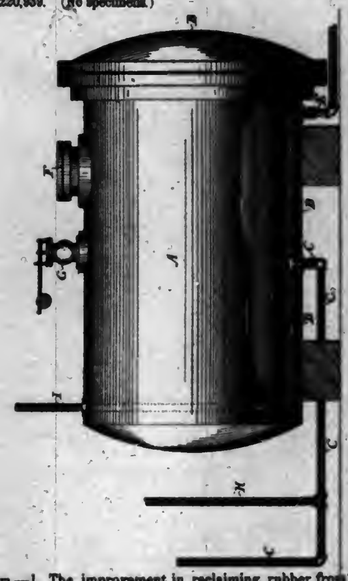
Claim.—1. The herein-described life-saving boat, consisting of a skeleton frame comprising a keel, a stem and stern post secured thereto, flexible sheer-strakes hinged to opposite sides of the stem and stern post, a vertical standard, a horizontal brace formed in two sections hinged to said standard, stays for staying said brace, hinged together and to the keel so as to form a groove in which the standard is stepped, and a canvas covering for said frame, substantially as described.

2. The herein-described life-saving boat, consisting of a skeleton frame comprising a keel, a stem and stern post secured thereto, flexible sheer-strakes hinged to opposite sides of the stem and stern post, a vertical standard, a horizontal brace formed in two sections hinged to said standard, stays for staying said brace hinged together and to the keel so as to form a groove in which the standard is stepped, the outer ends of the stays being hinged to the outer ends of the brace, and a canvas covering for said frame secured to the keel, the stem and stern posts and the sheer-strakes, respectively, substantially as described.

3. A convertible life-saving boat comprising a canvas-covered skeleton folding frame, and mattresses extending lengthwise of the frame on opposite sides, substantially as and for the purposes specified.

4. In a collapsible life-saving boat, the combination, with a canvas-covered foldable skeleton frame, of inflatable air-chambers divided into a plurality of compartments or cells arranged and extending lengthwise of the frame on opposite sides, substantially as and for the purposes specified.

5. In a collapsible and convertible life-saving boat, the combination, with a skeleton canvas-covered folding frame and mattresses secured to and extending lengthwise on opposite sides of said frame, of inflatable air-chambers interposed between the mattresses and the skeleton frame, substantially as and for the purposes specified.



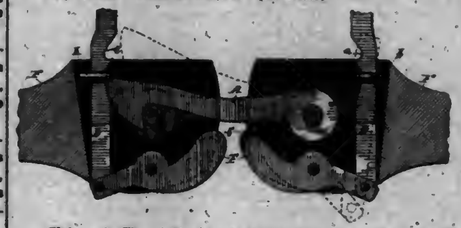
6. In a collapsible and convertible life-saving boat, the combination, with a skeleton canvas-covered folding frame and mattresses secured to and extending lengthwise on opposite sides of said frame, of inflatable air-chambers divided into a plurality of compartments interposed between the mattresses and the skeleton frame, substantially as and for the purposes specified.

7. In a collapsible and convertible life-saving boat, the combination, with a canvas-covered foldable skeleton frame, of mattresses A F, connected with each other and with the sheer-strakes, and canvas covering and inflatable air-chambers interposed between said mattresses and the boat, substantially as and for the purposes specified.

8. In a collapsible and convertible life-saving boat, the combination, with a canvas-covered foldable skeleton frame, of mattresses A F, connected with each other and with the sheer-strakes and canvas covering, and inflatable air-chambers divided into a plurality of compartments interposed between said mattresses and the boat, substantially as and for the purposes specified.

9. In a collapsible life-saving boat, a skeleton frame comprising a keel, stem and stern posts, and a sheer-strake hinged to opposite sides of said posts, of a vertical central standard hinged to the keel, a horizontal brace formed in two parts hinged to the central standard, and the lateral or rib braces b^5 b^5, connected with the horizontal brace and vertical standard, as described, for the purposes specified.

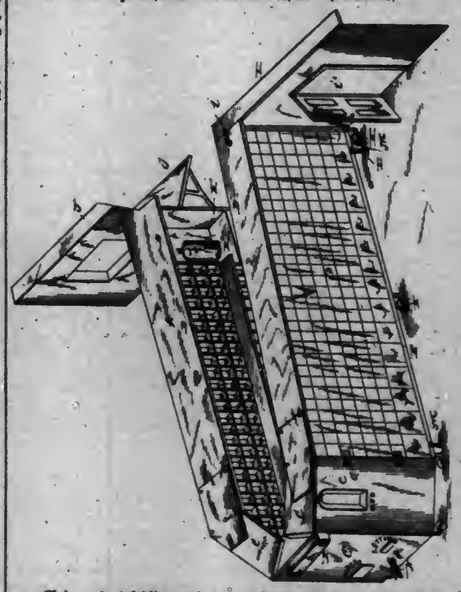
395,987. PROCESS OF RECOVERING RUBBER FROM WASTE. NATHANIEL C. MITCHELL, Philadelphia, Pa. Filed Dec. 7, 1886. Serial No. 220,939. (No specimens.)



Claim.—1. The improvement in reclaiming rubber from waste, consisting in heating the waste immersed in the reclaiming solution in a close vessel under pressure above the ordinary boiling-point of such solution, substantially as described.

2. The improvement in reclaiming rubber from waste, consisting in heating the waste immersed in a solution containing for each one hundred (100) pounds of waste about fifteen to twenty-five (15 to 25) pounds of hydrochloric acid or its specified substitute in excess of the quantity requisite to combine with the decomposable mineral compounds in a close vessel under pressure to about two hundred and forty degrees Fahrenheit, (240° F.,) substantially as described.

3. The improvement in reclaiming rubber from vulcanized waste, consisting in treating the waste with a reclaiming solution, so as to corrode the fibrous matter, and then washing out the products of corrosion and steaming the rubber at a high temperature and pressure, substantially as described.



395,988. CAR-COUPLING. GEORGE H. MOATS, Ironton, Ohio. Filed May 7, 1888. Serial No. 273,129. (No model.)

Claim.—1. The within-described automatic car-coupler, comprising a gravitating coupling-hook, the shaft C between the jaws of the coupling-head on which said hook articulates, a vertical depressing-lever notched as described, the keeper for this lever, and a gravitating striking bar or lever provided with a superposed piece, *b'*, and pivoted to the said depressing-lever, all substantially as set forth.

2. The combination, with coupling-head, of a curved gravitating coupling-hook, a transverse shaft, C, to which this hook is pivoted, a loaded striking bar or lever, E, provided with a superposed piece, *b'*, for the purpose described, a notched depressing-lever pivoted to the tail of said striking-bar, and a keeper, *b*, all constructed and adapted to operate substantially as herein set forth.

395,989. POST-OFFICE FURNITURE. JOHN M. MORRIS, Chicago, Ill. Filed Sept. 15, 1888. Serial No. 285,475. (No model.)

Claim.—1. A folding and removable post-office compartment consisting of a frame-work containing lock boxes and drawers in the sides, suitable openings through which to deposit the mail matter, openings through which the mail may be delivered, and compartments for containing the mail-bags, registered letters, and other mail matter, substantially as described.

2. A folding and removable post-office compartment consisting of a folding end, sides hinged to the said end, and an end hinged to one of the said sides and adapted to be swung out at right angles to the said side, substantially as described.

3. In a folding and removable post-office compartment consisting of the side wings provided with the lock-boxes and the lock-drawers, the corner wings provided with the delivery-windows and the end wing provided with suitable openings in which to deposit mail to be delivered, substantially as described.

4. In a folding and removable post-office compartment, the combination, with the side wings, of the shelves H, secured thereto and designed to meet each other when the device is folded to prevent any mail matter falling to the floor, substantially as described.

5. In a folding and removable post-office compartment, the combination with the side wings provided with shelves H, of the end wing, J, provided with the shelf *j*, substantially as described.

6. In a folding and removable post-office compartment, the combination, with the bottom of the device, of the casters secured thereto and designed to facilitate its removal, substantially as described.

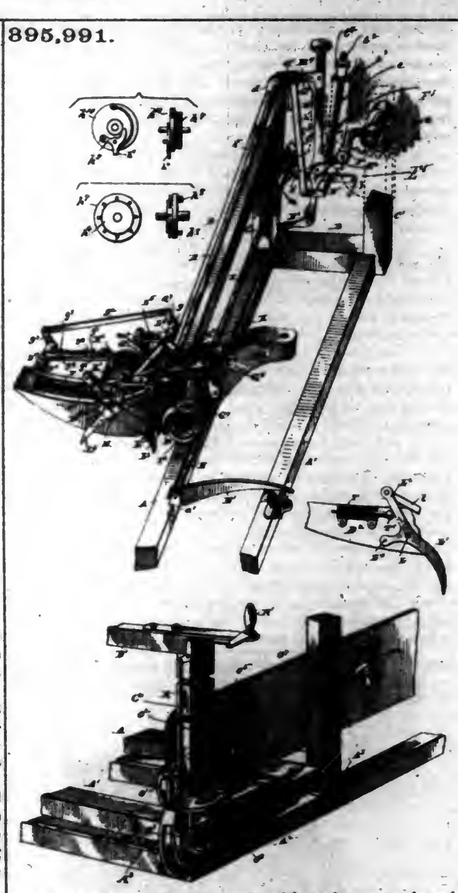
7. In a folding and removable post-office compartment, the combination, with the bottom portion provided with casters, of the hooks designed to engage staples in the floor to hold the device stationary, substantially as described.

8. In a folding and removable post-office compartment, the combination, with the end wing, of a box secured thereto and designed to contain the rope or chain to be used when the device is to be removed from the building, substantially as described.

9. In a folding and removable post-office compartment, the combination, with the side wings provided with suitable compartments to serve as lock-boxes and lock-drawers, of the compartment designed for the reception of the mail-bags, substantially as described.

395,990. HORSE-DETACHER. GEORGE W. MCLAUGHEN and ALONZO K. LOFTIN, Gastonia, N. C. Filed Oct. 30, 1888. Serial No. 289,547. (No model.)

Claim.—1. The combination, with the hame, of the link or plate fitting in a slot in the thill, the chain connecting the said link or plate to the hame, and a spring-bolt mounted on the thill and engaging a notch in the link or plate, substantially as set forth.



2. The combination, with the thill provided with a longitudinal slot, of the link or plate fitting in the said slot, the rearward-extending arm on the hame provided with an elongated loop, and the trace-chain connected to the link or plate and sliding in the said loop, as set forth.

3. The combination, with the thill provided with a longitudinal slot having a wedge-shaped tenon or projection at its front end, the link or plate flexibly connected to the hame, fitting in the slot in the thill and provided at its front end with a V-shaped notch engaging the said tenon or projection, and the spring-bolt engaging a notch in the rear end of the link or plate, substantially as specified.

4. The combination, with a thill provided with a longitudinal slot having a wedge-shaped projection, E, at its front end, of the link or plate connected by a chain to the hame, fitting in the slot in the thill and provided at its front end with a V-shaped notch engaging the wedge-shaped projection in the slot, the spring-actuated bolt fitting in a longitudinal bore at the rear end of the slot and engaging a notch in the rear end of the link or plate, and the operating-cord I, attached to a lateral eye on the bolt and passing rearwardly through guiding-eyes on the thill, substantially as specified.

5. The combination, with the thill provided with a longitudinal slot, B, and the spring-actuated bolt mounted in a bore in rear of the slot, of the link or plate C, fitting in the slot and engaged by the bolt, and provided with a longitudinal slot, *c*, having offsets or notches *c'* in its upper side registering with notches c^3 in the upper side of the thill, the elongated loop on the thill, and the trace-chain engaged at its front end in the said loop and at its rear end in the registering offsets and notches *c'* c^3, when the link or plate is in position in the slot, substantially as specified.

395,991. GRAIN-BINDER. MARION L. NICHOLS, New York, N. Y., assignor to the Nichols Harvester Company, same place. Filed Oct. 8, 1887. Serial No. 251,787. (No model.)

Claim.—1. The combination of packers which deliver the grain to the grain-receptacle, the auxiliary intermittently-operating packers, and an intermittently-operating separator acting to force the grain backward away from the main packers, substantially as described.

2. The combination of the packers which deliver the grain to the grain-receptacle, the intermittently-operating packers, an intermittently-operating separator, and a grain-trip arm controlled by the grain accumulated to form the bundle, acting to throw the packer-operating mechanism out of action and the separator-arm-actuating mechanism into action.

3. The combination of the binder, the intermittently-operating packers, a binder-trip for throwing the binding devices into action, and intermediate mechanism between said trip and the intermittently-operating packers, whereby the stopping of the packers causes through the intermediate mechanism the starting of the binder.

4. The combination of the separator, mechanism for actuating the same, said separator connected with the binder-trip to control the action of the binding devices, and intermittently-operating packers connected to the separator-actuating mechanism, substantially as described, whereby the packers act to control the action of the separator, as set forth.

5. The combination of a grain-trip arm connected with the packer-trip arm to control the action of the intermittently-operating packers to throw the same out of action, a separator, a trip for controlling the action of the separator intermediate between the packers and the separator and acted upon by the intermittently-operating packers, and a binder-trip connected with the separator to be acted upon and controlled thereby, substantially as described.

6. The combination, with intermittently-operated packers, a trip-arm therefor, a separator, a trip therefor, and a trip-arm controlled by the grain accumulated to form the bundle and acting upon both the packer and separator trips, of mechanism connecting the separator and packer trips together, substantially as described, whereby the grain-trip arm shall act upon the packer-trip arm, and in connection with the packer-trip arm also upon the separator-trip, as set forth.

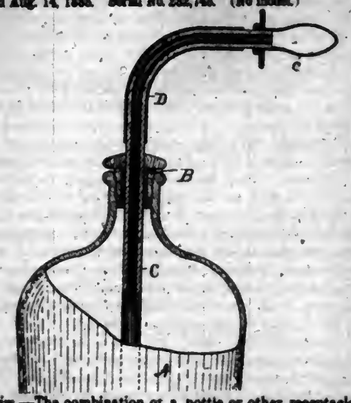
7. The combination of the grain-trip arm acted upon and controlled by the grain accumulated to form the bundle, the gear-wheel for operating the binding devices, a lever, F, acted upon by the grain-trip arm, and a hub and cam on the gear-wheel for engaging the lever, substantially as and for the purpose set forth.

8. The combination of intermittently-operating packers, a clutch for engaging said packers with their operating-shaft, a packer-trip arm acting to throw the packers out of action, and a locking-dog on the packer-trip arm acting on said packer-clutch, substantially as described, whereby the dog is caused to lock and hold the trip-arm until engaged with the clutch holding the packers in action, as set forth.

9. The combination of intermittently-operating packers, a clutch for engaging said packers with their operating-shaft, a packer-trip arm acting to throw the packers out of action, a grain-trip arm acted upon by the grain accumulated to form the bundle to throw the packer-trip arm into the path of the pawl of the clutch, a separator, a separator-trip, and a locking-dog mounted upon and acting on the packer-trip arm, substantially as described, whereby the separator-trip is held from being thrown into action until the packer-trip arm is engaged by the pawl of the clutch and the packers thrown out of action, as set forth.

10. The combination of the packers, the clutch for engaging the same with their operating-shaft, the pawl of said clutch, a swinging packer-trip arm mounted on the packer-frame to engage the pawl to throw the packers out of action, and a dog mounted on the swinging packer-trip arm in position to be acted upon by the pawl of the clutch to release the dog, substantially as and for the purpose set forth.

11. The combination of the packers, the clutch for engaging the same with their operating-shaft, the pawl of said clutch, a separator, mechanism for throwing the same into and out of action, a swinging packer-trip arm mounted on the packer-frame, a dog mounted on the swinging packer-trip arm to engage the pawl of the packer-clutch, substantially as described, whereby the packers are thrown out of action as the separator is thrown into action, as set forth.



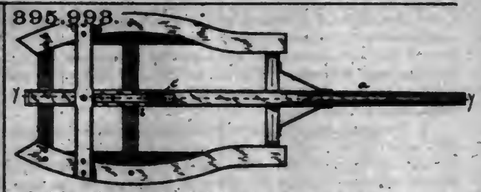
12. The combination of the separator, the gearing for operating the same, the clutch for engaging the separator with its actuating mechanism, the pawl of said clutch, and a spring-bolt mounted on the separator-supporting frame to engage the arm of the separator, substantially as described, whereby the pawl of the clutch is held out of contact with the friction-rollers carried by the driving-shaft when the separator is at rest, as set forth.

13. The combination of the harvester-frame, the binder-frame mounted and adapted to move thereon, and a pivoted swinging lever mounted on the harvester-frame and connected with both the header-board and the binder-frame, so that an accelerated movement is imparted to the header-board by the movement of the binder-frame, as set forth.

14. The combination of the harvester-frame, the binder-frame mounted and adapted to move thereon, a pivoted swinging lever mounted on the harvester-frame, having one long and one short arm, a header-board connected to the long arm, and a connection between the short arm and the binder-frame, whereby an accelerated movement is imparted to the header-board by the movement of the binder-frame, as set forth.

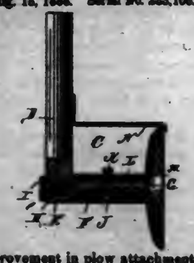
15. The combination of the harvester-frame, a movable binder-frame, the pivot-pin on the harvester-frame, the pivoted swinging lever having one long and one short arm and mounted to oscillate on the pin, and its long arm connected to the header-board and its short arm slotted and engaging a pin on the binder-frame, substantially as described.

395,992. NURSING-BOTTLE. LOUIS W. OSTER, Cleveland, Ohio. Filed Aug. 14, 1888. Serial No. 282,743. (No model.)



Claim.—The combination of a bottle or other receptacle and a stopper with a glass tube passing through said stopper, the part of said tube outside the bottle being bent substantially at right angles to the other part thereof, a nipple, and a tight-fitting rubber tube surrounding the bent part of said glass tube, substantially as and for the purpose specified.

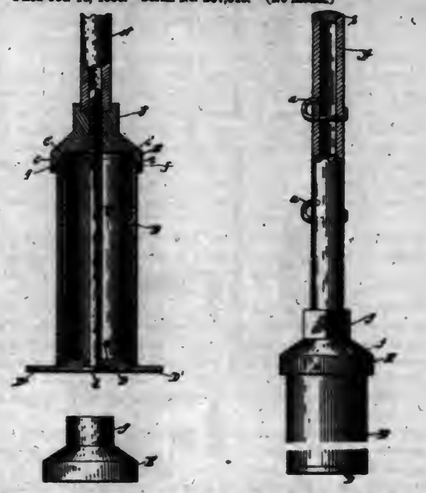
395,993. BOB-SLED. JACOB FARR, Irwin, Pa. Filed Jan. 23, 1888. Serial No. 261,606. (No model.)



Claim.—1. In a bob-sled or other vehicle, the combination of a continuous pole pivoted at an intermediate point of its length and a fixed truss or back-stop arranged in close proximity to and in rear of the rear extremity of said pole, to limit the depression of the rear end of the pole at a point slightly below the normal position thereof, substantially as described.

2. In a bob-sled or other vehicle, the combination of a continuous pole pivoted near its rear end, a fixed truss or back-stop arranged in rear of said pole in close proximity thereto, to limit the downward movement of the rear end of the pole at a point slightly below the normal position thereof, and a spring secured to the frame of the sled or vehicle, to limit the upward movement of the rear end of the pole, substantially as described, for the purpose set forth.

3. In a bob-sled or other vehicle, the combination of a continuous pole pivoted at an intermediate point of its length, a vertically-inclined fixed truss or back-stop, *b*, arranged in rear of said pole in close proximity to the rear extremity thereof, and adapted to limit the depression of the rear end of said pole at a point slightly below its normal position, and a spring, *c*, fixed to the frame of the sled or vehicle, and bearing on the upper side of the pole to limit the upward play thereof, substantially as described.



395,994. PLOW ATTACHMENT. ADDISON J. PARKHURST, Frederick, Dak. Filed Aug. 18, 1888. Serial No. 283,106. (No model.)

Claim.—As an improvement in plow attachments, the combination of the standard having its lower end provided with a transverse angular tapered opening, E, the cylindrical axle having an annular groove and provided with a reduced tapered angular projection inserted through the opening E and properly secured, the concave disk having a hollow cylindrical hub fitting on the cylindrical axle, the set-screw mounted in the hub and engaging the annular groove in the axle, and the scraper secured to the standard and bearing against the front concave face of the disk, as specified.

395,995. FENCE-POST. WILLIAM A. PRATER, Paw Paw, Mich. Filed Oct. 11, 1888. Serial No. 287,815. (No model.)

Claim.—1. The combination of a cylindrical tile, a bottom cap-plate therefor, an upper flanged cap-plate for the tile, provided with

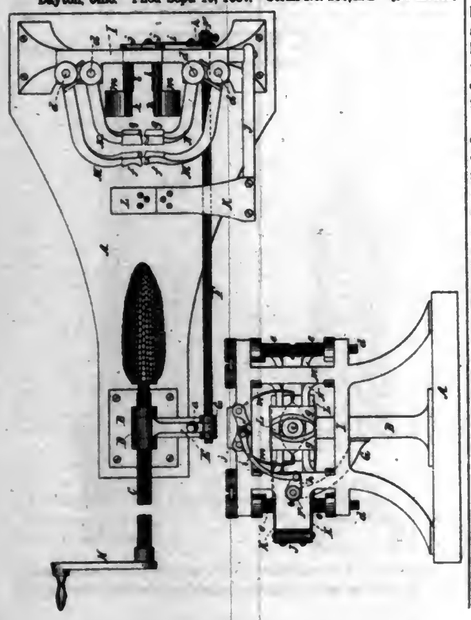
a central passage and an enlargement, *g*, upon its upper surface, this enlargement being recessed, a central securing-bolt passed up centrally through the cap-plates and tile, and a metallic tubular post screwed upon the upper projecting end of the said bolt, and having its lower end fitted in the recess in the upper end of the said enlargement *g*, substantially as described.

2. The combination of the cylindrical tile B, having its upper outer edge beveled, as at *c*, a centrally-perforated metallic bottom cap, D, fitted over the lower end of the tile and provided with the upper circular enlargement, *e*, and the lateral annular flange D′, the upper centrally-perforated cap, E, fitted over the upper beveled end of the tile and provided with an overhanging beveled flange, *f*, and an enlargement, *g*, a securing-bolt passed up centrally through the caps and tile, and a hollow metallic post, A, tapped upon the upper projecting end of the said securing-bolt, and fitting in a recess in the upper end of the said enlargement *g*, substantially as and for the purposes herein specified.

395,996. FLYING TARGET. ALBERT C. REESE, Belleville, Ill.

Filed Mar. 29, 1888. Serial No. 268,776. (No model.)

Claim.—1. In a flying target, the combination of the cylindrical casing 3 and disk 10, forming the central air-chamber, 2, and the casing 6, forming an annular chamber, 5, concentric with the chamber 2, whereby when the target is rotated and sprung buoyancy is added to its flight, substantially as and for the purpose set forth.



2. In a flying target, the combination of the cylindrical and annular faces, the circumferential cylindrical walls forming central and annular air-chambers, the understep 4, and circular rims 7, 8, and 9, all arranged when the flying target is rotated and sprung to add buoyancy and stability to its flight, substantially as and for the purpose set forth.

3. A flying target consisting of a circular solid face and concentric cylindrical and annular air-chambers extending from one side thereof, substantially in the manner herein set forth.

4. A flying target consisting of a circular solid disk, a concentric cylindrical air-chamber extending therefrom, a concentric annular disk formed on said cylindrical air-chamber in a different plane from the circular disk, and a concentric annular air-chamber extending from said annular disk, as herein shown and described.

5. In a flying target, a circular or annular solid face having formed thereon cylindrical rims or flanges forming cylindrical or annular air-chambers, and thus affording buoyancy and stability to the flight of the target, as herein explained.

395,997. MACHINE FOR HULLING GREEN CORN. JOHN RITTY, Dayton, Ohio. Filed Sept. 19, 1887. Serial No. 250,194. (No model.)

Claim.—1. In a machine for hulling green corn, the combination, with a rotary screw-threaded ear-carrying shaft and a nut engaging the same, of stationary spring-pressed cutter-jaws provided with cutting-points for splitting the kernels transversely of the cob and spring-pressed inclined presser-jaws set spirally opposite the pitch of the screw of the ear-carrying shaft for forcing the meats out through the slits formed by the cutting-points, substantially as described.

2. In a machine for hulling green corn, the combination, with the rotary forwardly-progressing ear-carrying shaft, gearing engaging the same to cause its forward movement, and the cutting-knives and presser-jaws, of grappling-jaws connected to the shaft-gearing, whereby they will grasp the cob during the return movement of the shaft and automatically release the same upon the engagement of the gearing for moving the shaft forward, substantially as described.

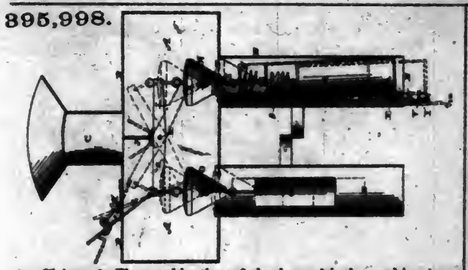
3. In a machine for hulling green corn, the combination, with the cutting-knives and pressing-jaws and ear-carrying shaft having the screw for engaging the ear, of grappling-jaws for positively holding the cob when passed through the cutting and pressing devices and preventing its backward rotation, whereby the screw on said shaft may be disengaged from the cob, substantially as described.

4. In a machine for hulling green corn, the combination, with the cutting-knives and pressing-jaws, the screw-threaded ear-carrying shaft having the screw for engaging the ear, and the half-nut engaging said shaft, of grappling-jaws for positively holding the cob when passed through the cutting and pressing devices and preventing its backward rotation, whereby when said nut is disengaged from the shaft the latter may be rotated and the screw withdrawn from the cob held by said grappling-jaws, substantially as described.

5. In a machine for hulling green corn, the combination, with the cutting and pressing devices, the screw-threaded ear-carrying shaft having the screw for engaging the ear, and the half-nut engaging said shaft, of grappling-jaws for holding the cob when passed through the cutting and pressing devices and a shaft connecting said jaws and half-nut, whereby when the latter is released from the shaft the jaws will be caused to close and grasp the cob, substantially as and for the purpose set forth.

6. In a machine for hulling green corn, the combination, with the knives for cutting the kernels and the ear-carrying shaft, of a shaft and operating mechanism, substantially as described, connecting the knives and the gearing of the ear-carrying shaft, for causing the separation of said knives during the disengagement of said gearing and the return movement of the shaft, substantially as described.

7. In a machine for hulling green corn, the combination, with the knives for cutting the kernels, the screw-threaded ear-carrying shaft, and the half-nut engaging the same, of a shaft connecting said knives and nut, whereby when the nut is disengaged from the shaft the knives will be separated to prevent their engagement with the shaft during its return movement, substantially as described.



8. In a machine for hulling green corn, the combination, with the knives for cutting the kernels, the screw-threaded ear-carrying shaft having the screw for engaging the ear, the half-nut engaging the shaft, and the jaws for grasping the cob after being passed through the knives, of a shaft connecting the half-nut, knives, and grappling-jaws, whereby when the nut is disengaged from the shaft the knives will be opened and the grappling-jaws closed to effect the release of the shaft from the cob and its return to first position, substantially as described.

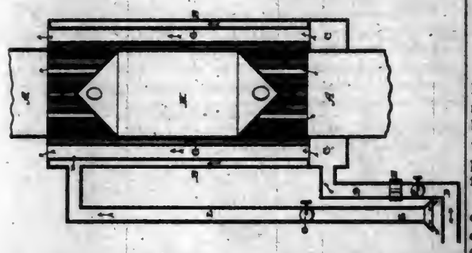
9. In a machine for hulling green corn, the combination, with the cutting-knives carried by the flat springs K K, the screw-threaded ear-carrying shaft having the screw for engaging the ear, the half-nut engaging the shaft, and the jaws for grasping the cob after being passed through the knives, of a shaft, F, on which the half-nut is mounted, said shaft carrying a cam located between said springs K K, and being connected to the grappling-jaws for operating the latter, whereby when the half-nut is disengaged from the ear-carrying shaft the shaft F will be rotated, the knives separated by the cam, and the grappling-jaws closed, permitting the disengagement of the shaft from the cob and its return to first position, as set forth.

10. In a machine for hulling green corn, the combination, with the cutting-knives, the screw-threaded ear-carrying shaft, the half-nut engaging said shaft, and the jaws connected by gear-teeth for grasping the cob after it has passed between the knives, of a shaft on which said nut is mounted, having a crank-arm thereon, and a link connecting the crank-arm and one of said grappling-jaws, whereby said jaws will be separated upon the disengagement of the nut with its shaft and the consequent rotation of the shaft upon which it is mounted, substantially as described.

11. In a machine for hulling green corn, the combination, with the yielding cutter-jaws L, provided with cutting points *b*, of the yielding presser-jaws M N, provided with the spirally-set presser-blocks *f f g g*, substantially as and for the purpose described.

395,998. RAIN-WATER CUT-OFF. DANIEL W. ROLAND, Akron, Ohio. Filed Oct. 23, 1888. Serial No. 288,923. (No model.)

Claim.—1. The combination of the box with the rocking lever placed therein, the valves attached to opposite ends, a weight attached to one of the valves, a can or bucket attached to the other valve, an automatically-acting valve, which is closed by the side of the pipe E as the can is raised, connected to the bucket or can, and the outlet and discharge pipes, substantially as shown.



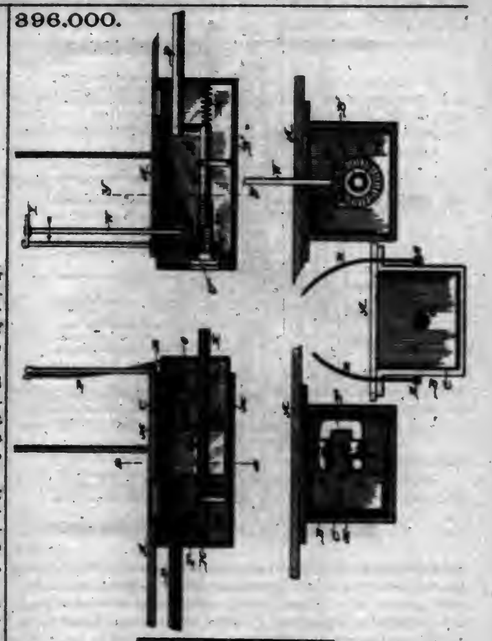
2. The combination of the box provided with the inlet-pipe and the outlet and discharge pipes, the rocking lever having a valve attached to each end, a weight attached to one of the valves, a bucket or can attached to the other end, a spring, F, for supporting the bucket or can, and an automatically-operating valve connected to the bucket, substantially as described.

3. The combination of the rocking lever, the valve for closing the waste-pipe, a spring connected to the valve, a bucket or can connected to the lower end of the spring, a spring having a valve connected thereto for closing the leak-hole in the can or bucket, and the notched extension secured to the waste-pipe for operating the valve, substantially as described.

4. The combination of the bucket provided with a flange, S, at its top, and a leak-hole, with the outlet-pipe, the U-shaped extension V, provided with the notch W, and the wire U, provided with a valve, X, substantially as shown.

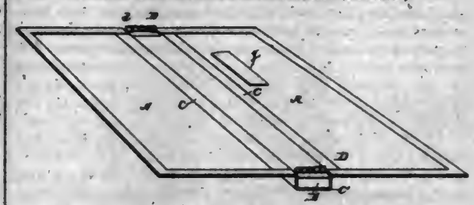
5. The combination of the rocking lever provided with a valve at each end for closing the outlet and waste pipes, a rod connected to one end of the lever and extending to the top of the box, and a catch or locking device for engaging with the rod, substantially as described.

395,999. COMBINED STOVE-PIPE HEATER AND VENTILATOR. ALEXIS H. ROSS, Waukon, Iowa. Filed June 29, 1888. Serial No. 278,514. (No model.)



Claim.—The combination of the stove-pipe, the air-chamber located in its lower end, the pipe for admitting air to this chamber, the pipes G, which extend from the top of the chamber through the heater, the chamber H, located in the center of the heater and provided with the pipes G′ J, and which chamber H receives its air from the chamber C, substantially as described.

396,000. CAR-HEATER. ROBERT P. SARTELL, St. Cloud, Minn. Filed July 8, 1887. Serial No. 243,731. (No model.)



Claim.—1. The combination, in railway-car heaters, of two cars provided with the chests B and B′, one of the said chests having its outer end open and provided with the longitudinally-movable chest L in the said open end, the steam-pipes extending through said chests, and the coupling to connect the opposing ends of the steam-pipes when the cars come together, substantially as described.

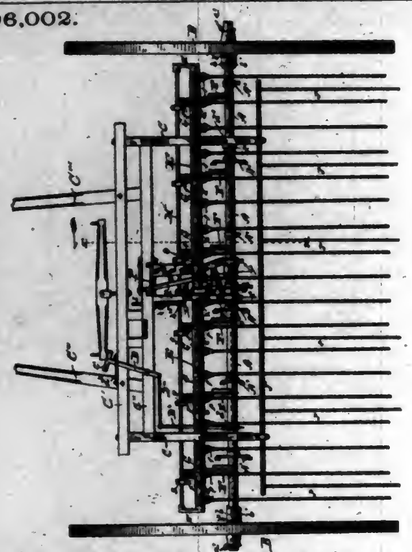
2. The combination, of the cars having the chests B and B′ on their opposing ends, the outer end of the chest B′ being closed and the outer end of the chest B being open, the longitudinally-movable chest L, arranged in the open end of chest B and adapted to be projected therefrom, and the lever connected to the chest L and adapted to move the same longitudinally, for the purpose set forth, substantially as described.

396,000. [duplicate]

396,001. TEMPORARY BINDER. GREGORY H. SCHARF, Toledo, Ohio. Filed May 15, 1886. Serial No. 202,302. (No model.)

Claim.—1. In a binder for periodicals and other papers, foldable leaves flexibly attached to a back piece provided with retainers at right angles to the back piece and having openings through which a binding-cord is passed, the upper encircling edge of each opening to which the binding-cord is fastened being at a height from the back piece corresponding to the thickness of material to be bound, as and for the purpose set forth.

2. In a binder for periodicals and other papers, flexible binding-cords held in parallel relation to a rigid back piece and at a distance corresponding to the thickness of the material to be bound by retainers attached to the back piece, as and for the purpose set forth.



3. As a new article of manufacture, a binder comprising the foldable leaves, the rigid back piece to which the leaves are connected, and the end retainers carried by and projecting at right angles from the back piece, each retainer being bent from a single piece of wire and having a series of overlapping loops, substantially as described.

396,002. COMBINED HAY RAKE AND TEDDER. SAMUEL B SHANK, Millersville, assignor to Israel L. Landis, Lancaster, Pa. Filed June 21, 1888. Serial No. 277,791. (No model.)

Claim.—1. The combination, with the axle provided with a spindle, of a wheel journaled upon the said spindle, a sleeve, *b*, secured upon the axle and extending over the joint between the inner end of the hub of the wheel and the shoulder of the axle, this sleeve being serrated or notched on its periphery at or near its outer end, and a spring-actuated pawl pivoted upon the inner face of the hub and normally engaging the said ratcheted sleeve, substantially as herein set forth.

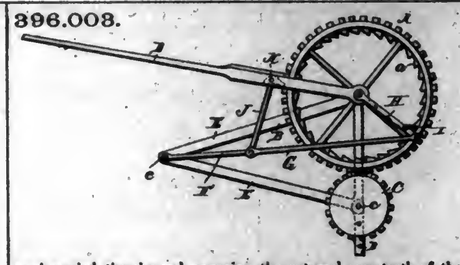
2. The combination, with an axle provided with transporting-wheels, tappets secured upon the axle, and stop-collars *d d*, secured upon the axle, the former collar being flanged, of a movable frame mounted upon the axle and limited in its movements by the said stop-collars, a rake-shaft mounted in the frame and movable with it, independent oscillating rake-sections pivoted upon the rake-shaft and pro-

396,002.

vided with cams, the lever D', pivoted upon the frame and engaging the stationary stop-collar *d*, connecting-link D'', a spring-lever, D, pivoted upon the frame of the machine and provided with a foot-piece, and a notched retaining-loop, *d''*, bolted to the frame, all arranged as and for the purpose set forth.

3. The combination of the axle provided with transporting-wheels, a frame mounted upon the axle, a rake-shaft mounted upon the frame, rake-tooth sections pivoted upon this shaft, these rake-sections being provided with forwardly and downwardly extending arms *c'*, a rock-shaft, H, parallel to the rake-shaft and journaled in arms upon the ends of the rake-shaft, adjustable clips *g*, secured upon the said rock-shaft, these clips being provided with rearwardly and downwardly inclined lips *g'* to engage the arms *c'*, and means, substantially as described, for rocking the shaft H, as herein described.

4. The combination, with an axle mounted on wheels, a frame upon the axle, a rake-shaft journaled in the frame, rake-sections pivoted on the rake-shaft, and a dumping-lever, K, mounted on the rake-shaft, a portion of this lever extending below the rake-shaft, of a stationary bracket secured to the frame, a stationary clutch-sleeve, M, on the axle, a sliding clutch-sleeve on the axle adapted to engage the stationary clutch-sleeve, an angle-lever, O, pivoted upon the said stationary bracket and connected to the sliding clutch-sleeve, an operating-lever, P, attached to this angle-lever O, a rigid arm, M'', on the said stationary sleeve, and a link, M''', pivotally connecting this rigid arm with the said dumping-handle K, all arranged to operate substantially as herein set forth.

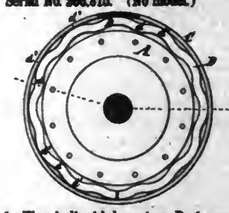


5. The combination of an axle provided with transporting-wheels, a frame, a rake-shaft mounted in the frame, independent rake-sections pivoted on this rake-shaft, each of these rake-sections being provided with forwardly and downwardly projecting arms *c'*, a rock-shaft parallel with and in front of the shaft and journaled in arms H', secured on the same, adjustable clips *g*, secured on the rock-shaft and provided with rearwardly and downwardly projecting lips *g'*, these lips being adapted to bear upwardly upon the said arms *c'* on the rake-sections, a forwardly and downwardly inclined lip, *h'*, secured rigidly on the rock-shaft, and a knee-lever, I, pivoted on the frame, the rear end of this lever being adapted to bear upon the said inclined lip *h'* on the rock-shaft, substantially as and for the purpose set forth.

6. The combination of an axle provided with wheels, a frame, a rake-shaft, rake-sections mounted on this shaft and provided with forwardly and downwardly projecting arms *c'* and upwardly-projecting arms *f''*, a rock-shaft, H, journaled in rigid arms on the rake-shaft and arranged parallel therewith, clips *g*, secured on the rock-shaft and provided with rearwardly-extending lips *g'*, adapted to bear upon the said arms *c'*, and means for rocking the rock-shaft, substantially as described.

396,003. MECHANICAL MOTION. WASHINGTON C. SHOWALTER, Lancaster, Wis., assignor of one-half to J. H. Reed, same place. Filed Feb. 16, 1888. Serial No. 264,310. (No model.)

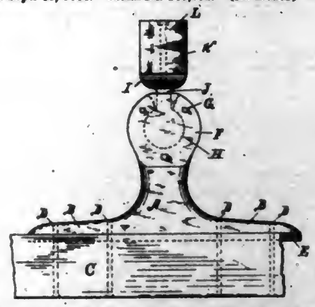
Claim.—1. The combination of the main gear-wheel A, having an internal ratchet and external gear-teeth, the operating-lever, the



396,003.

pawl carried thereby and engaging the external gear-teeth of the wheel A, the link-rod, the pawl carried by the link-rod and engaging the internal ratchet of said wheel A, and toggle-lever connections between the link-rod and the operating-lever, as set forth.

2. In a mechanical motion to convert reciprocatory motion into circular motion, the combination, with the driving gear-wheel having the internal ratchet, *a*, the lever pivoted upon the shaft of said gear-wheel, and the pawl K, pivoted on the lever and engaging the gear-wheel, of the rod F, pivoted to the point of junction of the supporting-bars E, the rod G, pivoted to and forming a toggle-joint with the rod F, the link-rod H, connecting the outer end of the rod G and the shaft of the gear-wheel A, the link-rod J, connecting the lever and toggle-joint, and the pawl I, pivoted on the link-rod H and engaging the ratchet *a*, substantially as specified.



396,004. PISTON. WILLIAM SIMPKIN, Richmond, Va. Filed Mar. 10, 1888. Serial No. 266,815. (No model.)

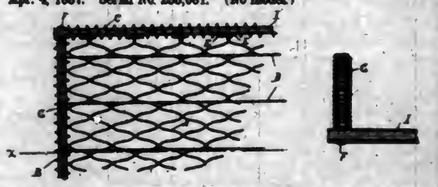
Claim.—1. The helicoidal spring D, formed with corrugations *d d'* on its bearing-surface for expanding piston-packing, said circles of corrugations being adapted for bearing on different circles of packing, substantially as described.

2. The combination, with a piston-head and its packing, of a helicoidal spring provided with longitudinal corrugations on its bearing-surface, the said corrugations forming circles of spaced impact points on the helicoidal winds of the strip of which the spring is formed, said corrugations being adapted for bearing on different circles of packing, substantially as and for the purpose described.

396,005. SLEIGH-KNEE. WILLIAM H. SPEAR, Humboldt, Iowa. Filed Sept. 18, 1888. Serial No. 285,752. (No model.)

Claim.—1. A sleigh-knee composed of two parts, the first terminating in a circular disk united to the part at one side by a narrow neck in its own plane, and the second having a recess receiving and closely fitting said disk, whereby the two parts are articulated in a manner permitting limited motion in a single vertical plane only, substantially as set forth.

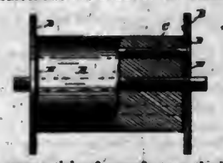
2. The combination, with the runner C and the beam K, of the plate I, secured to said beam and bearing the integrally-formed neck J and disk H, the knee-body A, provided with the recess in its upper end to receive said disk and bolted at its lower end to said runner, and the plate F, retaining said disk in said recess, substantially as set forth.



396,006. PLATFORM-ADJUSTING DEVICE FOR HARVESTERS. JOHN F. STEWARD, Chicago, Ill. Filed Apr. 3, 1888. Serial No. 269,479. (No model.)

Claim.—1. In a harvesting-machine, the ground-wheel, the vertically-adjustable platform-frame, and the intermediate wheel-support, as usual, in combination with a guide on the platform-frame, a chain passed beneath the guide, with one end extended upward and secured to the wheel-carrier and the other end left free to be grasped and lifted by hand, and a plate or fastening device on the frame to engage and hold said chain, whereby the operator is enabled by a direct upward lift upon the chain to effect the easy and positive adjustment of the platform-frame.

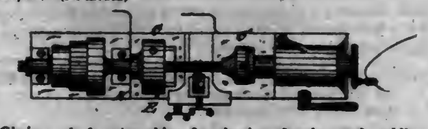
2. The harvester-platform, the arm or bracket hinged thereto and the grain-wheel carried by the arm, in combination with the guide or bearing *b* on the frame, and the chain passed from the wheel-carrying arm downward beneath the guide and exposed at the opposite end, that it may be grasped and lifted by hand, whereby the attendant standing at the side of the machine is enabled to apply a direct lifting action and to easily effect the vertical adjustment of the frame.



396,007. WIRE FABRIC. DANIEL C. STOVER, Freeport, Ill. Filed Apr. 4, 1887. Serial No. 233,681. (No model.)

Claim.—In a wire fabric, a helical coil passing along one margin thereof, a bar passing along the adjacent or intersecting margin of the fabric, and a rod engaging said bar and entering said coil axially, the greatest diameter of said rod being slightly greater than the normal interior diameter of the coil, whereby the marginal coil and the bar may be rigidly connected at the corner of the fabric.

396,008. BOBBIN. OTHO C. SULLIVAN, Stonington, Conn. Filed Sept. 19, 1887. Renewed June 28, 1888. Serial No. 278,462. (No model.)



Brief.—The object of the invention is to improve the construction of bobbins for winding silk, to prevent the drawing down of the silk thread between the barrel and the heads of the bobbin.

Claim.—1. As a new article of manufacture, the bobbin comprising the drum, the heads secured on the ends of the drum, and the elastic pieces E, secured between the said heads and the ends of the drum, and thereby filling the cracks or spaces between the said heads and the ends of the drum, for the purpose set forth, substantially as described.

2. As a new article of manufacture, the bobbin comprising the drum A, made of wood, the heads B, made of metal and secured on the ends of the drum, and the pieces E, of rubber, cloth, felt, or other suitable elastic material, secured between the ends of the drum and the heads B, for the purpose set forth, substantially as described.

396,009. FORMING, BRAZING, AND WELDING OF METALS BY ELECTRICITY. ELIHU THOMSON, Lynn, assignor to the Thomson Electric Welding Company, Boston, Mass. Filed Feb. 21, 1887. Serial No. 228,277. (No model.)

Claim.—1. In a machine for shaping, forming, and welding metals, means for holding and rotating the metal to be operated upon, connections to pass heavy electric currents through the same, and means for imparting the lateral pressure of die-surfaces to the rotating metal, as and for the purpose described.

2. In an electric metal-working apparatus, die or forming-surfaces faced with a non-conductor of heat of a refractory nature.

3. In an electric metal-working apparatus, rotary chucks or holders mounted on a suitable frame, but insulated from one another, and suitable means for passing heavy electric currents to the work in said holders.

4. A lathe having its chucks or holders insulated from one another, in combination with means for passing heavy electric currents through the metal mounted on the lathe.

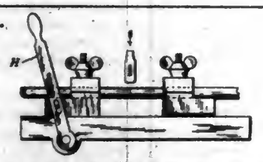
5. In an electric metal-working apparatus, the combination of two rotary chucks or holders insulated from one another and means connected with one of said chucks for moving it to and from the other chuck after the manner of the back head of a lathe.

6. The combination, with suitable holders for rotating a metal piece and suitable connections for passing a heavy electric current through the same, of one or more lateral die-rolls, as and for the purpose described.

396,010. METHOD OF ELECTRIC FORGING. ELIHU THOMSON, Lynn, assignor to the Thomson Electric Welding Company, Boston, Mass. Original application filed May 21, 1886, Serial No. 202,842. Divided and this application filed Feb. 6, 1888. Serial No. 263,153. (No model.)

Claim.—1. The herein-described art of upsetting metals into any desired shape, which consists in subjecting the blank to be worked to the heating action of a heavy electric current sufficient in volume to soften the same and then subjecting the blank to an endwise pressure, substantially as described.

2. The herein-described art or process of electric upsetting, consisting in clamping the bar or blank of metal at two points, leaving a section of the metal between the clamps, passing an electric current through the clamps and section of metal between them so as to soften the metal, then causing said blanks to approach each other in the line of the blank to upset the heated bar or blank between the clamps, substantially as specified.

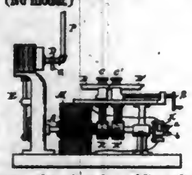


3. The herein-described method of upsetting metal bars or blanks, which consists in heating the bars or blanks by electric currents traversing them and upsetting the metal bar into the desired shape.

4. The herein-described process of forming a lateral expansion or projection on a bar or piece of metal, consisting in passing a heavy electric current through the metal blank and then subjecting the blank to pressure while inclosed in a non-conducting mold having a lateral opening.

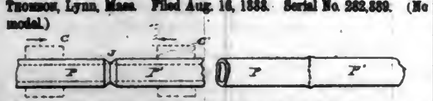
396,011. METHOD OF ELECTRIC WELDING. ELIHU THOMSON, Lynn, Mass. Filed May 15, 1886. Serial No. 278,960. (No model.)

Claim.—1. The herein-described method of forming a finished joint between two pieces of metal, consisting in heating the joint by an electric current passed through the same, applying pressure while the metal is in a heated condition, removing the pressure, and then hammering and shaping the metal while subjected to a heating electric current.



396,011.

2. The herein-described method of finishing an electric weld, consisting in removing the pressure by which the weld is effected, and then hammering or shaping or otherwise working the pieces while they are traversed by a heating electric current.



3. The herein-described method of finishing an electrically-welded joint, consisting in simultaneously applying a heating electric current, and a force tending to separate the joint while subjecting the joint to the hammering or other operation.

396,012. APPARATUS FOR ELECTRIC WELDING AND WORKING METALS. ELIHU THOMSON, Lynn, Mass. Filed May 17, 1888. Serial No. 274,194. (No model.)

Claim.—An apparatus for electric welding, forging, brazing, or other metal-working operations in which an electric current is employed as the heating agent, comprising, in combination, a dynamo-machine supplying heating-current, a driving-power for the same, suitable clamps or holders for the work, and suitable means in proximity to the work and under the control of the operator for throwing the driving-power on or off to any desired amount, as desired, to vary the current and the heating effects in the work at will.

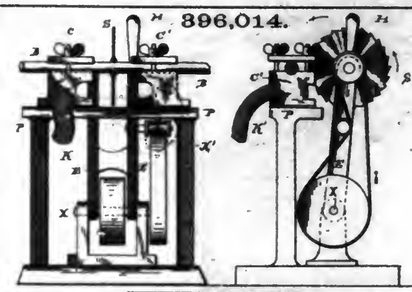
396,013. ELECTRIC PIPE-JOINING AND PIPE-WORK. ELIHU THOMSON, Lynn, Mass. Filed Aug. 16, 1888. Serial No. 282,859. (No model.)

Claim.—1. The herein-described improvement in forming electrically-welded joints between pipes, tubes, or tubular pieces, consisting in forming the taper or chamfer upon the end of the tube or tubular portion, abutting the end of the tube against the tube or pipe to which it is to be joined, and subjecting the two pieces or sections of pipe to an endwise pressure while they are in a heated state, as and for the purpose described.

2. The herein-described improvement in electrically welding pipes, tubes, or tubular pieces or objects, consisting in forming a double taper or chamfer both from the bore out and from the outside inward, as and for the purpose described.

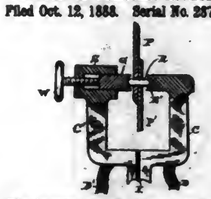
3. The herein-described improvement in electrically welding pipes, tubes, or tubular pieces, consisting in chamfering or tapering the tubular end so as to leave a narrow ridge or edge rather nearer the inside than the outside diameter of the tube, as and for the purpose described.

4. The herein-described improvement in electrically welding lead, tin, or other soft pipes, tubes, or tubular pieces, consisting in forming the abutting end of the tube with a narrowed edge preliminarily to the welding operation, as and for the purpose described.



5. The herein-described improvement in welding together two tubular sections or pieces of lead, tin, or other soft metal, consisting in forming the abutting ends of the tubes or tubular portions with a narrow edge or ridge, passing a heating electric current across the joint, and moving the pieces together to follow the melting of the tapered portion.

396,014. ELECTRIC METAL WORKING. ELIHU THOMSON, Lynn, Mass. Filed Oct. 3, 1888. Serial No. 287,561. (No model.)



Claim.—1. The hereinbefore-described method of reducing or separating metal rods, bars, or pieces, consisting in heating the same by an electric current of large volume and then applying a suitable force to separate the metal or to extend the same at the heated section.

2. The herein-described novel art of cutting off or reducing the section of bars or rods, consisting in heating the bar or rod electrically at the point of division or reduction and then applying the proper separating or reducing power or force, as and for the purpose described.

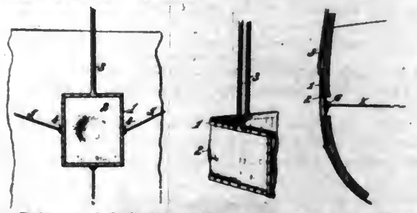
396,014.

396,015. METHOD OF ELECTRIC RIVETING. ELIHU THOMSON, Lynn, Mass. Filed Oct. 12, 1888. Serial No. 287,910. (No model.)

Claim.—1. The herein-described improved method of riveting, consisting in heating the rivet or rivet-blank electrically while in place, and then heading either or both ends of the same.

2. The herein-described method or process of riveting, consisting in making the rivet while in position a portion of a circuit carrying a heating or large volume of electric current, and then setting the rivet by any desired means, as and for the purpose described.

3. The herein-described method of riveting, consisting in passing a heavy electric current through the rivet or rivet-blank while the same is in position, and then applying end-pressure to the rivet to set the same.



4. The herein-described method of riveting, consisting in applying to opposite ends of the rivet while in position suitable metal blocks or pieces, either or both movable, including said blocks and rivet in an electric circuit carrying an electric current of large volume for the purpose of heating the rivet, and then forcing said blocks or pieces toward one another to set the rivet.

5. The herein-described method of riveting, consisting in heating the rivet while in place by an electric current until it assumes a welding temperature, and then applying pressure to set the rivet in its seat and unite the sides of the same to the metal body through which it passes.

6. The herein-described method of fastening two pieces of metal together, consisting in passing a heating electric current through a rivet or rivet-blank, passing through the pieces as well as through the pieces of metal themselves in the neighborhood of the rivet, and applying pressure to set the rivet and weld the pieces together.

7. The herein-described method of electric riveting, consisting in pressing the plates together, heating the rivet inserted through the plates by a heavy electric current flowing through the same, and applying end-pressure to the rivet to head or set the same.

396,016. LEAK-STOPPER FOR HOLDS OF VESSELS. PLATT B. VIELE, Rochester, N. Y. Filed Apr. 10, 1886. Renewed June 14, 1888. Serial No. 277,091. (No model.)

Claim.—1. A leak-stopper for vessels, composed of a frame of detachable and flexible flat steel bars or strips that will conform to the shape of the vessel and a flexible covering secured to said frame, substantially as described.

2. A leak-stopper for vessels, composed of a supporting-frame provided with handles and a flexible covering secured to said frame, and having loops or rings attached to its inner side for attachment of ropes or guys to pass through the opening in the hull of the vessel, substantially as described.

3. A leak-stopper for vessels, consisting of a frame and handles therefor composed of detachable bars provided with perforations, a flexible covering secured to said frame and having loops or rings on its inner side, and guys attached to said frame and to the loops on the inner side of its covering, substantially as described.

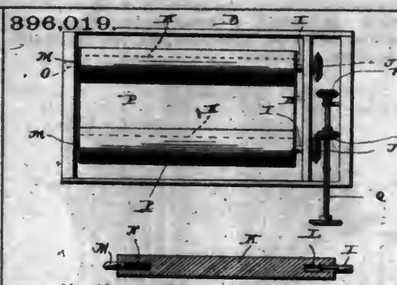
396,017. WRENCH. THOMAS WARREN, Centralia, Ill. Filed July 31, 1888. Serial No. 281,552. (Model.)

Claim.—In a wrench, the combination of the handle provided with a series of notches and the sliding sleeve or collar placed thereon, with the jaw provided with a shank which is pivoted to the handle, the sliding jaw, and the brace provided with projections at its free end to catch in the notches in the handle, substantially as set forth.

396,018. DRILLING-MACHINE. CHARLES M. WOOLWORTH, Ottumwa, Iowa. Filed Mar. 24, 1888. Serial No. 268,423. (No model.)

Claim.—1. The combination of frame A, having bars A' A', provided with notches *c'* and ribs *a*, with the drill-shaft D, nut *d*, having arms *d'*, and the frame E, carrying the driving-gearing for said shaft, provided with the brace-plates E' E', bearing against the inner faces of the bars A', substantially as and for the purpose described.

2. The combination of the supporting-frame A, having notched side bars, substantially as described, and the grooved drill-shaft D and nut *d*, having outstanding arms *d'*, with the frame E, carrying the drill-shaft driving-gear and provided with plates E' E', bearing against the inner faces of bars A', and bracing the frame laterally, and lugs *e e*, all constructed and arranged substantially as and for the purpose described.



3. The combination of the frame A, composed of side bars, A' A', having ribs *a* and notches *c'*, and the sleeve B, adjustable tube B', and block C, with their adjustable rods and tubes, with the nut *d*, having arms *d'*, the grooved shaft D, and the frame E, carrying the gears F and G, with their shafts and cranks, and having the brace-plates E' E', engaging the inner faces of bars A', and the lugs *e*, engaging the outer edges of said bars, all constructed substantially as and for the purpose described.

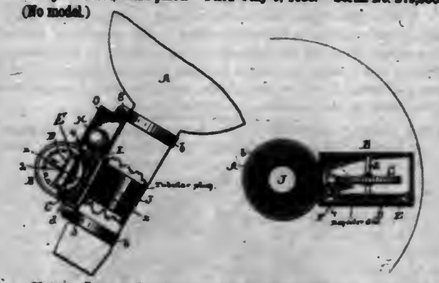
396,019. STATION-INDICATOR. JOSEPH R. ANGEL, Bald Mount, Pa., assignor of one-half to Silas C. Fulton, Denver, Colo. Filed Nov. 6, 1888. Serial No. 290,106. (No model.)

Claim.—As an improvement in station-indicators, the combination of the casing having the sockets O in one end, the shafts I I, journaled within the casing and having angular inner ends, the belt-carrying rollers having recesses in their opposite ends, the recesses in one end being angular and adapted to engage the angular inner ends of the shafts I, the pintles mounted in the recesses in the opposite ends of the rollers and adapted to engage the sockets O, and the springs

396,019.

arranged in said recesses, between the ends of the same and the pintles, and normally projecting the pintles outward to engage the sockets, as specified.

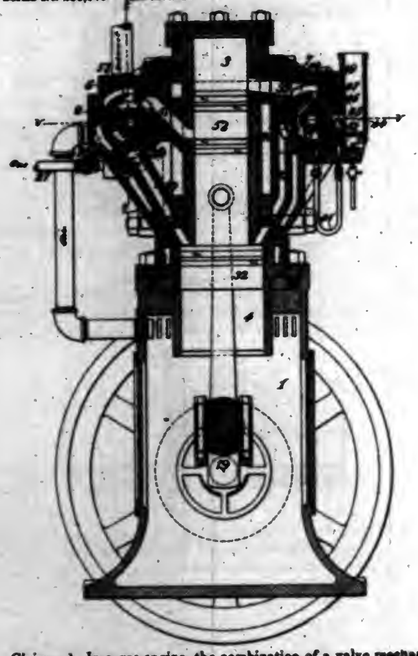
396,020. SAFETY-GATE FOR FURNACE FEED-PIPES. CHARLES C. BARBOUR, Grand Rapids, Mich., assignor of one-half to Foster, Stevens & Co., same place. Filed Oct. 13, 1888. Serial No. 288,472. (No model.)



Claim.—1. In a furnace feed-pipe, the safety-gate, which consists of a section of said pipe severed from the main part and adapted to be removed from its position, leaving a space exposed to the air between the adjacent parts of the pipe, substantially as described.

2. In a furnace feed-pipe, the safety-gate, which consists of a section of the pipe severed from the main part and adapted to be removed from its position, in combination with the slides adapted to close the apertures left in the pipe by the removal of said section, substantially as described.

3. In a safety-gate for furnace feed-pipes, the combination, with the pipe having a section severed and adapted to be removed, of the upper and lower plates attached, respectively, to the upper and lower remaining parts of the pipe, said plates having guides or ways and the slides moving in such ways or guides, the severed sections of the pipe being fastened between said slides, and said plates and slides provided with perforations registering with the openings in the pipes, substantially as described.

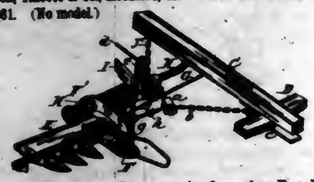


4. In a safety-gate for furnace feed-pipes, the severed section of the pipe adapted to be removed, the slides to which it is attached, the ways for such slides, and the doors in the slides to give access to the pipes when the gate is closed, substantially as described.

396,021. DRINK-REGISTERING ATTACHMENT FOR LIQUOR-BOTTLES. HENRY C. BARKER, Kansas City, Mo., assignor of one-half to Henry P. Scott, same place. Filed July 9, 1888. Serial No. 279,350. (No model.)

Claim.—In a registering attachment for bottles, the combination of a closed case provided with exterior devices which hold it upon the bottle, the shaft 2, mounted within said case, the ratchet-wheel C, mounted on said shaft, the lever I, pivotally mounted in said case, the pawl *d*, carried by one end of said lever and arranged to engage the teeth of the ratchet-wheel, a loose ball, H, which engages and depresses the end of said lever opposite said pawl when the bottle is turned, a spring which returns the lever to its normal position after engagement with said ball, the pointer D, also mounted upon shaft 2, so as to move in unison with the ratchet-wheel, and a graduated dial-plate, substantially as described.

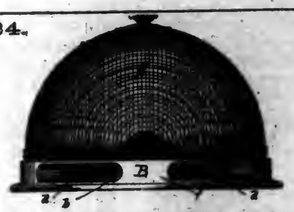
396,022. GAS-ENGINE. J. CHARLES BECKFELD, Allegheny, Pa., assignor of one-half to Albert Schmid, same place. Filed Nov. 23, 1887. Serial No. 255,979. (No model.)



Claim.—1. In a gas-engine, the combination of a valve mechanism controlling the flow of gas and air from the compression-cylinder to the power-cylinder and the passage of flame from the igniter to the power-cylinder, a burner having a supply-connection with the power-cylinder, and a burner connected to and receiving its supply of gas and air through the valve mechanism, substantially as set forth.

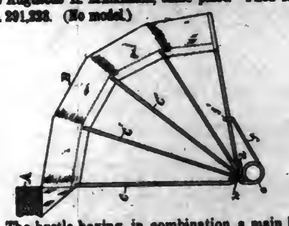
2. In a gas-engine, the combination of a valve mechanism controlling the flow of gas and air from the compression-cylinder to the power-cylinder and the passage of flame from the igniter to the power-cylinder, a burner having a supply-connection with the power-cylinder, a burner connected to and receiving its supply of gas and air through the valve mechanism, and a burner having an independent source of supply, substantially as set forth.

3. In a gas-engine, the combination of a valve mechanism for controlling the passage of flame from the igniter to the power-cylinder, a burner having a supply-connection with the power-cylinder, and a burner receiving its supply of gas and air from the compression-cylinder, substantially as set forth.



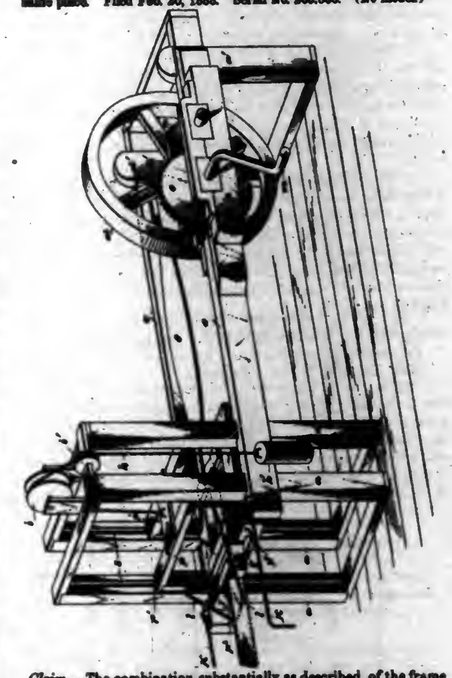
4. In a gas-engine, the combination of a compression-cylinder and a power-cylinder suitably connected for the passage of gas and air, a burner receiving its supply of gas and air from the compression-cylinder, and a valve mechanism for controlling the passage of flame from the burner to the power-cylinder and preventing the extinction of the flame by the explosion, substantially as set forth.

396,023. MOWER. JOHN C. BLOOM, Kalamazoo, Mich., assignor to Emerson, Talcott & Co., Rockford, Ill. Filed Jan. 27, 1887. Serial No. 225,661. (No model.)



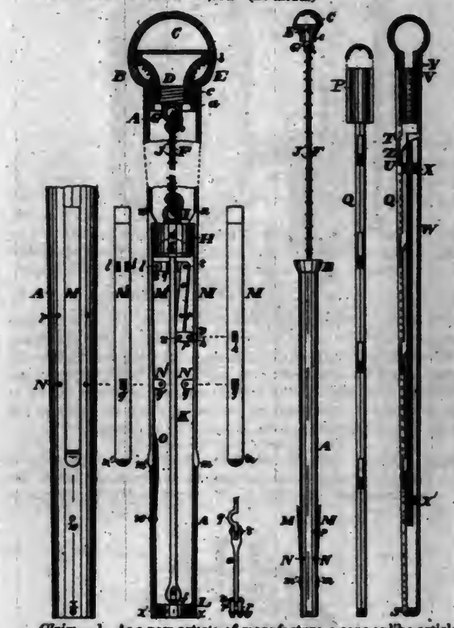
Claim.—The hinged coupling-arm, the finger-bar H and pivoted shoe F, post *g* on the shoe, and sheave *a* on the coupling-bar, with the flexible connection *b*, having the limit-stop *b*' thereon, in combination with the movable evener, substantially as specified.

396,024. INSECT-TRAP. JOHN H. BROWN, New York, N. Y., assignor to Geo. C. Twinbury, same place. Filed Aug. 27, 1888. Serial No. 283,898. (No model.)



Claim.—An insect-trap consisting of a dish-shaped base having a bottom within the dish formed as a low cone and provided with an aperture through the side or wall, in combination with the covered way leading from the aperture to a narrow opening within the trap, the said covered way being formed of woven wire, the edges of which are attached to the wall and bottom of the dish, and having a mouth at the inner end projecting over the top of the cone, the said base having also a suitable cover, all substantially as described.

396,025. BUSTLE. VICTOR H. BUSCHMANN, Baltimore, Md., assignor to Augustus H. Brinkmann, same place. Filed Nov. 19, 1888. Serial No. 291,232. (No model.)



Claim.—The bustle having, in combination, a main bow, C, provided near each end with a lateral U-shaped bend, *d*, a coil, *e*, below the said U-shaped bend, and a spring-arm, *f*, projecting from the coil, the bows C, each having hook ends *g*, all of which on one side pivot in one of said U-shaped bends of the main bow, and a hook, *h*, uniting the two sides of the U-bend and confining the hook ends of the bows, as set forth.

396,026. WOOD-SAWING MACHINE. BENJAMIN F. CAMP, Clinton, Ky., assignor, by mesne assignments, of one-half to John E. Bowers, same place. Filed Feb. 20, 1888. Serial No. 265,060. (No model.)

Claim.—The combination, substantially as described, of the frame provided at front with vertical standards having ways, the gravitating counterbalanced sash-frame mounted in said ways and provided with horizontal grooved side sills, the cross-head mounted to slide in said grooves and connected by pitman with the driving-crank, the saw secured at one end to the front of the cross-head, and guides secured to the sash-frame adjacent to the cross-head and bearing with their free ends upon opposite sides of the saw-blade.

396,027. CANE. WILBUR M. CARPENTER, St. Louis, Mo. Filed Oct. 4, 1886. Serial No. 215,318. (No model.)

Claim.—1. As a new article of manufacture, a cane or like article composed of a suitable case, a detachable head, and a flexible connection between said head and the cane-body, whereby the head is allowed a certain range beyond the end of the cane, and is thereby adapted to be used as a weapon of defense, substantially as described.

2. A cane or like article consisting of a case, a detachable head, and a connection between said head and the cane, whereby the said head is allowed a certain range of movement beyond the end of the cane, the connection between the head and cane being formed with spurs or teeth, substantially as described.

3. A cane or like article consisting of a case, a head detachable therefrom having a smooth exterior and teeth or like projections upon its under surface, and a connection between said head and case allowing limited movement of the head, and also provided with spurs or projections throughout its extent, substantially as described.

4. A cane or like article consisting of a body portion, a head detachable therefrom, a connection between said head and the cane, and elastic means for automatically withdrawing said head to its normal position after use, substantially as described.

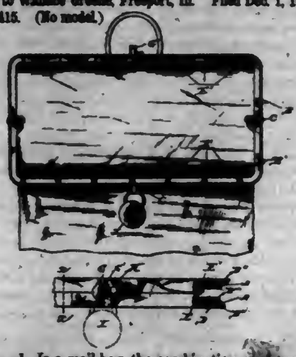
5. A cane or like article consisting of a case, a head detachably connected therewith, positive means for holding said head in position, and a hand device for releasing the holding device, whereby the said head may have a limited movement to be used as a weapon of defense, substantially as described.

6. A cane or like article consisting of a suitable case, a detachable head, a flexible connection between said head and cane, holding-catches for keeping the head in its normal position, and releasing means in connection with each other, whereby in the operation of one upon one side of the cane the other will be automatically operated to release the head, substantially as described.

7. In a cane or other staff having a button or plunger, as shown, an elastic cord connecting said button or plunger to the bottom of the case, substantially as shown.

8. A cane or like article consisting of a suitable case, a detachable head, a sliding block within the cane, the connection between said sliding block and the cane-head, the flexible connection between said sliding block and the cane-body, and holding-catches for retaining the block in position until released, substantially as described.

9. In a cane or other staff having a button or plunger, two catches and their connecting rods and levers, and a spring, substantially as shown.



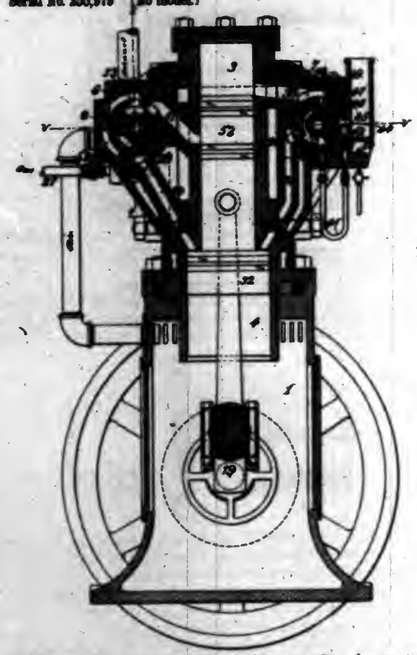
10. A cane or like article having a body portion and a weighted part extensibly connected to said body portion, and a catch, as M, for holding said weighted part in place, said catch, terminating in a handle, substantially as described.

396,028. PAPER PAIL. JOHN L. COLHAPP, Chicago, Ill., assignor of two-thirds to Charles Chamberlain, same place. Filed Mar. 24, 1888. Serial No. 268,402. (No model.)

Claim.—An oyster-bucket the sides and bottom of which consist of a blank of flexible material having a practically-circular bottom, and an octagonal edge, said blank divided by radial creases into segments, each of which is again divided by a crease which intersects a radial side of the segment at the center and is at right angles to the peripheral side of the segment, the blank being folded into an inner and outer series of folds, respectively, on the creases B and C, substantially as shown and described, in combination with rivets which hold the gathered portions of the blank so as to form the top of the bucket, a bail attached thereto, and cement between the folded portions of the sides of the bucket, all substantially as and for the purpose shown and described.

396,029. BAG-LOCK. LYMAN B. CUTLER, Monmouth, assignor of one-half to Wallace Greene, Freeport, Ill. Filed Dec. 1, 1888. Serial No. 292,415. (No model.)

Claim.—1. In a mail-bag, the combination, with two pivotally-connected opposing jaws secured to the edges of the bag's open end, of a series of hooks arranged at intervals along the inner face of one of said jaws, a series of catches arranged at corresponding intervals along the inner face of the opposing jaw, and legs having inclined impinging surfaces fixed upon the respective jaws and overlapping when the jaws are closed, whereby the jaws may be thrown bodily in opposite directions as the bag closes to permit engagement of the hooks, substantially as set forth.



2. The combination, with a mail-bag, of two opposing jaws secured to the bag's edges, a series of rigid hooks arranged at intervals along one of said jaws, a series of catches placed at corresponding intervals along the other jaw and adapted to be simultaneously engaged by said hooks when the jaws are moved bodily in the proper direction with reference to each other, and the lock passing through both jaws, or projections thereon, to prevent such bodily motion.

3. The combination, with a mail-bag, of the downwardly-bent pivotally-connected jaws secured to its edges, the staples fixed at intervals upon one of said jaws, the correspondingly-placed hooks fixed upon the opposing face of the other jaw and adapted to engage the staples respectively, the leg fixed upon one jaw and having the V-shaped projection, the overlapping leg fixed upon the opposing jaw and provided with a corresponding depression, and the lock having its link passed through both legs and preventing bodily movement of the jaws with reference to each other, substantially as set forth.

396,030. AUTOMATIC VEHICLE-BRAKE. BENJAMIN A. DAVIS, Bermuda, assignor to George Davis, Petersburg, Va. Filed Nov. 7, 1888. Serial No. 290,230. (No model.)

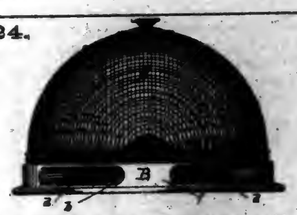
Claim.—The combination, in a wagon or other vehicle, of the pole having the slots or openings *c c*, the pins or bolts *e e*, passing through said openings, the brake-bar, the chain, and pawl and ratchet connecting with said pole, substantially as described.

396,022. GAS-ENGINE. J. CHARLES BUSKFELD, Allegheny, Pa., assignor of one-half to Albert Schmid, same place. Filed Nov. 23, 1887. Serial No. 256,979. (No model.)

Claim.—1. In a gas-engine, the combination of a valve mechanism controlling the flow of gas and air from the compression-cylinder to the power-cylinder and the passage of flame from the igniter to the power-cylinder, a burner having a supply-connection with the power-cylinder, and a burner connected to and receiving its supply of gas and air through the valve mechanism, substantially as set forth.

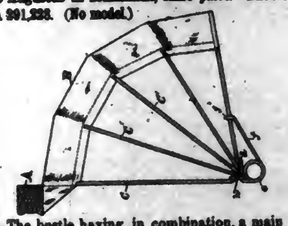
2. In a gas-engine, the combination of a valve mechanism controlling the flow of gas and air from the compression-cylinder to the power-cylinder and the passage of flame from the igniter to the power-cylinder, a burner having a supply-connection with the power-cylinder, a burner connected to and receiving its supply of gas and air through the valve mechanism, and a burner having an independent source of supply, substantially as set forth.

3. In a gas-engine, the combination of a valve mechanism for controlling the passage of flame from the igniter to the power-cylinder, a burner having a supply-connection with the power-cylinder, and a burner receiving its supply of gas and air from the compression-cylinder, substantially as set forth.



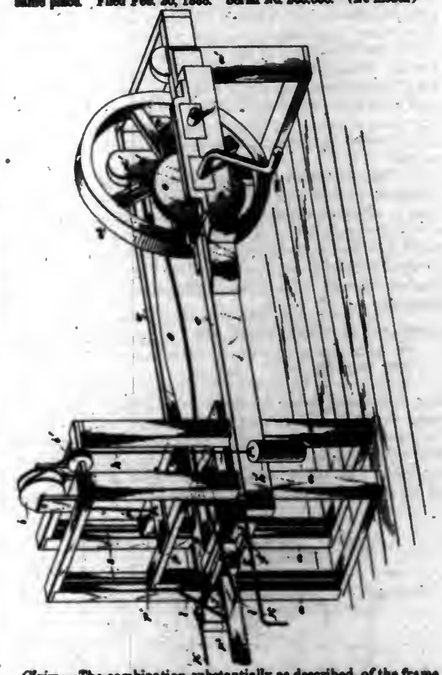
4. In a gas-engine, the combination of a compression-cylinder and a power-cylinder suitably connected for the passage of gas and air, a burner receiving its supply of gas and air from the compression-cylinder, and a valve mechanism for controlling the passage of flame from the burner to the power-cylinder and preventing the extinction of the flame by the explosion, substantially as set forth.

396,023. MOWER. JOHN C. BLOOM, Kalamazoo, Mich., assignor to Emerson, Talcott & Co., Rockford, Ill. Filed Jan. 27, 1887. Serial No. 225,661. (No model.)



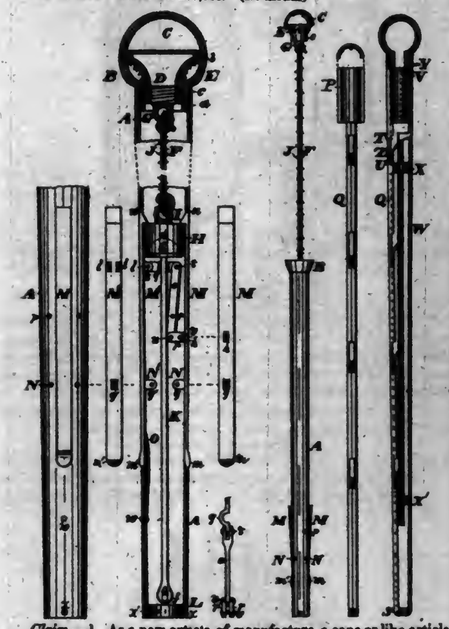
Claim.—The hinged coupling-arm, the finger-bar E and pivoted shoe F, post *g* on the shoe, and sheave *a* on the coupling-bar, with the flexible connection *b*, having the limit-stop *h* thereon, in combination with the movable evener, substantially as specified.

396,024. INSECT-TRAP. JOHN H. BROWN, New York, N. Y., assignor to Geo. C. Townsbury, same place. Filed Aug. 27, 1888. Serial No. 283,898. (No model.)



Claim.—An insect-trap consisting of a dish-shaped base having a bottom within the dish formed as a low cone and provided with an aperture through the side or wall, in combination with the covered way leading from the aperture to a narrow opening within the trap, the said covered way being formed of woven wire, the edges of which are attached to the wall and bottom of the dish, and having a mouth at the inner end projecting over the top of the cone, the said base having also a suitable cover, all substantially as described.

396,025. BUSTLE. VICTOR H. BUSCHMANN, Baltimore, Md., assignor to Augustus H. Brinkmann, same place. Filed Nov. 19, 1888. Serial No. 291,228. (No model.)



Claim.—The bustle having, in combination, a main bow, C, provided near each end with a lateral U-shaped bend, *d*, a coil, *e*, below the said U-shaped bend, and a spring-arm, *f*, projecting from the coil, the bows C, each having hook ends *g*, all of which on one side pivot in one of said U-shaped bends of the main bow, and a hook, A, uniting the two sides of the U-bend and confining the hook ends of the bows, as set forth.

396,026. WOOD-SAWING MACHINE. BENJAMIN F. CAMP, Clinton, Ky., assignor, by mesne assignments, of one-half to John R. Bowers, same place. Filed Feb. 20, 1888. Serial No. 265,060. (No model.)

Claim.—The combination, substantially as described, of the frame provided at front with vertical standards having ways, the gravitating counterbalanced sash-frame mounted in said ways and provided with horizontal grooved side sills, the cross-head mounted to slide in said grooves and connected by pitman with the driving-crank, the saw secured at one end to the front of the cross-head, and guides secured to the sash-frame adjacent to the cross-head and bearing with their free ends upon opposite sides of the saw-blade.

396,027. CANE. WILBUR M. CARPENTER, St. Louis, Mo. Filed Oct. 4, 1886. Serial No. 215,318. (No model.)

Claim.—1. As a new article of manufacture, a cane or like article composed of a suitable case, a detachable head, and a flexible connection between said head and the cane-body, whereby the head is allowed a certain range beyond the end of the cane, and is thereby adapted to be used as a weapon of defense, substantially as described.

2. A cane or like article consisting of a case, a detachable head, and a connection between said head and the cane, whereby the said head is allowed a certain range of movement beyond the end of the cane, the connection between the head and cane being formed with spurs or teeth, substantially as described.

3. A cane or like article consisting of a case, a head detachable therefrom having a smooth exterior and teeth or like projections upon its under surface, and a connection between said head and cane allowing limited movement of the head, and also provided with spurs or projections throughout its extent, substantially as described.

4. A cane or like article consisting of a body portion, a head detachable therefrom, a connection between said head and the cane, and elastic means for automatically withdrawing said head to its normal position after use, substantially as described.

5. A cane or like article consisting of a case, a head detachably connected therewith, positive means for holding said head in position, and a hand device for releasing the holding device, whereby the said head may have a limited movement to be used as a weapon of defense, substantially as described.

6. A cane or like article consisting of a suitable case, a detachable head, a flexible connection between said head and cane, holding-catches for keeping the head in its normal position, and releasing means in connection with each other, whereby in the operation of one upon one side of the cane the other will be automatically operated to release the head, substantially as described.

7. In a cane or other staff having a button or plunger, as shown, an elastic cord connecting said button or plunger to the bottom of the cane, substantially as shown.

8. A cane or like article consisting of a suitable case, a detachable head, a sliding block within the case, the connection between said sliding block and the cane-head, the flexible connection between said sliding block and the cane-body, and holding-catches for retaining the block in position until released, substantially as described.

9. In a cane or other staff having a button or plunger, two catches and their connecting rods and levers, and a spring, substantially as shown.

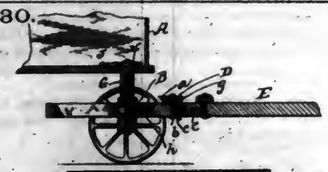
10. A cane or like article having a body portion and a weighted part extensibly connected to said body portion, and a catch, as M, for holding said weighted part in place, said catch, terminating in a handle, substantially as described.

396,028. PAPER PAIL. JOHN I. COLHAPP, Chicago, Ill., assignor of two-thirds to Charles Chamberlain, same place. Filed Mar. 24, 1888. Serial No. 268,402. (No model.)

Claim.—An oyster-bucket the sides and bottom of which consist of a blank of flexible material having a practically-circular bottom, and an octagonal edge, said blank divided by radial creases into segments, each of which is again divided by a crease which intersects a radial side of the segment at the center and is at right angles to the peripheral side of the segment, the blank being folded into an inner and outer series of folds, respectively, on the creases B and C, substantially as shown and described, in combination with rivets which hold the gathered portions of the blank so as to form the top of the bucket, a bail attached thereto, and cement between the folded portions of the sides of the bucket, all substantially as and for the purpose shown and described.

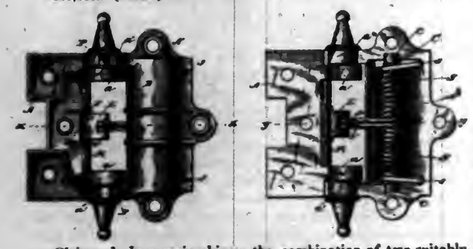
396,029. BAG-LOCK. LYMAN B. CUTLER, Monmouth, assignor of one-half to Wallace Greene, Freeport, Ill. Filed Dec. 1, 1882. Serial No. 262,415. (No model.)

Claim.—1. In a mail-bag, the combination, with two pivotally-connected opposing jaws secured to the edges of the bag's open end, of a series of hooks arranged at intervals along the inner face of one of said jaws, a series of catches arranged at corresponding intervals along the inner face of the opposing jaw, and lugs having inclined impinging surfaces fixed upon the respective jaws and overlapping when the jaws are closed, whereby the jaws may be thrown bodily in opposite directions as the bag closes to permit engagement of the hooks, substantially as set forth.



2. The combination, with a mail-bag, of two opposing jaws secured to the bag's edges, a series of rigid hooks arranged at intervals along one of said jaws, a series of catches placed at corresponding intervals along the other jaw and adapted to be simultaneously engaged by said hooks when the jaws are moved bodily in the proper direction with reference to each other, and the lock passing through both jaws, or projections thereon, to prevent such bodily motion.

3. The combination, with a mail-bag, of the downwardly-bent pivotally-connected jaws secured to its edges, the staples fixed at intervals upon one of said jaws, the correspondingly-placed hooks fixed upon the opposing face of the other jaw and adapted to engage the staples respectively, the lug fixed upon one jaw and having the V-shaped projection, the overlapping lug fixed upon the opposing jaw and provided with a corresponding depression, and the lock having its link passed through both lugs and preventing bodily movement of the jaws with reference to each other, substantially as set forth.

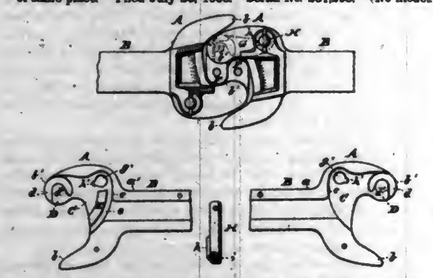


396,030. AUTOMATIC VEHICLE-BRAKE. BENJAMIN A. DAVIS, Bermuda, assignor to George Davis, Petersburg, Va. Filed Nov. 7, 1888. Serial No. 290,220. (No model.)

Claim.—The combination, in a wagon or other vehicle, of the pole having the slots or openings *c c*, the pins or bolts *c c*, passing through said openings, the brake-bar, the chain, and pawl and ratchet connecting with said pole, substantially as described.

396,030.

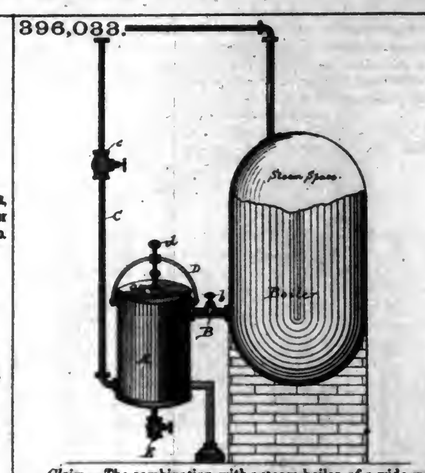
396,031. SPRING-HINGE. LEVI M. DEVORE and FRED. W. HOEFER, Freeport, Ill., assignors, by direct and mesne assignments, to the Stover Manufacturing Company, same place. Filed Feb. 27, 1888. Serial No. 265,460. (Model.)



Claim.—1. In a spring-hinge, the combination of two suitably-connected leaves, one of which is provided with a pivotal rod or pin, a spring-coil mounted parallel to the hinge-axis upon the other of said leaves and having its free or working end upon the side of the coil next the door or jamb, and a link connecting said free end with said pivotal rod, substantially as set forth.

2. The combination, with the leaf A', of the leaf A, connected therewith by suitable pintles and having the rod R at one side of the axis of the leaves, the arbor C, mounted on the leaf A', the springs S S, coiled about the arbor C and having their outer ends, *s s*, secured to the leaf A' and their inner ends, *s' s'*, extending toward the rod R, and the link L, connecting the ends *s' s'* and the rod R and adapted to cross the axis of the hinge as it is opened or closed, and thereby to reverse the operation of the spring upon the leaves, substantially as and for the purpose set forth.

3. The combination of the leaves A A', one provided with the rod R at one side of the axis of the leaves and the other with the hood or shell B, the arbor C, lying within the shell B and having its ends secured in bearings *c c* in the leaf, the springs S S, coiled about the arbor and having their ends *s s* secured by passing through the shell and their ends *s' s'* extended toward the rod R, and the link L, connecting the ends *s' s'* with the rod, substantially as and for the purpose set forth.



396,032. CAR-COUPLING. ROBERT H. DOWLING, Newark, Ohio, assignor of two-thirds to Charles Follett and Charles H. Follett, both of same place. Filed July 28, 1888. Serial No. 281,293. (No model.)

Claim.—1. The combination of the draw-head having the recess C, the hubs forming the curved way *d*, and the shoulder *d'*, the coupling-jaw having the shank provided with the curved ribs *f* to engage the hubs, and the locking-bolt having the guard thereon, substantially as specified.

2. The combination of the draw-head having the recess, the curved rear wall, and the curved rib E, the hubs forming the curved way and the shoulder, the coupling-jaw having the shank portion at right angles thereto, provided with the curved lug, the bolt-opening having the beveled edge, the curved rib *f*, and the locking-bolt having the guard and the beveled end, substantially as specified.

396,033. DEVICE FOR PREVENTING INCRUSTATION. EDWARD E. EICHENROER, Dayton, Ohio, assignor of one-half to Christian J. Wentman, same place. Filed June 11, 1888. Serial No. 276,763. (No model.)

Claim.—The combination, with a steam-boiler, of a wide-mouthed receptacle having a removable cover, a pipe leading from the steam-dome to the lower part of the receptacle, and a pipe leading from the upper part of the receptacle to the lower part of the boiler, above the bottom thereof, whereby the anti-incrustation solution is caused to circulate from the receptacle into the boiler, above the sediment and at the most advantageous point, substantially as specified.

396,034. ADDING-MACHINE. DORR E. FELT, Chicago, Ill., assignor, by direct and mesne assignments, to himself and Robert Tarrant, same place. Filed May 31, 1887. Serial No. 239,781. (No model.)

Claim.—1. In an adding-machine, the combination, with the numeral-wheels and the carrying mechanism, embracing pawls and ratchet-teeth for actuating said wheels, of a stop for preventing over-rotation by the carrying mechanism, consisting of arms movable into locking position with said pawls, substantially as set forth.

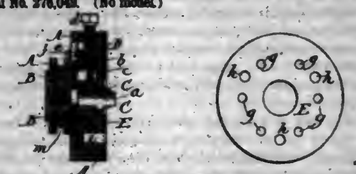
2. The combination, in an adding-machine, with the numeral-wheels having equispaced teeth J, of the arms L and pawls M, substantially as set forth.

3. In an adding-machine, the combination, with the numeral-wheels having equispaced teeth J, of the cam-disks F, the arms L, and pawls M, substantially as set forth.

4. In an adding-machine, the combination, with the numeral-wheels having the teeth J and the carrying pawl and lever, of the locking-arm and its moving devices, substantially as specified.

5. The combination, in an adding-machine, and with the numeral-wheels and setting mechanism thereof, of the locking devices consisting of arms L and pawls M and cam-disks for releasing the former, substantially as set forth.

6. The combination, with the stop devices L and M, acting in conjunction with ratchet-teeth J, of said teeth J, the cam-disks, the pinions actuating the disks, the segment-levers, and the cams S, substantially as and for the purpose specified.

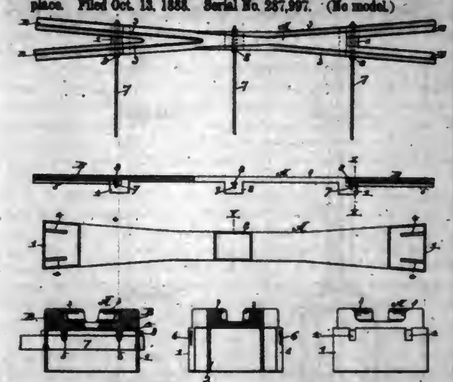


7. In an adding-machine, the combination, with the numeral-wheel and its carrying-mechanism, of a stop for preventing over-rotation under the impulse of the carrying mechanism, consisting of an arm movable into position to act with the actuating-pawl of the carrying mechanism in locking the numeral-wheel, and means for moving said arm out of such position at will, substantially as set forth.

8. In an adding-machine, the combination, with the numeral-wheels and their carrying mechanism, of a stop device consisting of an arm acting in conjunction with the pawl of the carrying mechanism to lock the numeral-wheels, said pawl being withdrawable from the locking position for renewing the carrying operation, substantially as set forth.

9. The locking-detents *i*, having heads *a* formed on its edges and

integral therewith, in combination with the rods *h* and the stop-levers H, substantially as set forth.



396,035. LATHE-CHUCK. DORR E. FELT, Chicago, Ill., assignor of one-fourth to Robert Tarrant, same place. Filed June 4, 1888. Serial No. 276,042. (No model.)

Claim.—1. In combination with a shell, A, and body B, jaws for holding a wire or disk, adjustable blocks D, toggle-links *c*, face-plate E, screws for adjusting the blocks D, and set-screws *f*, for holding the blocks D in their adjusted position, substantially as and for the purpose specified.

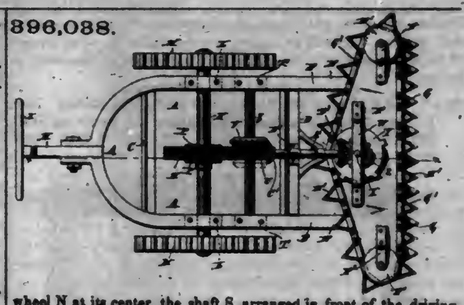
2. In a chuck, the combination of a shell, A, and body B, with holding-jaws, adjustable blocks D, toggle-links *c*, face-plate E, and dowel-pins *i*, substantially as and for the purpose specified.

396,036. STREET-RAILWAY TRACK. THOMAS H. GIBSON, Albany, N. Y., assignor to the Metallic Street Railway Supply Company, same place. Filed Oct. 13, 1888. Serial No. 287,997. (No model.)

Claim.—1. A base-plate for street-railway frogs and switches, provided with angularly-arranged treads and having at its opposite ends pendent boxes extended therefrom, said boxes being adapted to receive the ends of track-rails whose heads coincide with said treads, as and for the purpose herein specified.

2. A base-plate for street-railway frogs and switches, provided with angularly-arranged treads and having pendent boxes formed thereon, the sides of said boxes being provided with oppositely-located openings for receiving cross-ties, and the keys by which said cross-ties are secured in place, as and for the purpose herein specified.

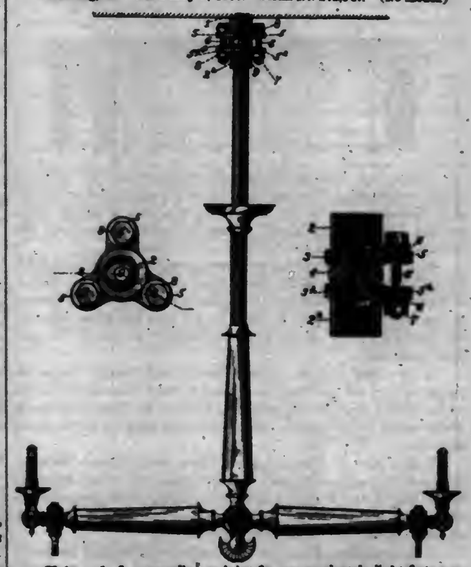
396,037. METHOD OF MAKING FERRULES. ERNST L. GOTTGHALD, Dresden, Germany, assignor to John Bister, Brooklyn, N. Y., and Joseph Schmitt, Hoboken, N. J. Filed Oct. 5, 1888. Serial No. 287,317. (No model.)



Claim.—The process herein described of manufacturing ferrules, which process consists in first passing a rivet through an aperture in the closed end of a ferrule, in then placing disks or plates on the projecting end of said rivet, and in then welding the rivet and disks together in a compact mass, substantially as described.

396,038. LAWN-MOWER. LEWIS D. HALL, Concordia, Kans., assignor of one-half to S. D. Houston, Jr., same place. Filed Oct. 13, 1887. Serial No. 252,238. (No model.)

Claim.—1. The combination, in a mower, of the frame having the finger-plate at its front end, the pulleys on the ends of the said finger-plate, the fingers secured to the front side of the finger-plate, the sprocket-wheel arranged on the finger-plate, the miter-wheel Z, secured to the said sprocket-wheel, the endless chain engaging the sprocket-wheel and passing around the pulleys, the cutters attached to the said endless chain and adapted to pass continuously over the fingers, the driving-shaft journaled in the frame and having the gear-



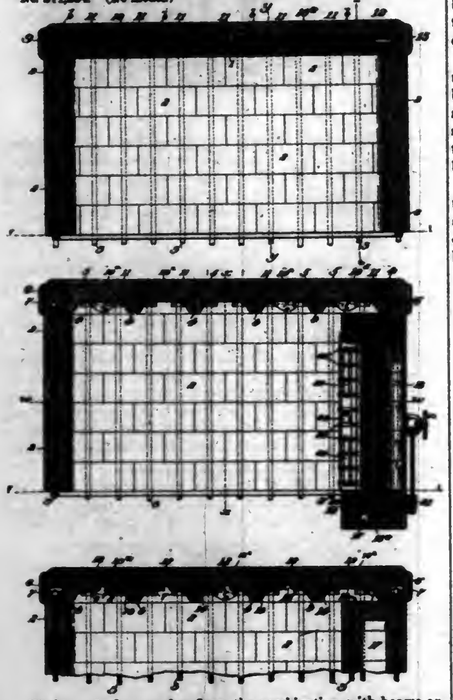
396,038.

wheel N at its center, the shaft S, arranged in front of the driving-shaft and having the pinion engaging with the gear-wheel and adapted to be reversed on shaft S, for the purpose set forth, and the longitudinally-arranged shaft A', midway between the sides of the frame, having the miter-wheel at its front end engaging the wheel Z and the miter-wheel at its rear end engaging the wheel V, substantially as described.

2. The combination of the frame, the driving-shaft journaled therein, the shaft S, geared to the driving-shaft, the plate arranged at the front end of the frame and having the fingers sharpened on their projecting converging edges, the endless sprocket-chain on the plate, having the cutters H' sharpened on their projecting converging edges, the sprocket-wheel arranged at the center of the plate and engaging the sprocket-chain to drive the latter, the longitudinal shaft A', arranged in the center of the frame, gears D' and Z, connecting the same with the sprocket-wheel, and gears C' and V, connecting shaft A' with the driving-shaft, the said gear V being adapted to be reversed on shaft S to operate the sprocket-chain in either direction, substantially as described.

396,039. COUPLING FOR GAS AND ELECTRIC-LIGHT FIXTURES. REINHOLD HERMAN, Crafton, assignor to George H. Baxter, Pittsburg, Pa. Filed May 2, 1888. Serial No. 272,547. (No model.)

Claim.—1. In a coupling or joint for gas or electric-light fixtures, the combination of two threaded nipples, each provided with circular seats at their adjacent ends, and a bearing-ball formed of insulating material arranged between said nipples, substantially as set forth.



2. In a coupling or joint for gas or electric-light fixtures, the combination of two threaded nipples, each provided with circular seats at their adjacent ends, a bearing-ball formed of insulating material interposed between said nipples, and bolts for adjusting the nipples in proper relation to each other, substantially as set forth.

3. In a coupling or joint for gas or electric-light fixtures, the combination of two threaded nipples, each provided with circular seats at their adjacent ends, and perforated bearing-ball formed of insulating material arranged between said nipples, substantially as set forth.

4. In a coupling or joint for gas or electric-light fixtures, the com-

tination of two threaded nipples, each provided with circular seats at their adjacent ends, and an angularly-perforated bearing-ball formed of insulating material arranged between said nipples, substantially as set forth.

396,040. ROOF FOR VAULTS AND OTHER STRUCTURES. JOHN T. HOUSE, Chicago, Ill., assignor to the National Safe Deposit and Vault Manufacturing Company, Pittsburg, Pa. Filed Apr. 19, 1888. Serial No. 271,234. (No model.)

Claim.—1. In a roof or floor, the combination, with beams arranged side by side and having key-strips on the opposing sides thereof, of blocks interposed between the beams and secured to the key-strips, the said blocks having lateral recesses to receive the flanges of the beams, substantially as and for the purposes described.

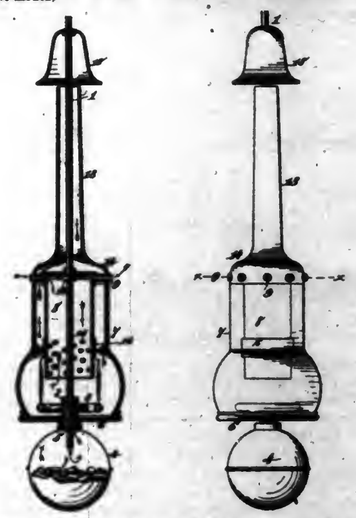
2. In a roof or floor, the combination, with beams arranged side by side and having dovetailed key-strips on the opposing faces thereof, of blocks interposed between the beams and having lateral grooves or mortises corresponding in shape to the said key-strips, whereby the blocks are fitted on the strips, substantially as and for the purposes described.

3. In a roof or floor, the combination, with flanged beams arranged side by side, of blocks interposed between them and supported by the flanges, and tie-rods extending through the blocks lengthwise of the beams and connecting the blocks, substantially as set forth and described.

4. In a roof or floor, the combination, with flanged beams arranged side by side, of blocks interposed between them and supported by the flanges, and blocks 14, secured to the sides of the flanged beam and having seats to which the key-blocks of the roof structure are secured, substantially as set forth and described.

5. In a roof or floor, the combination, with flanged beams arranged side by side, of blocks interposed between them and supported thereby, the outer beams of the series being arranged with the flanges beneath the upper blocks of the walls and with the webs of the beam in contact with the sides of the blocks, substantially as set forth and described.

6. In a roof or floor, the combination, with flanged beams arranged side by side, of blocks interposed between them and supported by the flanges, and tie-rods connecting the blocks, said tie-rods being divided, and intermediate blocks of the series having cavities within which the tie-rods project, so as to afford means for tightening them, substantially as set forth and described.



7. In a roof or floor, the combination, with flanged beams arranged side by side, of blocks interposed between them, fitting against the sides or webs of the beams, and laterally recessed for the reception of the flanges of the beams on both sides of the blocks, and connected with each other by tongues and grooves at their meeting ends, said blocks extending above the flanges on the outer sides of the beams, overlapping the same, and meeting over the said flanges, substantially as and for the purposes described.

8. In a roof or floor, the combination, with beams arranged side by side and having dovetailed key-strips on the opposing faces thereof, of blocks interposed between the beams and having lateral grooves or mortises corresponding in shape to the said key-strips, whereby the blocks are fitted on the strips, said blocks having also interlocking tongues and grooves at the ends, substantially as and for the purposes described.

9. In a roof or floor, the combination, with flanged beams arranged side by side, of blocks interposed between them and supported by the flanges, supporting-blocks 14 at the sides of the flanged beams and having seats to which the key-blocks of the roof structure are secured, and tie-rods which extend lengthwise of the beams and pass through open slots in the key-blocks and through holes in the other blocks of the series, substantially as and for the purposes described.

10. In a roof or floor, the combination, with flanged beams arranged side by side, of a series of blocks interposed between them and keyed laterally thereto by longitudinal keys, and a block at the end of the series which is bolted in place on the inner side and is not keyed to the beams, substantially as and for the purposes described.

396,041. CARBURETING-LAMP. JOSHUA KIDD, Newark, N. J.; James Kidd (administrator of said Joshua Kidd, deceased) assignor to Walter I. Kidd, same place. Filed May 12, 1886. Serial No. 201,984. (No model.)

Claim.—1. In a carbureting-lamp for enriching gas by the vapor of naphthaline or other heavy hydrocarbon, the combination of a gas-burner, a carbureting-vessel located below the gas-burner, a gas-inlet pipe communicating with the carbureting-vessel, and in which the gas is heated before entering said vessel, for the purpose of melting and vaporizing the hydrocarbon, and a heat-arrester closed at the top and placed about the gas-inlet pipe to retain the heat in contact with said pipe, substantially as described.

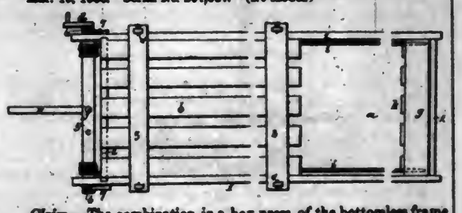
2. In a carbureting-lamp for enriching gas by the vapor of naphthaline or other heavy hydrocarbon, the combination of a vertical gas-inlet pipe communicating with the carbureting-vessel, and in which the gas is heated before it enters said vessel, a gas-burner adjacent to the carbureting-vessel and the gas-inlet pipe, a tube surrounding the gas-inlet pipe and communicating with the gas-burner and the carbureting-vessel, a vertical tubular casing provided with a bell-shaped or flaring lower opening placed around the vertical gas-pipe to converge and retain the heat in contact with said pipe, and a carbureting-vessel detachable from the fixed part of the apparatus, substantially as and for the purposes described.

3. In a carbureting-lamp for enriching gas by the vapor of naphthaline or other heavy hydrocarbon, the combination of a gas-burner, a carbureting-vessel located below the gas-burner, a central gas-inlet pipe adjacent to the gas-burner and communicating with the carbureting-vessel, an inner tubular casing open at the lower end and provided with air-inlet tubes at the upper end and placed about the gas-inlet pipe to converge the heat and bring it in contact with said pipe, and an outer glass chimney surrounding the gas-inlet pipe and the inner tubular casing to cause a circulation of air about the flame, substantially as and for the purposes described.

4. In a carbureting-lamp for enriching gas by the vapor of naphthaline or other heavy hydrocarbon, the combination of a carbureting-vessel, a gas-burner communicating with the carbureting-vessel, a central gas-inlet pipe adjacent to the gas-burner and communicating with the carbureting-vessel, an outer casing located around the gas-burner and the central gas-inlet pipe, an air-heating device suspended within the outer casing and surrounding the central pipe, a solid plate or disk located below the gas-burner for supporting the outer casing and closing its lower end, and a piece of platinum located in proximity to the gas-burner, so as to be brought to a state of incandescence by the heat, substantially as described.

5. In a carbureting-lamp for enriching gas by the vapor of naphthaline or other heavy hydrocarbon, the combination of a carbureting-vessel, a gas-burner communicating with the carbureting-vessel, a gas-inlet pipe also communicating with said vessel, a gas-heating device formed on or attached to said pipe and adjacent to the gas-burner, and a piece of platinum or other similar substance capable of being raised to a state of incandescence by the heat from the flame and located in proximity to the gas-burner, substantially as and for the purposes described.

6. The combination, in a carbureting-lamp for enriching gas by the vapor of naphthaline or other heavy hydrocarbon, of a gas-burner, a carbureting-vessel located below the gas-burner, a straight vertical gas-inlet pipe adjacent to the gas-burner and communicating with the carbureting-vessel, and a heat-retaining casing placed about the inlet-pipe to bring the heat from the gas-flame in contact with said pipe, substantially as described.



7. The combination, in a carbureting-lamp for enriching gas by the vapor of naphthaline or other heavy hydrocarbon, of a gas-burner, a straight vertical gas-inlet pipe adjacent to the gas-burner and communicating with the carbureting-vessel, a casing placed about the inlet-pipe to bring the heat from the gas-flame in contact with said pipe, and a carbureting vessel detachable from the fixed portion of the apparatus, substantially as described.

8. The combination, in a carbureting-lamp for enriching gas by the vapor of naphthaline or other heavy hydrocarbon, of a carbureting-vessel, a gas-burner connected with said vessel, a gas-inlet pipe adjacent to the burner and communicating with the carbureting-vessel, and an air-heating device consisting of two or more vertical casings, one within the other, the outer casing surrounding the gas-burner and closed at its lower end, and the inner casing having its lower end above the gas-burner, substantially as described.

9. The combination, in a carbureting-lamp for enriching gas by the vapor of naphthaline or other heavy hydrocarbon, of a gas-burner, a carbureting-vessel, a central gas-inlet pipe located above the gas-burner and communicating with the carbureting-vessel, and a glass chimney surrounding the burner and inlet-pipe to intensify the combustion of the flame and to increase the heat on said pipe, substantially as described.

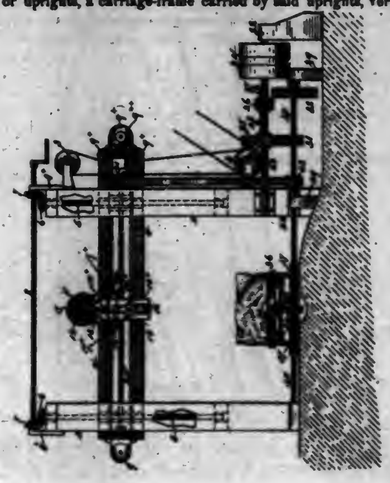
10. The combination, in a carbureting-lamp for enriching gas by the vapor of naphthaline or other heavy hydrocarbon, of a carbureting-vessel, a gas-burner, a straight vertical gas-inlet pipe in which the gas is heated before entering the carbureting-vessel, a tube communicating with the gas-burner and the carbureting-vessel and located around the inlet-pipe, and a heat-arresting casing placed around the inlet-pipe to bring the heat from the gas-flame in contact with said pipe, substantially as and for the purposes described.

396,042. PORTABLE HAY-PRESS. GEORGE R. LOCKEY, Paris, Tenn., assignor of one-half to W. Devereaux Kendall, same place. Filed Mar. 19, 1888. Serial No. 267,667. (No model.)

Claim.—The combination, in a hay-press, of the bottomless frame having end and side walls, the removable top shutter arranged upon one end of the press, and a follower device comprising a follower, a rope or chain, and a windlass, the whole constituting a portable hay-press which may be used upon any suitable floor of a vehicle or building, substantially as herein described.

396,043. FOLDING SIGHT FOR FIRE-ARMS. WILLIAM LYMAN, Middlefield, Conn. Filed July 10, 1888. Serial No. 279,517. (No model.)

Claim.—1. In folding sights for fire-arms, the combination of a base, post, or supporting part for the folding sight-piece, having a seat or guide for receiving or holding a spring, the folding sight-piece hinged or pivoted to the supporting part and adapted to swing down from the vertical or aiming position, stops on the fixed and folding parts for limiting the swing of the sight-piece, a spring contained or guided in the supporting part, and a connecting-piece between the spring and the folding sight-piece in position to swing to each side of the central plane through the sight-hinge and spring as the sight is folded up or down, and thus direct the pressure of the spring upon the sight-piece to hold it securely in place at each extremity of its throw.



2. In folding sights for fire-arms, the combination of a base or supporting part for the sight-piece, having a seat or guide for receiving or holding a spring, the folding sight-piece hinged to the supporting part and adapted to swing down from the vertical or aiming position, a spring contained or guided in the supporting part, a pitman or connecting-piece resting upon and guided subject to the expansion of the spring at the lower end and pivoted or hinged to the folding sight-piece at its upper end in position to adapt the spring to hold the sight-piece securely at either extremity of its swing, and suitable stop-shoulders on the sight-piece and supporting part to limit the folding movement of the sight-piece, for the purpose described.

3. In folding sights for fire-arms, the combination, with the sight-post having a barrel chamber or recess to receive a spring, of the folding sight-piece hinged to the sight-post above the spring-chamber, a spiral spring received in the chamber or recess of the sight-post, and a pitman or connecting-piece attached to or bearing upon the spring at one end and attached or pivoted to the folding sight-piece at the opposite end at a point forward of a central line through the hinge thereof and the spring when the sight-piece is elevated and sufficiently near each line to swing by to the opposite side thereof as the sight-piece is depressed, whereby the spring is adapted to hold the sight-piece either in the aiming or in the depressed position, as specified.

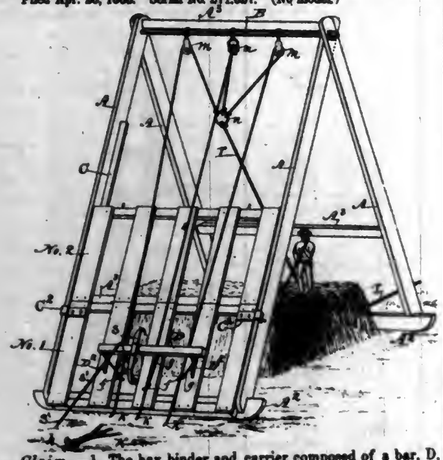
4. In folding sights for fire-arms, the combination, with the sight-post A, having a barrel chamber or recess, *y*, the folding sight-piece C, hinged to the sight-post, a spiral spring, A, received in the chamber or recess of the sight-post, and a pitman or connecting part fitted in the barrel of the sight-post at its lower end, resting upon the spring, and pivoted at its upper end to the folding sight-piece forward of its hinge and in such position that the thrust of the spring is brought against the sight-piece to hold it in a vertical position, and when the sight-piece is folded down to press against the same on the opposite side of its hinge and hold the sight depressed, substantially in the manner described.

396,044. MACHINE FOR DRESSING STONE. FRANK MANNING, Narberth, Pa., assignor to the Manning Machine Company, of New Jersey. Filed July 13, 1888. Serial No. 279,854. (No model.)

Claim.—1. In a stone-dressing machine, the combination of standards or uprights, a carriage-frame carried by said uprights, vertical

396,044.

traveling screws engaging the frame for adjusting said frame vertically, a carriage mounted on said frame, a screw in the frame for causing the carriage to travel transversely, a pulley on said screw, a transverse shaft mounted in the uprights carrying a pinion and pulley, a band passing over the pulleys on the shaft and screw, and a stone-carrying truck provided with a rack adapted to mesh with the pinion on the transverse shaft, said parts being arranged and operating substantially in the manner and for the purpose described.

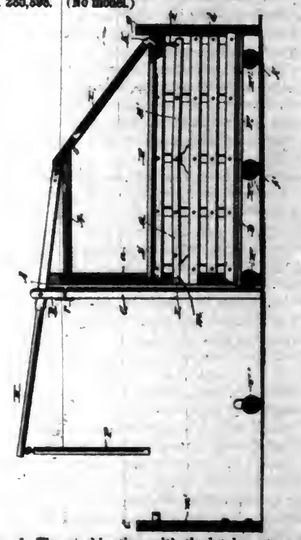


3. In a stone-dressing machine, the combination of the posts or uprights, the carriage-frame mounted therein, the pulleys carried by the frame, the carriage carrying the cutting mechanism mounted on said frame, the pulleys on the carriage, the belt passing over the pulleys of the carriage-frame and carriage for operating the cutting mechanism, and mechanism in the carriage for throwing the cutting mechanism into and out of operation, substantially in the manner and for the purpose described.

3. In a stone-dressing machine, the combination of the standards or uprights, the vertically-adjustable carriage-frame carrying pulleys, the transversely-traveling carriage mounted on said frame carrying pulleys, the belt passing over the pulleys of the carriage-frame and carriage for operating the cutting mechanism, the transverse shaft mounted in the standards, the gear-wheel on said shaft, and the truck carrying the rack meshing with said gear-wheel, said parts being arranged and operating substantially in the manner and for the purpose described.

4. In a stone-dressing machine, the combination of the standards or uprights, the vertically-adjustable carriage-frame carrying pulleys mounted therein, the carriage mounted in the frame carrying pulleys, pulleys on the standards, a belt passing over the pulleys on the frame and standards and a belt passing over the pulleys on the frame and carriage, a transverse screw in the carriage-frame carrying a pulley, a transverse shaft mounted in the standards carrying a pulley, a belt passing over the pulley of the screw and shaft, a gear-wheel on said shaft, a rack on the stone-carrying trucks meshing with said gear-wheel, differential gearing on said shaft, and a driving-shaft having differential gearing adapted to mesh with the differential gearing of said transverse shaft for imparting different speeds to said shaft, substantially in the manner and for the purpose described.

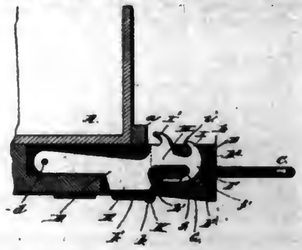
5. In a stone-dressing machine, the combination of the standards or uprights, the carriage-frame mounted in said standards carrying a single pulley at one end, a double pulley at the opposite end, and guiding-pulleys adjacent to the double pulley, a carriage having cutting mechanism mounted on the frame, pulleys carried by the carriage, a belt passing over the single and double pulleys, and the pulleys on the carriage-frame, operating substantially in the manner and for the purpose described.



396,045. PORTABLE HAY-STACKING MACHINE. LEROY MILLER, Albia, Iowa, assignor of one-half to William F. Walker, same place. Filed Apr. 23, 1888. Serial No. 271,627. (No model.)

Claim.—1. The hay binder and carrier composed of a bar, D, having a pivoted lever, *s*, the ropes *g*, the rings *f*, *h*, and *n*, and the ropes *k* and *r*, in connection with a derrick having an inclined frame, and pulleys *m*, to operate in the manner set forth.

2. The uprights A, having fixed strips C, and connected with cross-pieces to produce a rigid frame, a second frame constructed in the same manner and hinged to the top ends of the uprights A, an inclined frame formed in detachable sections adapted to be placed upon the fixed strips or bearings C, a hay binder and carrier comprising a bar, D, having a pivoted lever or hook, *s*, rings *f*, *h*, and *n*, ropes *g*, *k*, and *r*, and pulleys *m*, arranged and combined to operate in the manner set forth.



396,046. GATE. CASTNELL J. MOORE, Webster, Iowa, assignor of one-half to Manville D. Johnson, same place. Filed Sept. 20, 1888. Serial No. 285,898. (No model.)

Claim.—1. The combination, with the latch-post provided with a suitable latch-bar, *m'*, and the gate adapted to close against the said post, of the latch mounted on the gate and comprising the levers M and M', connected together at their adjacent ends, the free end of the lever M being provided in its lower edge with a notch, *m*, adapted to engage the said latch-bar, the operating-levers, and the bell-crank or angle lever K, having one of its arms connected by the cord or wire *k* to the free end of the lever M', and having its other arm connected to the ends of the operating-levers by means of the swinging bar I, substantially as and for the purpose specified.

2. The combination, with the main post, of the roller F, arranged at its lower end, the rollers F' F', arranged on opposite sides of the main post below the plane of the roller F, the gate provided at its lower edge with a track sliding on the said rollers, and operating means, substantially as specified, for the purpose set forth.

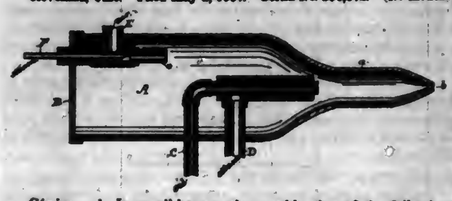
396,047. CAR-COUPLING. SAMUEL MYERS, Manheim, Pa., assignor of two-thirds to Emanuel Balmer and Ephraim W. Stine, same place. Filed June 16, 1888. Serial No. 277,327. (No model.)

Claim.—1. The combination of the link of ordinary construction, the draw-head B, having the recess *b*, open at top, the sides *b²*, and floor *b³*, all inclined outwardly within the mouth of the draw-head, and the slot *b'* in its floor, and the locking-bar D, pivoted at a proper point within the draw-head and provided with the convex outer end, F, the projections or points *f* I I', respectively, and rectangular projection E, standing in the slot *b'*, substantially as specified.

2. The combination, with the link, the draw-head having its recess open above and having the slot *b'* in its floor, and the locking-bar D, having the convex outer end, the projections or points *f* I I', respectively, and the rectangular projection E, resting in the slot *b'*, of mechanism, substantially as described, whereby the said locking-bar can be raised from the sides or top of the car, substantially as specified.

3. The combination of the draw-head having the longitudinal slot *b'* in its floor and the longitudinal notch *f''* in the upper side of the floor, the locking-bar pivoted in the draw-head and having the projection E, engaging the slot *b'*, and the point *f*, resting in the notch *f''*, the shaft mounted transversely on the bottom of the draw-head and having a crank-arm bearing against the projection E, and the link engaging the locking-bar, as set forth.

396,048. COMBINED SHAFT-HOLDER AND WRENCH. HENRY W. HOTT, Cameron, Tex., assignor of one-half to Sterling P. Cross, same place. Filed May 2, 1888. Serial No. 272,576. (No model.)



Claim.—1. In a combination shaft-holder and wrench, the combination of the arms A B, and the threaded shaft attached to the arm A and engaging a tapped aperture in the arm B, substantially as specified.

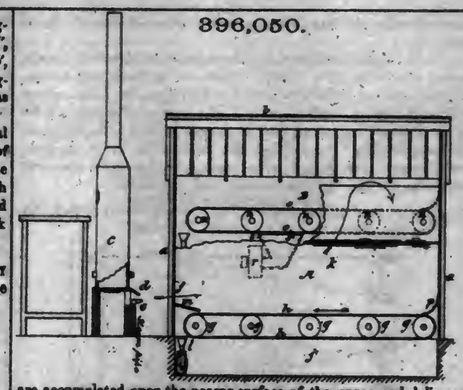
2. The combination of the arms A B, the jaws attached to the ends of the arms, and the threaded shaft attached to the end of the arm A and engaging a tapped aperture, D, in the arm B, substantially as specified.

3. The herein-described combination shaft-holder and carriage-tool, consisting of the arms A B, having their lower ends tapered to form screw-drivers E F, of different sizes, the heads on the upper ends of the arms, the jaws G G on the heads, and the threaded shaft attached to one of the arms and engaging a tapped aperture in the other arm, substantially as specified.

396,049. OIL-BURNER. AUGUSTUS U. PAGE and JOHN BRAGG, Cleveland, Ohio. Filed May 2, 1887. Serial No. 236,572. (No model.)

Claim.—1. In an oil-burner, the combination of the following elements, to wit: a shell or case having a contracted nozzle, with a centrally-compressed and laterally-expanded outlet, with an air-inlet pipe to said case having an expanded chamber with contracted outlet, and inclosing within such chamber a steam-pipe, and an oil-inlet pipe to said case surrounded by a separate and independent steam-pipe, substantially as described.

2. An oil-burner composed of a shell having a contracted nozzle, with centrally-compressed and narrow laterally-elongated opening, and containing an air-inlet pipe inclosing a steam-inlet pipe, and an oil-inlet pipe surrounded by a separate steam-inlet pipe, substantially as described.



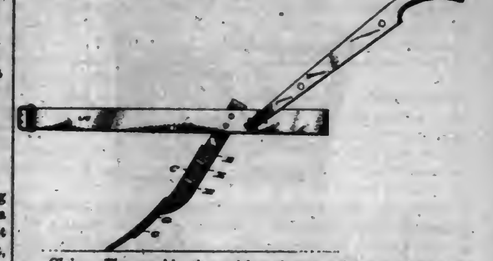
396,050. APPARATUS FOR GATHERING MINERAL WOOL. RICHARD D. A. PARROTT, Arden, N. Y., assignor to Livingston Gifford, Jersey City, N. J. Filed Feb. 14, 1888. Serial No. 263,990. (No model.)

Claim.—1. In an apparatus for gathering mineral wool, the combination, with a blowing-chamber, of a traveling meshed screen obstructing the passage to the outer air, whereby the fibers are arrested from the currents and delivered from the blowing-chamber, substantially as described.

2. In an apparatus for gathering mineral wool, the combination, with the blowing-chamber, of a meshed traveling screen arranged at the bottom thereof, through which the shot are sifted, substantially as described.

3. In an apparatus for gathering mineral wool, the combination, with the blowing-chamber, of a meshed apron traveling in the opposite direction to that at which the currents enter the chamber, whereby the shot falling at the further extremity of the chamber fall upon the bare surface of the apron and are sifted therethrough, and the fibers

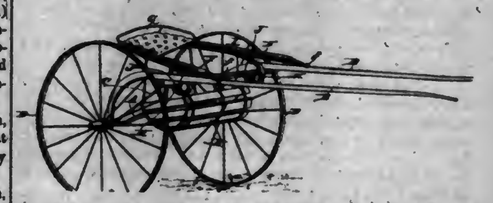
396,050.



are accumulated upon the nearer surface of the apron and delivered thereby, substantially as described.

4. In an apparatus for gathering mineral wool, the combination, with the blowing-chamber, of a meshed traveling screen arranged at the bottom thereof and provided with means whereby it is shaken to sift the shot, substantially as described.

5. In an apparatus for gathering mineral wool, the blowing-chamber divided into compartments A and B, each of said compartments being provided with a traveling meshed apron and said compartments communicating with each other by an elevated passage, whereby the coarser fibers will be separated from the lighter fibers, substantially as described.

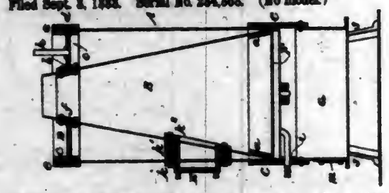


6. In an apparatus for gathering mineral wool, the combination, with a blowing-chamber, of a traveling meshed screen obstructing the passage to the outer air, whereby the fibers are arrested from the currents and delivered from the blowing-chamber, and an air-exhaust arranged to induce a forced current through the screen, substantially as described.

396,051. PLOW. WILLIAM T. RHODES, Flatonia, Tex., assignor of one-half to Richard G. Faires, same place. Filed Aug. 2, 1888. Serial No. 281,719. (No model.)

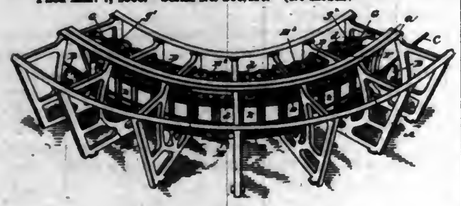
Claim.—The combination, with a plow or cultivator blade provided with countersunk holes near its lower end and in advance of the lower end of the standard, of the double-ended point H, provided with countersunk holes nearer one end than the other, the said point being constructed to be secured to the blade by bolts passing through the holes in both the blade and point before mentioned, whereby the said point may be reversed and positively secured at different lengths below the shovel, substantially as specified.

396,052. ROAD-CART. WILLIAM H. SCHMEDLEN and ROBERT E. BYRNE, Coldwater, Mich.; said Byrne assignor to said Schmedlen. Filed Nov. 14, 1888. Serial No. 290,803. (No model.)

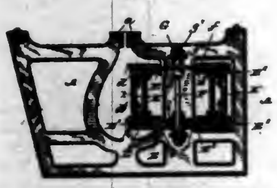


Claim.—1. In a road-cart, the combination, with the thills and the seat-bars pivoted to the thills, of the inverted-C springs interposed between the seat-bars and the cross-bars of the thills by a swinging yoke-coupling, and the foot-rest secured at its lower end to the said

coupling and at its upper end to the seat-bars, substantially as set forth.



2. The herein-described sulky or road-cart, composed of the axle having wheels, the thills suitably braced and provided with a cross-bar, the seat-bars pivoted at their lower ends to the thills and supporting the seat at their upper ends, the inverted-C springs secured to the seat-bars and having their lower ends fastened to the said cross-bar by a swinging yoke-coupling, and the foot-rest having its lower end connected with the said yoke-couplings and having its upper end secured to the said seat-bars, substantially as set forth.



396,053. STEAM-GENERATOR. ISAIAH SHARP, Rodney, Ind. Filed Sept. 5, 1888. Serial No. 284,963. (No model.)

Claim.—The combination, with the casing A and tapering flue B, of a top plate provided with a central opening and formed with a flanged ring, *c*, and an inclined ring, *b*, fitting around the flue, an inner ring, *f*, fitted within the flue, and a ring, *d*, secured outside of the casing, substantially as set forth and described.

396,054. CURVE FOR CABLE RAILWAYS. CHARLES L. SNYDER, Kansas City, Mo., assignor of one-half to Isaac M. Ridge, same place. Filed Mar. 7, 1888. Serial No. 266,406. (No model.)

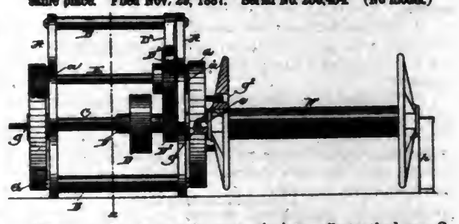
Claim.—1. In a cable railway, the combination, with a cable, of an endless carrier composed of a plurality of wheeled travelers for carrying the cable or grip, the cable or grip bearing faces of the travelers being substantially fixed in a plane parallel to the path of the travelers, substantially as set forth.

2. In a cable railway, the combination, with a cable, of an endless carrier composed of a plurality of wheeled travelers linked together, the cable or grip bearing faces of the travelers being substantially fixed in a plane parallel to the path of the travelers, substantially as set forth.

3. In a cable railway, the combination, with a cable, of an endless carrier composed of a plurality of travelers the axles of which are linked together, the cable or grip bearing portions of the travelers being secured to the links, substantially as set forth.

4. In a cable railway, a traveler forming one of the elements of an endless carrier, the said traveler consisting, essentially, of a block, a pair of wheels secured to one side of the block to rotate freely relatively thereto, and bearings provided with laterally-extended seats *h h'* for securing the block to the wheels, substantially as set forth.

5. In a cable railway, a traveler forming one of the elements of an endless carrier, the said traveler consisting, essentially, of a block, an upper and a lower bearing separable from each other and secured to one side of the block, and a pair of wheels journaled in the bearings, the said bearings being provided with laterally-extended seats for the blocks and with transverse eyes at their ends, substantially as set forth.

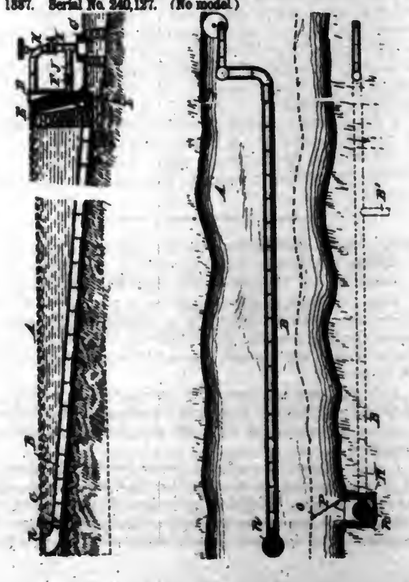


6. In a cable railway, the combination, with an upper track and a lower track, of a series of travelers forming an endless carrier for the cable or grip, each traveler consisting of a pair of wheels provided with flanges to rest on the upper edges of the tracks and a bearing-block attached to the wheel-bearings to travel in a plane parallel with the tracks, substantially as set forth.

7. In a cable railway, the combination, with an advance-track a return-track, each track consisting of an upper and a lower rail and a series of travelers forming an endless carrier suspended on said tracks, the wheels of the carrier having flanges on their upper edges, of an end spindle provided with scallop-edged disks adapted to engage the faces of the wheels below the said flanges and carry them bodily around the ends, substantially as set forth.

8. In a cable railway, the combination, with an advance-track, a return-track, and a series of travelers forming an endless carrier suspended on said tracks, of an end spindle for carrying the travelers around from one track to the other and a guide-plate attached to the spindle to form a support for the travelers around the end, substantially as set forth.

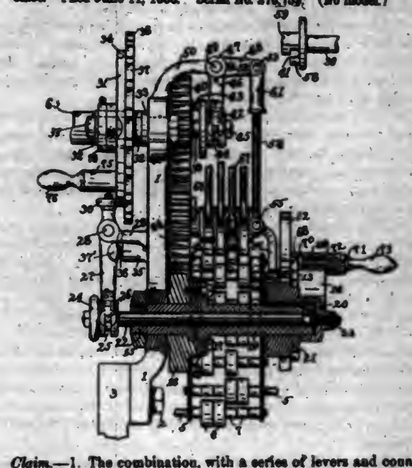
9. The combination, with suitable supporting-brackets forming a conduit for the cable and grip, of a set of tracks secured to the supporting-brackets within the conduit, a set of tracks secured to the brackets at one side of the conduit, a pair of end spindles journaled in suitable bearings attached to the brackets, and a series of travelers forming an endless carrier mounted on the tracks and spindles, each traveler having an extended bearing-surface presented toward the center of the conduit as it travels along the conduit, substantially as set forth.



396,055. WARP-BEAMING MACHINE. SUSAN F. STONE and JOSEPH H. STONE, North Andover, Mass., (administrators of Joseph M. Stone, deceased,) assignors to the Davis & Furber Machine Company, same place. Filed Nov. 29, 1887. Serial No. 256,434. (No model.)

Claim.—1. In a beamer for warps, the internally-toothed gear G, having dogs or projections to engage the head of and rotate a warp-beam, the shaft E and its attached pinion *a*, spur-gear D^8, and its holding-pawl D^4, combined with pulley D' and pinion D^3, to engage and drive the said gear D^3, all substantially as shown and described.

2. In a beamer, two gears or plates, G, having each a series of internal teeth, as *b*, combined with a rotating shaft, as E, and with a pinion, as *a*, upon each end of the said shaft to rotate the said gears or plates, whereby two warp-beams may be rotated, substantially as described.

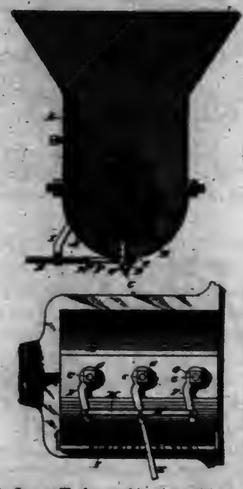


396,056. WATER-POWER DEVICE. JAMES SWAN, Chicago, Ill., assignor of one-half to Bernard A. Eckhart, same place. Filed June 3, 1887. Serial No. 240,127. (No model.)

Claim.—1. The combination of an inclined water-pipe with a receiving attachment at one end to receive water from a water-source—as, for instance, a stream, lake, or the like—with a stand-pipe having a discharging end and a power device to receive the said water from said pipe at a point below the surface of the water in such water-source at the place at which such water is received in such inclined pipe.

2. The combination of an inclined water-pipe the receiving end of which receives water from a water-source—as, for instance, a lake, stream, or the like—in combination with a stand-pipe at the lower end of such water-pipe, and a discharge end thereon, a power appliance to which water is supplied, said stand-pipe, discharge end, and power appliance being placed at a point on the inclined water-pipe below the point at which such pipe receives its supply of water.

396,057. PATTERN MECHANISM FOR LOOMS, &c. WILLIAM WATTIE, Worcester, Mass., assignor to the Knowles Loom Works, same place. Filed June 11, 1888. Serial No. 276,739. (No model.)



Claim.—1. The combination, with a series of levers and connections to a loom or other machine, of a main pattern-surface, star-wheel, sliding pin-wheel, hollow pin-wheel stud supporting a driving-gear in train, and said driving-gear and means for actuating the same, hollow sleeve fast to said gear, adjustable connecting-rod passing through said hollow stud and sleeve and means for adjusting said rod, spring-actuated rocker-lever, and an auxiliary pattern-surface, star-wheel, sliding pin-wheel driven by a gear in train, and said gear and means for actuating the same, hollow pin-wheel stud supporting said gear, spring-actuated bell-crank, adjustable connector, and pattern-lever, substantially as shown and described.

2. The combination, with a series of levers and connections to a loom or other machine, of a main pattern-surface, shaft carrying said pattern-surface, star-wheel loose on said shaft and provided with a series of sockets the same angular distance apart as the pattern-bars, collar fast on said shaft, spring-actuated pin socketed in said collar, sliding pin-wheel, pin-wheel stud, sleeve, gear in train and means for actuating the same, connecting-rod, rocker-lever, and an auxiliary pattern-surface, star-wheel, sliding pin-wheel and connections between said pin-wheel and gear in train, and said gear in train and means for actuating the same, pin-wheel stud, bell-crank, connector, and pattern-lever, substantially as shown and described.

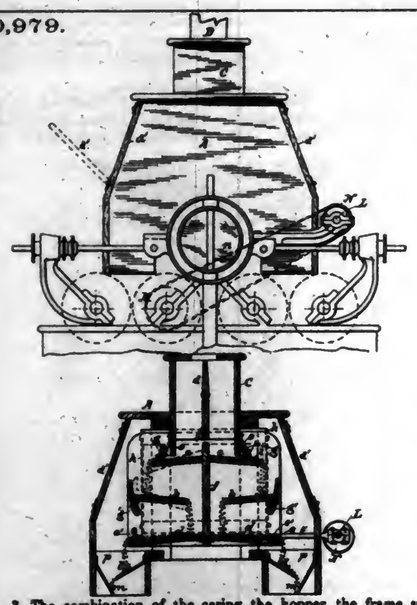
3. The combination, with a series of levers and connections to a loom or other machine, of a main pattern-surface, shaft carrying said pattern-surface, star-wheel loose on said shaft and provided with a series of sockets the same angular distance apart as the pattern-bars, collar fast on said shaft, spring-actuated pin socketed in said collar, sliding pin-wheel, pin-wheel stud, sleeve, gear in train and means for actuating the same, connecting-rod, rocker-lever, and an auxiliary pattern-cam loose on an auxiliary star-wheel and provided with a spring-actuated pin socketed on said cam, auxiliary star-wheel provided with a series of sockets the same angular distance apart as the points and indications on cam, sliding pin-wheel and connection between said pin-wheel and gear in train, and said gear in train and means for actuating the same, pin-wheel stud, bell-crank, connector-rod, and pattern-lever, substantially as shown and described.

4. The combination, with a series of levers and connections to a loom or other machine, of a main pattern-surface made up of links, rolls, tubes, and reversible projecting bars, star-wheel, sliding pin-wheel, pin-wheel stud, sleeve, gear in train and means for actuating the same, connector-rod, and rocker-lever, and an auxiliary pattern-surface, star-wheel, sliding pin-wheel, and connections between said pin-wheel and gear in train, and said gear in train and means for actuating the same, pin-wheel stud, bell-crank, connector, and pattern-lever, substantially as shown and described.

396,058. FEED-REGULATOR FOR GRINDING-MILLS. JAMES F. WISCHELL, Springfield, Ohio, assignor to the Foos Manufacturing Company, same place. Filed Apr. 23, 1887. Serial No. 235,949. (No model.)

Claim.—1. In a mill, the combination, with a casing and a crushing-chamber composing a part of the frame thereof, a main shaft rotated longitudinally through the chamber and across the casing, and grinding mechanism in the casing near one end of the chamber, the rotating part thereof being carried by said shaft, of a series of bars located across the chamber, having shanks which extend through the wall of the chamber, a handle on one of them and arms on the others, a bar connecting the arms with the handle, and a locking device with which the handle engages, whereby the said bars may be adjusted and held, and a cylindrical body on the shaft having lugs or projections which coact with said bars and crush the material and feed it to the grinding mechanism.

2. In a mill, the combination, with a casing and a crushing-chamber composing a part of the frame thereof, a main shaft running longitudinally through the chamber and across the casing, and grinding mechanism in the casing near one end of the chamber, the rotating part thereof being carried by the said shaft, of a series of bars located across the said chamber, having shanks which extend through the wall thereof, devices connected to said shanks to adjust and hold the bars at varying angles in one general direction and at varying angles in the opposite general direction, whereby said bars control the speed of feeding from the maximum to the minimum degree of slowness and from the maximum to the minimum degree of rapidity, one of said directions being of a general slow feeding and the other of a general faster feed, and a cylindrical body on said shaft within said chamber, and having peripheral lugs or projections which coact with said bars to crush and feed the material.



REISSUES.

10,979. FEED MECHANISM FOR ROLLER-MILLS. WILLIAM M. JEWELL, Pine, Colo., assignor to Samuel H. Templeton, Scranton, Iowa, and J. A. McAnulty, Denver, Colo. Filed June 13, 1885. Serial No. 168,559. Original No. 280,184, dated June 26, 1883.

Claim.—1. The combination, with the rollers of a roller-mill, of the vibrating inclined riffle-board *d*, having a corrugated or serrated upper surface, and an end riffle, *c*, which is adjustable back and forth, and the spout *p*, having the oppositely-inclined overlapping equalizing-shelves *l* and *m*, projecting from its opposite sides or walls, substantially as described.

2. The combination, with the casing A and the hopper C, of the frame B, suspended within said casing and provided with a series of oppositely-inclined adjustable distributing-shelves, the eccentric-shaft L, and the rod or pitman *k*, for imparting vibratory or shaking motion to said frame, and the rollers of a roller-mill, substantially as described.

10,979.

3. The combination of the casing, the hopper, the frame suspended beneath said hopper and provided with a series of oppositely-inclined adjustable distributing-shelves, the upper shelf of the series having an anti-centering ridge or rib at its outer end, the eccentric-shaft and the rod or pitman for vibrating said frame, and the rollers of a roller-mill, substantially as described.

4. The combination of the grain-reducing rollers, the hopper, the frame suspended between said rollers and hopper, means to shake or vibrate said frame, and the inclined riffle-boards *d*, provided with the adjustable end riffles, *e*, substantially as described.

5. The combination, with the casing A and the hopper C, of the vibrating frame B, provided with two oppositely-inclined distributing-shelves, *c* and *b*, and the spout *p*, having the oppositely-inclined overlapping equalizing-shelves *l* and *m*, which project from its sides or walls, substantially as described.

6. The combination, with the rollers of a roller-mill, of two oppositely-inclined shaking distributing-shelves, *c* and *b*, the outwardly and downwardly inclined riffle-board *d*, having a corrugated or serrated upper surface, and the spout *p*, having the oppositely-inclined overlapping stationary equalizing-shelves *l* and *m* projecting from its sides or walls, substantially as described.

7. The combination of the hopper C, the casing A, the vibrating frame B, suspended therein and provided with the downwardly and outwardly inclined adjustable shelf *c*, with the downwardly and inwardly inclined adjustable shelf *b*, and with the downwardly and outwardly inclined riffle-board *d*, having a serrated upper surface, and the spout *p*, having the stationary oppositely-inclined overlapping equalizing-shelves *l* and *m*, substantially as described.

8. The combination of a casing, a hopper having a swinging gate at the lower edge of its front wall, two oppositely-inclined vibrating distributing-shelves, an outwardly and downwardly inclined riffle-board having a corrugated or serrated upper surface, and an adjustable riffle at its outer end, substantially as described.

9. The combination, with a casing and a hopper, of an outwardly-inclined vibrating distributing-shelf arranged closely to said hopper and provided at its outer end with an anti-centering ridge or rib, an inwardly-inclined vibrating distributing-shelf, a riffle-board having a serrated upper surface, and devices for adjusting the plane of said shelves, substantially as described.

10. The combination, with the casing A and the hopper C, of the vibrating frame B, suspended beneath said hopper and provided with an outwardly-inclined shelf, *c*, having a ridge or rib, *i*, with an inwardly-inclined shelf, *b*, and with an outwardly-inclined riffle-board, *d*, having a serrated upper surface and an adjustable end riffle, *e*, and means for vibrating said frame, substantially as described.

11. The combination of a casing, A, a hopper, C, a vibrating frame, B, suspended beneath said hopper and provided with an adjustable outwardly-inclined shelf, *c*, having a ridge or rib, *i*, at its outer end, with an adjustable inwardly-inclined shelf, *b*, and with an outwardly-inclined riffle-board, *d*, having a serrated upper surface and an adjustable end riffle, *e*, and means for vibrating said frame, substantially as described.

PHOTO LITH. NORRIS PETERS WASHINGTON D.C.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

MARSH *et al. v.* NICHOLS, SHEPHERD & COMPANY.

Decided December 10, 1888.

STATEMENT.—PATENT DEFECTIVE BY REASON OF THE OMISSION OF THE SIGNATURE OF THE SECRETARY OF THE INTERIOR.

The patent had not at the date of the suit been signed by the Acting Secretary of the Interior, but was subsequently signed by him. The Circuit Court dismissed the bill. Complainant took an appeal in 1885 to this Court. In 1887 Congress passed an act for relief of patentees, making the patent legal, valid, complete, and operative from its original date, December 28, 1880. *Held:*

1. DEFECTIVE PATENTS—PROCEEDINGS AGAINST.

While a patent of the United States can be attacked for defects upon its face only by regular proceedings instituted for that purpose, and is not open to collateral attack, except where specially provided by statute, this rule applies only to such patents as have been in fact executed under proper authority, and does not apply to any others.

2. SAME—CERTAIN DEFECTS SPECIFIED.

Thus it may be shown that the patent was never executed by the person whose name appears on it, or that it was wrongly dated, or was never signed by the person who appeared to have signed it, or was signed after the official was out of office.

3. PATENTS DEFINED—WHAT IS SECURED BY THE GRANT.

A patent for an invention conveys nothing which the Government owns or its predecessor ever owned, is the evidence of the inventor's exclusive right, and creates for him a property interest, which Government secures to him by a grant.

4. WHAT IS REQUIRED TO SECURE THE GRANT.

This grant, however, is regulated by statute, and requires the signatures of all the officials required by statute.

5. DEFECTIVE GRANT MAY BE CORRECTED BY EXISTING OFFICERS OF THE DEPARTMENT.

Such grants, if defective from insufficient execution, may be corrected subsequently, upon application to the proper Department; but the correction must be made by the existing officers of the Department.

6. SAME—BUT DATE OF CORRECTION BECOMES THE TRUE DATE OF PATENT.

The correction by the same Acting Secretary of the Interior is sufficient, the Commissioner of Patents remaining the same at the date of the correction, which is the true date of the patent.

7. DATE OF CORRECTION MAY BE ESTABLISHED BY PROOF.

In this instance the actual date of correction, being more than six months after the date written in the patent, may be shown by proof.

8. WHAT PROFITS TO BE ACCOUNTED FOR.

In this instance there can be no accounting for profits earned subsequently to the suit, which was not tenable at the date of its commencement.

APPEAL from the Circuit Court of the United States for the Eastern District of Michigan.

Mr. R. A. Parker and *Mr. O. D. Conger* for the appellants

Mr. C. F. Burton for the appellees.

Mr. Justice FIELD delivered the opinion of the Court.

This is a suit in equity for the infringement of an alleged patent of the United States, which, it is averred, was obtained by the complainant Marsh and his assignee and co-complainant, Lefever, for a new and useful improvement in steam-engine valve-gear, with a prayer that the defendant corporation may be required to account for and pay over to the complainants the profits acquired by it and damages sustained by them by its unlawful acts, and be enjoined from further infringement. The bill sets forth that the alleged patent was obtained on the 28th day of December, 1880, and was in due form of law, under the seal of the Patent Office of the United States, signed by the Secretary of the Interior, countersigned by the Commissioner of Patents, and dated on that day and year. The answer of the defendant to these allegations is, that it knows nothing of the issue of the patent, except as informed by the bill or by hearsay, and, therefore, neither admits nor denies them, but leaves the complainants to make such proofs thereof as they may deem advisable. A replication having been filed to the answer, proofs were taken, among which there was put in evidence an instrument in the form of a patent of the United States, purporting to be signed "A. Bell, Acting Secretary of the Interior," and countersigned and sealed as alleged in the bill. By stipulation of the parties certain facts were admitted with reference to this instrument, and allowed to be considered, "so far as relevant, competent, or material, on any motion or at any stage of the cause, including final hearing." The facts thus admitted were substantially these: That the instrument was received from the Patent Office by the complainants Marsh and Lefever (the parties named therein as patentees) on or about January 2, 1881, in all respects in the same condition as it now is, save that the words "A. Bell" were not thereon where they now appear; that the signature to it of E. M. Marble, Commissioner of Patents, and the seal of the Patent Office are genuine; that neither of the complainants nor their counsel knew of the omission of the signature of the Secretary of the Interior to the instrument, but supposed it was in all respects regular, their attention never having been called to the same until on or about February 12, 1882, long after the commencement of the present suit; that on or about February 17 following, it was sent by the solicitor of the complainants to the Patent Office at Washington, accompanied by a request of the complainants Marsh and Lefever to have the mistake corrected; and that on or about February

24 it was returned to the solicitor signed "A. Bell," Acting Secretary of the Interior, but without any other change.

A letter dated April 28, 1882, from E. M. Marble, who was the Commissioner of Patents when the instrument was issued, was also admitted in evidence. The letter set forth the various steps taken by Marsh and Lefever to obtain a patent for the invention claimed, and by the officers of the Patent Office in preparing, executing, and delivering it to them; and shows that every requirement of the law and of the regulations of the Patent Office was complied with when the instrument was issued, except the affixing to it of the signature of the Acting Secretary of the Interior, and that its omission, as established by the history and record of the case, was purely accidental, and probably was caused by the instrument being inadvertently laid aside or withdrawn from before the Acting Secretary while he was engaged in signing patents.

The circuit court held that the signature of the Secretary of the Interior was essential to render the instrument operative as a patent of the United States for the invention claimed; that until thus signed it was not only a defective instrument, but was entirely void, and therefore that the suit could not be maintained; and it dismissed the bill. Its decree was entered on the 16th of April, 1883, and from it the complainants on the 26th of February, 1885, took an appeal to this Court. Subsequently, and on the 3d of February, 1887, Congress passed an act for the relief of the patentees, reciting in its preamble the issue to them on the 28th of December, 1880, of the Letters Patent mentioned in due form of procedure, except that by accident or mistake they were not signed by the Secretary of the Interior, and that they were signed by the then Acting Secretary on February 24, 1882, and declaring as follows:

That the letters-patent named in the preamble of this act are hereby, and by this act, made legal, valid, complete, and operative, in law and equity, from the twenty-eighth day of December, eighteen hundred and eighty, to the same extent and for the same term that the same would have been legal, valid, complete, and operative if the signature of the Secretary of the Interior had, at the time of the supposed issue of said letters-patent on the day aforesaid, been placed thereon, and the omission of said signature thereon had not occurred: *Provided, however*, That the provisions of this act shall not be held or construed to apply to or affect any suits now pending, nor any cause of action arising prior to its passage. (24 Stat., 378.)

In support of their appeal the appellants now contend in substance as follows: first, that the defendant could not impeach the patent for the irregularity in its signing and issue, this not being apparent on its face, without pleading such defense and regularly putting the question in issue; second, that the patent being regular on its face, evidence to show that the signature was irregularly placed to it was incompetent; third, that the correction of the omission in the patent was within the power of the Acting Secretary of the Interior at the time; that when the omission was thus remedied the patent was operative from its original date, or, at least, from the date of the correction, February 24, 1882; and that the complainants were, even in this latter view, entitled to an accounting from that date; fourth, that if the patent did not become valid from its date on the subsequent signature by the Acting Secretary of the Interior, then the act of Congress of February 3, 1887, cured all irregularities in the signing of the patent, made it valid from its date, and must govern the decision in this Court. The first three positions may be considered together.

It is undoubtedly true as a general rule that a patent of the United States, whether for land or for an invention, can be attacked for defects, not apparent on its face, only by regular proceedings instituted for that purpose, and is not open to collateral attack, except where specially provided by statute. (*Eureka Co.* v. *Bailey Co.*, 11 Wall., 488, 492.) But this rule applies only to those cases where the patent has been in fact executed, and the authority of the officers to issue the same was complete. In such cases the impeachment must be by pleadings setting up the specific acts which, it is alleged, vitiate and defeat the instrument. It is always open to show that an instrument produced in evidence, whether in an action at law or in a suit in equity in support of a claim or defense, was never executed by the person whose signature it bears, but that it is a simulated and forged document. And when the time of execution is material to the enforcement of the instrument, it is competent to show the date when the signature of the party was attached. Antedating cannot be used to cut off existing rights or defenses of third parties which would not be impaired or defeated if the true date was given. With respect to patents for land we have had frequent occasion to assert their inviolability against collateral attack, where the Land Department had jurisdiction, and the land formed part of the public domain, and the law provided for their sale. But we have also held that if the land patented was never the property of the United States, or had been previously sold, or reserved for sale, or the officers had no authority to execute the instrument, the fact could be shown in any action or proceeding whenever the patent is offered in evidence. (*Smelting Co.* v. *Kemp*, 104 U. S., 636, 641; *Steel* v. *Smelting Co.*, 106 U. S., 447, 452, 453; *Mahn* v. *Harwood*, 112 U. S., 354, 358.) And so also may the fact be shown, if the instrument itself was never signed by the officers whose names are attached to it, or when they were in office, or at the time stated. As was said in a case lately before this Court, antedating by an agent after his power has been revoked, so as to bind his principal, partakes of the nature of forgery, and is always open to inquiry, no matter who relies upon it. (*Anthony* v. *Jasper County*, 101 U. S., 693, 698.) The same doctrine applies when a patent is signed by an officer of the Patent Office, or Land Department, after he has gone out of office. His power to give effect to his acts as an officer of the Government is then at an end, and no efficacy can be imparted by antedating them, even though the act be the correction of a mere mistake or omission. The mistake or omission must stand in the condition he left it so far as he is concerned, with all its consequences. If corrected at all, it must be by officers in power at the time of the correction, who have succeeded to his authority. This doctrine has special force in its application to a patent for an invention. A patent for land has, in the legislation of Congress, a twofold operation. It conveys the title where previously that remained in the United States; but where issued upon the recognition and confirmation of a claim to a previously-existing title it is evidence of record of the existence of

that title, or of equities respecting the land requiring recognition by a quit-claim from the Government. It always imports that the Government conveys, or has previously conveyed, interests in the lands, something which it at the time owns, or its predecessor once owned. And by the proceedings previous to its issue there is created in the claimant an equitable right to the conveyance of the legal title, or his right to such title is so established that he can enforce it against others who, with notice of his claims, may have obtained the patent. (*Langdeau* v. *Hanes*, 21 Wall., 521, 529.) But the patent for an invention conveys nothing which the Government owns or its predecessors ever owned. The invention is the product of the inventor's brain, and if made known would be subject to the use of any one, if that use were not secured to him. Such security is afforded by the act of Congress when his priority of invention is established before the officers of the Patent Office, and the patent is issued. The patent is the evidence of his exclusive right to the use of the invention; it therefore may be said to create a property interest in that invention. Until the patent is issued there is no property right in it, that is, no such right as the inventor can enforce. Until then there is no power over its use, which is one of the elements of a right of property in anything capable of ownership. In *Gayler* v. *Wilder*, (10 How., 477, 493,) this subject was to some extent considered, when the Court, by Chief Justice Taney, said:

The inventor of a new and useful improvement certainly has no exclusive right to it until he obtains a patent. This right is created by the patent, and no suit can be maintained by the inventor against any one for using it before the patent is issued.

And again:

The monopoly did not exist at common law, and the rights, therefore, which may be exercised under it cannot be regulated by the rules of the common law. It is created by the act of Congress, and no rights can be acquired in it unless authorized by statute, and in the manner the statute prescribes.

Section 4883 of the Revised Statutes prescribes the manner in which patents for inventions shall be attested. It declares that—

all patents shall be issued in the name of the United States of America, under the seal of the Patent Office, and shall be signed by the Secretary of the Interior and countersigned by the Commissioner of Patents, and they shall be recorded, together with the specifications, in the Patent Office in books to be kept for that purpose.

The signatures of all the officers here named must be attached to the instrument, or it will be an uncompleted document, and therefore ineffectual to confer—

the exclusive right to make, use, and vend the invention or discovery throughout the United States and the Territories thereof.

The omission of one signature is no more permissible than the omission of all. On this point we have a pertinent adjudication in *McGarrahan* v. *Mining Company*, (96 U. S., 316.) There the question arose as to the validity of an instrument as a patent for land of the United States, which had not been countersigned by the Recorder of the General Land Office. The law then in force respecting patents for land issued by the General Land Office provided that they should be issued in the name of the United States under the seal of said office, and be signed by the President of the United States, or by a secretary appointed by him for that purpose, and countersigned by the Recorder of the General Land Office, and be recorded in said office in books to be kept for that purpose; and the Court held that the fact the instrument was not countersigned by the Recorder of the General Land Office was fatal to its validity, and that the instrument did not become operative as a patent until it was attested by all the parties named in the statute. Until then the United States had not executed a patent for a grant of lands. In deciding the case the Court, by Mr. Chief Justice Waite, said:

Each and every one of the integral parts of the execution is essential to the perfection of the patent. They are of equal importance under the law, and one cannot be dispensed with more than another. Neither is directory, but all are mandatory. The question is not what, in the absence of statutory regulations, would constitute a valid grant, but what the statute requires. Not what other statutes may prescribe, but what this does. Neither the signing nor the sealing nor the countersigning can be omitted, any more than the signing or the sealing or the acknowledgment by a grantor, or the attestation by witnesses, when, by statute, such forms are prescribed for the due execution of deeds by private parties for the conveyance of lands. It has never been doubted that in such cases the omission of any of the statutory requirements invalidates the deed. The legal title to lands can not be conveyed except in the form provided by law.

This decision is as applicable to a patent for an invention as it is to a patent for lands, and in accordance with it the instrument issued to the complainants Marsh and Lefever for the invention they claim was not, at the time it was issued, by reason of the absence of the signature of the Secretary of the Interior, operative to create any right in them. But though the instrument was thus inoperative, they were not barred from afterward obtaining a correction of it so as to render it effective as a patent, to which they had become entitled. Where mistakes are committed by officers of the Land Department in issuing evidence of a claimant's rights, not amounting to errors of judgment in the exercise of judicial discretion, but which are the result of accident or inadvertence, they may be remedied upon proper application to the Department. We have an instance of such action in the case of *Bell* v. *Hearne*, (19 How., 252.) It there appeared that a patent for land was issued to one James Bell, while the records of the office showed that one John Bell was the applicant and the party entitled to it. Some years after it was received by James Bell, he returned it to the General Land Office, and upon an examination of the records of the Department, and being satisfied therefrom of the original mistake in the designation of the first name of the party entitled to the patent, the Commissioner of the General Land Office canceled the original patent and issued a new one to John Bell; and the question before the Court was as to the power of the Commissioner to receive the original patent and to issue a new one, upon which question the Court said:

The Commissioner of the General Land Office exercises a general superintendence over the subordinate officers of his department, and is clothed with liberal powers of control, to be exercised for the purposes of justice, and to prevent the consequences of inadvertence, irregularity, mistake, and fraud in the important and extensive operations of that officer for the disposal of the public domain. The power exercised in this case is a power to correct a clerical mistake, the existence of which is shown plainly by the record, and is a necessary power in the administration of every department.

It is true the omission of the signature of the Acting Secretary of the Interior to the instrument issued to the complainants Marsh and Lefever was not a mere clerical error, but an omission of a signature essential to the creation of the instrument as a patent, being in that respect like the omission of a grantor's name to a deed. A clerical error, as its designation imports, is an error of a clerk or a subordinate officer in transcribing or entering an official proceeding ordered by another. But we have no doubt that the

power of the Department to prevent the consequences of inadvertences and mistakes in its officers extends so far as to remedy an omission like the one under consideration. The manner of affording the remedy is the only question in such cases. Clearly, it must be by the action of existing officers of the Department, not by former officers, who have gone out of office. Mr. Schurz, who was Secretary of the Interior when the instrument in question was issued, could not have supplied the omission by signing the document when it was returned to the Department for that purpose in February, 1882, for he was then no longer in office. Mr. Kirkwood had succeeded him as Secretary, and was then in office. He could undoubtedly have taken up the application of the complainants Marsh and Lefever, and having found upon examination that they were entitled, by proceedings and proofs already had in the Department, to the patent, have signed the instrument and delivered it to them in a perfected form. This official duty, however, appears to have been performed by Mr. Bell, who was Acting Secretary under him, as he had been under Secretary Schurz. The omission in the instrument as originally issued was thus supplied. The Revised Statutes (sec. 177) provide that in the case of the death, resignation, absence, or sickness of the head of any department, the first or sole assistant thereof shall, except in certain cases referred to, (not material here,) perform the duties of such head until a successor is appointed or such absence or sickness shall cease. The signing of the instrument by Mr. Bell as Acting Secretary implies that one of the conditions on which he was authorized to act in that capacity had arisen. With his signature added the instrument was complete. No other signature was required, the same person who signed it as Commissioner of Patents still continuing in office. The only embarrassment from completing the instrument in this way arises from its date. The signature, which completed its execution, was attached February 24, 1882, while its date is December 28, 1880, more than thirteen months before. The statute declares that—

every patent shall bear date as of a day not later than six months from the time at which it was passed and allowed and notice thereof was sent to the applicant or his agent. (R. S., section 4885.)

This provision was intended to prescribe the date on which the patent would begin to run; but should any question arise in the future as to the duration of this patent, the time at which its execution was completed by the signature of the Acting Secretary may be proved. It would have been well if the date of the signing had been added to his signature, or in some way indicated on the instrument itself, so that it might have gone upon the records of the Patent Office, as from that time only could the instrument operate as a patent for the invention claimed, unless greater efficacy was imparted to it by the act of Congress, which we shall presently consider.

The position that an accounting for profits earned subsequently could be claimed in this suit is not tenable. An accounting for such profits after suit can be demanded only where the infringement complained of took place previously and continued afterward.

As to the act of Congress passed February 3, 1887, for the relief of the appellants, only a few words need be said. It may be conceded that the defect arising from the omission of the Secretary's signature to the instrument is cured as to the future by that act, but it contains a proviso which excepts its provisions from applying to or affecting any suits then pending, or any cause of action arising prior to its passage. It is evident that Congress did not intend to give to the act any retroactive effect, and to prevent such a construction inserted the proviso, thus limiting the extent of its operation. (*Wayman* v. *Southard*, 10 Wheat. 1, 30.) As thus limited, the act, as well observed by counsel, is in harmony with the law relating to reissues, allowing the inventor upon the surrender of his patent with a defective specification to have a new patent for the remainder of his term.

For the reasons expressed it follows that the decree below must be affirmed; and the cross-appeal, being from rulings in the exclusion of evidence offered with respect to the alleged infringement, must be dismissed; and it is so ordered.

U. S. Circuit Court—Northern District of Illinois.

THE SCHLICHT & FIELD COMPANY *v.* THE SHERWOOD LETTER FILE COMPANY.

Decided November 5, 1888.

SHANNON—TEMPORARY BINDERS.

The first claim of Letters Patent No. 217,907, granted July 29, 1879, to James S. Shannon, for improvements in temporary binders, as modified by a disclaimer limiting the combination by the addition of the words, "when the fixed and vibrating wires are used in pairs, whether operating simultaneously or each separately," *Held* void, in view of the prior state of the art, as a mere duplication.

Messrs. Banning & Banning for the complainant.
Messrs. Dyrenforth & Dyrenforth for the defendant.

BLODGETT, *J.*:

By the bill in this case the defendant is charged with the infringement of Letters Patent No. 217,907, granted July 29, 1879, to James S. Shannon, for an improvement in temporary binders, and an injunction and accounting for damages are asked for.

The patentee in his specification says:

My invention relates to a novel construction in temporary binders of the class having fixed receiving-wires and hinged or vibrating transfer-wires; and consists, first, in giving movement to the latter on a vertical axis for the purpose of swinging their free ends toward or from the free ends of the fixed wires; secondly, in means, provided and arranged substantially as herein shown and described, whereby the vertically-vibrating wires are held stationary, either in contact with or removed from the fixed wires; and, thirdly, in connecting the two swinging wires of a double file, so that in rotating one the other is also operated.

The patent contains four claims; but infringement is here charged only as to the first, which is in the following words:

1. In combination with the fixed wire B and the base A, the arched vibrating wire C, having a positive rotary movement in the axis of its vertical portion, whereby its free end may be swung into contact with or away from the free end of the fixed wire, substantially as described.

The complainant has filed a disclaimer, which is in the following words:

Your petitioner is aware that in the patent to William C. Bussey, No. 198,968, issued January 8, 1878, for an improvement in bill-files, an arrangement of a base-plate, one fixed wire and one arched vibrating wire are shown, but in that and similar arrangements where only one wire is used there is nothing to steady the papers and prevent them from turning to one side or the other. Your petitioner therefore limits the first claim of said patent to a combination, with the fixed wire B and the base A, of the arched vibrating wire C, having a positive rotary movement in the axis of its vertical portion when the fixed and vibrating wires are used in pairs, whether operating simultaneously or each separately, as shown and described in said patent.

So that by this disclaimer the complainant limits this first claim to the use of the vertical and vibrating wires in pairs.

The patent shows devices whereby the vertically-vibrating wires are held stationary, either in contact with or removed from the fixed wires, and also a device whereby the two vibrating wires are rotated simultaneously by pressure upon either one. But these two devices for holding the wires stationary either in contact with or away from the fixed wires and for operating both wires simultaneously are not involved in this suit.

The defenses interposed are: (1) that the patent as shown by this first claim is void for want of novelty; (2) that defendant does not infringe.

The disclaimer filed by the complainant admits that the Bussey patent of January 8, 1878, anticipates the combination of a single vibrating or arched wire with a fixed vertical wire as shown by the first claim of complainant's patent; but complainant has attempted by the disclamer filed herein to obviate the effect of the Bussey patent by limiting the complainant's device to a tablet or letter file containing at least a pair of wires, so that we now have to deal with complainant's patent, as amended or limited by the disclaimer, as consisting of two vertical wires and two vibrating wires, each vibrating wire coacting with one of the vertical wires to form a continuous arch or ring, so that the papers upon the file may be passed over from the spindle on to the transfer or vibrating wire for the purpose of removing the letter or paper from the file without disturbing the relations of the other papers upon the file, and the vibrating wires having a free movement on their vertical axes, so as to admit the swinging of the free ends into contact with or away from the ends of the fixed wires. And the question now is, it being conceded that the Bussey patent shows a single vertical or vibrating wire coacting with a fixed vertical wire, precisely like the single vertical and vibrating and fixed wires described in the first claim of the complainant's patent, is there any invention in duplicating these wires so as to hang the papers to be filed upon two spindles instead of one? That there may be some advantage in holding the papers by two points of suspension or attachment to the letter-file, or "temporary binder," as it is called in this patent, is probable; but when Bussey had shown the method of making a file with one set of wires, could there be any invention in simply making a letter-file with two such sets, so as to have two points of attachment of the papers to the letter-file, thereby, as in the language of the disclaimer, "steadying the papers and preventing them from turning to one side or the other?" It does not seem to me that this mere duplication of parts calls for the exercise of inventive talent. There is no more invention in fastening papers to a letter-file by two points of attachment instead of one than there would be in fastening a board to a piece of studding or beam by two nails instead of one.

In *Dunbar* v. *Myers* (94 U. S., 187) the patent was for putting deflecting-plates on both sides of a circular saw for cutting veneers. It was conceded that the use of a deflecting-plate on one side of the saw was old, and the Court said at page 195:

Grant that two such plates are in certain cases better than one used alone, still the question arises whether it involves any invention to add the second plate to a machine already constructed with one plate. Beyond doubt every operator who had used a machine having one deflecting-plate knew full well what the function was that the deflecting-plate was designed to accomplish, and the reasons for placing it at the side of the saw are obvious to the understanding of every one who ever witnessed the operation of a circular saw. Ordinary mechanics know how to use bolts, rivets, and screws, and it is obvious that any one knowing how to use such devices would know how to arrange a deflecting-plate at one side of a circular saw which had such a device properly arranged on the other side, it being conceded that both deflecting-plates are constructed and arranged precisely alike, except that one is placed on one side of the saw and the other on the opposite side. Both are attached to the frame in the same manner; nor is it shown either in the specification or drawings that there is anything peculiar in the means employed for arranging the deflecting-plates at the sides of the saw, or in attaching the same to the frame.

And the same rule was followed in *Mellner* v. *Voss*, (4 Hughes, 262.)

I am therefore of opinion that in the light of the Bussey patent the complainant has gained nothing by the attempt to limit this patent to the use of the wires in pairs, and I must therefore find that this patent is void for want of novelty.

U. S. Circuit Court—Northern District of Illinois.

THE SCHLICHT & FIELD COMPANY *v.* THE SHERWOOD LETTER FILE COMPANY.

Decided November 5, 1888.

SHANNON—PAPER-FILE.

The first claim of Letters Patent No. 254,847, granted March 14, 1882, to James S. Shannon, for a paper-file, *Held* void as covering only an aggregation of parts, and not a patentable combination.

Messrs. Banning & Banning for the complainant.
Messrs. Dyrenforth & Dyrenforth for the defendant.

BLODGETT, *J.*:

The bill in this case charges the defendant with the infringement of Letters Patent No. 254,847, granted March 14, 1882, to James S. Shannon for a paper-file, and asks for an injunction and accounting for damages.

In his specification the patentee says:

This invention relates to paper-files having receiving-wires; and it consists in providing a punch attached to the file base or tablet, adapted to simultaneously punch as many holes in the papers to be filed as there are receiving-wires on the file, and to punch them somewhat larger than and in proper position to admit said receiving-wires. By this means the papers may lie closer and smoother on the file. They may be shifted more freely on the wires, and the apertures therein are not torn out or enlarged in filing or shifting them. It is more particularly intended as an improvement on the files described in Letters Patent of the United States No. 217,907 and No. 217,909, dated July 29, 1879, wherein the receiving-wires are sharpened to puncture the papers, and wherein transferring-wires are employed in connection with the receiving-wires. In the use of said files the papers are often shifted from one pair of wires to the other, and it is found that in such frequent transfers the apertures made by the puncturing-wires are apt to be torn out or enlarged. Moreover, in the act of filing by thrusting the papers down upon the wires the edges of the apertures so made are ragged, a burr, so to speak, is formed about the holes in the paper, and in pressing the papers down and in shifting them the burrs of one sheet enter the holes in the adjacent sheet above it, so that the sheets are not readily separable without inconvenience or tearing. By providing on the file a punch adapted by a single motion to cut clean-edged holes in the papers corresponding with the number and position of the receiving-wires, and a little larger than the wires, the papers so punched may be more expeditiously filed, they will lie flat and compact upon the tablet, they may be freely transferred from the receiving to the transfer-wires and back again, and in no ordinarily careful handling are they liable to be torn.

No claim is made in this case upon the form of construction embodied in the punch; but the patent covers simply and only the idea of affixing to a letter-file tablet a punch for the purpose of perforating the papers to be filed, so that they may be more readily manipulated upon the receiving-wires of the letter-file.

Infringement in this case is charged only as to the first claim of the patent, which is:

1. The paper-file described, consisting of a base, A, and two parallel receiving-wires, B B, provided with a double punch mounted upon the same base, and adapted to simultaneously punch two holes in the paper in position and of size to admit the receiving-wires, substantially as set forth.

The defenses set up are: (1) non-pantentability of the device, and (2) that defendants do not infringe.

The defendants manufacture and sell a letter-file containing receiving and vibrating wires, operating substantially like those shown in the complainant's patent, with a punch located under the arch of the vibrating wires, so that the papers to be filed are passed through the space between the ends of the receiving and vibrating wires to the punch, where they are perforated, when they may be retracted or drawn back and passed over the receiving-wires upon the file. The defendant's punch is attached to the tablet, and in that respect is like the complainant's, although in the exhibits of the complainant's and defendant's tablets offered in evidence the defendant's punch is located at a different place from the location of the punch on the complainant's tablet; but as there is no specific place designated in the complainant's patent as to where the punch shall be located, I do not know that this difference is in any special degree material in the consideration of this case, so that the case simply presents this question: Is it patentable to locate any kind of a punch upon a paper-file, so that the papers to be filed thereon may be punctured by the punch to enable them to be more readily passed upon the receiving-wires of the file?

It is obvious that the punch performs no new function by reason of its being attached to a tablet from what it would if it were attached to a table, window-sill, or any other location where it could be used readily in connection with the tablet, and a patent, therefore, merely for this attachment seems to me to come entirely within the principle laid down by the Supreme Court in *Hailes* v. *Van Wormer* (20 Wall., 253) and *Reckendorfer* v. *Faber*, (92 U. S., 347.) In the latter case the patent was for the idea of attaching a piece of rubber to the end of a lead-pencil, so that the rubber could be used readily to erase pencil-marks. In that case the rubber performed no new function by being attached to the pencil. It was undoubtedly a convenient arrangement, whereby the rubber was readily at hand to erase or correct any mistakes made in the use of the pencil, but it was still nothing but an eraser attached to the pencil; and the Court in its opinion says:

This combination consists only of the application of a piece of rubber to one end of the same piece of wood which makes a lead-pencil. It is as if a patent should be granted for an article, or a "manufacture," as the patentee prefers to term it, consisting of a stick twelve inches long, on one end of which is an ordinary hammer, and on the other end is a screw-driver or a tack-drawer, or what you will see in use in every retail shop, a lead-pencil on one end of which is a steel pen. It is the case of a garden-rake, on the handle end of which should be placed a hoe, or on the other side of the same end of which should be placed a hoe. In all these cases there might be the advantage of carrying about one instrument instead of two, or of avoiding the liability to loss or misplacing of separate tools. The instruments placed upon the same rod might be more convenient for use than when used separately. Each, however, continues to perform its own duty and nothing else. No effect is produced, no result follows from the joint use of the two.

A handle in common, a joint-handle, does not create a new or combined operation. The handle for the pencil does not create or aid the handle for the eraser. The handle for the eraser does not create or aid the handle for the pencil. Each has and each requires a handle the same as it had and required, without reference to what is at the other end of the instrument, and the operation of the handle of and for each is precisely the same whether the new article is or is not at the other end of it. In this and the cases supposed you have but a rake, a hoe, a hammer, a pencil, or an eraser, when you are done. The law requires more than a change of form or juxtaposition of parts, or of the external arrangement of things, or of the order in which they are used to give patentability.

So here the punch performs no new or increased function by being attached to the tablet. It is still nothing but a punch, and, as the proof shows, is often attached to a table or some other permanent fixture, so as to be convenient for use in connection with several tablets. I therefore think that this is but an aggregation of parts, and as such does not come within the field of invention.

In *Pickering* v. *McCulloch* (104 U. S., 310) the Supreme Court, speaking by Mr. Justice Matthews, said:

In the patentable combination of old elements all the constituents must so enter into it as that each qualifies every other. * * * It must form either a new machine of a distinct character and function, or produce a result due to the joint co-operating action of all the elements. It is not the mere adding together of separate contributions.

For these reasons I consider the defense of non-patentability is fully made out, and the bill is dismissed for want of equity.

U. S. Circuit Court—Southern District of Iowa.

WESTINGHOUSE *v.* CARPENTER.

Decided June 29, 1888.

EXPIRATION OF PATENT—INJUNCTION THEREAFTER.

Under the law the monopoly secured by a patent ceases with the expiration of the patent, and articles made during the life of the patent in infringement of it cannot be enjoined after its expiration, and an injunction already granted as to such articles will be dissolved.

MOTION to dissolve injunction.

Mr. J. Snowden Bell, Mr. Nathaniel French, Mr. George H. Christy, and *Mr. William Bakewell* for the complainant.

Messrs. Banning & Banning for the defendant.

MILLER, *J.*:

We are of the opinion that the motion ought to be granted. The attorney for the plaintiff practically concedes, from the decisions of the courts on that subject, that the motion to dissolve the injunction should be granted on account of the expiration of the patent, which expired a few days ago with the expiration of a prior English patent. He, however, insists that the injunction should be continued as to the use and sale of those articles which were manufactured and sold while the patent was alive, the manufacture of which was an infringement of this patent; that he should have the benefit of having forbidden them while the patent was in existence, and that the injunction should be continued as to the selling or using of those manufactures, notwithstanding the expiration of the patent.

We are of the opinion that with the expiration of his patent the plaintiff's right to forbid anybody to make, sell, or use the articles to which this invention refers expires. His monopoly is continued for seventeen years by law, or whatever period the law allows his patent to run. That monopoly is against the making, selling, or using of such articles. He has the benefit of that monopoly, and has had that benefit with regard to those articles in which he now asks to be further protected. He may recover the damages he has sustained in this suit, which is still pending in this court. He may recover for the damages which were inflicted before the injunction was brought, and he still asks that the court shall enjoin the sale and use of those articles for which he expects to get damages. Speaking for myself and also for Judge Love, I do not believe that is the true doctrine on this subject.

There are some particular circumstances showing that the use of this patented article was an experiment to see whether it could be used successfully in this country, and under all the circumstances we are disinclined to make any modification of the motion to dissolve the injunction, but dissolve it absolutely.

Commissioner.

Indexes to Patents on Electricity.

Appendix No. 2 to the index to patents relating to electricity, covering the period of time from July 1, 1882, to June 30, 1883, has been issued, and is now for sale. These indexes, arranged alphabetically, numerically, and by classes, are completed to June 30, 1883, and comprise the following volumes:

Vol. 1. Index to patents relating to electricity granted by the United States prior to June 30, 1881, with an appendix, July 1, 1881, to June 30, 1882. One volume, 250 pages. In paper covers, $3; bound, $5.

Vol. 2. Appendix No. 2, July 1, 1882, to June 30, 1883. One volume, 50 pages. In paper covers, $1.50.

Vol. 3. Appendix No. 3, July 1, 1883, to June 30, 1884. One volume, 60 pages. In paper covers, $1.50.

Vol. 4. Appendix No. 4, July 1, 1884, to June 30, 1885. One volume, 60 pages. In paper covers, $1.50.

Vol. 5. Appendix No. 5, July 1, 1885, to June 30, 1886. One volume, 54 pages. In paper covers, $1.50.

Vol. 6. Appendix No. 6, July 1, 1886, to June 30, 1887. One volume, 52 pages. In paper covers, $1.50.

Publishers' Catalogues.

This Office would be pleased to receive from manufacturers and publishers such catalogues, circulars, price-lists, or other advertisements relating to the sciences and mechanical arts as are published by them for gratuitous distribution; but notice is hereby given such manufacturers or dealers who feel disposed to send their publications that not less than three copies should be forwarded in order that the subjects may be properly indexed, classified, and subclassified in the Scientific Library for convenient and ready reference.

18,861 to 18,868, inclusive.—OIL-CLOTH.—*Charles T. Meyer* and *Victor E. Meyer*, Bergen, N. J., assignors to *Edward C. Sampson*, New York, N. Y. Applications filed December 13, 1888. Serial Nos. 293,502 to 293,509, inclusive. Term of patents 3½ years.

18,869.—RUG.—*Adolph Petzold*, Philadelphia, Pa., assignor to *John Bromley & Sons*, same place. Application filed December 17, 1888. Serial No. 293,923. Term of patent 3½ years.

18,870.—PHOTOGRAPH-EXHIBITOR STAND.—*George M. Porteous* and *Frederick S. Miller*, Chicago, Ill. Application filed November 5, 1888. Serial No. 290,004. Term of patent 7 years.

18,871.—PHOTOGRAPH-EXHIBITOR-CASE BODY.—*George M. Porteous* and *Frederick S. Miller*, Chicago, Ill. Application filed December 17, 1888. Serial No. 293,887. Term of patent 7 years.

18,872 and 18,873.—PHOTOGRAPH-EXHIBITOR STAND.—*George M. Porteus* and *Frederick S. Miller*, Chicago, Ill. Applications filed December 17, 1888. Serial Nos. 293,888 and 293,889. Term of patents 7 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

16,169.—CIGARS.—*The Cigarmakers Co-Operative Association*, Boston, Mass. Application filed September 24, 1888. Used since April 1, 1888.

"The representation of two tobacco-leaves arranged nearly vertically, their stems being bent toward each other and crossed, three cigars placed at the top of the space between the leaves, two cigars being oblique to each other, and the third cigar vertical below the two others, and the letters 'C C A,' a 'C' on each side of the vertical cigar and the 'A' below it."

16,170.—TEAS AND COFFEES.—*Samuel Cleland Davidson*, Belfast, Ireland. Application filed October 30, 1888. Used since September, 1885.

"The word 'SIROCCO.'"

16,171.—FABRIC MACHINE-BELTING.—*The Eureka Belting Manufacturing Company*, New York, N. Y. Application filed November 21, 1888. Used since January, 1888.

"The words 'EUREKA BELT.'"

16,172.—IRON AND WOOD PUMPS.—*Flint & Walling Manufacturing Company*, Kendallville, Ind., Kansas City, Mo., and Fort Worth, Tex. Application filed November 22, 1888. Used since October 1, 1888.

"The word 'HOOSIER.'"

16,173.—WIPERS MADE OF SILK WASTE WOVEN INTO CLOTH.—*Louis C. Fuchs*, Chicago, Ill. Application filed November 23, 1888. Used since October 25, 1888.

"The word 'SILKOLINE.'"

16,174.—CIGARS.—*Manuel Garcia*, Havana, Cuba. Application filed December 12, 1888. Used since January, 1887.

"The words 'LA VERDADERA' and a monogram of the letters 'M G.'"

16,175.—LEATHER, CLOTH, AND RUBBER BOOTS AND SHOES.—*Hanan & Son*, New York, N. Y. Application filed November 2, 1888. Used since January 1, 1883.

"The word 'HANAN' inclosed by an elliptical border or line."

16,176.—CACHOUX.—*Thomas Jackson*, Manchester, county of Lancaster, England. Application filed November 20, 1888. Used since 1849.

"A profile likeness of Prince Albert."

16,177.—BOILER AND PIPE COVERINGS, FILLINGS, LININGS, AND THE LIKE.—*H. W. Johns Manufacturing Company*, New York, N. Y. Application filed October 26, 1888. Used since March 15, 1888.

"The word 'ASBESTO-SPONGE.'"

16,178.—WRITING-PAPER.—*David King*, Springfield, Ohio. Application filed May 14, 1888. Used since May, 1888.

"The letters 'G. A. R.' and the representation of an eagle mounted upon two crossed cannon, the American flag, and a five-pointed star."

16,179.—ANTIPYRETIC DRUG.—*Ivan Levinstein*, Manchester, county of Lancaster, England. Application filed October 23, 1888. Used since August, 1888.

"The words 'PYRODINE LEVINSTEIN.'"

16,180.—CIGARS.—*Antonio Lopez*, Havana, Island of Cuba. Application filed December 12, 1888. Used since January, 1881.

"The words 'LA ROSA AROMATICA.'"

16,181.—PERFUMED TABLETS FOR BATH AND TOILET USE.—*Heinrich Mack*, Ulm, Wurtemberg, Germany. Application filed November 26, 1888. Used since June 8, 1887.

"The words 'PASTA MACK,' printed diagonally in a square, and the fac-simile of the registrant's signature, 'H. MACK, ULM °/D.'"

16,182.—PERFUMERY PREPARATIONS FOR THE BATH.—*Heinrich Mack*, Ulm, Wurtemberg, Germany. Application filed November 26, 1888. Used since June 8, 1887.

"The words 'PASTA MACK.'"

16,183.—PERFUMERY PREPARATIONS FOR THE BATH.—*Heinrich Mack*, Ulm, Wurtemberg, Germany. Application filed November 26, 1888. Used since June 8, 1887.

"The words 'PASTA MACK' and the representation of a lady lying in a bath, from which clouds of steam are rising."

16,184.—CRACKERS AND CAKES.—*Fredrick W. Medcraf*, Syracuse, N. Y. Application filed November 19, 1888. Used since October 1, 1888.

"The representation of a sheaf of wheat inclosed within a circle surrounding the same in the form of a seal."

16,185.—REMEDIES FOR ALL DISEASES OF THE NOSE, THROAT, AND BRONCHIAL TUBES.—*James I. Moore*, *Henry Robinson*, and *William S. Blackshear*, Waco, Tex. Application filed September 19, 1888. Used since January, 1886.

"The word 'CACTERINE' and the picture of a cactus."

16,186.—STEAM AND HYDRAULIC COMBINATION PISTON-PACKING.—*Moran & Saunderson*, New York, N. Y. Application filed October 12, 1888. Used since February 20, 1872.

"The representation of a crowing cock standing upon a roll of piston-packing, underneath appearing the words 'WHILE I LIVE I'LL CROW,' the whole thereof inclosed within a circle."

16,187.—CIGARS.—*Mutual Union Cigar Company*, Chicago, Ill. Application filed October 15, 1888. Used since September 9, 1887.

"The letter 'A,' the figure '1,' and the word 'STAR' or the symbol of a star."

16,188.—TONIC AND ALTERATIVE REMEDY.—*Samuel Nicholson*, Washington, D. C. Application filed September 6, 1888. Used since March 30, 1887.

"The words 'PHOSPHA ALTA COMP—.'"

16,189.—PLUG CHEWING AND PREPARED SMOKING TOBACCO.—*Mathew L. Ogburn*, Winston, N. C. Application filed November 16, 1888. Used since June 1, 1885.

"The words 'BULL OF THE WOODS.'"

16,190.—SHOTGUN-CARTRIDGES.—*The Peters Cartridge Company*, King's Mills and Cincinnati, Ohio. Application filed September 25, 1888. Used since January 1, 1888.

"A red label bearing the words 'DUCKING CARTRIDGES.'"

16,191.—SHOTGUN-CARTRIDGES.—*The Peters Cartridge Company*, King's Mills and Cincinnati, Ohio. Application filed September 25, 1888. Used since January 1, 1888.

"The words 'PETERS POPULAR.'"

16,192.—SHOTGUN-CARTRIDGES.—*The Peters Cartridge Company*, King's Mills and Cincinnati, Ohio. Application filed September 25, 1888. Used since August 1, 1886.

"The representation of a blank cartridge resting on a shotgun with the words 'BLANK SHOT GUN CARTRIDGES.'"

16,193.—SHOTGUN-CARTRIDGES.—*The Peters Cartridge Company*, King's Mills and Cincinnati, Ohio. Application filed September 25, 1888. Used since January 1, 1888.

"The words 'QUICK SHOT CARTRIDGES.'"

16,194.—CORSETS.—*Henry Le Prince*, Paris, France. Application filed November 22, 1888. Used since 1883.

"The representation of an oval band, within which are the words 'ELÉGANCE & SOLIDITÉ: PARIS.' Inside the band are the letters 'L. P.' Surmounting the band and resting upon the top thereof is the representation of a Prince's crown, and beneath the whole are the words 'MARQUE DE FABRIQUE.'"

16,195.—COLLARS AND CUFFS.—*Rogers, Peet & Co.*, New York, N. Y. Application filed November 22, 1888. Used since November 16, 1888.

"The compound word 'HOME-RULER.'"

16,196.—CIGARS, CHEROOTS, CIGARETTES, AND MANUFACTURED TOBACCO.—*Ernest Wenigmann*, New York, N. Y. Application filed November 16, 1888. Used since November 1, 1888.

"The word 'WATERLOO.'"

LABELS.

5,792.—Title: "AMBER" (FOR PAINTS AND COLORS.)—*Binswanger & Pollock*, Philadelphia, Pa. Application filed December 19, 1888.

5,793.—Title: "THE COTTON OIL PRODUCT CO'S COTTON SEED LARD."—*The Cotton Oil Product Company*, New York, N. Y. Application filed December 20, 1888.

5,794.—Title: "THE COTTON OIL PRODUCT CO'S FOR THE NURSERY," (FOR A PURGATIVE MEDICINE.)—*The Cotton Oil Product Company*, New York, N. Y. Application filed December 20, 1888.

5,795.—Title: "THE COTTON OIL PRODUCT CO'S TOILET COTTON SEED SOAP."—*The Cotton Oil Product Company*, New York, N. Y. Application filed December 20, 1888.

5,796.—Title: "THE COTTON OIL PRODUCT CO'S SOAP POWDER."—*The Cotton Oil Product Company*, New York, N. Y. Application filed December 20, 1888.

5,797.—Title: "THE COTTON OIL PRODUCT CO'S LAUNDRY COTTON SEED SOAP."—*The Cotton Oil Product Company*, New York, N. Y. Application filed December 20, 1888.

5,798.—Title: "MELLINS FOOD FOR INFANTS AND INVALIDS."—*Dolliber-Goodale Company*, Portland, Me., and Boston, Mass. Application filed August 13, 1888.

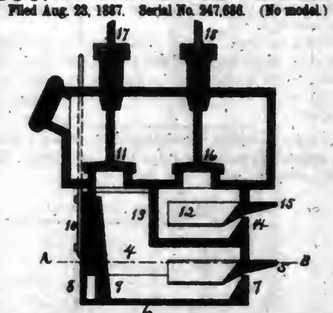
5,799.—Title: "LABEL FOR LENSES."—*Johnston Optical Co.*, Detroit, Mich. Application filed December 10, 1888.

5,800.—Title: "LABEL FOR LENSES."—*Johnston Optical Co.*, Detroit, Mich. Application filed December 10, 1888.

5,801.—Title: "LABEL FOR LENSES."—*Johnston Optical Co.*, Detroit, Mich. Application filed December 10, 1888.

5,802.—Title: "LABEL FOR LENSES."—*Johnston Optical Co.*, Detroit, Mich. Application filed December 10, 1888.

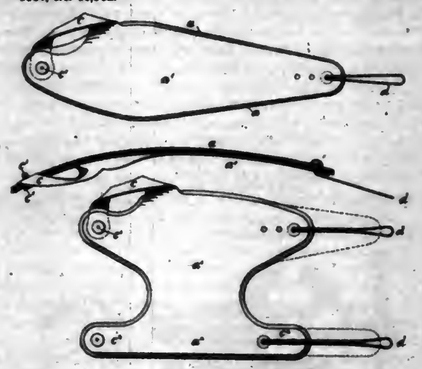
5,803.—Title: "LABEL FOR LENSES."—*Johnston Optical Co.*, Detroit, Mich. Application filed December 10, 1888.



5,804.—Title: "GOLD AND SILVER SOLUTION" (FOR A MEDICINAL REMEDY.)—*Harrison B. Meech*, Omaha, Nebr. Application filed December 21, 1888.

5,805.—Title: "DR. SCHAEFFER'S DENTIFRICE."—*Elizabeth Schaeffer*, Charlestown, W. Va. Application filed December 20, 1888.

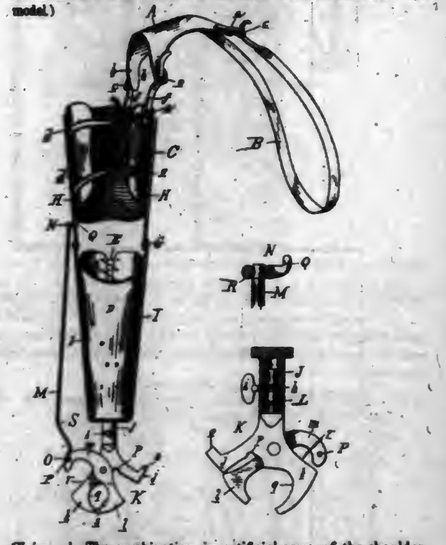
PATENTS



GRANTED JAN. 15, 1889.

396,059. SPRINKLING-NOZZLE. JOHN W. ANDERSON, South Bend, Ind. Filed Aug. 23, 1887. Serial No. 247,636. (No model.)

Claim.—In a sprinkling-nozzle, a shell having two water-ways therein and having an independent discharge-slot communicating with each water-way, and an upwardly-inclined flange forming the upper side of each slot and projecting out beyond that portion of the shell which forms the lower side of the slots, in combination with two inlet-valves located inside the body of the nozzle, substantially as shown and described.



396,060. BLOTTING-PAD. MOSES AFLALO, London, England, assignor of one-half to James Aylward Game, same place. Filed June 5, 1888. Serial No. 276,072. (No model.) Patented in England July 23, 1887, No. 10,502.

Claim.—1. A blotter consisting of the blotting-pad *a*, a shield, *a'*, on which said pad is mounted, an integral tab, *c*, which forms the thumb attachment, a stud, *c'*, to which the free end of said tab is detachably secured, and a loop, as *d*, secured to the pad and shield opposite to the stud *c'*, and adapted to engage the said stud and form an attachment to the palm of the hand, all combined and arranged substantially as set forth.

2. A blotter consisting of the blotting-pad *a*, a shield, *a'*, on which said pad is mounted, having an extension, a^2, an integral tab, *c*, on the shield *a'*, a stud, *c'*, to which said tab is attached, thus forming a loop to receive the thumb, a loop, *d*, on the main part of the shield, adapted to engage the stud *c'*, and a similar loop, $d^\times$, on the extension a^2, adapted to engage a stud, c^3, on the opposite side of said extension, all combined and arranged substantially as set forth.

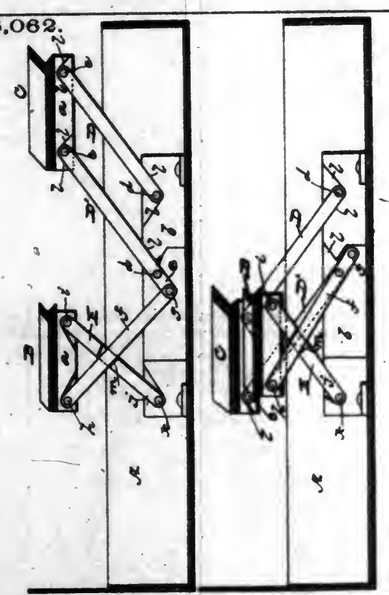
396,061. ARTIFICIAL ARM AND HAND. JUDSON J. ALLWARD, Columbiaville, Mich. Filed Oct. 29, 1888. Serial No. 289,367. (No model.)

Claim.—1. The combination, in artificial arms, of the shoulder-cap A, provided with a body-strap, B, the casing C, strapped to the shoulder-cap, the socket of the forearm D, secured by an elbow-joist to the casing C, the socket J on the forearm, the claw detachably secured to said socket, and the rod M, connected by the swivel-joist N to the casing of the upper arm and to the movable jaw of the claw, substantially as described.

2. The combination, with the forearm, of the socket J, formed thereon, the claw K, provided with a shank, L, adapted to engage into the socket J and having an annular groove, *k*, and the set-screw *i*.

3. In an artificial arm, the combination, with the movable jaw of a claw provided with an eye, P, of the rod M, provided with the hook O, and the swivel N, detachably connecting it to the casing of the upper arm near the elbow-joint, substantially as described.

4. The combination, with the casing C and socket D, of the bars H and I, secured upon opposite sides thereof, respectively, the elbow-joint G, the claw K, having the stationary and movable jaws, and the rod M, provided upon one end with the hook O and at the other with the swivel N, consisting of the hook-stud Q, provided with an eye, R, in which the rod M is rotatably secured, all arranged and constructed to operate as described.

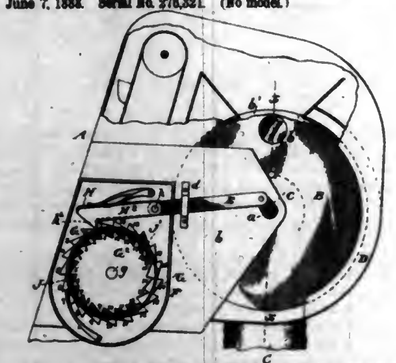


5. The claw K, consisting of the stationary jaws *j* and *k* and the movable jaws *l* and *m* in one piece and pivotally secured to the stationary part of the claw, in combination with the rod M, substantially as described.

6. The claw K, provided with a shank, L, adjustably and detachably secured to the socket of the arm D, the stationary jaws *j* and *k*, provided with the hook O and circular face *q*, respectively, and the movable jaw *l*, provided with the curved face *s*, and the hook-shaped movable jaw *m*, substantially as described.

396,062. SHIFTING SEAT FOR VEHICLES. ENOCH H. BATES, Washington, D. C. Filed Mar. 29, 1888. Serial No. 268,743. (No model.)

Claim.—1. The combination, in a shifting-seat vehicle, of the



396,062.

cross-bars *f* E, pivoted at *h i* to the front seat, and the bar E, pivoted at *k* to the bearing *b*, and pivoted rear seat-bars, said bar *f* pivoted directly to the extended end *e* of the bar *D'*, substantially as described.

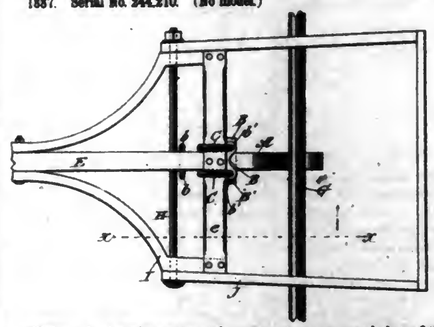
2. The combination of the pivoted cross-bars provided with supporting lugs or bearings, and the pivoted rear seat-bars, said cross-bars and rear bar, *D'*, connected directly to one another, as shown and described.

396,063. GRAIN-TALLY. JASON BURR, Owatonna, Minn. Filed June 7, 1888. Serial No. 276,321. (No model.)

Claim.—1. The combination, with the revolving measure, the crank-arm on the shaft thereof, and the pitman connected at one end to said crank-arm and the other end free of the wheels or shaft of the registering mechanism, of the notched wheel having an annular notched flange, the smaller notched wheel within said flange, and the spring-actuated dogs on the free end of said pitman, substantially as and for the purpose specified.

2. The combination of the revolving measure, its shaft, the crank-arm on said shaft, the notched wheel provided with a notched flange, the smaller notched wheel within said flange, the pitman connected at one end to said crank-arm, with its other end free of said wheels and their shaft, the dogs pivoted to the free end of the pitman on a common pivot and engaging said wheels, and the springs on a common pivot and bearing one on each of said dogs, substantially as described.

396,064. INSIDE CALIPERS OR GAGE. JOHN A. BLAIR, Philadelphia, Pa. Filed Aug. 4, 1888. Serial No. 282,005. (No model.)

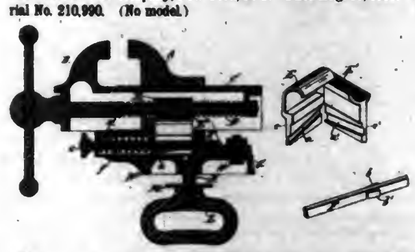


Claim.—1. An interior calipers consisting of a tube having an exteriorly-screw-threaded end with a rod adapted to slide in said end, and a sleeve secured to said rod and adapted to rotate on the screw-threaded end of said tube, and having a collar with clamping-screw whereby said sleeve is secured in place on said tube, substantially as described.

2. An interior calipers consisting of the tube A, with an exteriorly-screw-threaded end, the plug K, adapted to fit in the other end of the tube A and having a pointed end, a rod adapted to slide in the screw-threaded end of the tube and having a pointed outer end, the sleeve C, with split collar D and screw E, and the screw H securing said collar to the said sliding rod, said parts being combined substantially as and for the purpose set forth.

3. The described measuring-tool or interior calipers, consisting of two extensible parts adapted to slide the one within the other, in combination with a connecting-sleeve having a set-screw for securing one of said extensible parts and an interiorly-screw-threaded collar with set-screw attachment for securing the other of said parts, substantially as described.

4. The combination of the hollow sleeve A, screw-threaded at one end, with the sliding extension part B and connecting-sleeve C, with collar D and screw-threads on its interior at one end and provided with set-screws for securing said parts together, substantially as described.

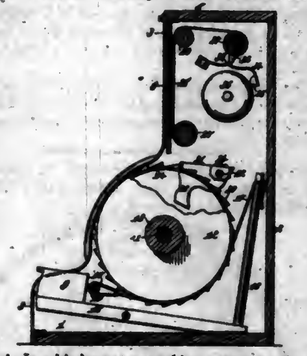


396,065. WAGON-TONGUE SUPPORT. EDWIN D. BLAKE, Chicago, Ill., assignor of two-fifths to Frank Scales, same place. Filed July 13, 1887. Serial No. 244,210. (No model.)

Claim.—1. A spring-support for wagon-tongues, consisting of the spring A, having a straight portion at the front end adapted to fit the straight surface of the tongue, and a portion at the rear curved down to the under side of the axle and then up behind the same, in combination with plates and bolts, substantially as shown and described, for securing the same to the rear end of the tongue, as specified.

2. A spring-support for wagon-tongues, consisting of the part A, having a straight portion at one end and a curved portion at the other end, in combination with plates B, provided with ears *b'*, having bolt-holes, bar B', with bolt-holes registering with those of said ears, and hook-bolts C, for attaching the said part A to the rear end of the wagon-tongue, substantially as specified.

396,066. VISE. JOHN A. BLAKE, Watertown, N. Y., assignor to the Prentiss Vise Company, New York, N. Y. Filed Aug. 16, 1886. Serial No. 210,990. (No model.)



Claim.—1. In a vise, and in combination with the screw thereof, a divided nut consisting of two vertically-moving sections, each having a rigid part extending below the screw, and an opener, as the bar F, working in recesses in the sections, substantially as described.

2. In a vise, the two half-nuts arranged to move in parallel lines and provided with the shanks having oppositely-inclined channels, the sliding bar carrying the wedges or inclines, and the clamping-screw, combined and arranged for operation substantially as shown and described.

3. In a vise, the two half-nuts arranged to move in parallel lines and provided with the channeled shanks, the sliding bar carrying the two wedges for engaging with the shanks and forcing the half-nuts to move simultaneously in opposite directions, a returning spring applied in connection with said bar, and the clamping-screw mounted in the sliding vise-bar, combined and arranged substantially as shown and described.

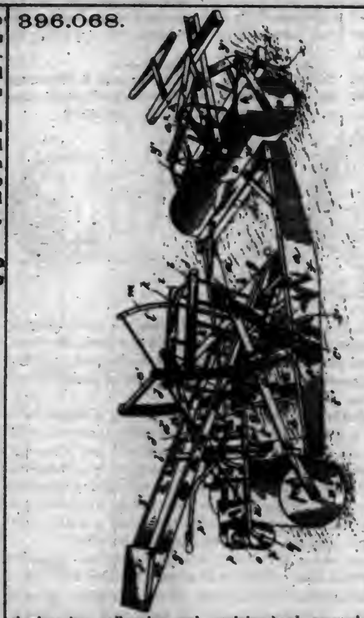
4. In a vise, and in combination with the screw thereof, a divided nut having one section constructed to rise and the other to fall, and each section having an inclined groove, the two grooves running in opposite directions and their central lines crossing each other, a slide working between the sections, provided with studs working in said grooves, whereby the one section is raised and the other lowered, substantially as described.

396,067. KINDERGARTEN TEACHING APPARATUS. HOWARD BODEY, Norristown, Pa. Filed Apr. 7, 1888. Serial No. 269,953. (No model.)

Claim.—1. In a kindergarten teaching apparatus, the combination, with a flanged alphabet-wheel, of a key-lever having a standard at one end, a cord attached to the upper part of said standard and arranged in frictional contact with the flange of the alphabet-wheel, a spring attached to the other end of said cord, and a support for said spring, substantially as described.

2. In a kindergarten teaching apparatus, the combination, with a cup-shaped or flanged alphabet-wheel having ratchet-teeth struck from its closed side, of a weighted pawl pivoted above said alphabet-wheel in position to engage its ratchet-teeth and prevent backlash, said pawl being provided with a pivotal bearing on each side of the ratcheted alphabet-wheel, and having a cross-piece or brace that extends across the flange of the wheel to stiffen the pawl and connect its pivotal bearings, substantially as described.

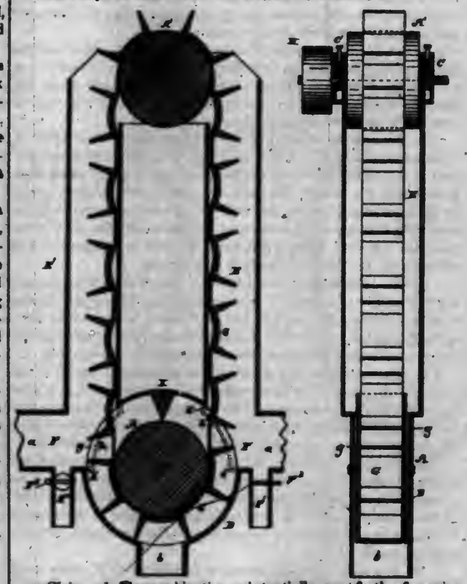
3. In a kindergarten teaching apparatus, the combination of a series of flanged alphabet-wheels having projecting ratchet-teeth, pawls engaging said teeth to prevent backlash, means for independently rotating the alphabet-wheels, and a casing having in its face openings to expose the letters or characters on the wheel-flanges, and provided between said openings with segmental grooves projecting from the face of the casing to receive the ratchet-teeth of the alphabet-wheel and permit the letters on the wheel-flanges to be exposed in close proximity to the openings in the face of the casing, substantially as described.



4. A kindergarten teaching apparatus, comprising the wood cabinet containing a traveling pictorial strip rotating alphabet-wheels having ratchet-teeth and key-levers for the wheels, and a front wall to the cabinet composed of a sheet of metal provided with the top opening, 6, for exposing the pictures, a transverse line of openings, 7, for exposing the alphabet-letters, grooves 10, for the ratchet-teeth, and a transverse bottom opening, 8, through which the keys project, and having its top, bottom, and opposite side edges bent inward to form flanges, which are secured to the inner sides of the cabinet, substantially as described.

396,068. HARROW AND ROLLER. JESSE BOLLINGER, Carrollton Md. Filed Sept. 17, 1888. Serial No. 285,655. (No model.)

Claim.—1. In a combined land-roller and harrow, the combination, with the pivoted harrow-bars, of the pivoted frame secured thereto, the curved lever having the notches, the tubular standard provided with the coiled spring, angular lever, slotted curved pivoted side bars for the rear roller, the tilting frame provided with the small rollers and the cord, and the vertical lever connected to said cord and to the pivoted frame and harrow-frame, substantially as described.



2. The combination, with the harrow-frame provided with the teeth and the operating parts connected thereto, as described, of the front harrow hinged to the frame of the tongue and provided with

396,068.

the loop-bar, coil-spring, and retaining-hook pivoted to said tongue, substantially as described.

396,069. WATER-MOTOR. BYRON R. BOWER, Bainbridge, Ga. Filed Sept. 24, 1887. Serial No. 250,608. (No model.)

Claim.—1. The combination, substantially as set forth, of a casing, the upper and lower pulleys, the bucket-carrying belt, the buckets thereon, the side rings on the lower pulley, and the water-stop located over the lower pulley and between the side rings.

2. The combination, substantially as set forth, of the upper and lower pulleys, the casing for the lower pulley completely inclosing it, except at the water-ports, the bucket-carrying belt, the buckets thereon, an entrance-port at the side of the casing, a discharge-port at the bottom of the casing and entrance-port on the opposite side of the apparatus and the drain-spouts, and valves located under the entrance-ports.

3. The combination, substantially as set forth, of the upper and lower pulleys, the casing for the lower pulley inclosing it and having

an entrance-port at one side and a discharge-port at the bottom, the side rings on the lower pulley, and the water-stop over the pulley between the rings.

396,070. RIBBON-WINDING DEVICE. WILLIAM S. BURROUGHS, St. Louis, Mo., assignor to the American Arithmometer Company, same place. Filed Nov. 22, 1887. Serial No. 255,923. (No model.)

Claim.—1. The combination of a ribbon and two spools carrying the same, a driver for each spool, one of which is a reversible driver, and both drivers connected with one operating device, and a yielding connection, substantially as described, between one of the spools and its driver, substantially as described.

2. The combination, with two spools carrying a ribbon, of a driver turning in but one direction, having a yielding connection with one of said spools, a reversible driver connected with the other said spool, and means for operating said drivers, substantially as described.

3. The combination, with two spools, of a step-by-step driver for one of the spools, a yielding connection between the driver and said spool and a reversible driver for the other spool, and means for operating said drivers simultaneously, substantially as described.

4. The combination of the two spools, ribbon, and two connected drivers, one of said drivers having a yielding connection with one of said spools, and of less diameter than the other, whereby to move the latter spool at a greater speed than the other spool, substantially as described.

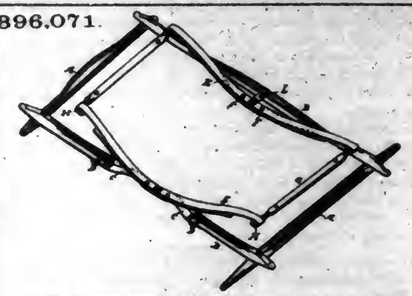
5. The combination of two spools carrying a ribbon, a driver frictionally connected with one spool, a driving spring-pawl engaging with the wheel of the other spool-driver and supported on a radially-yielding bearing, and a connection, substantially as described, between said pawl and said driver, substantially as specified.

6. In a ribbon-winding device, the combination of a spool mounted upon a shaft, *a*, and having a toothed driving-wheel, a vibrating arm, a vibrating spring-actuated pawl carried by the arm, and means, substantially as described, for vibrating the arm, and a radially-yielding bearing for the pawl, substantially as described.

7. In a ribbon-winding device, the combination of spool A, mounted on a shaft, *a*, a toothed driving-wheel, a vibrating arm pivoted to the shaft and having a sliding bearing, a spring which tends to draw the arm toward the shaft, a pivoted reversible pawl carried by the arm, engaging with the teeth on the wheel, and carrying a pin projecting through a slot in the arm concentric with the pivot of the pawl, and a pivoted spring which holds the pawl in engagement with the teeth of the wheel, substantially as described.

8. The combination, with a spool, B, and frictionally-connected driver therefor, of a spool, A, and reciprocating driving-pawl having a radially-yielding support and pivoted to swing to either side, and a spring connected to press said pawl against the spool in each position, and means for operating said drivers, substantially as described.

9. In a ribbon-winding device, the combination of spools A and B, a driving-wheel, C, positively connected with the spool A, a driving-wheel yieldingly connected with the spool B and of less size than the driving-wheel of spool A, and means, substantially as described, for simultaneously turning said wheels, substantially as described.

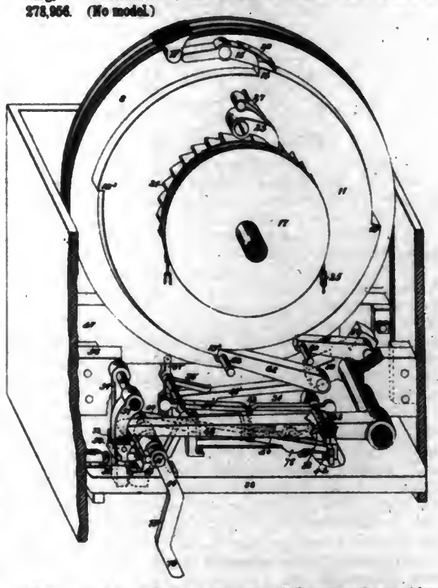


10. In a ribbon-winding device, the combination of spools A and B, driving-wheel C, positively connected with spool A, a driving-wheel yieldingly connected with spool B and of less size than wheel C, and an intermittently-operating pawl for wheel D, tending to rotate spool B away from spool A, and a reversible pawl for the wheel C, substantially as described.

11. In a ribbon-winding device, the combination of spools A and B, toothed wheel C, positively connected with wheel A, toothed wheel D, frictionally connected with spool B, the vibrating arm carrying a reversible spring-actuated pawl for rotating wheel C, vibrating arm carrying a non-reversible spring-actuated pawl for rotating wheel D, and reciprocating devices connecting said arms for vibrating them synchronously, substantially as described.

396,071. SIDE SPRING FOR CARRIAGES. EDWIN A. CRUSE, Cortland, N. Y. Filed Nov. 17, 1883. Serial No. 291,060. (No model.)

Claim.—1. The combination, with the side bars of a buggy, of curved hangers forming central supports for the springs, the curved springs centrally supported therein, and the end bars swiveled in said springs, substantially as described.



396,071.

2. The combination, with the side bars of a buggy, of a pair of curved hangers, the longitudinally-extending springs, and the retaining drop-bracket attached to the side bars and springs, substantially as described.

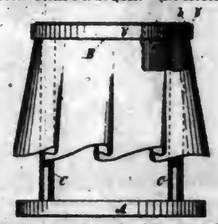
3. The combination, with the side bars, of the curved hangers secured thereto and the springs centrally supported thereon and extending lengthwise of the vehicle, all arranged substantially as shown and described.

396,072. RAILROAD-CROSSING GATE. OLIVER H. CLARK, Pittsburg, Pa. Filed Jan. 24, 1884. Renewed July 3, 1888. Serial No. 278,956. (No model.)

Claim.—1. In a railroad-crossing or similar gate, the combination of an oscillating barrier, a wheel secured to the shaft of the barrier, two loose clutch-wheels, one on each side of the fixed wheel, and having reversely-arranged pawl, ratchet, and trip mechanism, locking-stops for each clutch-wheel, and the escapement mechanism, substantially as described, for actuating the stops, whereby the barrier may be both raised and lowered by pulleys and weights, substantially as and for the purposes specified.

2. In a railroad-crossing or similar gate having an oscillating barrier with a fixed wheel on its shaft, and a loose clutch-wheel, the combination therewith of a shaft, 46, having two arms or cranks, 57 and 58, stops or pawls 59 and 62, pivoted on said arms, an arm or lever, 48, secured to and extending transversely from the shaft, a support, 51, and suitable mechanism for tripping the support 51, substantially as and for the purposes specified.

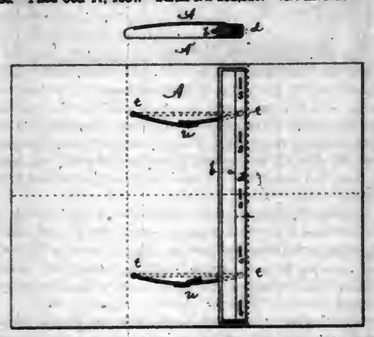
3. In a railroad-crossing or similar gate having an oscillating barrier with a fixed wheel and loose clutch-pulleys on its shaft, and having a rocking arm with locking stops or pawls, the combination therewith of a vibrating arm or lever attached to the rock-shaft of the pawls, a support for the free end of the vibrating arm or lever, and a second vibrating lever, 40, controlled by a trip, and an arm, 73, on the shaft of the last-mentioned lever, which controls the support or trip of the first-named vibrating arm or lever, substantially as and for the purposes specified.



4. In a railroad-crossing or similar gate having an oscillating barrier with a fixed wheel and loose clutch-wheels on its shaft, a rock-shaft with pawls or stops, a vibrating arm for controlling the rock-shaft, a trip, and a second vibrating arm, 40, for controlling the first trip, 51, the combination therewith of a second trip, 34 42, operated by the armature of an electro-magnet, substantially as and for the purposes specified.

5. In a railroad-crossing or similar gate having an oscillating barrier with a fixed wheel and loose clutch-wheels on its shaft, a rock-arm with pawls or stops, trips, and vibrating levers for operating the trips, the combination therewith of a hook, 65, and a trip, 68 and 70, operated from the fixed wheel 8 of the shaft, substantially as and for the purposes specified.

6. In a railroad-crossing or similar gate having an oscillating barrier with a fixed wheel and loose clutch-wheels on its shaft, a rock-arm with pawls and trips, the combination therewith of a tappet, 45, and a cam-arm, 44 75 76, keyed to the shaft of a vibrating lever, 40, and a pin on a rock-arm, 48, whereby the rock-arm is caused to operate the lever 40, substantially as and for the purposes specified.

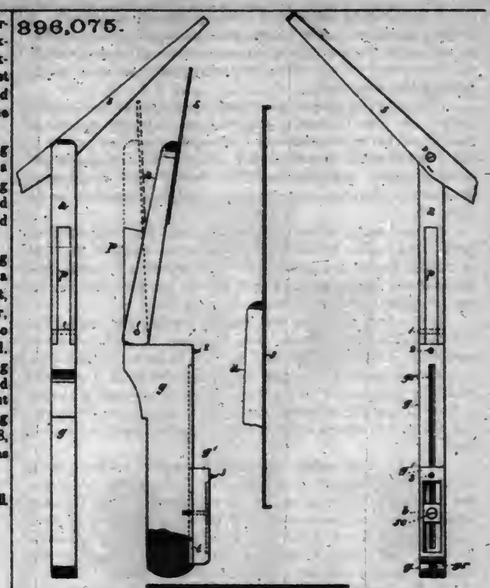


7. In a railroad-crossing or similar gate having an oscillating barrier with a fixed wheel and loose clutch-wheels on its shaft, and rock-shaft and pawls, the combination therewith of an escapement mechanism consisting of the vibrating arm 48, trip 51 54, vibrating arm 40 73, tappet 45, cam-arm 44, hook 65, trip 68 70, fixed wheel 8, trip 34 42, and an electro-magnet and its armature, substantially as and for the purposes specified.

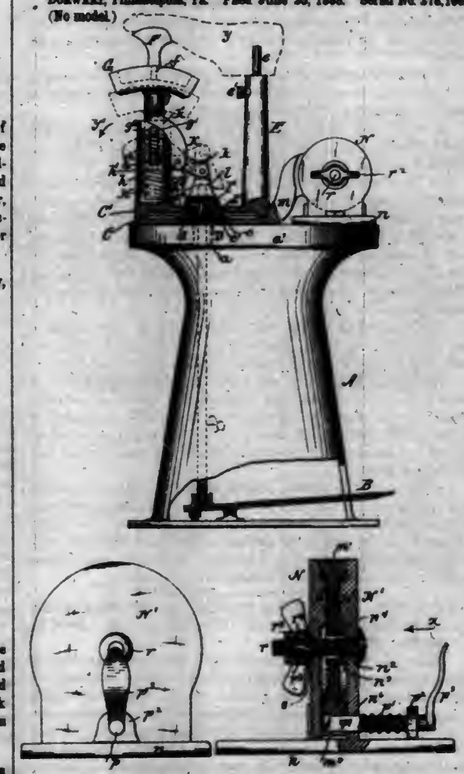
396,073. EMBROIDERY-FRAME. GEORGE W. CORY, Kane, Ill. Filed May 19, 1888. Serial No. 274,445. (No model.)

Claim.—In an embroidery-frame having a stretcher consisting of two circular hoops adapted to each other, as herein described, the combination therewith of a support consisting of two vertical standards secured immovably in a circular lap-board adapted to rest and permit of being rotated horizontally upon the lap of the operator, the inner hoop of the stretcher being pivotally secured at diametrically-opposite points to the upper ends of the standards, as and for the purpose set forth.

396,074. STUB-FILE ENVELOPE. JOHN W. CHRISMANN, Troy, Ohio. Filed Oct. 17, 1887. Serial No. 252,523. (No model.)



Claim.—As a new article of manufacture, a stub-file envelope comprising adhesive flaps with intervening narrow strips of paper and the same attached to the envelope near one end thereof to hold and enfold legal-cap sheets, and elastic straps held in orifices in the back of said envelope to bind the contents thereof, substantially as shown and described.



396,075. SIDING GAGE AND SQUARE. PHILANDER M. CURTIS, Lebanon, Ind. Filed May 10, 1888. Serial No. 273,493. (No model.)

Claim.—The siding-gage herein described, comprising the gage *g*, having the spur 2, the adjustable gage-block *g'*, connected therewith, having the spur 3 upon its face, and the movable arm *a*, hinged to the gage *g*, as shown, and carrying the straight-edge *f*, pivoted at its upper extremity, all combined substantially as shown and described.

396,075.

396,076. HEELING, NAILING, AND FINISHING JACK. GEORGE DORWART, Philadelphia, Pa. Filed June 25, 1888. Serial No. 278,106. (No model.)

Claim.—1. In a heeling, nailing, and finishing jack, the combination of plate C, the plate C', rotating thereon, a post having adjustable pin rigidly secured to plate C', another standard or column rigidly secured to plate C', a spring-supported block, G, on said standard or column, an adjustable toe-rest on block G, and devices for elevating and depressing said block G and toe-rest, substantially as set forth.

2. In a heeling, nailing, and finishing jack, the combination of rotating plate C', the post E thereon, having adjustable pin *e*, the tubular column H, provided with spring-supported block G and toe-rest F, and devices for vertically raising and lowering said toe-rest and block, substantially as set forth.

3. In a heeling, nailing, and finishing jack, the combination of a plate, C, the plate C', rotating thereon, a post, E, rigidly secured to plate C' and having adjustable pin *e*, the spring-supported toe-rest F, and a disk or end, *m'*, secured to plate C and pivoted or hinged to and between parallel clutching-plates N N', having lower permanently-fixed ends or edges and upper free ends or edges, substantially as set forth.

4. In a heeling, nailing, and finishing jack, the combination of plate C', the tubular standard H thereon, having spring A^9, the head or block G, having stem *g*, fitting the bore of standard H, resting upon spring A^9 and having studs or pins *g'*, lever K, toe-rest F, and actuating devices for said lever, substantially as set forth.

5. In a heeling, nailing, and finishing machine, the combination of hinged plate C, the rotating plate C' on plate C, tubular sleeve or connection D between said plates, the post E, having adjustable pin *e*, column or standard H, having spring-supported block G, provided with stem *g*, adjustable toe-rest F on block G, pins or studs *g'* on stem *g*, lever K, engaging with said pins or studs, and devices for operating said lever to depress said block and toe-rest F, substantially as set forth.

6. In a heeling, nailing, and finishing machine, the combination of plates C C', the hollow or tubular sleeve D, connecting said plates the treadle-bar *b*, passing up through said sleeve, a post, E, having adjustable pin *e*, column or standard H, having spring-supported block G, provided with stem *g*, having pins or studs *g'*, and an adjustable toe-rest, F, and a lever, K, engaging with pins *g'* and having a pivoted block, *l*, engaging with bar *b*, substantially as set forth.

7. In a heeling, nailing, and finishing jack, the combination of plate C, having central opening, *c*, with recess *c'* on the lower side of said plate, plate C', having threaded central opening, c^3, and sleeve D, having flange *d*, fitting recess *c'* in plate C and screw-threaded at d^2 for engaging with the threaded opening c^3 in plate C', substantially as set forth.

8. In a heeling, nailing, and finishing jack, the toe-rest head or block G, having in its upper side a series of transverse recesses or slots G', substantially as and for the purpose set forth.

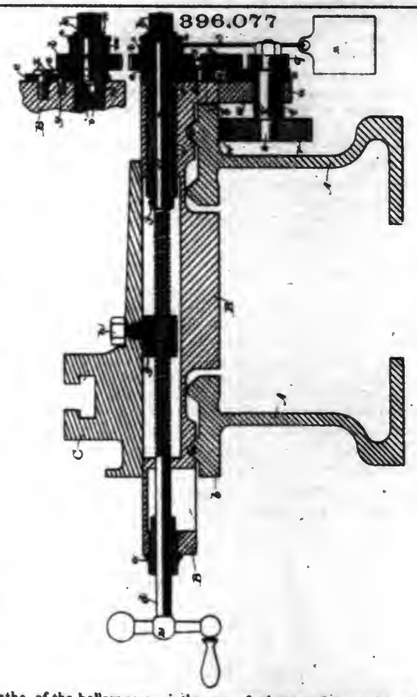
9. In a heeling, nailing, and finishing jack, the toe-rest head or block G, having stem *g* and segmental end in the top of which are transverse recesses G', substantially as set forth.

10. In a heeling, nailing, and finishing jack, the combination of jack-plate C, plate C', rotating thereon, a heel and a toe rest on plate C', a disk or end, *m'*, having opening or recess m^2, and stops m^4, secured to plate C, a bracket, *n*, having integral parallel plates N N', having stops n^2 between, and to which plates N N' said disk or end *m'* is pivoted, a thumb-nut for the pivot for said disk or end, and spring-actuated stop-bar *p*, engaging with opening or recess m^2 in end *m'*, substantially as set forth.

11. In a heeling, nailing, and finishing jack, the combination of plates N N', having clamping bolt and nut r r^2, the plate end *m'*, pivoted to said plates N N', and stop-bar *p*, substantially as set forth.

12. In a heeling, nailing, and finishing jack, the combination of plates N N', united by base-plate *n* and having central apertures, a tubular bearing, n^4, and an opening, n^5, in one of said plates, stops n^2 on plates N N', bolt and nut clamp r r^2, stop-bar *p*, and plate end *m'*, pivoted on bearing n^4 and having stop m^4 and peripheral slot m^3, substantially as set forth.

13. In a heeling, nailing, and finishing jack, plate C, provided with arm *m* and disk or plate *m'*, pivoted to clutching-plates having stops for limiting the movement of said plate *m'* on its pivot, and a stop-bar for locking it in its normal position, in combination with plate C', swiveled to plate C, and heel and toe rest supports or posts rigidly secured to said plate C', substantially as set forth.

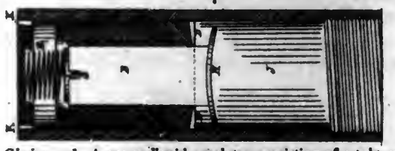


396,077. MACHINE FOR TURNING AND GRINDING TAPERS.

JOSEPH FLATHER, Nashua, N. H. Filed July 26, 1888. Serial No. 280,963. (No model.)

Claim.—1. The combination of bed A, provided with rack *w*, saddle B, arranged to move on ways *a* and provided with tool-post slide C, screws *d i*, having independent rotative action, but secured from relative lineal displacement, a threaded connection between screw *d* and the tool-post slide, and a system of gearing connecting the rack with screw *i*, and through screw *d* with tool-post slide C, whereby the lineal movement along bed A may impart a rotary movement to screw *i* and a movement to screw *d* and slide C transverse to said bed, substantially as specified.

2. The combination of bed A, its rack *w*, saddle B, tool-post slide C, screws *d i*, and a train of gears engaging said rack and screw *i*, all arranged to operate substantially as specified.



3. The combination, with the tool-support of a metal-turning

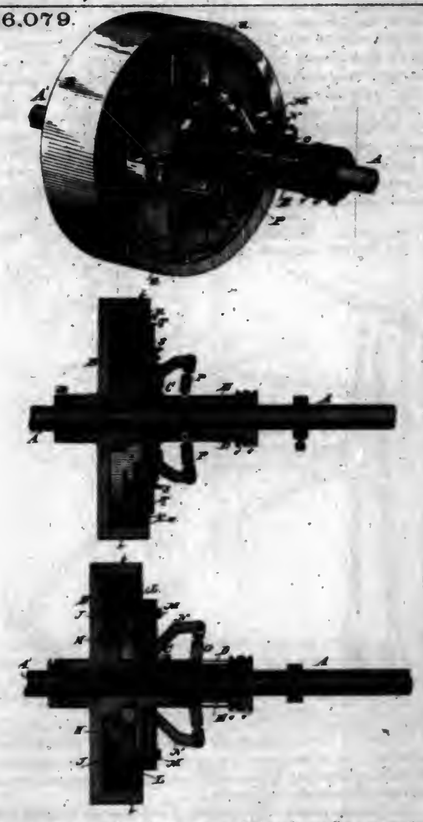
lathe, of the hollow screw *i*, the cross-feed screw *d*, journaled in and interlocked with said hollow screw, a rack, and the gear mechanism connected with said rack and hollow screw, all substantially as specified.

396,078. APPARATUS FOR REGULATING AND CONTROLLING THE EXIT OF GAS OR LIQUIDS.

CHARLES S. FORD, Sr., Philadelphia, Pa., assignor to Charles T. Hallowell and Frank W. Shriver, both of same place. Filed Mar. 29, 1883. Serial No. 268,909. (No model.)

Claim.—1. A gas or liquid regulator consisting of a tube with grooves in its lower end, a post adapted to slide in the bore of said tube and having secured to its lower end a disk or diaphragm, a second disk with openings therein, and a spring between second diaphragm and post, the said post being fitted in said tube so as to form passages leading from end to end thereof, said parts being combined substantially as described.

2. A gas or liquid regulator consisting of a tube having radial grooves in its lower edge, an angular post in the bore of said tube, forming passages between said post and tube, a perforated disk above said post, a spring between said disk and post, and a disk connected to the lower end of said post, said parts being combined substantially as described.



3. A gas-regulator consisting of the tube or cylinder A, having the radial grooves D at its lower end, the angular post B, adapted to slide within the tube A, and having the diaphragm H secured to its lower end, the pin-piece G, secured to the upper end of the post B, the diaphragm F, having the perforations K, and the spring E between said diaphragm F and pin-piece G, said parts being combined substantially as described.

396,079. CLUTCH.

JAMES GIBBONS, Springfield, Mass. Filed June 22, 1887. Serial No. 242,195. (No model.)

Claim.—1. The combination, in a clutch, of friction engaging mechanism and positive engaging mechanism, each independently operative, two operating-collars supported on the same shaft with the clutch, and levers connecting the collars with their respective parts, whereby the movement of one collar causes the friction engaging

396,079.

mechanism to operate and movement of the other collar causes the positive mechanism to operate, and a stop to prevent the operation of the positive mechanism until the friction mechanism is fully operated, substantially as shown and described.

2. A clutch having friction parts and positive engaging-jaws operating independently, and a stop whereby the positive operative mechanism cannot be brought into action until after the friction-connection is made, substantially as shown.

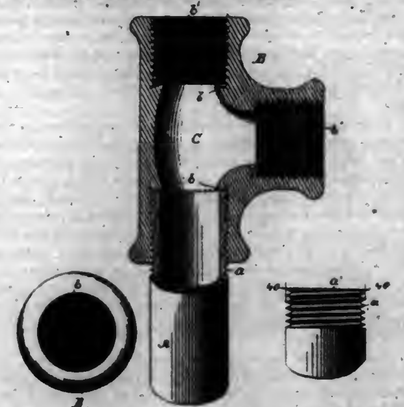
3. A clutch having positive jaws, one or both sets of which have inclined faces, one set of which give sidewise, whereby the other set will engage therewith when forced in contact, substantially as described.

4. In a clutch, the combination of a shell, as B, having jaws, as H, and a friction-surface, as *b*, with a plate, as C, carrying movable jaws, as J, and friction-blocks U, and means whereby the said movable parts are operated, substantially as shown.

5. In a clutch, the combination of a plate provided with movable jaws, as J, and inclined pieces L, engaging therewith, as shown, and bell-crank levers to move the pieces L, whereby the jaws are caused to traverse the incline and be moved to engage or disengage the jaws on a part, as B, substantially as shown.

6. In a clutch, the combination of independently-operating positive and friction engaging means with a stop to prevent operation of the positive mechanism until the friction mechanism is home, and means to cause the stop to cease to act by the complete operation of the frictional mechanism, substantially as shown.

7. A shell or part, as B, provided with positive locking-jaws, in combination with a plate or part, as C, having jaws, as J, movably secured thereto, and inclined pieces L, secured to parts M, and a collar, as E, connected with the parts M through the levers, as O and N, substantially as shown.

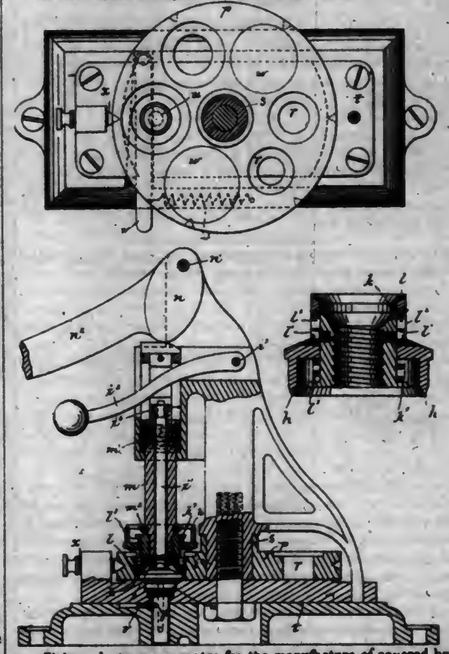


8. In a clutch having friction and positive engaging mechanism, the combination of two collars, as D and E, one being connected with the friction mechanism and the other with the positive mechanism, and a stop operating to prevent the locking movement of the positive locking means until the friction locking means is operated, said collars being connected with the jaws and friction-blocks by a system of levers, substantially as shown.

9. The combination of collars E D, one partially within the other, with plate C, having movable jaws and friction-blocks, and shell B having jaws, as H, and the connecting-levers O and P, and bell-crank levers, all substantially as shown.

10. Collars D E, having operating-levers provided with adjusting-collars *l*, in combination with positive and frictional engaging means and connecting-levers, substantially as described.

396,080. PIPE-JOINT.



JOHN A. GILLIAN, Kansas City, Mo. Filed Feb. 14, 1888. Serial No. 263,937. (No model.)

Claim.—A metal pipe-connection having an internal screw-threaded recess, the end walls of which are inclined from the bottom of the recess toward the end of the connection, and being of a diameter greater than that of the threads; in combination with an externally-threaded pipe adapted to enter said metal pipe-connection and be expanded by said end walls to fill said recess, in the manner and for the purpose substantially as described.

396,081. BUTTON-MACHINE.

JAMES M. GOTENDORF, Jr., Paris, France, assignor to Brunt Good, New York, N. Y. Filed Mar. 20, 1888. Serial No. 268,702. (No model.) Patented in France Dec. 10, 1886, No. 180,212, and in Belgium July 8, 1887, No. 78,153.

Claim.—1. In an apparatus for the manufacture of covered buttons, the combination, with a sliding plunger provided at its lower end with a punch, as *i*, whose acting face is outwardly beveled and hol-

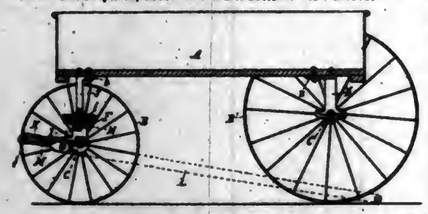
lowed, of a second independent punch, as *k*, secured to said sliding plunger in concentric relation to the first-mentioned punch, and having an inwardly-beveled acting face, whereby simultaneously with the clinching of the neck of the button the teeth of its collet may be forced inward and into the covering fabric, substantially as set forth.

2. In an apparatus for the manufacture of covered buttons, the combination, with a tubular sliding plunger provided with an inner stem, as i^2, arranged to slide independently of said plunger, and carrying at its lower end a punch, as *i*, of a second punch, as *k*, secured to the lower end of said sliding plunger in concentric relation to the first-mentioned punch, whereby the punch *i* may be brought down independently and in advance of punch *k*, for pushing the parts of the button into proper position for being acted upon, and simultaneously with the clinching of the neck of the button the teeth of its collet may be forced inward and into the covering fabric, substantially as set forth.

3. In an apparatus for the manufacture of covered buttons, the combination, with a sliding plunger provided at its lower end with a punch, as *i*, whose acting face is beveled and hollowed, as shown, of a second independent punch, as *k*, secured to said sliding plunger in concentric relation to the first-mentioned punch, and having an inwardly-beveled face and a gathering-tool, as *l*, adapted to receive the collet of the button, and having an inwardly-beveled acting face and fitted to slide on punch *k*, and a spring, as l^3, the parts being arranged whereby, first, the edges of the covering fabric are turned inwardly; second, the teeth of the collet are forced into said fabric, and, third, the neck of the shell of the button is clinched over the collet, all in one operation without change or readjustment of the operating-tools, substantially as set forth.

4. In an apparatus for the manufacture of covered buttons, the combination, with the sliding plunger, of punch *k* and a combined gathering-tool and ring-cutter, the latter reversible on the punch *k*, substantially as set forth.

5. The sliding plunger *m*, screw-threaded at its lower end and provided with abutment m^2, in combination with punch *k*, formed with an interior nut, and the combined gathering-tool and ring-cutter *l k*, substantially as set forth.



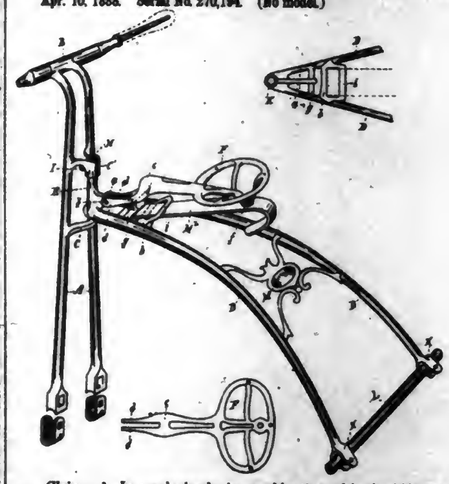
6. In an apparatus for covering the buttons herein described, the rotary die and cutter bed-plate, in combination with the cam and spring-actuated rectilinearly-movable punching, gathering, and cutting tools, substantially as specified.

7. In an apparatus for covering buttons, the combination, with the rotary die-plate, of a base-plate fitted with a spring-follower and a latch for securing said spring-follower depressed, substantially as set forth.

8. In an apparatus for covering buttons, the combination, with the rotary die-plate provided with a series of cavities, as *r*, of a base-plate fitted with a spring-follower having a head co-operating with said cavities, and a stem provided with a notch, as v^2, and a spring-actuated latch, *v*, co-operating with the notch in the follower-stem, substantially as and for the purpose set forth.

9. In an apparatus for covering buttons, a recessed base-plate, *t*, fitted with a headed spring-follower, a spring-actuated latch, as *v*, a rotary die-plate provided with a series of cavities, as *r*, and mounted to rotate about a central pillar, *s*, immediately over said base-plate, combined and co-operating with a punch-plunger, substantially as and for the purpose set forth.

396,082. WAGON RUNNING-GEAR. FRANK H. HARRIS, Toledo, Ohio. Filed Apr. 10, 1888. Serial No. 270,193. (No model.)



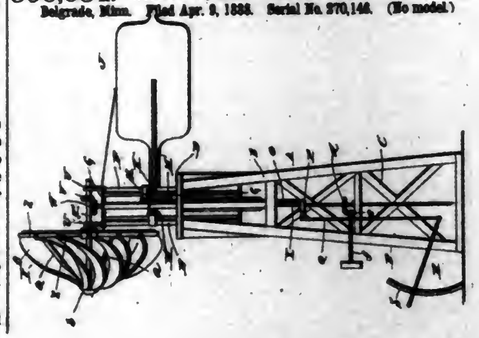
Claim.—1. The combination, in a wagon running-gear, of the front axle, the arched cap secured to said axle, the recess formed on the under side of said cap, the screw-threaded king-bolt engaging into said cap, and the nut for securing said king-bolt engaging into the recess of said cap to keep it from turning off, and the arched bolster supported by said cap, substantially as described.

2. The combination, with the front and rear axles of an express wagon, of the clamping-boxes E, consisting of the upper part, *a*, integrally formed with the axle-cap or support, and provided with the lip *c* and the part *b*, secured thereto and provided with the hook *d*, substantially as described.

3. The combination of the front axle, C, the axle-cap D, secured thereto, the forwardly-projecting bounds K, integrally formed therewith and provided with the inwardly-projecting hooks *j*, the pole L, and the draft-irons M, provided with the eyes *k* at their rear ends and secured to the pole at their forward ends, substantially as described.

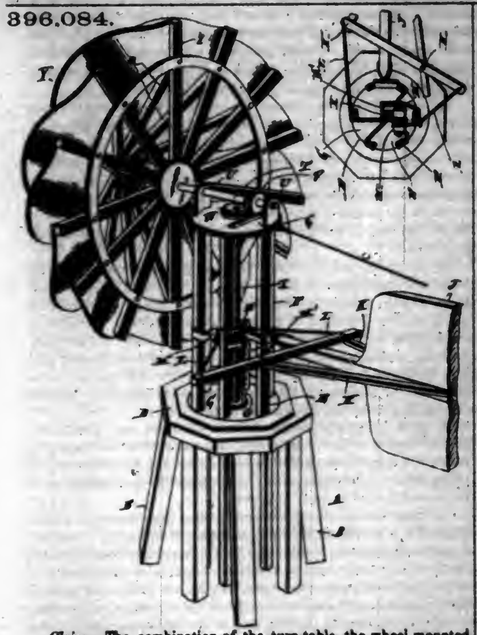
4. In a wagon running-gear, the combination, with the front axle, C, of the arched cap D, the clamping-boxes E, securing it to the front axle, the recess G, formed in the under side of the cap, the circular bearing F, formed on top of the cap D, the arched bolster J, secured to the wagon-body and provided with the circular bearing-plate *i*, the screw-threaded king-bolt I, and the king-bolt nut H, seated in the recess of the cap D, substantially as described.

396,083. VELOCIPEDE. FRANK H. HARRIS, Toledo, Ohio. Filed Apr. 10, 1888. Serial No. 270,194. (No model.)



Claim.—1. In a velocipede, in combination with the bifurcated backbone, a spring seat-support secured at one end to the seat-frame and slidingly engaging at the other end between cross-bars in the backbone, substantially as described.

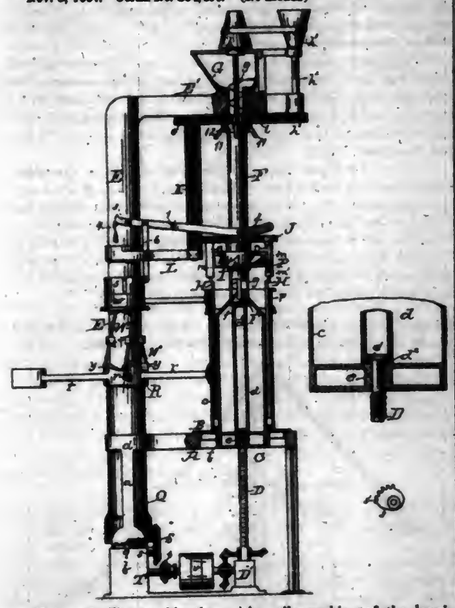
2. The combination of the bifurcated backbone, the saddle-frame pivotally secured thereto at its forward end, and the spring seat-support held at its forward end between the cross-bars in the bifurcation of the backbone and secured at its rear end to the rear end of the saddle-frame, substantially as described.



3. In a velocipede, the combination of the saddle-frame provided with the shank *c*, bifurcated at its forward end and terminating in the ears *d*, the backbone provided with the bracket *a*, having the rearward extension *j*, engaging between the bifurcations of the saddle, and the seat-supporting spring M', supporting the rear end of the seat, substantially as described.

4. The combination, with the bifurcated backbone D, of the saddle-frame provided with the shank *c*, bifurcated upon its forward end, the rearwardly-projecting arm *a* of the backbone, to which the forward end of said shank is pivotally secured, the rearward extension *j*, engaging between the bifurcations of the saddle-frame, the cross-bars *g*, *h*, and *i*, integrally formed with the backbone, and the seat-supporting spring M', supported at its forward end between these cross-bars upon all sides and at its rear end to the saddle-frame, substantially as described.

396,084. WINDMILL. NILS P. HISS and CHRR. VESTERGARD, Belgrade, Minn. Filed Apr. 9, 1888. Serial No. 270,146. (No model.)



396,084.

Claim.—The combination of the turn-table, the wheel mounted thereon, the vane hinged to the turn-table, the cord secured to the vane and passing around the wheel, and the vertically-movable rack-bar meshing with said wheel, as and for the purposes specified.

396,085. TILE-MACHINE. FRANK M. HIGBY, Chicago, Ill. Filed Nov. 5, 1887. Serial No. 254,400. (No model.)

Claim.—1. The combination, with a tile-machine, of the longitudinally-vibrating tamping-bars revolving horizontally around a common center, a vertically-reciprocating central core, and a removable mold surrounding the same between which the tiles are made.

2. In a tile-machine, the combination, with the mold and core, of a series of tamping-bars operating between the mold and core, a revolving cam or lifting plate which imparts longitudinal vibrations to the tamping-bars, and supporting-frames for the tamping-bars, the said tamping-bars, cam or lifting plate, and supporting-frames being connected to move vertically together upon a support extending in the same direction as the axis of the mold, upon which they are free to slide, whereby as the material is fed into the mold the cam-plate and tamping-bars are automatically moved simultaneously to accommodate themselves to such material, substantially as set forth.

3. In a tile-machine, the combination of a series of longitudinally-vibrated tamping-bars, a core and mold having its upper end increased in diameter, supports for the tamping-bars movable in the direction of the axis of the tile being formed, and also free to be moved radially, and spreaders which move the said supports and tamping-bars radially from their common center, substantially as and for the purpose set forth.

4. The combination, with a tile-machine, of the tamping-bars having a longitudinally-vibrating motion and moving around a common center, so that they together form a circle struck from said center, a removable mold, and a vertically-reciprocating core between which the tile is made.

5. In a tile-machine, the combination, with a core and mold, of a series of vibrating tamping-bars and an oscillating former adapted to be brought into contact with the inner surface of the tile being formed to produce a shoulder thereon, mounted upon a rotating support within the tile, substantially as described.

6. In a tile-machine, the combination, with a series of independently-acting tamping-bars placed an equal distance from a common center, a mold and core of a hollow vertical shaft arranged concentric with the said common center of said tamping-bars above and in alignment with the center of said core, and a spiral conveyer therein, said conveyer and shaft revolving independently one from the other, as set forth.

7. In a tile-machine, the combination, with a core and mold, one revolving relatively to the other, of a series of tamping-bars, movable formers carried by the core at its upper end adapted to engage with the interior of the tile to form a shoulder therein, and spreaders connected with the said formers to move them outward into contact with the tile when the tamping-bars have reached the upper end of the mold, substantially as described.

8. In a tile-machine, the series of longitudinally-vibrating tamping-bars, in combination with a mold having its upper end flared outward, a core, and spreading-blocks 16 and miter-blocks 17, as described, attached to the upper end of said core for making a shoulder in the upper end of said tile between said flared end of the mold and said core.

9. In a tile-machine, the combination, with the vertically-reciprocating core, a removable mold, and a platform upon which the same are supported, of a vertical shaft in alignment with the center of said core, and above and independent of the same a circular frame for supporting and directing the movements of the tamping-bars, and said tamping-bars.

10. In a tile-machine, the combination, with a vertically-reciprocating core, a removable mold, and a platform for supporting the same, of a vertical shaft in alignment with and above the center and independent of said core, a series of tamping-bars, and circular frame for supporting and directing the same and revolving around the center of said shaft, said tamping-bars having a longitudinal vibration, as set forth.

11. In a tile-machine, the combination, with a removable mold, a vertically-reciprocating core, and platform for supporting the same, of a vertical shaft above and in alignment with the center, but independent of said core, a series of tamping-bars having lateral arms at or near their upper ends, the cam-wheel I, having one or more cam-surfaces on its periphery and revolving with said shaft, and a circular frame for supporting and directing the vibrations of said tamping-bars.

12. In a tile-machine, the combination, with a mold, core, and platform for supporting the same, of a vertical shaft above and in alignment with the center of said core, a series of tamping-bars having transverse arms near their tops, gear-wheel revolving independently around said shaft having hangers depending from its arms with guides thereon for directing said tamping-bars, and cam-wheel I, fast to said shaft, having several cam-surfaces around its circumference.

13. The combination, with the mold, core, and platform supporting the same, of shaft F, tamping-bars H, having transverse arms near the upper ends with friction-rollers journaled in them, gear J, hangers *m*, depending from the arms thereof, having guides *m'* thereon, and cam-wheel I, having several cam-surfaces around its circumference and so mounted on said shaft as to revolve therewith, but having an independent vertical movement, substantially as and for the purpose set forth.

14. In a tile-machine, the combination, with the mold, core, and platform supporting same, of shaft F, cam-wheel I thereon, having cam-surfaces *k*, tamping-bars H, having lateral arms projecting from them near their upper ends, gear J, revolving around shaft F independently thereof, and inverted-L-shaped hangers *m*, having suitable guides on their vertical arms for directing the movement of said tamping-

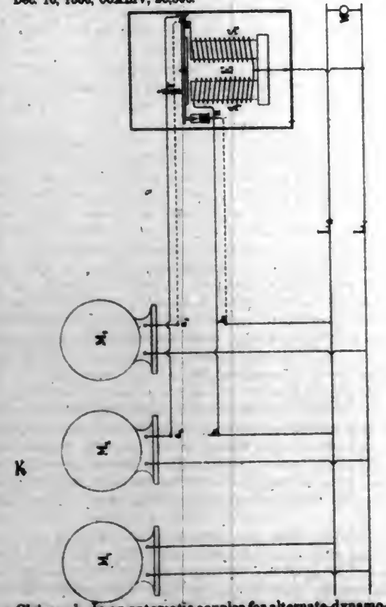
bars and secured to the arms of gear J by straps, in combination with spreading-bars 11, as set forth.

15. The combination, with tamping-bars H, gear J, and inverted-L-shaped hangers *m*, secured to the arms of said gear by straps and expansion-spring 9, of spreading-bars 11, as set forth.

16. The combination, with the tamping-bars having laterally-projecting arms at or near their upper ends, friction-rollers *n n* on the ends of said arms, hangers *m*, having guides *m'* thereon, and frames from which said hangers depend, of the cam-wheel I, having cam-surfaces *k* around its periphery.

17. The combination, in a tile-machine, with the core, a sleeve, *d*, arranged centrally and vertically therein, and screw-shaft D, having its upper end stepped to a less diameter, as shown, of shaft F, above and in vertical alignment with the center of said sleeve, whose upper end edges slip around the lower end of the heel of said shaft and are of such shape as to transmit the motion imparted to it by the screw D thereto.

18. In a tile-machine, the combination, with a screw-shaft, D, having its upper portion stepped to a less diameter and provided with a head at its upper extremity, the circumference of which is serrated, of the vertically-reciprocating core having a central boss in its bottom tapped to receive said screw, and a vertical central sleeve having its lower end edges flanged inward and serrated with reference to the serrated head of said screw.



19. In a tile-machine, the combination, with the mold and core having a truncated-cone-shaped top, of the hollow shaft F, having its lower end open and connected to a casting, F', which rests upon the said truncated part of the top of said core when the latter is at the limit of its upward movement, and has its sides beveled in alignment with the sides of said core top and converging to a common point.

20. In a tile-machine, the combination, with mold C, of the revolving boss R and radiating arms *r r* thereof, having their ends bifurcated and embracing said mold, substantially as and for the purpose set forth.

21. In a tile-machine, the combination, with a mold, of the cam *s*, the sleeve Q, collar R, and arms *r*, having their ends bifurcated.

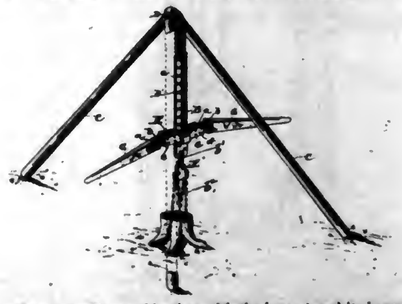
22. In a tile-machine, the combination, with a mold, of the cam *s*, the sleeve Q, collar R, and arms *r*, having their ends bifurcated, said cam having a series of cogs on its major radius, which, after said cam has raised said sleeve a distance corresponding to the difference between the major and minor radius of said cam, are adapted to engage a series of cogs, *q*, on the lower edge of said sleeve and revolve it a distance corresponding to that between said arms.

396,086. SYNCHRONIZING DEVICE FOR DYNAMO-ELECTRIC MACHINES. CARL HOFFMANN, Berlin, Germany, assignor to Siemens & Halske, same place. Filed Dec. 2, 1887. Serial No. 256,590. (No model.) Patented in Germany Sept. 15, 1886, No. 39,680; in Belgium Nov. 26, 1886, No. 75,380; in France Nov. 29, 1886, No. 179,969, and in Italy Dec. 10, 1886, CCXLIV, 20,898.

Claim.—1. In an automatic coupler for alternate-dynamo-electric machines, the combination, with a main circuit and auxiliary generator, of a magnet provided with two coils, one of the said coils being included in the main circuit and the other of the said coils being included in the circuit of the auxiliary generator, and an armature adapted when moved by the said coils to include the said auxiliary generator in the main circuit, as and for the purpose described.

2. In an automatic coupler for alternate-dynamo-electric machines, the combination of a main external circuit, an auxiliary generator, a magnet, coils surrounding the said magnet, one of the said coils having its ends connected to the main external circuit, the other of the said coils having its ends connected with the poles of the auxiliary generator, and an armature provided with a retracting device, adapted to include the auxiliary generator in the main circuit when moved by the said magnet, as and for the purpose described, and substantially as set forth.

3. In an automatic coupler for alternate-dynamo-electric machines, the combination of a main external circuit, an auxiliary generator, a magnet, coils surrounding the same, one of the said coils having its ends connected to the main external circuit, the other of the said coils having its ends connected with the poles of the auxiliary generator, and an armature electrically connected with the said auxiliary generator and adapted when moved by the said magnets to include the said generator in the main circuit at the time their impulses coincide, as and for the purpose described.

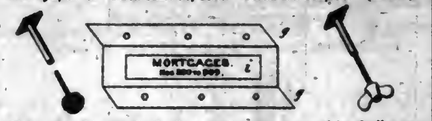


4. In an automatic coupler for alternate electrical generators, the combination, with a main circuit and an auxiliary alternate generator, of a magnet provided with an armature adapted to include the said generator in the main circuit at the moment their impulses coincide, as and for the purpose described.

5. In an automatic coupler for electrical generators, the combination of a main external circuit, consisting of two leads, L' and L^2, an auxiliary generator having one pole thereof connected with the lead L' of the main circuit, a horseshoe-magnet, around one leg of which is a coil, the ends of which are connected to the two leads of the main circuit, and around the other leg of which is a coil, one end of which is attached to the free pole of the said generator and the other end to the lead L', and an armature connected with the said pole to which the coil is attached, and adapted when moved by the magnet to form an electrical connection with the lead L^2 of the main circuit, as and for the purpose described.

6. In an automatic coupler for electrical generators, the combination of a main external circuit, an auxiliary generator, having one pole thereof connected with the corresponding lead of the main circuit, a horseshoe-magnet, around one leg of which is a coil connected with the main external circuit, and around the other leg of which is a coil, one end of which is connected to the same lead of the external circuit that is connected with one pole of the auxiliary generator, the other end of the said coil being connected to the other pole of the generator, and an armature adapted to include the said generator in the main circuit when moved by the said magnet, as and for the purpose described.

7. In an automatic coupler for electrical generators, the combination of a main external circuit having two leads, L' and L^2, an auxiliary generator having one pole thereof connected with the said lead L', a horseshoe-magnet, one leg of which is excited by a current derived from the main circuit, and the other leg of which is excited by a current from the auxiliary generator, and an armature adapted when moved by the said magnet to include the said generator in the main circuit, as and for the purpose described.

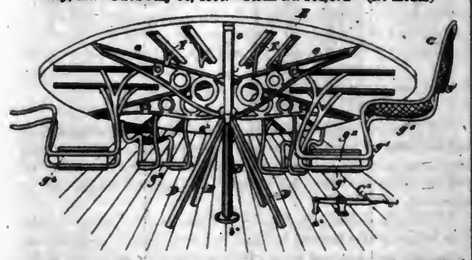


396,087. STUMP-EXTRACTOR. HARRY HOLLOWELL, Longville, Pa. Filed July 11, 1888. Serial No. 279,857. (No model.)

Claim.—1. The combination, with the lever A and its hanger B, and the perforated bar D', having link *b'*, and shouldered plate E', of the arms E, having projections *g*, adapted to be secured in the perforations *e* and bear against the upper edge of the lever in the curved recesses *d*, substantially as and for the purpose specified.

2. The combination, with the lever A and its hanger B, of the fulcrum-plates *a*, secured to the lever at each side and forming recesses, wherein the ends of the hanger to which the lever is fulcrumed extend, substantially as shown and described.

396,088. RECORD OR OTHER FILE. FREDERICK J. HOWARD, Brooklyn, N. Y. Filed Mar. 30, 1887. Serial No. 232,999. (Model.)



Claim.—1. The method of preparing paper or other similar material to be bound by a consecutive binding in a volume by the application of adhesive material to a portion of the surface of each of the sheets of such paper for the purpose of securing sheet to sheet, and providing suitable holes in the same for metal screws to pass through, such holes and adhesive substance being for the purpose of constituting a permanent volume, substantially as and for the purpose set forth.

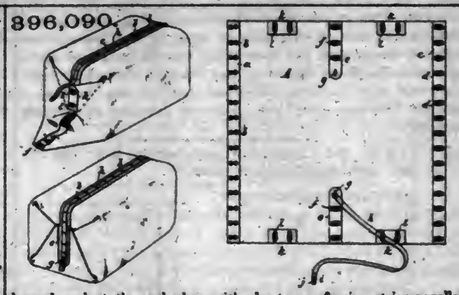
2. The process of filing legal records or other papers in a consecutive binding by preparing such papers with adhesive material upon the surface of the separate sheets, providing suitable holes for a fastening device, fastening the same within the covers, one or more sheets at a time, by the use of such adhesive material and of metal fastening devices, completing the binding by the use of a proper back and permanent fastening devices, substantially as and for the purpose set forth.

3. The combination, in a record or other file, of written or printed matter in sheets previously prepared by the application of adhesive material to the surface of the separate sheets, a metallic fastening device for rigidly fastening the same at one side or end by a consecutive binding by single sheets within suitable covers, so that the sheets are held as a solid volume capable of being changed to a permanent binding of said covers, and of suitable devices for completing the permanent volume, substantially as and for the purpose set forth.

396,089. ROTARY DINING-TABLE. DANIEL JOHNSON, Kansas City, Mo. Filed July 30, 1888. Serial No. 281,474. (No model.)

Claim.—1. The combination, with a rotating table, of a vertical rotating power-shaft adapted to support and rotate said table, suspensory rods adjustably attached to said table, and a seat connected with said rods adapted to rotate in unison with said table, as described.

2. The combination, with a rotating table provided with supporting-guides on its under portion, of a vertical power-shaft adapted to rotate and support said table, suspensory rods adjustably attached to and beneath said table in said guides, and a vibrating seat or seats attached to said rods and rotating with said table, as described.

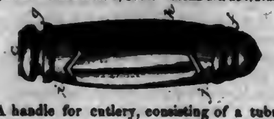


3. The combination, with a rotating table provided with supporting-guides on its under portion, of a vertical power-shaft adapted to support and rotate said table, suspensory rods adjustably attached to and beneath said table in said guides, a seat pivotally attached to said rods, and a counterbalancing-weight attached to said seat, for the purpose described.

396,090. SAMPLE PACKAGE OR WRAPPER. HENRY H. JOHNSON, New York, N. Y. Filed May 23, 1888. Serial No. 275,313. (No model.)

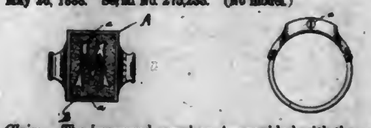
Claim.—1. A wrapper for sample and other packages, consisting of a sheet of flexible material provided at one edge with eyelets, at the opposite edge with staples arranged to pass through said eyelets when the edges are overlapped, and at one end edge with a strap so positioned that when the wrapper is folded the strap may pass through the staples, and at the other end edge with means for fastening and securing the free end of the strap, substantially as described.

2. A wrapper for sample and other packages, consisting of a sheet of flexible material having re-enforcing strips on its two side edges, one of said strips being provided with eyelets and the other with staples arranged to pass through said eyelets when the edges are overlapped, and at the end edges with short re-enforcing strips parallel with and intermediate the side strips, one of said side strips provided with a strap adapted to pass through the staples when the wrapper is folded, and the other end strip with means for fastening and securing the free end of the strap, substantially as described.



396,090.

3. A wrapper for sample and other packages, consisting of a sheet of flexible material provided at one of its side edges with a series of staples, at the opposite side edge and end edges with series of eyelets, said eyelets being relatively arranged to register with each other and with the staples when the wrapper is folded, and a strap secured near one end edge and arranged to lock the staples within the eyelets when the wrapper is folded, and a loop or eyelet in the free end of the strap for engaging a staple near the other end edge, substantially as and for the purposes described.

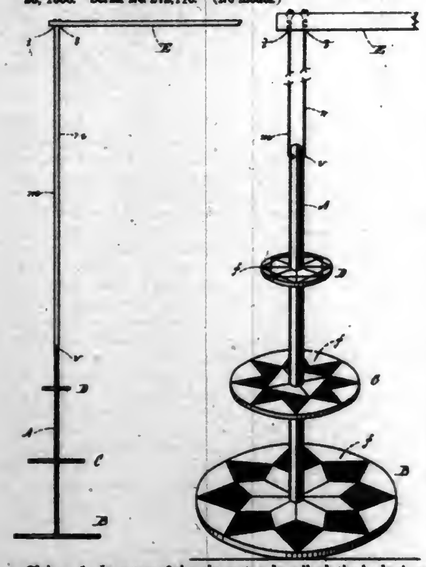


4. A wrapper for sample and other packages, consisting of a sheet of flexible material having re-enforcing strips *a e* on its side edges, in one of which is secured a row of staples and in the other a corresponding row of eyelets, re-enforcing strips *c c* at central points between the strips *a c* and parallel therewith, re-enforcing strips *k k* at the end edges intermediate the strips *a c* and *c c*, said strips *c* and *k* being provided with eyelets, and a locking-strap attached to one of the strips *c*, and adapted to pass through the staples when the wrapper is folded and be locked to a staple in the other strip *c*, substantially as described.

396,091. HANDLE FOR CUTLERY. FREDERICK R. KALDENBERG, New York, N. Y. Filed Dec. 9, 1887. Serial No. 257,472. (No model.)

Claim.—A handle for cutlery, consisting of a tubular shank or core provided with a flange at one end, and having a screw-threaded extremity fitting a threaded socket in an end section, and intermediate sections mounted on said shank to form a solid handle, as set forth.

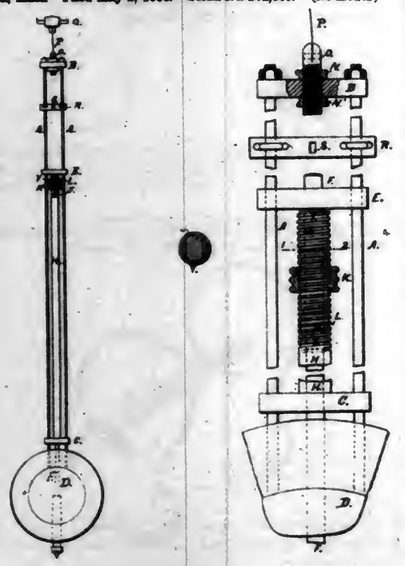
396,092. GEM-SETTING. DAVID KUTNER, Brooklyn, N. Y. Filed May 26, 1888. Serial No. 275,233. (No model.)



Claim.—The improved gem-box A, provided with the set-screws *a a*, terminating in the flattened portions *a' a'*, in combination with the gem B, provided with the slotted opening *b*, substantially as and for the purpose set forth.

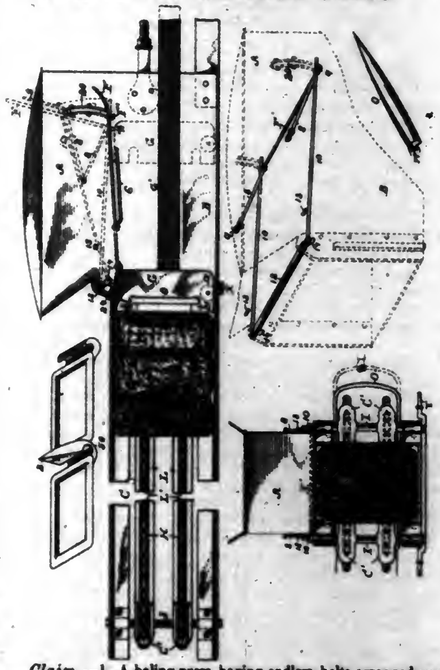
396,093. HARROW-TOOTH. GEORGE A. LAKE, Sherman, Mich. Filed June 29, 1888. Serial No. 278,532. (No model.)

Claim.—The combination, with a harrow-frame, of the curved spring-teeth B, each of which has an upper nearly circularly bent portion, a downwardly and frontwardly curving lower end, and a curved shoulder above said lower end, whereby the teeth are prevented from entering the soil above said shoulders, and the frame is prevented from descending to the ground at any point, substantially as specified.



396,094. TOY. EBENEZER F. LANE, Swanzey, N. H. Filed Apr 28, 1888. Serial No. 272,110. (No model.)

Claim.—1. In a toy of the character described, the body A, provided with a series of wheels of different sizes arranged in regular gradation, as B C D, the stock E, and the double cord *m*, combined and arranged to operate substantially as set forth.



2. In a toy of the character described, a body, as A, provided with a series of graded wheels secured thereon, as B C D, said wheels being ornamented or provided with figures, &c., to adapt them to produce kaleidoscopic effects when rotated, in combination with a stock, as E, and a double string, as *m*, connecting said body and stock, all being arranged to operate substantially as specified.

396,095. COMPENSATION PENDULUM. ALVIN LAWRENCE, Lowell, Mass. Filed May 2, 1888. Serial No. 272,805. (No model.)

Claim.—In a compensation pendulum, the combination, with the screw-nut, of a segmental or slotted cylinder having screw-threads thereon, and a rod fitting within said cylinder and also having screw-threads thereon, the nut engaging the threads of both the cylinder and the rod whereby the cylinder and rod are connected together by said nut, substantially as described.

396,096. BALING-PRESS. WINFIELD S. LIVINGOOD, Kansas City, Mo. Filed Feb. 11, 1888. Serial No. 263,701. (No model.)

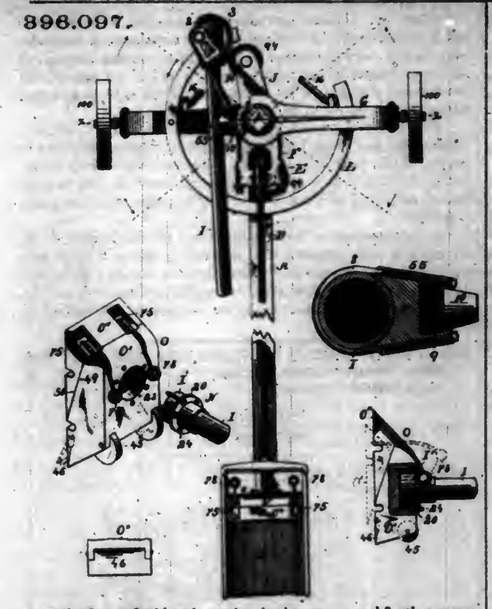
Claim.—1. A baling-press having endless belts arranged upon opposite sides of the baling-chamber, and provided with teeth which engage the material while being compressed, and also prevent it from moving backward when the plunger is withdrawn, substantially as described.

2. The combination of a baling-chamber, endless chains located upon opposite sides thereof, and provided with teeth for engaging the compressed material, and brakes for controlling the movement of the chains, as set forth.

3. In a baling-press, a baling-chamber provided with endless chains having laterally-projecting teeth which engage the compressed material during the passage through the chamber, substantially as described.

4. In a baling-press, a baling-chamber provided with endless chains traveling over sprocket-wheels, in combination with brakes for regulating the friction imparted to said wheels, substantially as described.

5. In a baling-press, a pair of levers pivoted at their rear ends to a horizontal bar, said horizontal bar arranged to be moved in a vertical plane, suitable fulcrums for said levers, and devices, substantially as described, for raising and depressing the free ends of said levers substantially as set forth.



6. In a baling-press, a feeding-apron connected to a compressing plunger, in combination with a feed-hopper and a press-box, levers arranged on either side of the hopper, and having their rear ends connected to a horizontal bar which extends across the hopper, and which is movable in a vertical plane, suitable fulcrums for said levers, and devices, substantially as described, connected with said apron for raising the free ends of the levers, substantially as set forth.

396,097. BALING-PRESS. WINFIELD S. LIVINGOOD, Kansas City, Mo. Filed Mar. 9, 1888. Serial No. 266,743. (No model.)

Claim.—1. In a baling-press, a pitman-rod provided with a bumper consisting of a hard base, a rubber cushion, and metallic contact-piece located upon the outside of the rubber, in combination with a stirrup for securing them to the pitman, substantially as described.

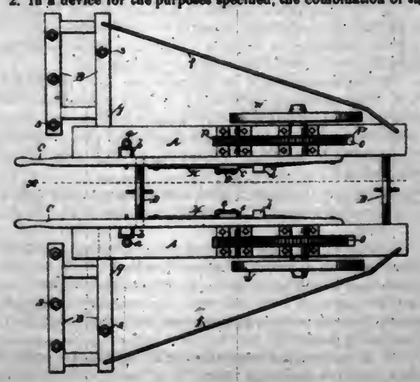
2. In a baling-press, a plunger-head consisting of a main section, in combination with a counterbalanced section hinged to and hanging

396,097.

over the front of said main section, in the manner and for the purpose described.

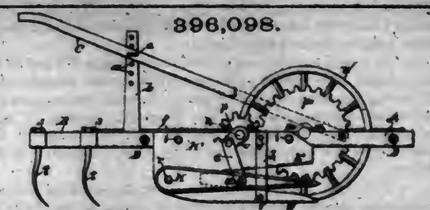
3. In a baling-press, a plunger-head composed of two sections consisting of a main rear section attached to the pitman-rod and a counterbalanced upper section arranged to hang over the front face of said main section, in the manner and for the purpose set forth.

4. In a baling-press, a plunger-head consisting of a main section, in combination with a movable section hinged to and hanging over the front face of said main section, in the manner and for the purpose substantially as described.



5. The combination, in a baling-press, of a plunger composed of two sections, as described, a scraper hinged to the front of the main section thereof, a counterbalanced section hinged above said scraper and to the main section, a swivel-jointed pitman-rod, and actuating mechanism, substantially as described.

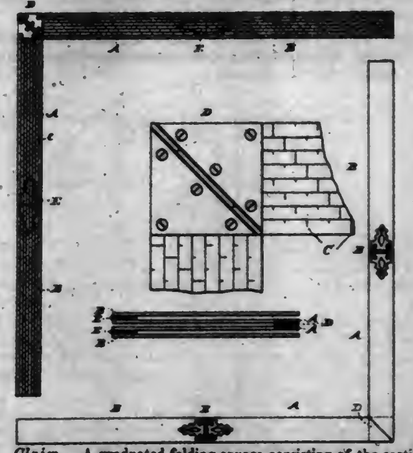
6. In a horizontal baling-press, a reciprocating plunger composed of two parts, the forward upper end of the lower or main part being inclined upward and backward, and the rear side of the upper part correspondingly inclined and adapted to slide on the incline of the main part, substantially as described.



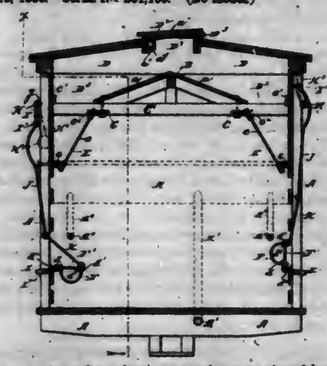
396,098. COMBINED STRAWBERRY-VINE CUTTER AND CULTIVATOR. GEORGE W. LOVE, Grayling, Mich. Filed Mar. 21, 1888. Serial No. 267,995. (No model.)

Claim.—1. In combination with the frame A, the transporting-wheel, the stationary forked cutting-blade H', the double-edged cutting-blade H, the pinions and intermediate parts coupling the pinions to the double-edged cutting-blade, and handles attached to the rails of the two-part frame, as and for the purposes specified.

2. In a device for the purposes specified, the combination of the



396,098.



frames A, the rods D for adjusting said frames, the transporting-wheels, the pinions mounted on said frames, the forked cutting-blades H', the double-edged cutting-blades H, the mechanism coupling the blades H to the pinions P, the cultivators attached to the frame A, and handles for guiding the machine, as and for the purposes specified.

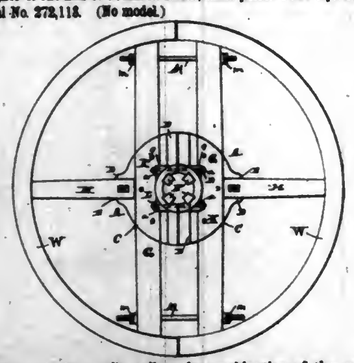
396,099. DRESS-MAKER'S SQUARE. KATIE A. LOVE, Clinton, Mo. Filed Apr. 26, 1888. Serial No. 271,977. (No model.)

Claim.—A graduated folding square consisting of the sections A B, the sections A, mitered at one end, the miter-hinge secured to the surface of the sections having its edges in line with the edges of the sections, and the strap-hinges securing the sections A B together and placed on the sides opposite the miter-hinge, substantially as specified.

396,100. STOCK-CAR. ALONZO C. MATHER, Chicago, Ill. Filed Jan. 18, 1888. Serial No. 261,109. (No model.)

Claim.—1. A stock-car having a continuous series of doors located centrally in and along the car-roof to form an unobstructed running board and give direct access to a feed-storage chamber located immediately beneath the car-roof, said chamber being provided with a floor of less width than the car and inclined from the center downward and outward toward openings D^2 on each side, and racks arranged below said openings along the sides of the car, substantially as described.

2. In a stock-car, the combination of the troughs F F, hinged to the sides of the car, the longitudinal rods H H, located along the sides of the car above said troughs and provided with levers H' H' and



cranks I I, and the jointed rods J J and K K, connecting said cranks to the troughs, substantially as described.

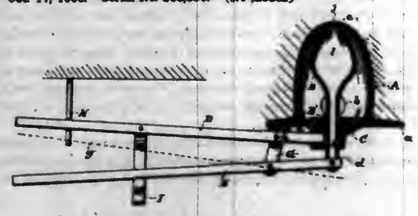
3. In a stock-car, the combination of the troughs F F and F^6 F^6, the reservoir M, extending across one end of the car, the main pipe M', leading therefrom and passing beneath the car to the opposite end thereof, said pipe being provided with an upright extension, M^3, having branches M^3 M^3, leading to the troughs F^6 F^6, and the pipes M^4 M^4, leading from the reservoir to the troughs F F, substantially as described.

4. In a stock-car, the combination, with the doorways G G and feed-storage chamber D, of upwardly-folding racks having chains f^7 f^7 attached to their inner sides, the rods f' f' on the sides of the doorways, and the links f^8 f^8, substantially as described.

5. The combination, in a stock-car, of the feed-racks E E, made in sections and arranged along side of the car, below the chamber D, the said racks having doorway-sections, with vertical guide-rods f' f' and links f^3 f^3, for connecting the said doorway-sections to the rods f' f', and a series of chains, f f, for forming the rear side of the said doorway-sections, arranged as shown and described, and for purposes set forth.

396,101. SPLIT PULLEY. JOHN J. MCERLAIN, South Bend, Ind., assignor of one-half to Frank A. Baker, same place. Filed Apr. 26, 1888. Serial No. 272,113. (No model.)

Claim.—1. In a split pulley, the combination of the opposite flanged hub-sections with the parallel spoke-bars secured, respectively, to the flanges of the opposite sections, the rim-sections attached, respectively, to said bars, the spokes H, and the rods and nuts uniting said spoke-bars on opposite sides of the hub, all constructed and arranged substantially as and for the purpose described.



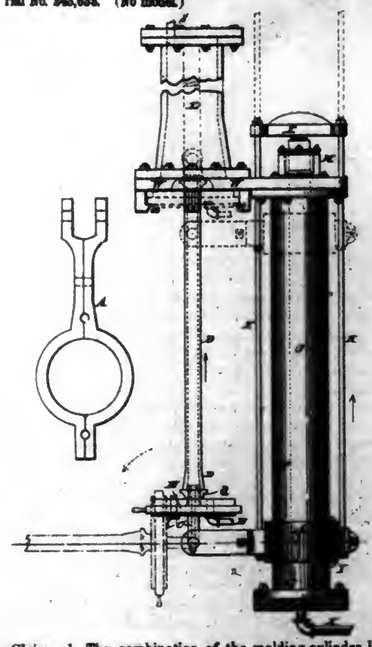
2. The combination of the opposite hub-sections having lateral channeled flanges with the parallel spoke-bars seated in said channels, the rim-sections, the bolts uniting said hub-sections, and the rods and nuts uniting the spoke-bars, all constructed and arranged substantially as and for the purpose described.

3. The combination, with the hub-sections having channeled flanges and the parallel spoke-bars seated in said channels, of the spokes attached to the flanges and extending at right angles to the spoke-bars, rim-sections attached to said bars and spokes, and the uniting bolts and nuts for the parts, all constructed and arranged substantially in the manner and for the purpose described.

4. The combination of the opposite hub-sections having lateral flanges with the spokes and spoke-bars secured to said flanges, the retaining-plates bolted to said flanges over the spokes and bars, the rim-sections, and the securing bolts and rods, all constructed and arranged substantially as specified.

5. The combination of the hub-sections having semicircular flanges provided at center with peripheral extensions and channeled, substantially as described, with the parallel spoke-bars, the spokes, the securing-plates, rim-sections, and uniting bolts and rods for the hub-sections and the spoke-bars, all constructed and arranged substantially as and for the purpose described.

396,102. TUYERE. BERNARD MCGRODER, Cleveland, Ohio. Filed Oct. 17, 1888. Serial No. 288,330. (No model.)



Claim.—1. A tuyere-iron consisting of the valves B C and levers D and E, in combination with the air-chamber constructed as described, with the said valve B adapted to the chamber and the opening e in the crown thereof, of the valve C having a seat in the base of said chamber and sliding upon the tubular stem of the valve B, arranged substantially as set forth, for the purpose described.

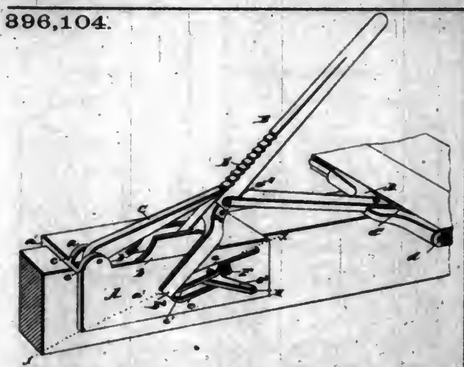
2. In combination with the levers D E, hollow valve B, having a tubular stem, and valve C, of the air-chamber, arranged as shown in relation to said valve B, of the guide I, secured to the lever D and inclosing the lever E, with projections *i* at the inside thereof, forming stops to arrest and hold said lever E at divers points within the guide, as set forth.

3. In a tuyere-iron, the combination of the air-chamber, a hollow valve, B, with a tubular stem, and having one or more air-passages in the apex of said valve, of the valve C, surrounding the tubular stem, and the levers D E, arranged in conjoint and operative relation with said valves, in the manner and for the purpose substantially as set forth.

396,108. MACHINE FOR FORMING SEAMLESS TUBES FROM PULP. HORACE J. MEDBERY, Ballston, N. Y. Filed July 7, 1887. Serial No. 243,633. (No model.)

Claim.—1. The combination of the molding-cylinder L, having inlet water-pipe S and outlet water-pipe M, the rubber bag secured at both top and bottom of the cylinder, the adjustable foraminated former D, with detachable head *d*, having water-outlets *m* in the same, the rotary adjustable locking-ring E, and the hooks *w*, substantially as and for the purpose described.

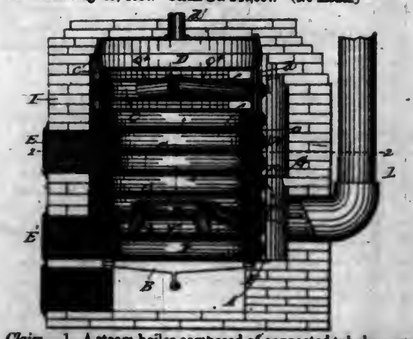
2. The grooved and perforated metal cylinder D, having groove *g*, the foraminated jacket *o*, of metal, the outer covering, O, of cloth, and the locking-key Q, fitting in the groove *g* and securing the said cloth covering, substantially as shown and described.



3. The combination of the hydraulic jack F G, cross-head I, rods K K, attached lifter A, surrounding the jack-cylinder, the molding-cylinder fixed to the upper end of the jack-cylinder, and the foraminated former D, with head *d*, and the hinge C, for connecting the former to the lifter, with an articulated joint, substantially as shown and described.

396,104. FLOOR-CLAMP. DELL B. MORRILL and FRANK S. MORRILL, Blackberry, Ill. Filed Mar. 13, 1888. Serial No. 267,105. (No model.)

Claim.—1. The combination of the case, the lever pivoted on the upper side of the same and having rack-teeth on its rear side, the clutch-bar pivotally connected to the front side of the lever, and the pawl pivoted at its lower end upon the upper side of the case, and having its upper end engaging the rack-teeth on the rear side of the lever, as set forth.



2. In a clamp, the combination, with the case composed of the plate *a* and two depending plates, *a'* *a'*, of the lever-handle pivoted to

396,104.

lugs on the plate *a*, and having the downward extension b^3, the semicircular dog having rearwardly-inclining teeth on its curved edge, and a forwardly-extending arm, c^3, and pivoted near said arm in a downwardly-inclined slot in the side of the case, and the coiled spring forcing the arm c^3 outward, substantially as specified.

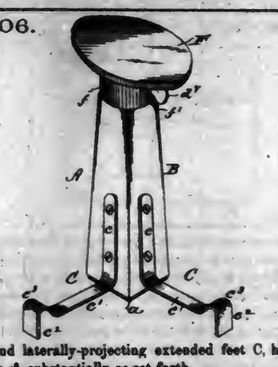
396,105. STEAM-GENERATOR. CLARENCE C. MULFORD, Streator, Ill. Filed Aug. 15, 1887. Serial No. 247,007. (No model.)

Claim.—1. A steam-boiler composed of connected tubular water-rings, combined together substantially as described, whereby the space inclosed within said rings serves as a fire-box, combustion-chamber, and direct-draft flue, a portion of said rings being incomplete circles, forming an aperture or apertures opening directly into the fire-box, whereby direct access to the fire is afforded through a door, substantially as described.

2. The combination of a series of connected horizontally-arranged water-rings with a suitable dome, and flanges with openings between two or more of said rings, substantially as and for the purpose specified.

3. In a steam-generator, a boiler composed of horizontal water-rings, the upper two or three of which rings have vertical flanges at their meeting-points, which flanges are cut away at the rear of said boiler, substantially as and for the purpose specified.

4. The combination of a boiler composed of horizontal water-rings secured together substantially as specified, whereby a direct-draft flue is formed within said rings, and a dome placed upon said rings, with a jacket surrounding said boiler and inclosing a space which serves as a diving-flue, a horizontal partition dividing said diving-flue into an upper and lower flue, connections between said direct flue and diving-flue at the back of the boiler, connections between the upper and lower diving-flues at the front of the boiler, and the smoke-pipe at the back of the boiler, substantially as specified.



396,106. SHOE-MAKER'S ANVIL. PHILIP MURTHA, Philadelphia, Pa. Filed Aug. 20, 1888. Serial No. 283,229. (No model.)

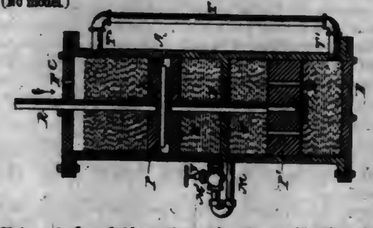
Claim.—1. A shoe-maker's anvil, herein described, comprising a standard having at its upper end a set-screw and at its lower end laterally-projecting feet having curved or raised outer ends, and removable anvil-blocks secured to said standard by said set-screw, substantially as set forth.

2. A shoe-maker's anvil comprising a standard having at its upper end a set-screw, d^3, removable anvil-block F, and at its lower end a cushion, *a*, and laterally-projecting feet C, having raised or curved ends c^2, substantially as set forth.

3. In a shoe-maker's anvil, the combination of standard A, having at its upper end a bracket or clip, d^3, the anvil-block F, having socket *f* and vertical slot *f'*, a cushion, *a*, on the lower end of said

396,106.

standard, and laterally-projecting extended feet C, having raised or curved ends c^2, substantially as set forth.



396,107. FLUID SPEED-REGULATOR FOR ELEVATORS. WILLIAM R. NICKERSON, Cambridge, Mass. Filed Sept. 21, 1888. Serial No. 285,996. (No model.)

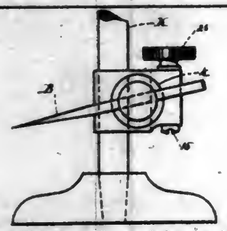
Claim.—1. In a fluid speed-regulator, the combination of the cylinder A, the piston-rod D D', and the piston B, having opening *b b*, with the fluid-tanks C C', substantially as described, and for the purpose set forth.

2. In a fluid speed-regulator, the combination of the cylinder A and piston B, said cylinder A and piston B being adapted to admit of the passage of fluid from one side of the piston to the other, with the fluid-tanks C C', substantially as described, and for the purpose set forth.

396,108. FLUID SPEED-REGULATING DEVICE. WILLIAM R NICKERSON, Cambridge, Mass. Filed Oct. 22, 1888. Serial No. 288,804. (No model.)

Claim.—1. In a fluid speed-retarder, the combination of the cylinder A, divided by a diaphragm, D, into two chambers, and pipes leading from one chamber to the other, with two pistons, P P', and piston-rod R, all operating together substantially as described, and for the purpose set forth.

2. In a fluid speed-retarder, the combination of the cylinder A, divided by a diaphragm into two chambers, with pistons P and P', having passages through them, the piston-rod R, and pipe T, substantially as described, and for the purpose set forth.

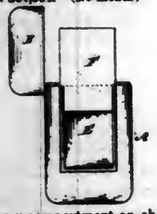


3. In a fluid speed-retarder, the combination of the cylinder A, divided by a diaphragm, D, into two chambers, with the pistons P P' and a pipe leading from one chamber to the other, having a valve to regulate the flow of fluid, substantially as described, and for the purpose set forth.

396,109. SURFACE-GAGE. CARL G. OSTMAN, Boston, Mass. Filed Sept. 6, 1888. Serial No. 284,669. (No model.)

Claim.—1. In a surface-gage, the combination of a body, a shaft journaled in said body and provided with an opening for receiving a pointer, a worm-gear on the shaft, provided with a pointer-groove, a worm in said body for actuating said gear, a nut on the shaft, whereby the pointer may be clamped onto said groove, and means for securing said body to a base or support, substantially as set forth.

2. In a surface-gage, the combination of a standard, a body provided with a clamping-arm for securing it to said standard, a shaft journaled in said body and arm and provided with a transverse opening for receiving a pointer, a worm-gear disposed on said shaft and



396,109.

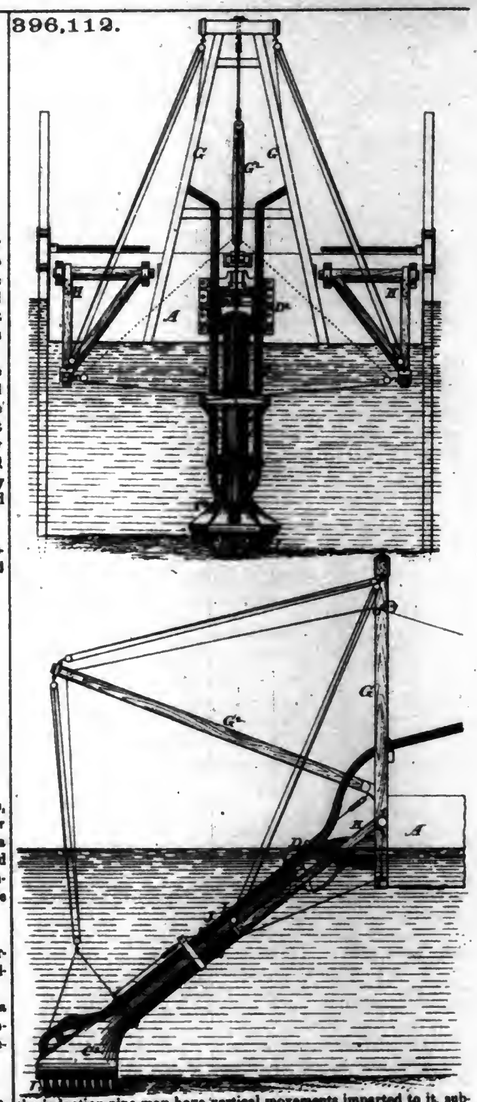
fitted to revolve in said body, said gear being provided in its outer face with a transverse slot for receiving said pointer, a worm fitted to revolve in said body and rotate said gear, and a nut adapted to be turned onto said shaft, whereby said body may be clamped onto said standard and said pointer clamped against said worm-gear and prevent it from revolving on the shaft as the worm is turned, substantially as set forth.

3. In a surface-gage, the standard K, in combination with the body A, having the clamping-arm *p*, the shaft *m*, journaled in said arm and body, the pointer B, disposed in an opening in said shaft, the worm-gear *k*, fitted to rotate in said body and provided with a slot in which said pointer may rest, the worm 15, journaled in said body in engagement with said gear, and provided with the rosette 25, and the nut H, adapted to be turned onto said shaft, whereby said body may be clamped in position on said standard and said pointer clamped against said gear, substantially as described.

396,110. POCKET-BOX. GEORGE W. PARIS, Brooklyn, N. Y., assignor to Hiram Howard and Stephen C. Howard, Providence, R. I. Filed Oct. 8, 1888. Serial No. 287,551. (No model.)

Claim.—A box having a compartment or chamber for matches, having an inwardly-bent portion forming a compartment or chamber for postage-stamps closed at its ends, a sliding cover for the latter, a swinging cover for the match compartment or chamber, the said swinging cover extending across the said sliding cover when the compartments or chambers are closed, and stops for preventing the entire removal of the sliding cover, substantially as specified.

396,111. VETERINARY REMEDY. BAILY M. V. B. PRICE, Arroyo Grande, Cal. Filed Nov. 6, 1888. Serial No. 290,126. (No specimens.)

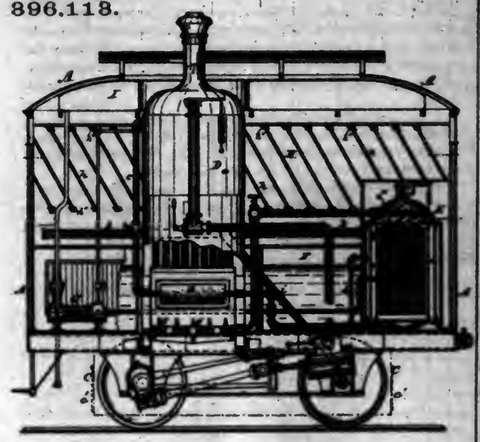


Claim.—The herein-described composition of matter, forming a medical compound, to be used in inoculating animals, which compound consists of equal parts of allium, (garlic-root,) phytolacca, (poke-root,) and asafetida, substantially as specified.

396,112. HYDRAULIC EXCAVATOR. WALTER P. RICE, Cleveland, Ohio. Filed June 4, 1888. Serial No. 276,042. (No model.)

Claim.—1. In hydraulic excavators, the combination, with a scow having a sluiceway, of an induction-pipe attached to the scow and leading into said sluiceway by means of a turn-table joint consisting of drum D^4, set in the frame D^4, and having trunnions d^3 d^3, playing in boxes *d d* on said frame, by which said induction-pipe may have imparted to it a side-swinging motion, substantially as and for the purpose specified.

2. In hydraulic excavators, the combination, with a scow having a sluiceway, of an induction-pipe attached to the scow and leading into said sluiceway by means of a turn-table joint, substantially as above described, and a second joint consisting of shell E, attached to a neck, D^4, of the drum D^3, and the shell F, hinged at E^2 to the shell E and having the induction-pipe C secured to said shell F, whereby



the induction-pipe may have vertical movements imparted to it, substantially as and for the purpose specified.

3. In hydraulic excavators, the combination, with the induction-pipe C, having the open foot C^3, of the pipes I J, leading into said foot C^3 from a force-pump on the scow, one of said pipes being curved and provided with a nozzle, K, and discharging into the axis of pipe C for inducing a current upward therein, and the other pipe curved and terminating in lower middle portion of the foot C^3, and provided with downwardly-projecting jet-nozzles N N, for disintegrating the earth, constructed and operating substantially as and for the purpose specified.

4. In hydraulic excavators, the combination, with a scow having a sluiceway provided therein, of an induction-pipe connected with said sluiceway by means of a turn-table joint, whereby said pipe is swung from side to side, a hinge-joint whereby it is also raised and lowered, pipes connected with force-pumps on the scow and leading into the foot, said foot having the plow-points and the nozzles, and a mechanism for imparting a swinging movement to the induction-pipe, all arranged to operate substantially as described, and for the purpose set forth.

396,113. STREET-LOCOMOTIVE. THOMAS ROBERTS, Baltimore, Md., assignor, by direct and mesne assignments, of one-half to John Stanley Frederick, John Carson, Mamie B. Gott, M. J. Kilroy, and William Dugdale, all of same place. Filed Nov. 28, 1887. Serial No. 255,890. (No model.)

396,113.

Claim.—1. In a street-locomotive, the condenser placed on the sides of the locomotives and provided with removable perforated plates or diaphragms to condense the exhaust-steam from the engines in a noiseless manner, as described.

2. In a street-locomotive, the combination of a boiler having a superheating device connected by pipes with a hydrocarbon-generator with one or more condensers provided with a series of removable perforated diaphragms and the perforated inlet-pipe for the exhaust-steam, all as specified.

3. In a street-locomotive, the boiler having a superheating device connected by a pipe to the hydrocarbon-generator with the inclined engines, the condenser having removable perforated plates and a perforated inlet-pipe for the exhaust-steam, and a water-tank under the roof, as shown.

4. In a street-locomotive, the boiler having a superheating device arranged in the furnace and connected to the hydrocarbon-generator, and the burners, as shown, with the engines and condensers having a series of removable perforated diaphragms and a perforated inlet-pipe for th exhaust-steam, arranged to produce a smokeless and noiseless locomotive, as specified.

5. In a street-locomotive, a boiler having a superheating device in the furnace and a series of hydrocarbon-burners for generating the steam, in combination with a hydrocarbon-generator, a pair of inclined engines arranged under the floor inclosed in a casing, and a condenser having a series of removable perforated diaphragms and perforated inlet-pipe for the exhaust-steam, a pump, and a tank under the roof for injection-water, all as specified.

6. In a street-locomotive or its equivalent, the combination of a boiler provided with a superheating device, *d*, and a series of hydrocarbon burners, with a generator, E, consisting of a casing having removable top and bottom, containing an inner casing with tubes, its upper tube-sheet provided with openings, and a perforated outlet-pipe for mixing the carbon vapors with the superheated steam, and a pair of inclined engines arranged under the floor, in the manner shown and described.

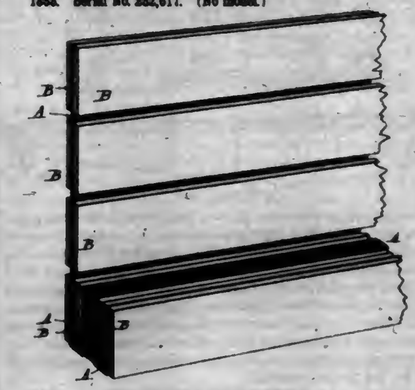
7. The combination of a boiler in which the steam is generated by burners with hydrocarbon vapors, and having a superheating device with one or more hydrocarbon-generators, a pair of engines, and one or more condensers provided with removable perforated diaphragms for condensing the exhaust-steam and producing a noiseless and smokeless locomotive, as and for the purpose set forth.

8. In street-locomotives, the combination of one or more condensers, H, having a series of removable perforated diaphragms, with a tank, I, for the condensing-water arranged above said condensers, a pump, G, and the feed-water tanks F, all arranged as shown and specified.

9. The street-locomotive herein described, consisting of the frame, the boiler D, having a superheating device, *d*, and the hydrocarbon-burners *g* for the generation of the steam, with the hydrocarbon-generator E, provided with tubes secured only at one end and free to expand and contract, a perforated outlet-pipe, *f*, for the vapors, the condensers H, tank I, pump G, feed-water tanks F, and engines B, inclosed in casing C, all constructed as shown and set forth.

10. The combination, in a street-locomotive, of a pair of inclined engines arranged under the floor of the locomotive and inclosed in a casing, as shown, with the condenser provided with removable perforated plates and a perforated inlet-pipe, and a generator, constructed as and for the purpose specified.

396,114. CIGAR-BOX. WILLIAM T. ROBERTSON, Montgomery, Ala. Filed Nov. 30, 1888. Serial No. 292,943. (No model.)



Claim.—1. In a receptacle, a false bottom, in combination with pliable bails adapted to lie wholly within the receptacle when not in use and to be bent over the upper edges of same when in use, in the manner and for the purpose substantially as described.

2. In a receptacle, a false bottom, in combination with pliable bails secured to the bottom and arranged to lock over the upper edges of the receptacle for holding the bottom at various heights, in the manner and for the purpose described.

3. The herein-described false bottom, provided with pliable metallic bails secured directly thereto, in the manner and for the purpose set forth.

4. The herein-described false bottom, provided with flat pliable metallic bails secured to its opposite sides, in the manner and for the purpose substantially as described.

396,115. INSIDE BLIND. CLARK ROBINSON, Hartley, Iowa, assignor of one-fourth to Moses J. Young, same place. Filed Aug. 13, 1888. Serial No. 282,617. (No model.)

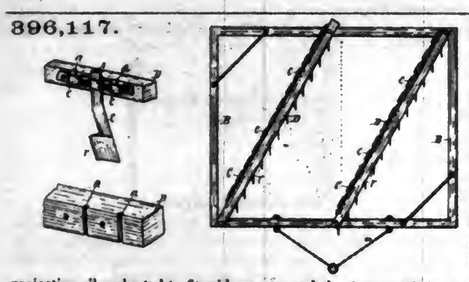
Claim.—1. As an improved article of manufacture, the material herein described, comprising a flexible sheet and slats applied to opposite faces thereof, said slats being separated from one another a sufficient distance to permit their folding one upon the other.

2. In combination with the flexible sheet, the slats applied to both faces thereof directly opposite each other, those on the same face of the flexible sheet being separated from each other, substantially as shown, whereby the fabric may be folded upon itself.

396,116. METHOD OF DECORATING SURFACES. THOMAS ROBINSON, Cambridge, assignor to the Stalactite Decorative Company, Brookline, Mass. Filed Apr. 11, 1888. Serial No. 270,343. (No specimens.)

Claim.—1. The improved method of decorating metal, wood, and other surfaces herein described, the same consisting in spreading an acidulated pigment upon the surface to be decorated, and then applying a liquid hop extract to said pigment, as set forth.

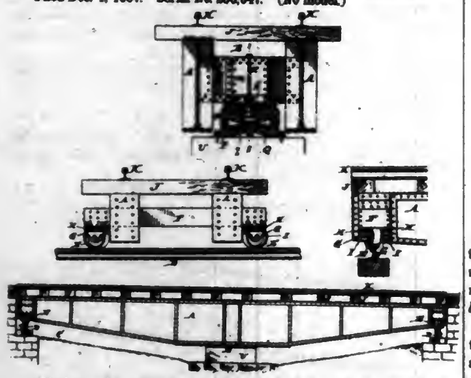
2. The improved method of decorating surfaces, the same consisting in spreading an acidulated pigment upon the surface to be decorated, and then applying to said pigment a liquid hop extract containing a dissolved gum, as set forth.



396,117. HARROW. CHARLES P. RUSSELL, Kalamazoo, Mich. Filed Apr. 30, 1888. Serial No. 271,274. (No model.)

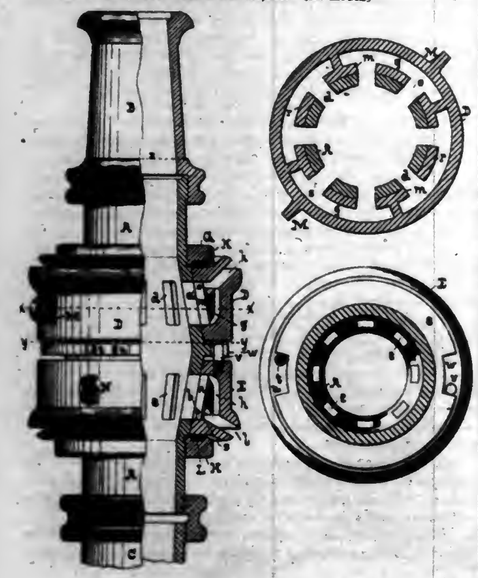
Claim.—1. In a rectangular-shaped harrow-frame, the combination of the obliquely-placed tooth-bars D D, the mortises or grooves *a a* in said bars, and teeth with projecting ribs adapted to fit said mortises or grooves for preventing lateral displacement of the teeth, as shown and described.

2. In a rectangular-shaped harrow-frame, the combination of the tooth-bars D D, the mortises or grooves *a a*, the twisted ribbed teeth adapted to fit said grooves, and the continuous clip-plate for securing said teeth to bar D, as described and shown.



3. In a rectangular-shaped harrow-frame, the combination of the bars D D, having mortises or grooves *a a*, as shown, the teeth having

396,117.

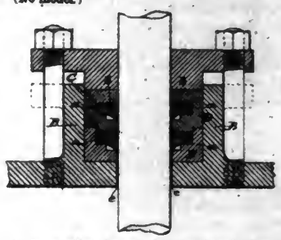


projecting ribs adapted to fit said grooves, and the share consisting of a diamond-shaped plate secured to said tooth, as shown and described.

396,118. TURN-TABLE. FRANCIS H. SAYLOR, Philadelphia, Pa. Filed Dec. 1, 1887. Serial No. 256,647. (No model.)

Claim.—In a turn-table, the combination, with the central pivoted support, of the main girders arranged to rest upon it without the interposition of adjusting-screws, beams, or struts F at each end of the main girders, said beams extending continuously across and on each side of the girders and being firmly riveted thereto, the trailing wheels having journal-boxes, and one or more movable plates interposed between the journal-boxes and the projecting ends of the beams F, so that each wheel can be independently adjusted without interfering with the solidity of its attachment to the table, all substantially as and for the purpose specified.

396,119. HOSE-NOZZLE. WALLACE STEBBINS, Baltimore, Md. Filed Oct. 17, 1888. Serial No. 288,349. (No model.)

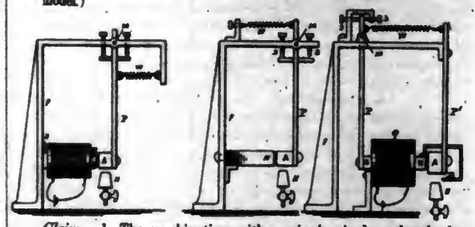


Claim.—1. In combination with a nozzle having a perforated conical face, a circumferentially-moving sleeve adapted to fit over the said face, having an annular chamber with apertures in its inner wall corresponding, practically, with those in the nozzle, and an angularly-directed outer escape-opening, substantially as and for the purpose specified.

2. In combination with a nozzle having two conical perforated faces separated by a flange, a pair of sleeves having annular chambers, with angularly-directed escape-openings, and inner perforated walls, substantially as and for the purpose specified.

3. In combination with a nozzle having a perforated conical face, a sleeve adapted to fit over the said conical face, having an annular chamber and a perforated inner wall, a flange on the said nozzle, and a pin projecting from the said sleeve into a notch in the said flange, substantially as and for the purpose specified.

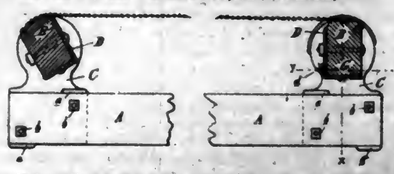
396,120. METALLIC PACKING FOR STUFFING-BOXES. WILLIAM W. ST. JOHN, Brooklyn, N. Y. Filed Sept. 12, 1887. Serial No. 249,439. (No model.)



Claim.—1. In stuffing-boxes, the sectional rings *a*, provided at their contact-surfaces with a bevel side, *c*, for forcing it against the rod, and a rectangular recess for the ring *b* on its outer side, and arranged in a receptacle having rings D B C, into which said rings *a* and *b* fit, all as and for the purpose set forth.

2. A stuffing-box consisting of the rings C D E, of the cross-section shown, to receive the sectional rings *a*, having one side beveled, as at *c*, and provided with a recess to receive the rectangular rings *b*, all arranged as shown and herein specified.

3. In stuffing-boxes, the counterbored rings C D E, of the cross-section shown, in combination with the rings *a*, having the bevel *c* on one side and the recess for the rings *b*, all constructed as shown and set forth.



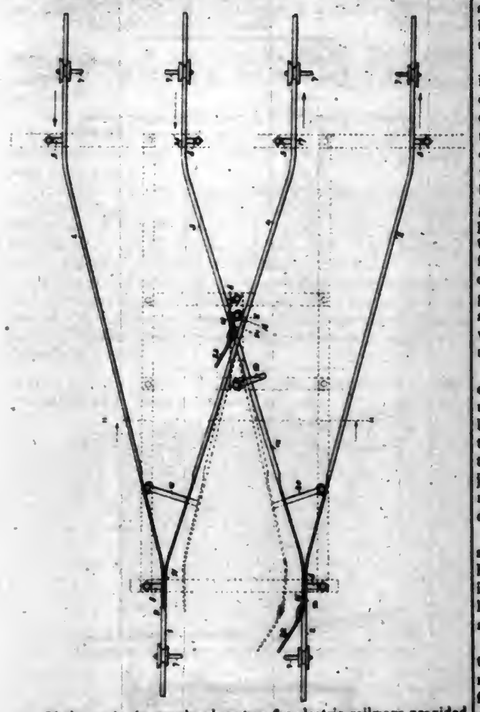
396,121. THERMO-MAGNETIC MOTOR. NIKOLA TESLA, Smiljan, Lika, Austria-Hungary. Filed Mar. 30, 1886. Serial No. 197,115. (No model.)

Claim.—1. The combination, with a swinging body under the influence of magnetism, of a burner or other source of heat acting to vary the magnetism, and a spring or other power to move the swinging body in the opposite direction to the action of the magnetism, substantially as set forth.

2. The combination, with two or more armatures connected to each other, of magnets to influence such armatures, and burners or other sources of heat to vary the magnetic action and cause the armatures to move, substantially as set forth.

396,122. COMBINED CORNER-IRON AND TIGHTENING DEVICE FOR WIRE MATTRESSES. CHARLES H. TRIPHAGEN, Portland, Mich. Filed Mar. 27, 1888. Serial No. 268,624. (No model.)

Claim.—The combination, with the side and cross bars of a mattress-frame, of the sets of brackets C, provided with flanges *a* and set-



cured to said side bars, the set of brackets at one end of the frame being provided with the corner-irons, to which the cross-bar B is secured, the brackets at the opposite end of the frame provided with adjusting-holes, and the cross-bar journaled therein and having the locking-latch G, which engages the adjusting-holes, substantially as described.

396,123. KEY-HOLE GUARD. CHARLES R. UHLMANN, Peoria, Ill. Filed May 2, 1888. Serial No. 272,615. (No model.)

Claim.—The combination, with the lock-case A, having its edge wall notched to a suitable depth and provided with integrally-formed lugs C H, of the sliding key-hole guard E, provided with the recess J, adapted to receive the lug H, the guard-actuating stud E', formed integrally with the guard and projecting through the notch in the edge wall of the case, the spring-actuated stud F, projecting from the guard E against the lug C, and the removable side plate, K, resting upon the guard E and stud E', retaining them in position, substantially as set forth.

396,124. SUSPENDED SWITCH FOR ELECTRIC RAILWAYS. CLARK H. WELLS, Kansas City, Mo. Filed Apr. 26, 1888. Serial No. 271,825. (No model.)

Claim.—1. An overhead system for electric railways provided with traveling trolleys and depending motor-connections, and consisting of main conductors carrying currents of opposite polarity, two pairs of branch conductors, the outer members of which form continuations of the main conductors, and the inner members being connected to said main conductors by an automatic switch provided with flexibly-supported end sections normally in contact with said main conductors, but adapted to be swung aside to permit the passage of trolleys traveling in either direction, substantially as described.

2. An overhead system for electric railways provided with traveling trolleys and depending motor-connections, and consisting of main conductors carrying currents of opposite polarity, two pairs of branch conductors, the outer members of which form continuations of the main conductors, a swinging bracket supporting the free end of one of the inner branch conductors and holding it normally in contact with one of the main conductors, said main conductor and free end being flattened at their surfaces of contact, and said free end rising gradually from its point of contact to the point where it crosses the plane of the other branch conductor, a movable switch-section flattened at its opposite ends and forming a lap-joint with the flattened free end of the other branch conductor and with the remaining main conductor, said free end and said movable switch-section being each provided with a gravitating guide-arm for shifting the switch-section, and swinging brackets normally holding said switch-section in contact with the said latter branch and main conductors, substantially as described.

3. An overhead system for electric railways provided with traveling trolleys and depending motor-connections, and consisting of main conductors carrying currents of opposite polarity, two pairs of branch conductors, the outer members of which form continuations of the main conductors, a swinging bracket supporting the free end of one of the inner branch conductors and holding it normally in contact with one of the main conductors, said free end rising from its point of contact with the main conductor to the point where it crosses the plane of the other branch conductor, and a movable switch-section connecting the free end of said latter branch conductor with the remaining main conductor, and swinging brackets normally holding said switch-section in contact with the latter branch and main conductors, substantially as described.

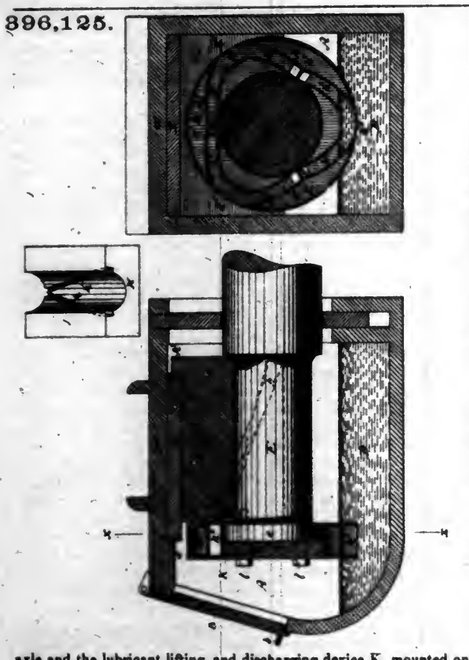
4. An overhead system for electric railways provided with traveling trolleys and depending motor-connections, and consisting of main conductors carrying currents of opposite polarity, two pairs of branch conductors, the outer members of which form continuations of the main conductors, a swinging bracket supporting the free end of one of the inner branch conductors and holding it normally in contact with one of the main conductors, said free end rising gradually from its point of contact with the main conductor to the point where it crosses the plane of the other branch conductor, a movable switch-section connecting the free end of the other branch conductor with the remaining main conductor, said free end and said movable switch-section being each provided with a gravitating guide-arm, and swinging brackets normally holding said switch-section in contact with the said latter branch and main conductors, substantially as described.

5. An overhead system for electric railways provided with traveling trolleys and depending motor-connections, and consisting of main conductors carrying currents of opposite polarity, two pairs of branch conductors, the outer members of which form continuations of the main conductors, a swinging bracket supporting the free end of one of the inner branch conductors and holding it normally in contact with one of the main conductors, said main conductor and free end being flattened at their surfaces of contact, and said free end rising gradually from its point of contact to the point where it crosses the plane of the other branch conductor, a movable switch-section flattened at its opposite ends and forming a lap-joint with the flattened free end of the other branch conductor and with the remaining main conductor, said free end and said movable switch-section being each provided with a gravitating guide-arm for shifting the switch-section, and swinging brackets normally holding said switch-section in contact with the said latter branch and main conductors, substantially as described.

6. An overhead system for electric railways provided with traveling trolleys having depending motor-connections, and consisting of main conductors and two pairs of branch conductors, the outer members of said pairs forming continuations of the main conductors, and the inner members crossing the one above the other at the switch, the lower one being provided at the point of crossing with a separable joint normally closed, but permitting the passage of the depending motor-connection of a trolley upon the upper branch, substantially as described.

7. In an overhead system for electric railways of the kind described, the combination, with a movable switch-section, of an obliquely-hinged gravitating guide-arm adapted thereby to fall normally in the path of a trolley advancing toward the branch from the main line, but to be thrown out of obstructive engagement by the trolleys advancing in the opposite direction, substantially as described.

8. In an overhead system for electric railways provided with trolleys and depending motor-connections, the combination, with a main conductor, of a branch and a swinging hanger supporting the free end of the branch and normally holding it in contact with said main conductor, and a gravitating obliquely-hinged guide-arm attached to the free end of said branch and projecting into the path of movement of a trolley advancing along the main conductor, substantially as described.

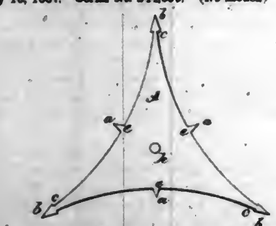


396,125. CAR-AXLE LUBRICATOR. HENRY P. WEST, Gloucester City, N. J. Filed Apr. 10, 1888. Serial No. 270,190. (No model.)

Claim.—1. The lubricant lifting and discharging device K, in combination with the journal E of the axle, arranged as described, and for the purposes set forth.

2. The lubricant lifting and discharging device K, in combination with the journal E of the axle and the saddle H, having diverging channels formed in the body thereof, all arranged as described, and for the purposes set forth.

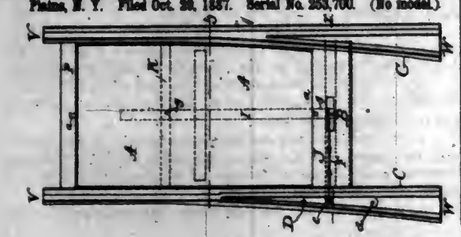
3. In a car-axle box, the combination, with the journal E, of the



396,125.

axle and the lubricant lifting and discharging device K, mounted on said journal, means, as described, for holding the same in position thereon, and the saddle H, provided with diverging channels in the body thereof, whereby the lubricant elevated by said device may be uniformly distributed over the surface of the journal, all arranged as described, and for the purposes set forth.

4. In a car-axle box, the combination of the journal E of the axle, the lubricant lifting and discharging devices K, mounted on said journal, means, as described, for adjustably maintaining said devices in position on said journal, and the saddle H, having diverging channels in the body thereof, whereby the lubricant lifted by said devices may be distributed uniformly over the surface of the journal in both directions, as shown and described.



396,126. CORNER-SHIELD. HOWARD WHITE, Lansdowne, Pa. Filed July 18, 1887. Serial No. 244,659. (No model.)

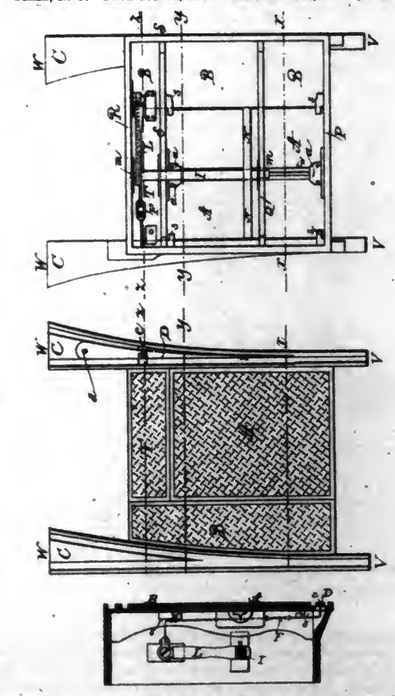
Claim.—1. A triangular-shaped corner-shield with barbed or arrow-headed points, substantially as shown, for the purpose specified.

2. In a corner-shield consisting of a triangular plate of metal, the combination of points projecting from the edges, with barbed or arrow-headed points at its vertices and a screw-hole in its center, all substantially as set forth.

396,127. STREET-RAILWAY SWITCH. WILLIAM WHITE, White Plains, N. Y. Filed Oct. 29, 1887. Serial No. 253,700. (No model.)

396,127.

Claim.—1. In combination with a tilting platform, as A, a rock-shaft, as I, provided with a double-armed lever, as N, and a rocker-arm, as H, a rocker-arm, as G, said rocker-arms articulated together by a circular socket-joint, and a connecting-rod, as E, articulated to a vibrating tongue, as D, whereby said tongue is operated by the tilting of said platform, substantially as and for the purposes set forth.



2. In a railroad tongue-switch, in combination with a tilting platform, a shaft, as I, an arm, as H, a yoke, as G, and a connecting-rod articulated to a movable tongue and provided with a turn-buckle, as F, for the adjustment of said parts, substantially as and for the purposes set forth.

3. A railroad tongue-switch provided with a tilting platform for operating its tongue, and a covered compartment outside of said platform between the rails containing working mechanism for operating said tongue, whereby access is obtained to the working parts through said compartment, substantially as and for the purposes set forth.

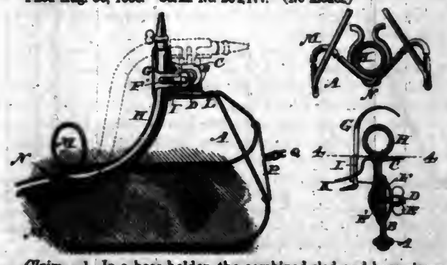
4. In a street-car switch, a movable tongue provided with a pivot, as *d*, re-enforced by a collar, as *p*, substantially as and for the purposes set forth.

5. In a street-car switch, in combination with a movable tongue and a connecting-rod for operating the same, a yoke, as G, an arm, as H, and a rock-shaft, as I, substantially as and for the purposes set forth.

396,128. STREET-RAILWAY SWITCH. WILLIAM WHITE, White Plains, N. Y. Filed Oct. 29, 1887. Serial No. 253,701. (No model.)

Claim.—1. In combination with a tilting platform, as A, a rock-shaft, as I, provided with a double-armed lever or beam, as N, and an arm, as L, having within a socket therein a spring, as J, and a follower, as K, a bell-crank, as G, a bar-spring, as *c*, and a connecting-rod, as E, united to said crank by said spring and articulated to a vibrating tongue, as D, whereby said tongue is operated by the tilting of said platform, substantially as and for the purposes set forth.

2. In a movable-tongue switch, a bell-crank, as G, having one arm adapted to receive a spring, as *c*, and another arm adapted to receive the reaction of another spring, substantially as and for the purposes set forth.



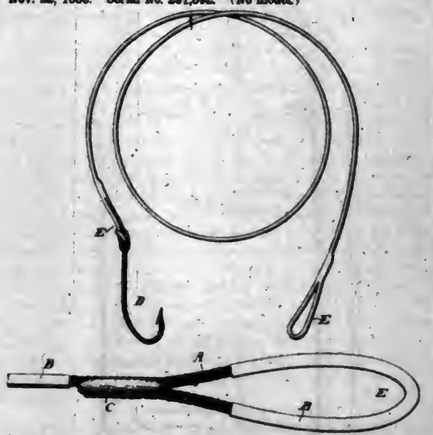
3. In a movable-tongue switch, a spring, as J, socketed within a vibrating arm, in combination with a follower, as K, substantially as and for the purposes set forth.

4. In a street-car switch, in combination with a movable tongue, a spring connecting-rod secured thereto for operating the same, substantially as and for the purposes set forth.

5. In a movable-tongue switch, a tilting platform or table provided with transverse and longitudinal braces, as O *w*, substantially as and for the purposes set forth.

6. In a movable-tongue switch, a stop or stops, as *s*, secured to the framing of the switch to limit the arc of vibration of the tilting platform, and provided with inclined grooves or gutters for rapidly conducting away any water falling upon and between said platform and adjacent parts of the switch box or framing, substantially as and for the purposes set forth.

396,129. HOSE-HOLDER. WARREN C. WILLITS, Denver, Colo. Filed Aug. 30, 1888. Serial No. 284,177. (No model.)



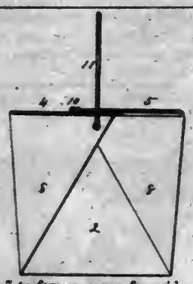
Claim.—1. In a hose-holder, the combined sled and hose-clamp, having a hose-supporter in front and formed of a single piece of metal bent around so as to form a hose-clamp in the rear, substantially as set forth.

2. In a hose-holder, the combined sled having a hose-supporter in front and formed of a single piece of metal bent around to form a hose-clamp in the rear, and a brace, S, from front to rear, substantially as set forth.

3. In a hose-holder, the combination of a standard composed of a fixed part, B, a movable part, C, pivoted thereto, and a vertically-sliding part, G, secured to the part C, and the spring-washer F and the extension K thereof engaging with the sliding part G for clamping the hose upon the part C, substantially as set forth.

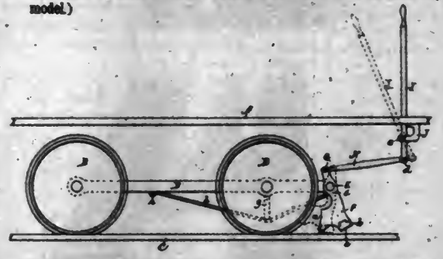
4. The combination, with the runners of a hose-holder formed of bent wire or metal, of the pivoted standard B C, the vertically-adjustable slide G, and the spring-washer F and the extension K thereof engaging with the slide G for clamping the hose upon the part C, substantially as set forth.

396,130. SHELL. HUGH L. WILLOUGHBY, Newport, R. I. Filed Nov. 22, 1888. Serial No. 291,592. (No model.)



Claim.—In a shell for fishing-tackle, the combination of a wire cord and an exterior coating of celluloid or equivalent tough or elastic material, substantially as set forth.

396,131. OYSTER-BUCKET. HENRY L. R. WOLF, Dayton, Ohio. Filed July 23, 1886. Serial No. 209,706. (No model.)

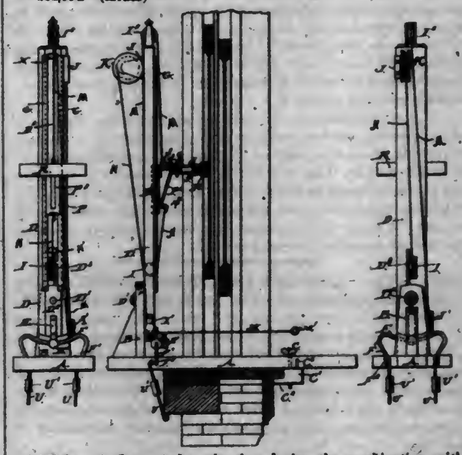


Claim.—The paper vessel having the bottom, the sides, and the ends with corner folds, as specified, provided with parts 4 and 5, and

396,131.

having folds 6 and 7 to form a cover for said vessel, substantially as shown and described.

396,132. BRAKE FOR CARS. JOHN YARRICK and EDWARD MEISTER, Philadelphia, Pa. Filed May 1, 1888. Serial No. 272,402. (No model.)



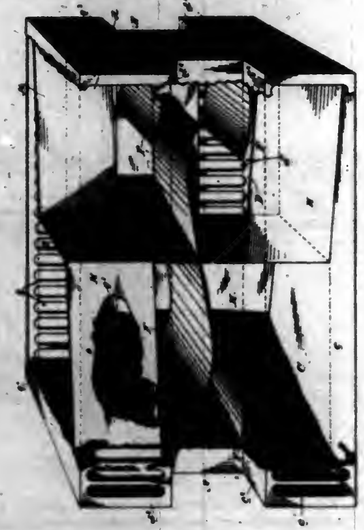
Claim.—1. The combination, with brake F, pivoted at E and adapted to engage with both the rail and wheel, of rods G and H and lever I, substantially as set forth.

2. The combination of frame D, brake F, and connecting and operating levers, substantially as described.

3. The combination, with the brake F, of the removable shoe *b*, substantially as described.

4. In the herein-described brake, the combination, with frame D, of rods *g* and *h*, substantially as and for the purposes set forth.

396,133. DEVICE FOR CLEANING WINDOWS. WILLIAM R. ZERR, Spring, Berks County, Pa. Filed Mar. 29, 1887. Serial No. 232,934. (Model.)



Claim.—1. In a window-cleaning device, the combination, with a base-piece having a standard at its outer end, of a post adjustably pivoted to said standard, a cross-head located in guides in the post, a rubber attached to the cross-head, an operating-cord secured to the top of said cross-head, and a separate cord secured to the bottom and attached to a spring-balance, all arranged and adapted to operate substantially as set forth.

2. In a window-cleaning device, the combination, with a cross-head guided in a vertical post secured to a base-piece, of two cords attached to opposite sides of said cross-head, one of which is adapted to raise said cross-head and the other is connected to a spring-balance and adapted to lower it, substantially as set forth.

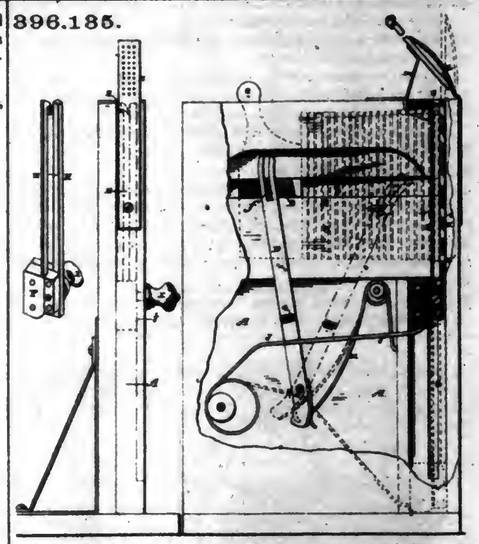
3. In a window-cleaning device, the combination, with a vertical post provided with guideways, of a cross-head adapted to move in said guideways, and having a clamp for a suitable rubber pivoted horizontally to it, substantially as set forth.

396,134. VENTILATOR. PETER ABRAHAMSON, San Francisco, Cal. Filed July 27, 1888. Serial No. 281,940. (Model.)

Claim.—1. A ventilator for the walls of buildings, houses, apartments, &c., consisting of a box or case having a central partition dividing it into independent separate passages, each passage having an aperture on opposite sides and at different elevations, one communicating with the outside and the other with the inside, the apertures on the same level in the two passages being reversed with respect to the side with which they communicate, substantially as herein described.

2. In a ventilator for buildings, houses, apartments, &c., a box or casing having a central partition dividing it into two independent separate passages having on opposite sides and at different elevations an aperture communicating the one with the inside and the other with the outside, the apertures on the same level in the two passages being reversed with respect to the side with which they communicate, and the deflecting-plates within the passages for breaking up the draft, substantially as herein described.

3. In a ventilator, a box or case having a partition dividing it into independent separate passages, each passage having an aperture on opposite sides and at different elevations, one communicating with the outside and the other with the inside, the apertures on the same level in the two passages being reversed with respect to the side with which they communicate, the side extensions for each aperture, and the plates H within the extensions, whereby the passages are kept separate, substantially as herein described.



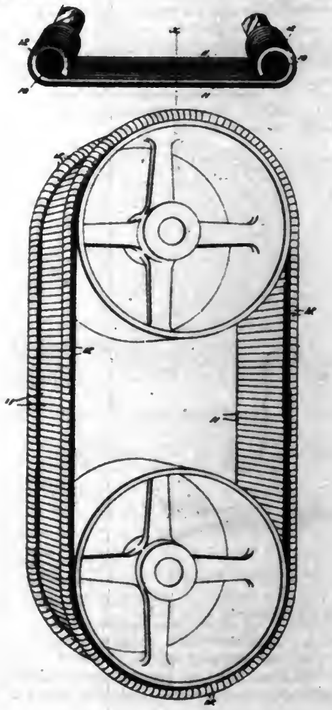
396,135. MATCH-SAFE AND AUTOMATIC LIGHTER. FRANK S. BALLARD, Burlington, Vt. Filed Apr. 21, 1888. Serial No. 271,373. (No model.)

Claim.—1. In a match-box, the combination, with a case adapted to receive a card or block of matches, of a spring-actuated slide for forcing the matches forward, a vertically-moving base, a knife secured thereto which passes between the matches and severs them as it is forced down, and a follower which is adapted to descend below the matches and to force them outward when it ascends, substantially as described.

2. In a match-box adapted to receive a card of matches, the combination of a spring-actuated slide for forcing the matches forward, a vertically-moving base, a follower for forcing the matches out of the box, secured thereto at its lower end, and a vertically-moving knife for severing the matches placed inside of the follower the width of a match, whereby it is in the proper position to sever it when forced down, substantially as shown.

3. In a match-box, the combination, with the case provided with grooves in one edge thereof, of the base, follower, and knife moving therein, the spring-actuated slide for forcing the matches forward, and a spring which engages the base and forces it upward when released, the knife and the follower being secured to the base at their lower

396,135.



ends, whereby they both move together in their proper relative positions, substantially as set forth.

4. In a match-box adapted to receive matches and automatically force them out lighted, the combination of a spring-actuated slide for feeding the matches forward, a spring-actuated follower for forcing them upward out of the box, the spring-lighter L, and the spring *m*, both secured to the case at their lower ends, just above the exit of the match, and between which the match is held, substantially as specified.

396,136. CONVEYING-BELT. DANIEL BRENNAN, Jr., Salterville, N. J. Filed Jan. 6, 1888. Serial No. 259,942. (No model.)

Claim.—1. A belt consisting of a series of metallic strips having end loops strung side by side upon a pair of ropes, substantially as shown and described.

396,136.

2. The combination, in a belt, of endless ropes and a series of metallic strips having end-loops and arranged side by side throughout the length of the belt and having a plain inner or contact surface, substantially as shown and described.

3. The combination, in a belt, of a pair of endless ropes connected and held apart by flexible metallic transverse strips arranged side by side throughout the length of the belt and having looped ends encompassing the ropes, substantially as shown and described.

4. The combination, in a belt, of two ropes, and a series of abutting metallic connections between and spacing said ropes and provided with end loops encompassing, but not firmly clamping, said ropes, the said strips forming a contact-surface of practically unbroken continuity, substantially as shown and described.

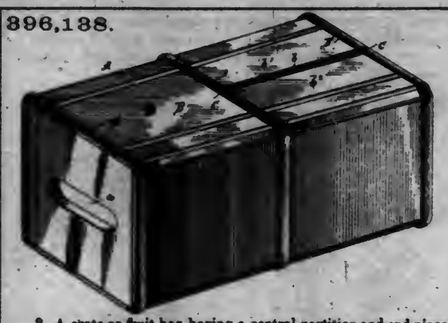
5. The combination, in a belt, of a pair of ropes, and a series of metallic strips connecting said ropes and abutting each other, whereby the said strips form the entire contact-surface of the belt, and which contact-surface is of practically unbroken continuity throughout the length of the belt, substantially as shown and described.

6. In a belt, the combination, with two ropes, of juxtaposed connecting-strips provided with looped ends through which the ropes pass, and with upwardly-extending projections forming a continuous side flange along the belt, substantially as shown and described.

7. The combination, with a pair of endless ropes, of a series of transverse strips connected to and spacing said ropes, the strips being provided with end loops encompassing the ropes, the interior surface of the loops being convexed, substantially as described.

396,137. FOOT-SHIELD FOR PIANO AND ORGAN CASES. MAX R. BRENKMAN, New Haven, Conn. Filed Oct. 31, 1888. Serial No. 289,854. (No model.)

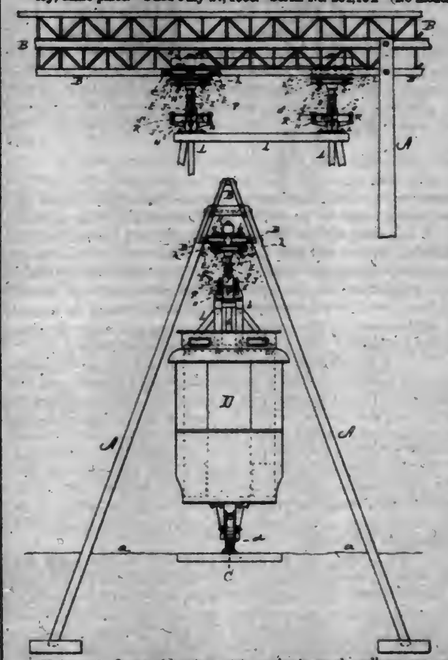
Claim.—1. The combination, with a shoe essentially U-shaped in cross-section, of a shield adapted to enter the said shoe, consisting of a padded body portion containing a pedal-recess in the bottom at each side of the center and a metal plate or stay, correspondingly recessed, attached to the body at the center thereof, substantially as shown and described, whereby the padded portion of the shield will extend a distance beyond each end of the stay, as and for the purpose specified.



2. The combination, with the casing of a piano, organ, or similar instrument, and a shoe essentially U-shaped in cross-section attached to the bottom of the said casing at the center of the front, of a shield consisting of a body portion provided with a padded outer face and pedal-recesses in the lower edge, one at each side of the center, and a metal plate or stay correspondingly recessed secured to the outer face of the said body, substantially as and for the purpose specified.

3. The combination, with the front casing of a piano, organ, or similar instrument, and a shoe essentially U-shaped in cross-section, provided with apertures in its outer wall, attached at the center and bottom of the said casing, of a shield adapted to enter the said shoe, consisting of a body portion of wood or equivalent material having a padded outer face, which padding extends over the top and bottom, partially covering the back, and having pedal-recesses produced in the lower edge, one at each side of the center, a metal plate or stay of less length than the shield-body, correspondingly recessed and attached to the outer face of the said body, and screws or equivalent fastening devices passed through the apertures in the shoe into the said plate or stay, all combined for operation substantially as shown and described.

396,138. FRUIT-BOX. JOSEPH S. BROWN, Huntington, Fla. Filed Apr. 16, 1888. Serial No. 270,846. (No model.)

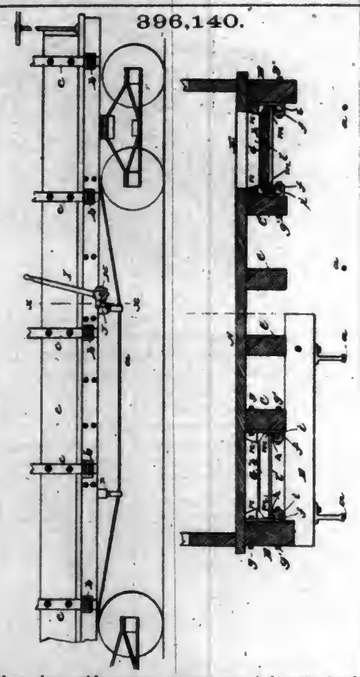


Claim.—1. A crate or fruit-box comprising a body, a partition intermediate of its ends, hoops encircling the body, one of said hoops passing around the partition, and a nail or similar retaining device passing through said hoop and entering the partition, and a cover having a longitudinal kerf-slit extending from one end of the box to the partition, substantially as and for the purpose described.

396,138.

2. A crate or fruit-box having a central partition and end pieces, hoops passing around the crate at the central partition and end pieces, and nails passing through the central partition and one of the end pieces, in combination with a slotted cover having its legs, formed by the slot, straddling the nails, whereby the cover may be withdrawn from the crate without removing the hoops, substantially as described.

396,139. SINGLE-RAIL RAILWAY. RUFUS H. BROWN, Peabody, Mass., assignor, by mesne assignments, of one-third to Frank W. Stanley, same place. Filed July 27, 1888. Serial No. 281,164. (No model.)



Claim.—1. In combination with a single-track railway-car and a trestle provided with a track, the following mechanism intermediate with the car and trestle, viz: wheels for running along the trestle-track, spring mechanism next said wheels for taking up rocking motion, springs next the rigid connections with the car for taking up rocking motion, and spring mechanism centrally located between the car and trestle for allowing vertical play, substantially as set forth.

2. The combination of the trestle provided with the track *c* and legs A, the wheels E, truck H H' H², axle *d*, and springs *h*, post I I', spring *g*, and block J, support K, pivots J', arms N P, and springs R, and the rigid connections L with the car, all substantially as and for the purpose described.

396,140. DUMPING-CAR. FERDINAND E. CANDA, New York, N. Y. Filed Mar. 9, 1888. Serial No. 266,674. (No model.)

Claim.—1. In a dumping-car having a substantially flat bottom or floor, and which dumps directly through one or more discharge-apertures in said floor, the combination, with said floor and the sills which support it on opposite sides of the discharge aperture or apertures therein, of the horizontally moving or sliding door or doors

396,140.

adapted to close said aperture or apertures below the level of the floor and arranged for support by said sills, substantially as specified.

2. In a dumping-car, the combination, with the car-floor and the sills which support said floor on opposite sides of one or more dumping or discharge apertures therein, of one or more horizontally-sliding doors adapted to close said aperture or apertures below the level of the floor and above the bottoms of the sills and arranged for support by and between the sills, and suitable operating mechanism for opening and closing said door or doors, substantially as specified.

3. In a dumping-car, the car-floor provided with a discharge-orifice, in combination with a horizontally-moving door to open and close said orifice, and constructed, in connection with its supports, to leave, when the dumping-orifice is closed, a free or open space between the edges of said door and its supports for the escape of small particles which could otherwise clog the door, essentially as described.

4. In a dumping-car, the combination, with a car-floor provided with a discharge-aperture, of beveled cleats fixed at the sides of the aperture and a horizontally-moving door arranged to operate below the beveled cleats and adapted to close the said discharge-aperture, substantially as specified.

5. In a dumping-car, the combination, with the car-floor A, provided with the discharge-aperture E, of the beveled cleats *n*, arranged at the side of the said aperture and below the car-floor, the horizontally-moving door G, provided with beveled edges, the bars or rails *h*, adapted to support the said door, and series of hooks or brackets *f*, secured to the car-sills and carrying the bars or rails *h*, substantially as specified.

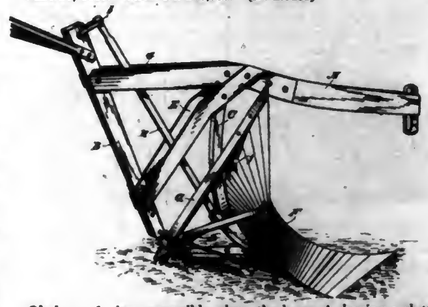
6. In a dumping-car, the combination, with the horizontally-moving door G, of the door-supporting bars or rails *h* and the hooks or brackets *f*, the said door G being arranged with an intervening space between its edges and its supports for the escape of dust or particles which could clog the door, substantially as specified.

7. In a dumping-car, the combination, with the horizontally-moving door, of the metal cleats *l*, provided with angled ends *m*, and the supporting bars or rails *h*, substantially as specified.

8. The combination, with the horizontally-moving door G, of the metal cleats *l*, provided with angled ends *m*, the supporting bars or rails *h*, the hooks or brackets *f*, and the distance-pieces *i*, substantially as specified.

9. In a dumping-car, the combination, with the horizontally-moving door G, adapted to close the opening in the car-floor, of the plate *k*, secured to the upper surface of the said door, substantially as specified.

10. In a dumping-car, the combination of the car-floor A, provided with an aperture, E, the beveled cleats *n*, arranged at the sides of the aperture, the hooks or brackets *f*, the bars or rails *h*, the distance-pieces *i*, the horizontally-moving door G, provided with the metallic cleats *l* and with the metallic covering *k*, and suitable mechanism for operating the same, substantially as described.



396,141. HEAD-PROTECTOR. GEORGE H. CHAPPELL, WILLIAM BROWN, and JOHN BROWN, Brownton, Minn. Filed May 8, 1888. Serial No. 273,174. (No model.)

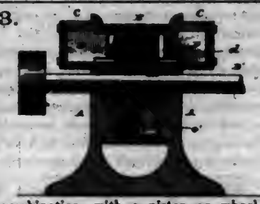
Claim.—1. The head-protector herein shown and described, the same consisting of the ring A, sliding ribs or arms *h*, connected thereto, supports *c d*, shoulder-pieces *f*, and web and covering B C, substantially as described.

2. In a head-protector, the ring A, formed with ways *a*, in combination with the sliding plates *g* and the arms or ribs *h*, hinged thereto, substantially as described.

396,142. REVERSIBLE PLOW. JAMES A. COLE, Julian, Cal. Filed June 29, 1888. Serial No. 278,585. (No model.)

Claim.—1. In a reversible plow, the beam A, having a slotted rear end, *a*, and the forward and rear standards secured to the beam, in combination with the pivot-shaft mounted in the lower ends of the standards, the double mold-board and landsides on said shaft, the lugs *f* on the back of the mold-board, the locking-lever H, fulcrumed on the shaft, so as to move forward and back, and having an eye on its lower end for engaging the mold-board lugs, said lever passing upwardly through the slotted rear end of the beam, and a catch for securing it to the rear standard, substantially as described.

2. In a reversible plow, the beam A, having a slotted rear end, *a*, the rear standard and the forward standard secured to the beam, and the inclined slotted brace bolted to both standards and to the beam, in combination with the pivot-shaft mounted in the lower ends of the standards, the double mold-board and landsides on said shaft, the lugs *f* on the back of the mold-board, the locking-lever H, fulcrumed on the shaft, so as to move forward and back, and having an eye on its lower end for engaging the mold-board lugs, said lever passing upwardly through and guided by the slotted brace and the slotted rear end of the beam, and the pivoted catch on the upper end of the rear standard for engaging the upper end of the locking-lever, substantially as described.



396,143. ROTARY ENGINE. WILLIAM C. CULBERTSON, Girard, Pa. Filed Mar. 1, 1883. Serial No. 265,833. (No model.)

Claim.—1. In a device of the kind described, a wheel or piston having inclined valve-operating grooves in its opposite faces.

2. The combination of a wheel or piston having inclined grooves in its opposite faces with heads having sliding valves working in said grooves, as set forth.

3. The combination, with a wheel or piston having inclined grooves in its opposite faces, of heads having valves adapted to work in said grooves and provided with base-flanges on one side thereof, as set forth.

396,143.

4. The combination, with a piston or wheel having inclined grooves in its opposite faces, heads having steam-chests, and sliding valves working in the grooves, of the wheel and exhaust-ports through heads back of the valves, substantially as set forth.

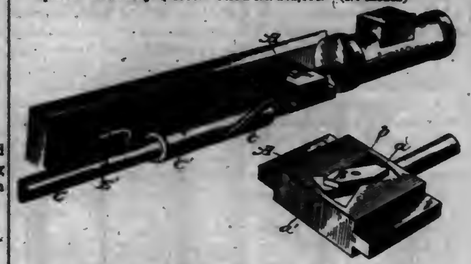
396,144. EYEGLASS-HOLDER. HENRY J. DALE, Chicago, Ill. Filed June 6, 1888. Serial No. 276,240. (No model.)

Claim.—An eyeglass-holder consisting of a body portion, a safety-pin substantially parallel with the body, an aperture or recess in the upper portion of the body, and a hook bent from the same piece of metal as the body of the holder, having its upper end bent downward and inward and shaped to fit in the recess in the upper portion of the body, substantially as described.

396,145. SAW-CLAMPING DEVICE. ROBERT F. DARLING, Seneca Falls, N. Y. Filed July 9, 1888. Serial No. 279,394. (No model.)

Claim.—1. The saw-vise jaws A A' *a a'*, having thereon the recessed stud or extension *c*, arranged for holding a pad against the saw, all made in one and the same piece, substantially as and for the purposes specified.

2. The saw-vise jaws A A' *a a'*, having thereon the extensions B B', all made in one and the same piece, in combination with the pivoted arms C C, provided at their free ends with movable or adjustable jaw-compressors, substantially as and for the purposes specified.



3. A saw vise or clamp in which the jaws and their supporting-arms are made in one and the same piece of cast metal, sufficiently flexible to permit the jaws to be clamped upon and released from the saw, and in which the said single or unitary part is combined with one or more clamps for temporarily clamping the saw between the jaws, substantially as and for the purposes specified.

396,146. LAMP-COVERING. GEORGE H. DEAN, St. Louis, Mo. Filed Jan. 10, 1883. Serial No. 260,326. (No model.)

Claim.—In a lamp-covering, the combination, with the concave halves forming a closed cover, of the hinge connecting the lower ends of the halves and the spring bearing on the halves at their hinged ends and holding them normally closed, substantially as set forth.

396,147. MECHANISM FOR CONVERTING MOTION. JOHN DE MORSIER, Corvallis, Oreg., assignor of one-half to John R. Bryson, same place. Filed May 4, 1888. Serial No. 272,801. (No model.)

Claim.—1. The mechanism for converting motion, comprising a swiveled or pivoted cam or lever, in combination with and engaging in opposite directions spiral grooves in a cylinder applied to a shaft, and means consisting of stationary or fixed cams for shifting or switching the pivoted cam, substantially as set forth.

2. In mechanism for converting motion, the combination, with the cross-head of an engine-piston provided with a swiveled or pivoted cam or lever, of a shaft carrying a cylinder provided with spiral grooves or channels, and means consisting of stationary or fixed cams for shifting or switching the said pivoted cam, substantially as set forth.

3. In mechanism for converting motion, the combination, with the piston cross-head carrying the pivoted or swiveled cam or lever, of the shaft carrying the cylinder, provided with grooves or channels spirally traversing the same and converging or meeting at opposite sides and ends thereof, and stationary or fixed cams for shifting or switching the pivoted or swiveled cam or lever, substantially as set forth.

4. In mechanism for converting motion, the combination, with the piston cross-head carrying the pivoted or swiveled cam or lever, consisting of a lower smaller portion provided with double beveled or pointed ends, and of an upper larger portion set in a recess in the cross-head, of the shaft carrying a cylinder provided with spiral grooves or channels converging or meeting at opposite sides and ends thereof, and fixed or stationary hook-shaped cams for switching or shifting the swiveled or pivoted cam or lever, substantially as set forth.

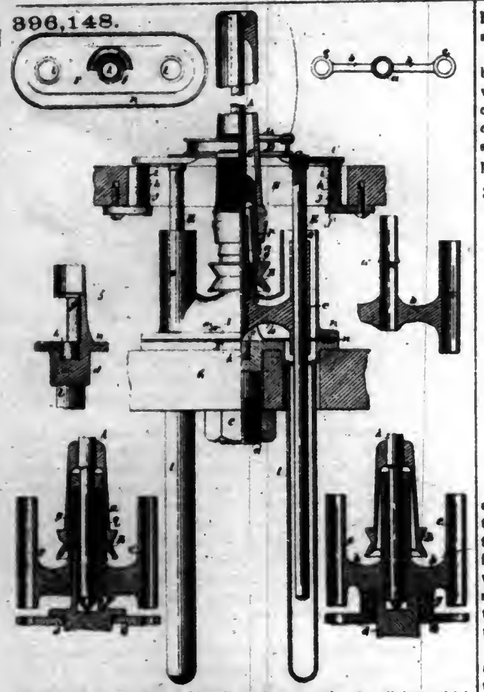
396,148. SUPPORT FOR SPINDLES AND RINGS OF RING-SPINNING MACHINES, &c. EDWARD DUNKER, Auburndale, (Newton,) Mass. Filed Aug. 3, 1887. Serial No. 246,075. (No model.)

Brief.—The spindle and its supports are so combined with the ring that the latter may have a lateral motion corresponding to that of the spindle.

Claim.—1. The combination, with a spindle, a spindle-bolster, and means for supporting said bolster in a yielding or flexible manner, of a ring, and connections between said bolster and ring, whereby the ring is caused to gyrate or vibrate with the bolster and spindle, substantially as specified.

2. The combination, with a spindle, a spindle-bolster, and means for supporting said bolster in a yielding or flexible manner, of a ring, and sliding connections between said bolster and ring, whereby the ring is caused to gyrate or vibrate with the bolster and spindle, substantially as set forth.

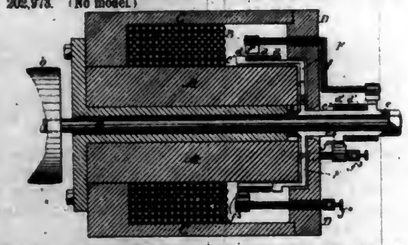
3. The combination of a fixed support, a spindle, a spindle-bolster, means for connecting said bolster with said fixed support in a yielding or flexible manner, a ring, sliding connections between said bolster and ring, and a rail movable in the direction of the length of the spindle and connected flexibly with said ring, substantially as set forth.



4. The combination, with a spindle, a spindle-bolster, means for supporting said bolster in a yielding or flexible manner, a ring, and sliding connections between said bolster and ring, whereby the ring is caused to gyrate or vibrate with the bolster, of a support or stand containing a chamber for oil inclosing the bolster and the bearings of said sliding connections, substantially as set forth.

5. The combination, with a spindle, a spindle-bolster, means for supporting said bolster in a yielding or flexible manner, a ring, and connections between said bolster and ring, whereby the ring is caused to vibrate or gyrate with the bolster, of a support or stand containing an oil-chamber inclosing the bolster, substantially as set forth.

6. The combination of a spindle, a yieldingly or flexibly supported spindle-bolster, rods adapted to move longitudinally and in the direction of the length of the spindle, bearings for said rods fixed to the spindle-bolster, and a ring fixed to said rods, substantially as set forth.



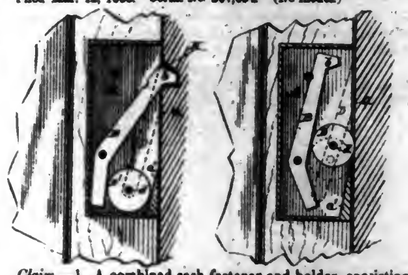
7. The combination of a spindle, a bolster therefor flexibly supported, rods adapted to move longitudinally and in the direction of the length of the spindle, bearings for said rods fixed to the spindle-

396,148.

bolster, a ring fixed to said rods, and receptacles for oil into which said rods extend, substantially as specified.

396,149. UNIPOLAR DYNAMO-ELECTRIC MACHINERY. RUDOLF EICKEMEYER, Yonkers, N. Y. Filed May 22, 1886. Serial No. 202,973. (No model.)

Claim.—1. In an electro-magnetic or magneto-electric machine, the combination, substantially as hereinbefore described, of a rotating armature provided with a series of independent radial bar-conductors, and outside conductors which couple the outer and the inner ends of the armature bar-conductors and couple said conductors in linear circuit.

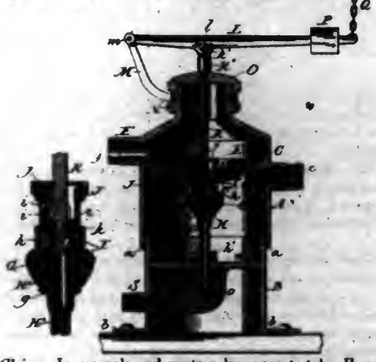


2. In an electro-magnetic or magneto-electric machine, the combination, substantially as hereinbefore described, of a rotating armature carrying a series of radial bar-conductors coupled in linear circuit by outside conductors, a magnetic shell affording annular coincident faces at right angles to the axis of the armature, and an exciting-helix housed within said shell for developing in said faces opposite polarity and affording between them an annular magnetic field for the reception of said radial armature-bar-conductors.

3. In an electro-magnetic or magneto-electric machine, the combination, substantially as hereinbefore described, of a rotating armature provided with a series of radial conductors and outside conductors which couple the outer ends of two or more of said armature-conductors with the inner ends of two or more other armature-conductors, and thus provide on said armature a linear electric circuit which at all points in its path includes two or more of said radial conductors.

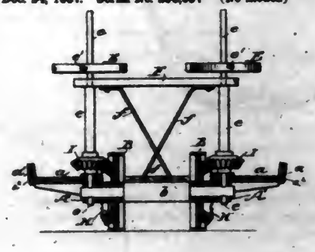
4. In an electro-magnetic or magneto-electric machine, the combination, substantially as hereinbefore described, of an armature provided with a series of independent radial conductors and outside conductors, each in electric communication with four or more of said armature-conductors, and coupling said armature-conductors in a linear circuit which embraces in its path at all points two or more of said armature-conductors.

5. In an electro-magnetic or magneto-electric machine, the combination, substantially as hereinbefore described, of an armature provided with a series of independent radial conductors and a series of conducting-rings coupled in pairs to two or more of said armature-conductors, and a series of outside conductors communicating with said rings and affording a continuous circuit which embraces at all points in its path two or more of said radial conductors.



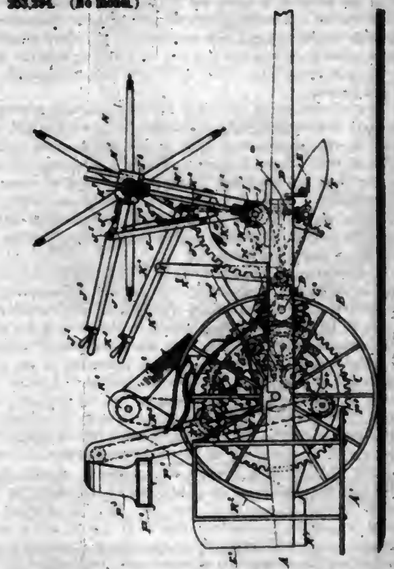
396,150. SASH-FASTENER. JOHN G. ERICKSON, Hadley, Minn. Filed Mar. 12, 1888. Serial No. 267,094. (No model.)

Claim.—1. A combined sash-fastener and holder, consisting in a casing having an opening in one side, an inclined locking-bolt within the casing and projecting, when thrown through said opening, to positively lock the sash when closed, a vertically and outwardly movable friction-holder, also in said casing in front of and below the bolt, whereby, when moved vertically, said friction-holder will retract and ride up said inclined bolt and be forced simultaneously outward thereby through the said opening in the casing to hold the sash open, substantially as set forth.



2. A sash-fastener comprising a casing having a side opening and a downward incline in the lower end of said casing, a bolt pivoted between its ends in said casing, and a disk working on said incline and against the lower end of said bolt to hold its upper end projected through the case-opening, substantially as set forth.

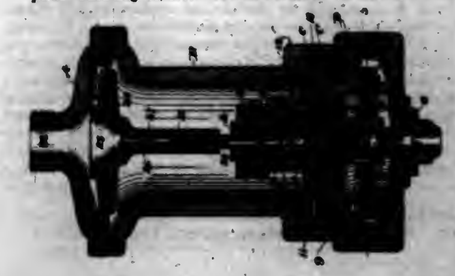
396,151. SUPPLY AND WASTE VALVE. RICHARD FIEN, Chicago, Ill. Filed Feb. 16, 1888. Serial No. 264,231. (No model.)



Claim.—In a supply and waste valve, a waste-tube, H, carrying a supply-valve seating upward, and a cage, J, above the supply-valve, in combination with a valve-stem, K, carrying a waste-valve, I, located in the cage J and seating downward to close the waste-tube H for simultaneously opening and closing the valves, substantially as specified.

396,152. CORN-CUTTER. GEORGE W. GIBSON, Kimbolton, Ohio. Filed Dec. 24, 1887. Serial No. 258,987. (No model.)

Claim.—The combination, with the machine-frame A, having the forward axle, *b*, the body being square and at its ends round and having vertical apertures within the side bars of the frame, wheels B, turning on said round ends of the axle and provided with gears H, and the side tables, *a a*, having fixed knives D, of the vertical shafts *e e*, extending at their lower ends down through the apertured side bars of the frame and the apertures in the axle, the gears I on the lower ends of the said shafts meshing into gears H, and the reels E on their upper ends, the cross-bar F, supporting the upper ends of shafts *e*, and the brace-bars G *f*, supporting said bar, the former from the rear of the frame and the latter from the forward axle, substantially as set forth.

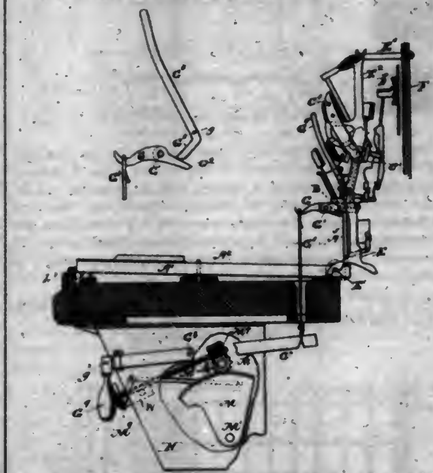


396,153. COMBINED HARVESTER AND THRASHING-MACHINE. LESTER A. GILLETT, Leonardville, Kans. Filed Oct. 26, 1887. Serial No. 253,294. (No model.)

Claim.—1. The combination, with a swinging frame carrying the cutter-bar and the endless carrying-belt, of a link connected with said swinging frame, a lever carrying said link, a lever-pawl pivoted on said swinging frame, a fixed notched segment engaged by said lever-pawl, and means, substantially as described, for connecting said lever-pawl with the handle end of said lever, so as to enable the operator to raise and lower the swinging frame and lock the same in position, substantially as shown and described.

2. The combination, with the swinging frame F, of the link K^{10} pivotally connected with the swinging frame F, the arm K^7, mounted on the main frame, the lever K^6, fulcrumed on the arm K^7 and pivotally connected with the link K^{10}, the hand-lever K^5, fulcrumed on said lever K^6, the link K^4, connected with the hand-lever K^5, the bell-crank lever K^3, fulcrumed on the end of said lever K^6 and connected with the link K^4, the link K^2, connected with said bell-crank lever K^3, the lever-pawl K, connected with said link K^2 and pivoted on said swinging frame F, and the fixed segment K', provided with notches in which said lever-pawl K engages, substantially as shown and described.

396,154. VALVE FOR FLUID-PRESSURE BRAKES. HERMAN GUHL, St. Louis, Mo., assignor to the American Brake Company, same place. Filed Aug. 21, 1888. Serial No. 283,333. (No model.)



Claim.—1. In a valve for fluid-pressure brakes, the combination of a balanced valve having ports leading to the reservoir and cylinder, a secondary valve having ports leading from the reservoir and balanced valve, and an exhaust-port, a diaphragm-chamber which communicates with the train-pipe, and a diaphragm connected with the secondary valve, and having a leak-port which is constantly open, substantially as and for the purpose specified.

2. In a valve for fluid-pressure brakes, the combination of a balanced valve having ports leading to the reservoir and cylinder, a secondary valve whose stem is of less cross-sectional area than the valve, ports leading from the auxiliary reservoir to the secondary-valve chamber and to the balanced valve, an exhaust-port for the secondary-valve chamber, a diaphragm-chamber connected with the train-pipe, and a diaphragm connected with the secondary valve and having a leak-port, substantially as and for the purposes specified.

3. The combination, with the valve-stem 18, of the perforated annular plug or gland 14 and the pin 19, substantially as and for the purposes specified.

396,155. PIANO-FORTE. FRANCIS W. HALE, Boston, Mass. Filed May 7, 1888. Serial No. 273,102. (No model.)

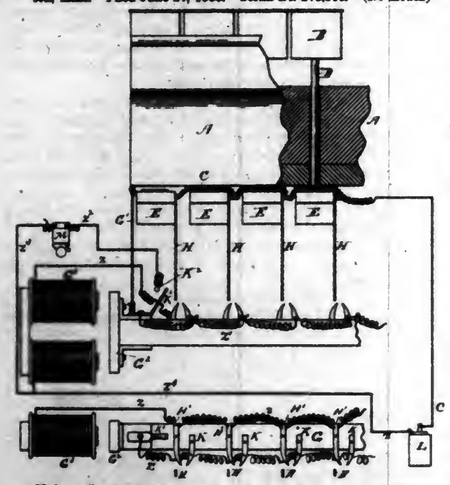
Claim.—1. In a piano-forte, the combination of the hand-lever G^3 G^7, rod G^2, and lever G, having an extension, G^4, adapted to lift the levers B and to throw forward the upper end of the lever G^3 G^4, with the hammer-stem rail C^9, substantially as described, and for the purpose set forth.

2. In a piano-forte, the combination of the key A', sticker L^3, and lever L, with the link L^4, lever L^5, cord L^7, and spring L^9, all operating together substantially as described, and for the purpose set forth.

3. In a piano-forte, the combination of the key A', sticker L^3, lever L, link L^4, lever L^5, cord L^7, and spring L^9, with swinging segment mechanism M M^2 M^3, all operating together substantially as described, and for the purpose set forth.

4. In a piano-forte, the combination of the lever L, link L^4, lever L^5, cord L^7, and spring L^9, with the resisting-bar L^8, spring L^{11}, and rocker L^{12}, substantially as described, and for the purpose set forth.

5. In a piano-forte, the combination of the segment M, link L^{16}, crank-arm L^{15}, shaft L^{14}, arm L^{13}, and rod L^{20}, with the resisting-bars L^8, all operating together substantially as described, and for the purpose set forth.



6. In a piano-forte, the combination of the key A', sticker L^3, lever L, and click-striker L^{16}; with the spring-plate P' P^2 P^3 P^4 and the contact-hook P^5 P^6, adapted to make and break an electric circuit, substantially as described, and for the purpose set forth.

7. In a piano-forte, the combination of the click-striker L^{16} and spring-plate P' P^2 P^3 P^4 with the contact-hook P^5 P^6, adapted to make and break an electric circuit, substantially as described, and for the purpose set forth.

8. In a piano-forte, the combination of the key A', sticker L^3, lever L, and click-striker L^{16}, with the spring-plate P' P^2 P^3 P^4 and spring-brace R, adapted to make and break an electric circuit, substantially as described, and for the purpose set forth.

9. In a piano-forte, the combination of the click-striker L^{16} with the spring-plate P' P^2 P^3 P^4 and spring-brace R, adapted to make and break and electric circuit, substantially as described, and for the purpose set forth.

396,156. ATTACHMENT FOR PIANOS. FRANCIS W. HALE, Boston, Mass. Filed June 27, 1888. Serial No. 278,368. (No model.)

Claim.—In connection with a piano-forte action, the combination of the stickers D and levers E, having metallic strips H electrically connected to one pole of a battery, with the movable rail G, adapted to be moved by magnetic action, and having upon it electric contact points or plates (electrically connected to a battery) adapted to be presented automatically in turn to the strips H, and an electrically-connected bell or other signal device, operating substantially as described, and for the purpose set forth.

396,157. WINDOW BURGLAR-GUARD. JOHN B. HARRIS, Butaw, Ala. Filed Nov. 30, 1888. Serial No. 291,386. (No model.)

Claim.—1. A window-guard consisting of a metallic grating having downwardly-projecting sharp spikes on its lower edge and mounted to slide vertically inside of a window, a catch for holding the grating in elevated position and for locking it when lowered, a weighted ball mounted on a tilting support and connected to the catch, and means adjacent to the window for releasing the catch, substantially as set forth.

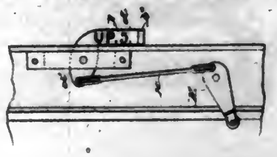
2. A window-guard consisting of a metallic grating having downwardly-projecting sharp spikes on its lower edge and mounted to slide vertically inside of a window, springs bearing against the upper end of the grating to throw it downward, a catch for holding the grating in elevated position, with the springs compressed, and for locking it when lowered, a weighted ball mounted on a tilting support and having a cord connecting it to the catch, a step mounted on springs beneath the window-sill on the inside of the window, a cord leading from the tilting support and held across the lower portion of the window, and a cord leading from the tilting support and connected to the spring-step, substantially as shown and described.

3. In a window-guard, a metallic grating having sharp spikes projecting downward from its lower end and mounted to slide vertically inside of a window, a catch for holding the grating in elevated position, a detachable weight mounted on a movable support and connected by a cord to the catch to release the same, and a cord extended across the lower portion of the window and connected to the movable support, substantially as shown and described.

4. In a window-guard, a metallic grating having sharp spikes projecting downward at its lower end and mounted to slide vertically inside of a window, a catch for holding the grating in elevated position, a detachable weight mounted on a movable support, a step mounted on springs beneath the window-sill, and a cord leading from the step to the movable support, on which the weight rests, substantially as shown and described.

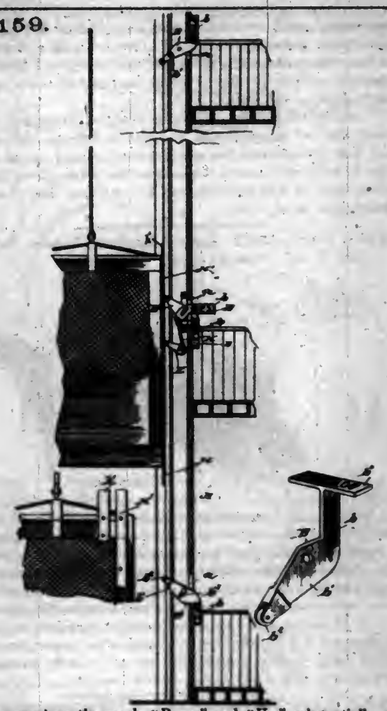
5. In a window-guard, the combination, with metallic grating 2, having sharp downwardly-projecting points at its lower end and vertical bars 10, with serrated edge 22, at its sides and mounted to slide vertically on window-frame 1 inside of window 2, of springs 38, connecting the upper end of grating 2 with the upper end of frame 1, lever 15, mounted in recess 17 in the window-frame 1 and having pin 19 adapted to engage holes 20 in adjacent bar 10, and a cam-shaped head, 16, with teeth 21, adapted to engage serrated edge 22 of bar 10, substantially as shown and described.

6. A window-guard consisting of the metallic grating 2, formed with the sharp points or spikes 4 at its lower end and mounted to slide in window-frame 1 on the inside of window 5, with vertical serrated bars 10, having holes 20 and located in pockets 9 in the window-frame, cushion-blocks 37, located in the lower ends of pockets 9, and coiled springs 38 in their upper end connected to the window-frame and to the grating 2, a lever, 15, pivoted in a recess, 17, in the side of window-frame 1 and having an arm, 18, projecting out of recess 17, and a cam-shaped head, 16, with teeth 21 adapted to engage serrated bar 10 and lock grating 2, and a pin, 19, adapted to engage holes 20, a bracket, 23, on the side of window-frame 1, a tilting bracket, 24, hinged to bracket 23 and having an arm, 25, a weighted ball, 26, adapted to rest on brackets 24 and 23 and having a cord, 27, leading to arm 18 of lever 15, a step, 30, mounted on springs 31, a cord, 35, leading from step 30 to arm 25, and a cord, 28, leading from staple 29 across the lower portion of window 5 and attached to arm 25, substantially as shown and described.



396,158. PROCESS OF RETTING FLAX. EDWIN A. HARTSHORN, Troy, N. Y. Filed Nov. 1, 1887. Serial No. 254,008. (Specimens.)

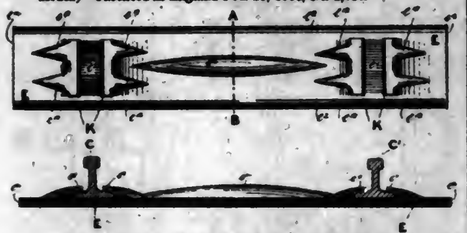
Claim.—The process hereinbefore described of retting flax, consisting of subjecting the flax to the action of hot water within a closed vessel under a pressure of from twenty to sixty pounds to the inch for about an hour, and then immediately thereafter treating it with cold air until cool, and then in sequence subjecting the flax to the action of steam in a closed vessel under a pressure of from thirty to sixty pounds to the inch for about an hour, and immediately thereafter and in sequence treating the flax with cold water, as herein set forth.



396,159. INDICATOR FOR ELEVATORS. OLIVER C. HAYWARD, New York, N. Y. Filed Feb. 1, 1888. Serial No. 262,630. (No model.)

Claim.—1. In an indicator for elevators, the combination, with a vertical shaft, stages or floors adjacent to said shaft, and the car adapted to travel in the latter, of angle-blocks which are pivoted above such stages or floors, one member or arm thereof projecting through the side of the shaft to engage with the car, and the outer member of said block being provided with an indicating-word and weighted to cause it to hang normally vertical parallel to the side of the shaft, as shown and described, to operate as specified.

2. In an indicator for elevators, the combination, with the car provided with side projections, of a double series of angle indicating-blocks, one series provided with a friction-roller upon the inner end adapted to engage the car, a lever connected with the inner member of the second series engaging the car and operating the block, and a horizontal projection integral with the outer member of each series of blocks, the said series having produced upon the faces of the respect-

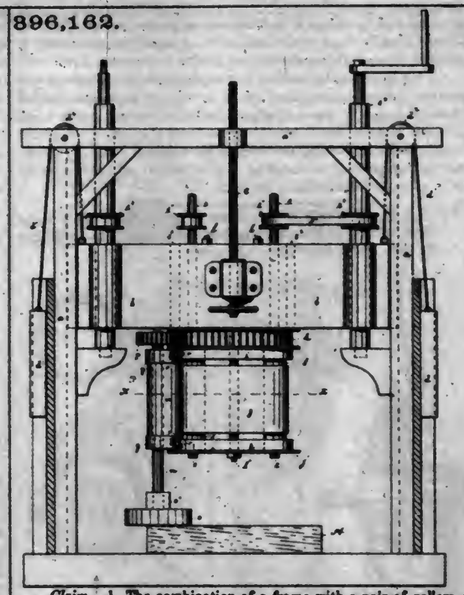


396,159.

ive outer members the words "Down" and "Up," substantially as and for the purpose specified.

396,160. SLEEPER. HENRY HIPKIN, Birmingham, County of Warwick, England. Filed May 30, 1888. Serial No. 275,466. (No model.) Patented in England Feb. 23, 1888, No. 2,716.

Claim.—A metallic sleeper in one piece, provided near its ends with pairs of raised jaws for holding the rails and ribs c^{19} for bracing said jaws, said sleeper also having a raised rib, c^4, extending lengthwise of said jaw as far as the inner ends of said ribs c^{19}, for the purpose set forth.

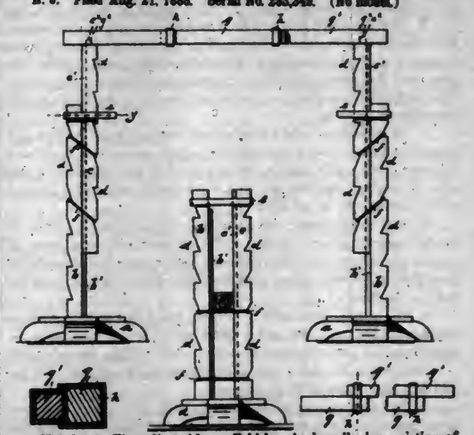


396,161. RESPIRATOR FOR FIREMEN. HUDSON R. HURD, Cleveland, Ohio. Filed Dec. 17, 1887. Serial No. 258,242. (No model.)

Claim.—A fireman's smoke-protecting device comprising a hat or cap provided with a strong projecting peak, *a*, a flexible visor secured to the edges of the said peak and provided with a glazed sight-aperture, and a cord, *b*, for securing the said visor to the face of the wearer, a long flexible air-inlet tube depending from the said visor, and the air-escape E on the peak of the cap, all arranged substantially as described and shown, and for the purpose set forth.

396,162. MACHINE FOR POLISHING STONES. MICHAEL HURTT, Poughkeepsie, N. Y. Filed Apr. 13, 1888. Serial No. 270,551. (No model.)

396,162.

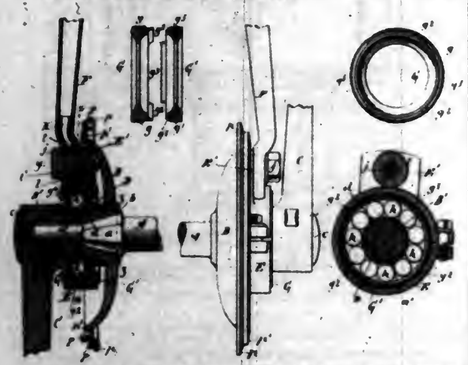


Claim.—1. The combination of a frame with a pair of rollers, a surrounding apron, a rack, a tube secured to said apron, a shaft passing through said tube and carrying a gear-wheel meshing into the rack, and a polishing-tool secured to the shaft, substantially as specified.

2. The combination of a frame with a pair of rollers, a surrounding apron, a rack, a pair of flanges, a tube secured to the apron and provided with a pair of guide-pins operating in conjunction with the flanges, and a tool-carrying shaft passing through the tube and in gear with the rack, substantially as specified.

3. The combination of a frame with a vertically-adjustable cross-head, a pair of rollers suspended therefrom, an apron surrounding said rollers, a rack, a tube secured to said apron, and a shaft passing through said tube and in gear with the rack, the shaft carrying the polishing-tool, substantially as specified.

396,163. ADJUSTABLE SCAFFOLD. MATTHIAS KILL, Newark, N. J. Filed Aug. 21, 1888. Serial No. 283,349. (No model.)



Claim.—1. The adjustable scaffold herein described, consisting of notched tongued standards secured to bases and provided with fixed bands, grooved standards adapted to pass through said bands and vertically adjustable on said fixed standards, and metallic loops for holding said adjustable standards when in position, and extensible rods connecting the tops of said adjustable standards, substantially as and for the purposes set forth.

2. In an adjustable scaffold, the combination, with a base or support and a fixed notched standard, of a vertically-adjustable notched standard, a metallic band rigidly secured to said fixed standard and

provided with notches *d d*, to hold said adjustable standard, and adjustable metallic loops for holding said adjustable standard when in position, substantially as shown, and for the purposes set forth.

3. In an adjustable scaffold the combination, with a base or support and a fixed notched standard, of a vertically-adjustable notched standard, a metallic band rigidly secured to said fixed standard and provided with recesses to receive said adjustable standard, adjustable metallic loops for holding said adjustable standard when in position, and rods connecting the tops of said adjustable standard, substantially as and for the purposes set forth.

396,164. VELOCIPEDE. BERRY G. LATTA, Friendship, N. Y., assignor to the Pope Manufacturing Company, Portland, Me. Filed Jan. 20, 1888. Serial No. 261,361. (No model.)

Claim.—1. In a journal-bearing, the combination, with a bearing box or case provided in its bore with right and left hand screw-threads, of two adjustable grooved collars arranged within said bearing-box and provided on their outer surfaces with right and left hand screw-threads, respectively, and having their inner adjacent portions beveled and made of smaller diameter than the main screw-threaded portions of the collars, and beveled segmental ribs or projections arranged on the inner faces of said reduced portion of the collars, substantially as set forth.

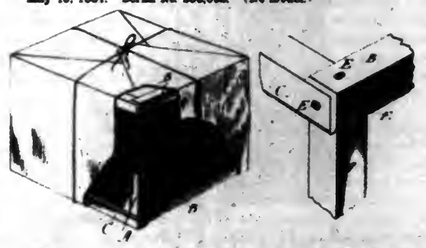
2. The combination, with the axle having a contracted cylindrical extension, *a'*, and the hub-flange B, having a tubular extension, B', of a crank, C, arranged upon said tubular extension, a screw-nut, *c*, applied to the end of the axle-extension *a'*, a grooved collar or sleeve, D, arranged between the hub-flange and the crank, grooved adjustable collars G G', and a bearing box or case, E, surrounding the collars G G', substantially as set forth.

3. The described improvement in the construction of a tubular fork end for attachment to a bearing in a velocipede, consisting in the extension of the tube end, the tapering, flattening, and forming the same with the insertion of a core, and the perforation of the two parts thus conformed together for attachment directly to the bearings, substantially as set forth.

4. The combination of a tubular fork-arm and a tubular fork end wrought thereon, and a strengthening-core inserted and conformed therewith, and a bolt passing through the fork end and its core and with its nut and shoulder securing the same directly to the bearing parts, substantially as set forth.

5. The combination, with a tubular fork-arm having a bent or concavo-convex lower end, of a stiffening or re-enforcing piece arranged in the lower end of the fork-arm, and supports having similarly-shaped faces bearing against opposite sides of the fork-arm, substantially as set forth.

6. The combination, with a tubular fork-arm having a bent or concavo-convex lower end and a stiffening or re-enforcing piece arranged therein, of the bearing box or case having a lug provided with a conical projection, and a fastening-bolt passing through the fork end and said lug, substantially as set forth.



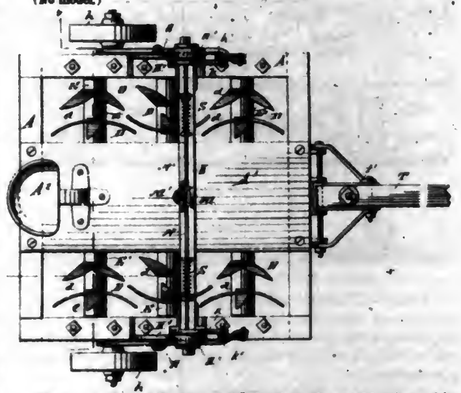
7. The combination, with a tubular fork-arm having a bent or concavo-convex lower end and a stiffening-piece inserted in said lower end, of the bearing box or case having a lug provided with a conical projection bearing against one side of the fork end, and a fastening-bolt, whereby the fork end is secured to said lug, and having in its head a conical seat, against which the opposite side of the fork end rests, substantially as set forth.

8. The combination, with two independent rows or sets of spokes, of a hub flange or disk provided with two annular rims arranged in different vertical planes, each of said rims supporting the inner ends of one set of spokes, substantially as set forth.

9. The combination, with a hub flange or disk provided with an internal annular rim and an external annular rim arranged in different vertical planes, of a set of spokes attached to said internal rim and a set of spokes attached to said external rim, the spokes attached to one of said rims passing outwardly from the hub in a direction substantially opposite to that of the spokes attached to the other rim, substantially as set forth.

10. The combination, with the axle, of two hub-flanges, each provided with two marginal rims arranged in different vertical planes, and each provided with two sets of spokes arranged against the outer sides of said rims, whereby the spokes of one set draw over the spokes of the other set, and both sets draw over the outer sides of said rims, substantially as set forth.

396,165. CRATE. ALBERT T. LINDERMAN, Whitehall, Mich. Filed May 13, 1887. Serial No. 238,082. (No model.)

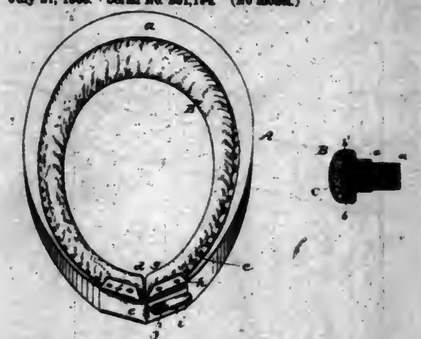


Claim.—1. In combination with a rectangular package, right-angled protectors arranged upon all of the edges of the package and a means for holding them in place, as and for the purpose stated.

2. In combination with a box, boxes, or packages, the pieces of right-angular angle-wood, A B C, applied on the outside of the corners, and means for holding them in place, substantially as described.

3. In combination with a box, boxes, or packages, the pieces of angle-wood, A B C, applied on the outside of the corners, one of these pieces being tenoned and the other two pieces being mortised to fit this tenon to form a lock-corner, as described.

396,166. SOD-CUTTER AND PULVERIZING-HARROW. ABRAHAM MADSON, Frenchville, Wis. Filed June 20, 1888. Serial No. 277,602. (No model.)



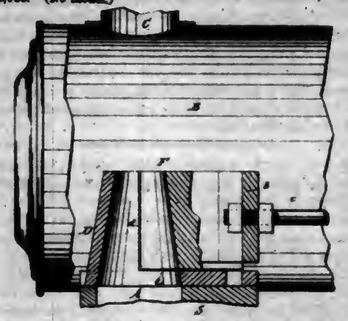
Claim.—1. In a sod cutter and pulverizer, the combination, with a shaft, of a series of cutters, D, arranged upon the shaft, each cutter consisting of two knives, *d*, curved in the direction of their longitudinal axis and having circular cutting-edges *d'*, and each cutter being spaced and arranged with its blades in alignment with the space between the blades of the adjacent cutter, substantially as herein shown and described.

2. In a sod cutter and pulverizer, the combination, with the recessed hangers *a* and the shaft B, having screw-threaded ends, of the cutters D, mounted on the said shaft, the sleeves E F, and the nuts *b b c*, substantially as herein shown and described.

3. In a sod cutter and pulverizer, the combination, with the supporting-frame, of the pivoted levers H, the wheels A, carried on the lower ends of the said levers, the rock-shaft K, provided with the arms *k*, the links connecting the arms *k* to the levers H, and means for locking the rock-shaft in position, substantially as herein shown and described.

4. In a sod cutter and pulverizer, the combination, with the supporting-frame and apertured brackets carried thereby, of the pivoted levers H, the wheels A, carried by the said levers, the rock-shaft K, provided with the apertured arms *k* and standard M, the links *k'*, connecting the arms *k* and levers H, the levers *m m'*, pivoted to the standard M, the hand-lever M', connected to the said levers *m m'*, and the sliding and spring-actuated rods N N', for engaging the apertures of the brackets and arms *k*, substantially as herein shown and described.

396,167. HORSE-BOOT. THOMAS B. MASON, Trenton, N. J. Filed July 27, 1888. Serial No. 281,194. (No model.)

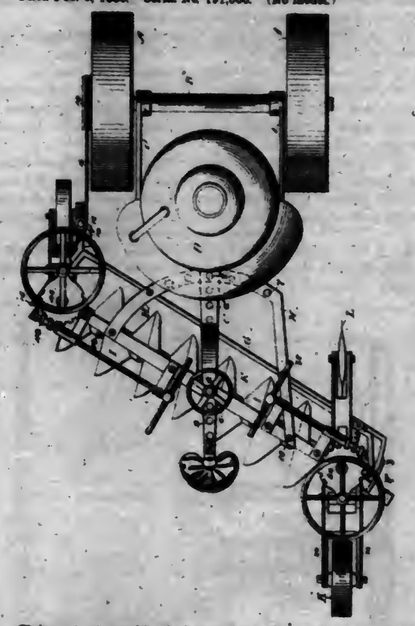


Claim.—1. A horse-boot formed of a divided ring having a widened portion, *a*, the hasp *c*, attached to one end of the divided ring, and the plate *h* and button *i*, attached to the opposite end of the divided ring, substantially as specified.

2. In a horse-boot, the divided elastic ring A, having the integral widened portion *a* between its ends, flanges *b b'* on its upper and lower sides at the inner edges thereof, and a fastening for the ends of the ring, substantially as set forth.

3. The combination, with the divided ring A, provided with the flanges *b b'*, of the lining B, secured to the said ring, and the padding C, interposed between the lining B and the inner edge of the ring, substantially as specified.

396,168. EXHAUST-NOZZLE. JOHN H. MCINDOE and WILLIAM MEREDITH, Mount Pleasant, Pa. Filed Aug. 17, 1888. Serial No. 282,963. (No model.)



Claim.—The combination, with the seat S, having an exhaust-channel, A, forming an opening through it, of the internally-tapering or conical nozzle D, arranged over said seat and provided in the fixed portion of its base with an opening, *e*, of as large area as the channel-opening through said seat, with which it registers, and the sliding block F or F', of tapering construction, on its inner end, fitted to slide at its base up to, subject to the action of, a stop, and away from or back of said opening *e* without overlapping it, whereby said sliding block when moved in or out not only operates to increase or diminish the top opening of the nozzle, but when fully adjusted inward does not contact said opening *e*, and baffling of the steam in the exhaust-channel is avoided, substantially as specified.

396,169. HOOK. PERKINS MILLS, Brooklyn, N. Y. Filed May 29, 1888. Serial No. 275,414. (No model.)

Claim.—The overhead double hook composed of a single length of wire having its two hooks back to back, both hooks coupled at their lower ends by a portion of the wire which serves as a brace, a bearing-surface at the upper end of each stem of each hook, an eye at one terminal of the wire midway between said bearing-surfaces, and a screw-threaded shank which occupies said eye, substantially as described.

396,170. STRAW-PLOW. JOHN Q. A. NEWSOM, Seymour, Ind. Filed Feb. 9, 1888. Serial No. 191,306. (No model.)

Claim.—1. A combined plow and traction-engine mounted upon a rigid frame and having a pair of non-swiveling supporting-wheels forward, a steering device located at the rear, consisting of a journaled curved or bent frame carrying a furrow-wheel at its rear end and a cutting-disk at the front end, and a hand-wheel having a horizontal shaft provided with a worm meshing with a sector-gearing connected to the steering-wheel and adapted to positively adjust said steering-wheel, substantially as described.

2. The combination, with the adjustable plow-shaft, of a series of spiral cutting-blades secured thereto and to each other, so as to form a continuous spiral cutter, the main part of such blades being formed on straight radial lines and its peripheral section being of concavo-convex form, substantially as described.

3. A spiral cutting-blade for attachment to a rotary plow-shaft, having its main portion formed on straight radial lines from its point of attachment to the shaft and its peripheral section of concavo-convex form, substantially as described.

4. The combination, with a revolving plow-shaft obliquely adjustable to the line of draft and supporting a series of spiral cutters adapted to form oblique ridges or furrows, of an auxiliary plow working in the line of draft and cutting a straight furrow intersecting the oblique furrows made by the spiral blades, and thus completing the cut, substantially as described.

5. The combination, with the draft-bar C, connected to the axle of the traction-wheels, of the bolster E, the screw 4, and the universal joint 5, substantially as described.

6. The combination, with the bolster E and the plow-shaft suspended therefrom, the draft-bar C, and the universal joint 5 between the draft-bar and bolster, of the segment H, bolted to the bolster and adjustable on the draft-bar, substantially as described.

7. The combination, with the bolster E, of the adjustable hanger J, carrying the journaled trailing-wheel K at one end and the leading cutter-wheel L at the other, substantially as described.

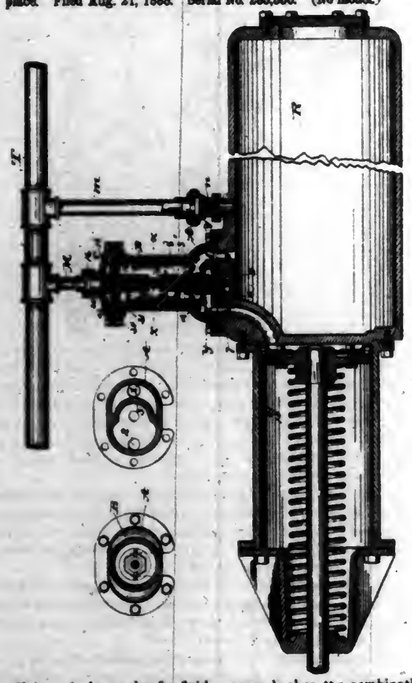
8. The combination of the bolster E, the hanger J, the disk 32 and pin 31, the disk 34, the worm 33, and hand-wheel 35, substantially as described.

9. The combination of the bolster E and plow-shaft, the hanger J, the screw M, and threaded lug 36, substantially as described.

10. The combination, with the traction-wheels and pulley 14, the

suspended adjustable plow-shaft having the pulley 15, and the cable or chain 16, of guide-pulleys interposed between pulleys 14 and 15 and means for adjusting such guide-pulleys relatively to the horizontal adjustment of the plow-shaft, substantially as described.

11. The combination, with the traction-wheels and axle and the adjustable plow-shaft, of the chain or cable for transmitting power to the plow-shaft and the adjustable bracket 19, carrying guide-pulleys, substantially as described.



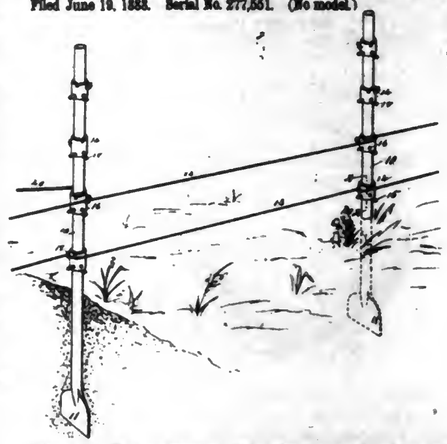
12. The combination, with the adjustable plow-frame, of the adjustable bracket 19, having independently-adjustable arms 22 and carrying guide-pulleys, substantially as described.

13. The combination, with the revolving plow-shaft supporting a series of spiral cutting-blades, of a series of traveling scrapers operated by the revolution of said blades, substantially as described.

14. The combination, with the revolving plow-shaft supporting a series of spiral cutting-blades, of an endless chain carrying a series of forked scrapers and operated by the revolution of said blades, substantially as described.

15. The combination, with the revolving plow-shaft supporting a series of spiral cutting-blades, of an endless chain, a series of forked adjustable scrapers pivoted to the chain guide-wheels on the scrapers, and a track for supporting the guide-wheels, substantially as described.

396,171. VALVE FOR FLUID-PRESSURE BRAKES. GEORGE H. POOR, St. Louis, Mo., assignor to the American Brake Company, same place. Filed Aug. 21, 1888. Serial No. 283,330. (No model.)



Claim.—1. In a valve for fluid-pressure brakes, the combination, with the inlet and exhaust valves, of an impulse-chamber which communicates with the auxiliary reservoir, a diaphragm which is arranged in the impulse-chamber and connected with the valves, and a reduction-valve arranged in a passage leading from the impulse-chamber to the train-pipe, substantially as and for the purposes specified.

2. In a valve for fluid-pressure brakes, the combination of the inlet and exhaust valves having a stem common to both, an impulse-chamber which communicates with the auxiliary reservoir, a diaphragm arranged in the impulse-chamber, and a reduction-valve interposed between the impulse-chamber and the train-pipe, substantially as for the purposes specified.

3. In a valve for fluid-pressure brakes, the combination of an exhaust-valve, a double-seated inlet-valve, an impulse-chamber, a leak leading from the impulse-chamber to the reservoir, said leak arranged to be closed by one face of the double valve, and a reduction-valve interposed between the impulse-chamber and the train-pipe, substantially as and for the purposes specified.

4. In a valve for fluid-pressure brakes, the combination of shell-section A, having passages 1 and 2 and ports 4 and 6, valves 5 and 7, connected by stem 8, hollow post 10, impulse-chamber 15, a diaphragm having a hollow stem, and a reduction-valve arranged in the hollow stem of the diaphragm, substantially as and for the purposes specified.

396,172. WIRE-TIGHTENER. THOMAS REILY, Glencoe, Iowa. Filed June 19, 1888. Serial No. 277,551. (No model.)

Claim.—1. The combination, with a fence-post, of a sleeve held to revolve thereon, provided with an attached arm on its outer side for engaging the fence-wire and aligning slots in the upper end, and means, substantially as shown and described, for retaining the sleeve in a fixed position, as and for the purpose specified.

2. The combination, with a cylindrical fence-post provided with diametrically-opposite apertures, of a sleeve revoluble upon said post, provided with apertures near the lower end, aligning slots in the upper end, and an upwardly-extending arm or projection secured to the outer surface, a detachable pin adapted to pass through the apertures of the sleeve and the apertures of the post, and means, substantially as shown and described, for supporting said sleeve, as set forth.

3. The combination, with a cylindrical fence-post provided with two sets of diametrically-opposite apertures, of a sleeve revoluble upon said post, provided with a series of apertures near the lower end, slots in the upper end, and a projection or arm secured to the outer surface, a detachable pin adapted to be passed through one set of post-apertures below the sleeve, and a second pin adapted to be passed through apertures in the sleeve and the other set of post-apertures, substantially as shown and described.

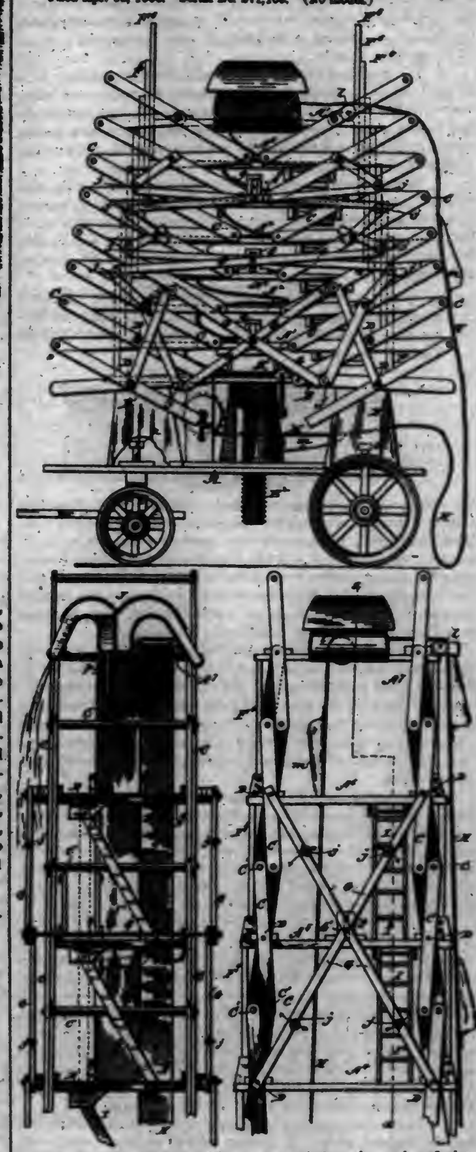
396,173. GATE. HARVEY C. RILEY, Perryville, Mo., assignor to himself and Robert M. Wilson, same place. Filed Oct. 29, 1888. Serial No. 289,377. (No model.)

Claim.—1. The combination, with a swinging gate having a horizontal double-ended lever-bar with angular arms at its ends, mounted on the hinged end of the gate, of posts located at the side of a road on opposite sides of the gate, a gate-operating cord leading from one of the posts to one end of the double-ended lever, a gate-operating cord leading from the other post to the other end of the double-ended lever, a cord for operating the gate-latch, leading from one of the posts to one angular arm of double-ended lever, over a guide thereon, to and over a guide on the other angular arm of double-ended lever, and from thence to the other post, and a latch-operating branch cord leading from the latch to the main operating latch-cord and connected therewith between the cord-guides on the angular arms of double-ended lever-bar, substantially as shown and described.

2. The combination, with swinging gate 1, having the horizontal Z-shaped bar 10, with arms 11 and 12, secured to the top of hinged upright 2, and the pivoted latch 6, of the post 16, with arm 15, and post 25, with arm 24, located at the side of a road on opposite sides of and at a suitable distance from the gate 1, a gate-operating cord, 26, with an end suspended beneath arm 24 of post 25, passing over a pulley, 29, thereon and extending and secured to arm 11 of Z-shaped bar 10, a gate-operating cord, 13, with an end suspended beneath arm 15 of post 16, passing over pulley 14 thereon and extending and secured to arm 12 of Z-shaped bar 10, a main latch-operating cord, 19, suspended beneath arm 24 of post 25, passing over a pulley, 23, thereon, extending to and passing over a pulley, 22, on arm 12 of Z-shaped bar 10, from thence to and over a pulley, 21, on arm 11 of bar 10, to and over a pulley, 20, on arm 15 of post 16, from which it is suspended, and a branch operating-cord, 17, extending from latch 6 to main latch-cord 19 and secured thereto between pulleys 21 and 22, substantially as shown and described.

3. The combination, with gate 1, hinged to fence-post 5, and having a pivoted latch, 6, and a Z-shaped double-ended lever-bar, 10, with angular arms 11 and 12 at its ends, of a post, 28, located at the side of a road a distance from fence-post 5 equal to the length of the gate, and having a latch-catch, 30, a post, 25, with an arm, 24, and a post, 16, with an arm, 15, located at the side of a road on opposite sides of the gate and at a suitable distance from post 5, a gate-operating cord, 26, connected to arm 11 of bar 10 and extending to and over a pulley, 29, on arm 24 and suspended therefrom, a gate-operating cord, 13, connected to arm 12 of bar 10 and extending to and over a pulley, 14, on arm 15, and suspended therefrom, a main operating latch-cord, 19, suspended from and extending over a pulley, 23, on arm 24, to and over a pulley, 22, on arm 12, to and over a pulley, 21, on arm 11, and from thence to and over a pulley, 20, on arm 15, and suspended therefrom, and a branch latch-cord, 17, extending to main latch-operating cord 19 and secured thereto between pulleys 21 and 22, substantially as shown and described.

396,174. BUSH-HAMMER. LUTHER H. ROWELL, South Thomaston, Me. Filed Mar. 22, 1888. Serial No. 268,115. (No model.)



Claim.—1. In a bush-hammer, the combination, with two pole-plates provided each with spaced bolt-holes and a shank-section tapered and threaded at the outer end, of a tapering-threaded sleeve and fastening-bolts, substantially as shown and described.

2. In a bush-hammer, a rectangular plate provided with a semi-cylindrical shank-section tapered and threaded at its outer end, and with spaced bolt-holes, substantially as shown and described.

3. The combination, with two pole-plates formed with shank-sections and provided with spaced bolt-holes, of cuts held between the plates, a sleeve engaging the shank-sections, and fastening-bolts, substantially as shown and described.

4. A bush-hammer pole comprising the separate and independent apertured pole-plates, each having shank forming a half-socket on its inner edge, a transverse integral gib extending inwardly from the outer edge of one plate, the outer edge of the opposite plate having a transverse recess receiving the end of said gib, and a sleeve surrounding the two-part handle socket, substantially as set forth.

396,175. FIRE-ESCAPE. JOHN D. BILLMANN, San Antonio, Tex. Filed Apr. 18, 1888. Serial No. 271,100. (No model.)

Claim.—1. An extensible tower consisting of a series of platforms, a series of lifting toggle-levers arranged in pairs as lazy-tongs at the four corners, and a series of bracing toggle-levers arranged, as described, to work reversely to the lifting-toggles, substantially as and for the purpose set forth.

2. An extensible tower consisting of a series of platforms, a series of lifting toggle-levers arranged in pairs as lazy-tongs at the four corners, and a series of bracing toggle-levers arranged to work reversely to the lifting-toggles, and having in their lengths outwardly-folding and inwardly-locking knuckle-joints *j*, substantially as and for the purpose described.

3. An extensible tower consisting of a series of vertically-adjustable platforms with hatchways, combined with a series of supporting toggle-levers, and folding ladders extending from one platform to the next, substantially as shown and described.

4. The combination, with an extensible tower, of a water-receptacle arranged at the top of the same and having perforated eave-troughs and a hose-pipe leading thereto from below for showering spray down between the tower and a burning building, as described.

5. The combination, in an extensible tower, of the vertically-adjustable platforms, the series of lazy-tongs for lifting the same, and a set of rigid upright guide-bars arranged on each platform and extending through an opening in the platform above, substantially as and for the purpose described.
